Root systems and Clifford algebras: from symmetries of viruses to E_8 and an ADE-like correspondence

Pierre-Philippe Dechant

Department of Mathematics, University of York

City University – December 6, 2016

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Main results

- New affine symmetry principle for viruses and fullerenes
- H_3 (icosahedral symmetry) induces the E_8 root system
- Each 3D root system induces a 4D root system
- This correspondence extends to exponents in the Coxeter plane (not just the original Trinity)
- Clifford algebra is a very natural framework for root systems and reflection groups
Overview

Clifford algebras and exceptional root systems
The Coxeter plane

Viruses
Root systems
Affine extensions
The Icosahedron

- Rotational icosahedral group is $I = A_5$ of order 60
- Full icosahedral group is the Coxeter group H_3 of order 120 (including reflections/inversion); generated by the root system icosidodecahedron

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems

Root systems
Affine extensions

Icosahedral viruses
Two viral surface layouts: a $T = 4$ Caspar-Klug quasiequivalent triangulation, and a pseudo $T = 7$ defying Caspar-Klug theory, which is based on a kite-rhombus tiling instead (HPV)

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Viruses
Root systems
Affine extensions

Root systems

Root system Φ: set of vectors α in a vector space with an inner product such that

1. $\Phi \cap \mathbb{R}\alpha = \{-\alpha, \alpha\} \ \forall \ \alpha \in \Phi$

2. $s_\alpha \Phi = \Phi \ \forall \ \alpha \in \Phi$

Simple roots: express every element of Φ via a $\mathbb{Z}$-linear combination.
reflection/Coxeter groups $\quad s_\alpha : v \to s_\alpha(v) = v - 2\dfrac{(v|\alpha)}{(\alpha|\alpha)}\alpha$

Root systems
Affine extensions

Cartan Matrices

Cartan matrix of α_is is
$$A_{ij} = 2\frac{(\alpha_i|\alpha_j)}{(\alpha_i|\alpha_i)} = 2\frac{|\alpha_j|}{|\alpha_i|}\cos\theta_{ij}$$

$$A_2: \ A = \begin{pmatrix} 2 & -1 \\ -1 & 2 \end{pmatrix}$$

Coxeter-Dynkin diagrams: node = simple root, no link = roots orthogonal, simple link = roots at $\frac{\pi}{3}$, link with label m = angle $\frac{\pi}{m}$.

$A_3 \circ\!\!-\!\!\circ\!\!-\!\!\circ$ $\qquad B_3 \circ\!\!-\!\!\circ\overset{4}{-}\circ$ $\qquad H_3 \circ\!\!-\!\!\circ\overset{5}{-}\circ$ $\qquad I_2(n) \circ\overset{n}{-}\circ$

Affine extensions
Lie groups to Lie algebras to Coxeter groups to root systems

- Lie group: manifold of continuous symmetries (gauge theories, spacetime)
- Lie algebra: infinitesimal version near the identity
- Non-trivial part is given by a root lattice
- Weyl group is a crystallographic Coxeter group: $A_n, B_n/C_n, D_n, G_2, F_4, E_6, E_7, E_8$ generated by a root system.
- So via this route root systems are always crystallographic. Neglect non-crystallographic root systems $I_2(n), H_3, H_4$.

Viruses, root systems and affine extensions

The Coxeter plane

Viruses
Root systems
Affine extensions

Affine extensions

An affine Coxeter group is the extension of a Coxeter group by an affine reflection in a hyperplane not containing the origin $s_{\alpha_0}^{aff}$ whose geometric action is given by

$$s_{\alpha_0}^{aff} v = \alpha_0 + v - \frac{2(\alpha_0|v)}{(\alpha_0|\alpha_0)}\alpha_0$$

Non-distance preserving: includes the translation generator

$$Tv = v + \alpha_0 = s_{\alpha_0}^{aff} s_{\alpha_0} v$$

New insight into RNA virus assembly

- There are specific interactions between RNA and coat protein (CP) given by symmetry axes

- Essential for assembly as only this RNA-CP interaction turns CP into right geometric shape for capsid formation

- The RNA forms a Hamiltonian cycle visiting each CP once – dictated by symmetry

- A patent for a new antiviral strategy (Reidun Twarock)

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence

Clifford Algebra and orthogonal transformations

- Form an algebra using the product between two vectors

$$ab \equiv a \cdot b + a \wedge b$$

- Inner product is symmetric part $a \cdot b = \frac{1}{2}(ab + ba)$

- Reflecting x in n is given by $\boxed{x' = x - 2(x \cdot n)n = -nxn}$ (n and $-n$ doubly cover the same reflection)

- Via Cartan-Dieudonné theorem any orthogonal (/conformal/modular) transformation can be written as successive reflections

$$\boxed{x' = \pm n_1 n_2 \ldots n_k x n_k \ldots n_2 n_1} = \pm A x \tilde{A}$$

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence

Clifford Algebra of 3D

- E.g. Pauli algebra in 3D (likewise for Dirac algebra in 4D) is

$$\underbrace{\{1\}}_{\text{1 scalar}} \quad \underbrace{\{e_1, e_2, e_3\}}_{\text{3 vectors}} \quad \underbrace{\{e_1 e_2, e_2 e_3, e_3 e_1\}}_{\text{3 bivectors}} \quad \underbrace{\{I \equiv e_1 e_2 e_3\}}_{\text{1 trivector}}$$

- We can multiply together root vectors in this algebra $\alpha_i \alpha_j \ldots$

- A general element has 8 components, even products (rotations/spinors) have four components:

$$R = a_0 + a_1 e_2 e_3 + a_2 e_3 e_1 + a_3 e_1 e_2 \Rightarrow R\tilde{R} = a_0^2 + a_1^2 + a_2^2 + a_3^2$$

- So behaves as a 4D Euclidean object – inner product

$$(R_1, R_2) = \frac{1}{2}(R_2 \tilde{R}_1 + R_1 \tilde{R}_2)$$

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence
- Order 120 group H_3 doubly covered by 240 (s)pinors in 8D space

- With (somewhat counterintuitive) reduced inner product this gives the E_8 root system

- E_8 is actually hidden within 3D geometry!

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence
Spinors from reflections
- The 6 roots $(\pm 1, 0, 0)$ and permutations of $A_1 \times A_1 \times A_1$ generate 8 spinors:
- $\boxed{\pm e_1, \ \pm e_2, \ \pm e_3}$ give the 8 spinors $\boxed{\pm 1, \pm e_1 e_2, \pm e_2 e_3, \pm e_3 e_1}$
- This is a discrete spinor group isomorphic to the quaternion group Q.
- As 4D vectors these are $(\pm 1, 0, 0, 0)$ and permutations, the 8 roots of $A_1 \times A_1 \times A_1 \times A_1$ (the 16-cell).

Trinities and McKay correspondence

H_4 from H_3

- The H_3 root system has 30 roots e.g. simple roots

$$\boxed{\alpha_1 = e_2, \alpha_2 = -\frac{1}{2}((\tau - 1)e_1 + e_2 + \tau e_3) \text{ and } \alpha_3 = e_3}.$$

- Subgroup of rotations A_5 of order 60 is doubly covered by 120
  spinors of the form $\boxed{\alpha_1\alpha_2 = -\frac{1}{2}(1 - (\tau - 1)e_1 e_2 + \tau e_2 e_3)}$,

  $\boxed{\alpha_1\alpha_3 = e_2 e_3}$ and $\boxed{\alpha_2\alpha_3 = -\frac{1}{2}(\tau - (\tau - 1)e_3 e_1 + e_2 e_3)}$.

-

  $(\pm 1, 0, 0, 0)$ (8 perms) , $\frac{1}{2}(\pm 1, \pm 1, \pm 1, \pm 1)$ (16 perms)

  $$\frac{1}{2}(0, \pm 1, \pm \sigma, \pm \tau) \text{ (96 even perms)},$$

  As 4D vectors are the 120 roots of the H_4 root system.

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence

Spinors from reflections

- The 3D Coxeter groups that are symmetry groups of the Platonic Solids:

- The $6/12/18/30$ roots in $A_1 \times A_1 \times A_1/A_3/B_3/H_3$ generate $8/24/48/120$ spinors.

- E.g. $\pm e_1, \pm e_2, \pm e_3$ give the 8 spinors $\pm 1, \pm e_1 e_2, \pm e_2 e_3, \pm e_3 e_1$

- The discrete spinor group is isomorphic to the quaternion group Q / binary tetrahedral group $2T$ / binary octahedral group $2O$ / binary icosahedral group $2I$).

Arnold's Trinities

Arnold's observation that many areas of real mathematics can be complexified and quaternionified resulting in theories with a similar structure.

- The fundamental trinity is thus $(\mathbb{R}, \mathbb{C}, \mathbb{H})$
- The projective spaces $(\mathbb{R}P^n, \mathbb{C}P^n, \mathbb{H}P^n)$
- The spheres $(\mathbb{R}P^1 = S^1, \mathbb{C}P^1 = S^2, \mathbb{H}P^1 = S^4)$
- The Möbius/Hopf bundles $(S^1 \to S^1, S^4 \to S^2, S^7 \to S^4)$
- The Lie Algebras (E_6, E_7, E_8)
- The symmetries of the Platonic Solids (A_3, B_3, H_3)
- The 4D groups (D_4, F_4, H_4)
- New connections via my Clifford spinor construction (see McKay correspondence)

Viruses, root systems and affine extensions

The Coxeter plane

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence

Platonic Trinities

- Arnold's connection between (A_3, B_3, H_3) and (D_4, F_4, H_4) is very convoluted and involves numerous other trinities at intermediate steps:

- Decomposition of the projective plane into Weyl chambers and Springer cones

- The number of Weyl chambers in each segment is $24 = 2(1+3+3+5), 48 = 2(1+5+7+11), 120 = 2(1+11+19+29)$

- Notice this miraculously is one less than the degrees of invariants $((2,4,4,6),(2,6,8,12),(2,12,20,30))$ of the Coxeter groups (D_4, F_4, H_4)

- Believe the Clifford connection is more direct

A unified framework for polyhedral groups

Group	Discrete subgroup	Action Mechanism
$SO(3)$	rotational (chiral)	$x \rightarrow \tilde{R}xR$
$O(3)$	reflection (full/Coxeter)	$x \rightarrow \pm\tilde{A}xA$
$\mathrm{Spin}(3)$	binary	$(R_1, R_2) \rightarrow R_1 R_2$
$\mathrm{Pin}(3)$	pinor	$(A_1, A_2) \rightarrow A_1 A_2$

- e.g. the chiral icosahedral group has 60 elements, encoded in Clifford by 120 spinors, which form the binary icosahedral group
- together with the inversion/pseudoscalar I this gives 60 rotations and 60 rotoinversions, i.e. the full icosahedral group H_3 in 120 elements (with 240 pinors)

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford basics
E_8 from the icosahedron
3D to 4D spinor induction
Trinities and McKay correspondence

Some Group Theory: chiral, full, binary, pin

- Easy enough to calculate conjugacy classes etc of pinors in Clifford algebra
- Chiral (binary) polyhedral groups have irreps
- tetrahedral (12/24): 1, 1', 1'', 2_s, $2'_s$, $2''_s$, 3
- octahedral (24/48): 1, 1', 2, 2_s, $2'_s$, 3, 3', 4_s
- icosahedral (60/120): 1, 2_s, $2'_s$, 3, $\bar{3}$, 4, 4_s, 5, 6_s
- Binary groups are discrete subgroups of $SU(2)$ and all thus have a 2_s spinor irrep
- Connection with the McKay correspondence!

The McKay Correspondence

More than E-type groups: the infinite family of 2D groups, the binary cyclic and dicyclic groups are in correspondence with A_n and D_n, e.g. the quaternion group Q and D_4^+. So McKay correspondence not just a trinity but ADE-classification. We also have $I_2(n)$ on top of the trinity (A_3, B_3, H_3)

New explicit connections
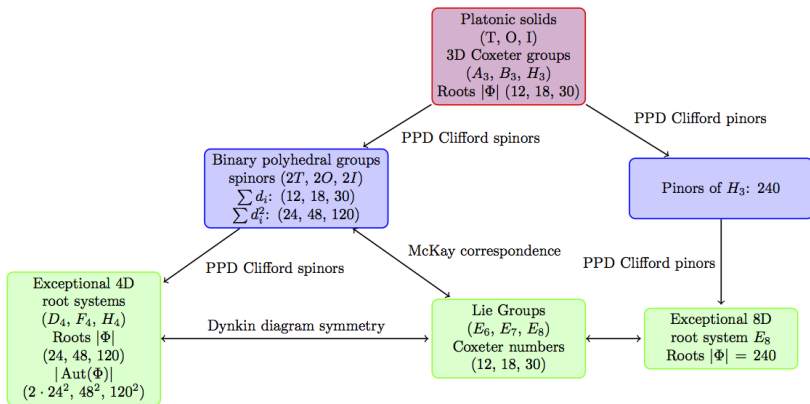

Overview

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

The Coxeter Plane

- Every (for our purposes) Coxeter group has a Coxeter plane.
- A way to visualise Coxeter groups in any dimension by projecting their root system onto the Coxeter plane

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane
Coxeter Elements, Degrees and Exponents

- Like the symmetric group, Coxeter groups can have invariant polynomials. Their degrees d are important invariants/group characteristics.

- Turns out that actually degrees d are intimately related to so-called exponents m $\boxed{m = d - 1}$.

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Coxeter Elements, Degrees and Exponents

- A Coxeter Element is any combination of all the simple reflections $\boxed{w = s_1 \ldots s_n}$, i.e. in Clifford algebra it is encoded by the versor $W = \alpha_1 \ldots \alpha_n$ acting as $\boxed{v \to wv = \pm \tilde{W} v W}$. All such elements are conjugate and thus their order is invariant and called the Coxeter number h.

- The Coxeter element has complex eigenvalues of the form $\boxed{\exp(2\pi m i/h)}$ where m are called exponents:
$$\boxed{wx = \exp(2\pi m i/h)x}$$

- Standard theory complexifies the real Coxeter group situation in order to find complex eigenvalues, then takes real sections again.

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Coxeter Elements, Degrees and Exponents

- The Coxeter element has complex eigenvalues of the form $\boxed{\exp(2\pi m i/h)}$ where m are called exponents

- Standard theory complexifies the real Coxeter group situation in order to find complex eigenvalues, then takes real sections again.

- In particular, 1 and $h-1$ are always exponents

- Turns out that actually exponents and degrees are intimately related ($\boxed{m = d - 1}$). The construction is slightly roundabout but uniform, and uses the Coxeter plane.

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

The Coxeter Plane

- In particular, can show every (for our purposes) Coxeter group has a Coxeter plane

- Existence relies on the fact that all groups in question have tree-like Dynkin diagrams, and thus admit an alternate colouring

- Essentially just gives two sets of mutually commuting generators

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane
The Coxeter Plane

- Existence relies on the fact that all groups in question have tree-like Dynkin diagrams, and thus admit an alternate colouring
- Essentially just gives two sets of orthogonal = mutually commuting generators but anticommuting root vectors α_w and α_b (duals ω)
- Cartan matrices are positive definite, and thus have a Perron-Frobenius (all positive) eigenvector λ_i.
- Take linear combinations of components of this eigenvector as coefficients of two vectors from the orthogonal sets $v_w = \sum \lambda_w \omega_w$ and $v_b = \sum \lambda_b \omega_b$
- Their outer product/Coxeter plane bivector $\boxed{B_C = v_b \wedge v_w}$ describes an invariant plane where w acts by rotation by $2\pi/h$.

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford Algebra and the Coxeter Plane – 2D case

$$I_2(n) \qquad \overset{n}{\circ\!-\!\circ}$$

- For $I_2(n)$ take $\boxed{\alpha_1 = e_1,\ \alpha_2 = -\cos\frac{\pi}{n}e_1 + \sin\frac{\pi}{n}e_2}$

- So Coxeter versor is just

$$\boxed{W = \alpha_1\alpha_2 = -\cos\frac{\pi}{n} + \sin\frac{\pi}{n}e_1e_2 = -\exp\left(-\frac{\pi I}{n}\right)}$$

- In Clifford algebra it is therefore immediately obvious that the action of the $I_2(n)$ Coxeter element is described by a versor (here a rotor/spinor) that encodes rotations in the e_1e_2-Coxeter-plane and yields $h = n$ since trivially $W^n = (-1)^{n+1}$ yielding $\boxed{w^n = 1}$ via $wv = \tilde{W}vW$.

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford Algebra and the Coxeter Plane – 2D case

- So Coxeter versor is just
$$W = -\exp\left(-\frac{\pi I}{n}\right)$$

- $I = e_1 e_2$ anticommutes with both e_1 and e_2 such that sandwiching formula becomes
$$v \to wv = \tilde{W} v W = \tilde{W}^2 v = \exp\left(\pm\frac{2\pi I}{n}\right) v \quad \text{immediately}$$
yielding the standard result for the complex eigenvalues in real Clifford algebra without any need for artificial complexification

- The Coxeter plane bivector $B_C = e_1 e_2 = I$ gives the complex structure

- The Coxeter plane bivector B_C is invariant under the Coxeter versor $\tilde{W} B_C W = \pm B_C$.

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

Clifford algebra: no need for complexification

- Turns out in Clifford algebra we can factorise W into orthogonal (commuting/anticommuting) components
  $$\boxed{W = \alpha_1 \ldots \alpha_n = W_1 \ldots W_n} \text{ with } \boxed{W_i = \exp(\pi m_i I_i / h)}$$

- Here, I_i is a bivector describing a plane with $\boxed{I_i^2 = -1}$

- For v orthogonal to the plane descrbed by I_i we have
  $$\boxed{v \to \tilde{W}_i v W_i = \tilde{W}_i W_i v = v} \text{ so cancels out}$$

- For v in the plane we have
  $$\boxed{v \to \tilde{W}_i v W_i = \tilde{W}_i^2 v = \exp(2\pi m_i I_i / h) v}$$

- Thus if we decompose W into orthogonal eigenspaces, in the eigenvector equation all orthogonal bits cancel out and one gets the complex eigenvalue from the respective eigenspace

Clifford algebra: no need for complexification
- For v in the plane we have

$$\boxed{v \rightarrow \tilde{W}_i v W_i = \tilde{W}_i^2 v = \exp(2\pi m_i I_i / h) v}$$

- So complex eigenvalue equation arises geometrically without any need for complexification
- Different complex structures immediately give different eigenplanes
- Eigenvalues/angles/exponents given from just factorising $W = \alpha_1 \ldots \alpha_n$
- E.g. H_4 has exponents $1, 11, 19, 29$ and
  $W = \exp\left(\frac{\pi}{30} B_C\right) \exp\left(\frac{11\pi}{30} I B_C\right)$
- Here we have been looking for orthogonal eigenspaces, so innocuous – different complex structures commute
- But not in general – naive complexification can be misleading

Imaginary differences – different imaginaries

So what has been gained by this Clifford view?

- There are different entities that serve as unit imaginaries

- They have a geometric interpretation as an eigenplane of the Coxeter element

- These don't need to commute with everything like i (though they do here – at least anticommute. But that is because we looked for orthogonal decompositions)

- But see that in general naive complexification can be a dangerous thing to do – unnecessary, issues of commutativity, confusing different imaginaries etc

Clifford algebras and exceptional root systems
The Coxeter plane

The countably infinite family $I_2(n)$ and ADE

- For A_1^3 can see immediately $8 = 2(1+1+1+1)$
- Simple roots $\alpha_1 = e_1$, $\alpha_2 = e_2$, $\alpha_3 = e_3$, $\alpha_4 = e_4$ give
$W = e_1 e_2 e_3 e_4 = (\cos\frac{\pi}{2} + \sin\frac{\pi}{2} e_1 e_2)(\cos\frac{\pi}{2} + \sin\frac{\pi}{2} e_3 e_4) = \exp(\frac{\pi}{2} e_1 e_2)\exp(\frac{\pi}{2} e_3 e_4)$
- Gives exponents $(1, 1, 1, 1)$ $(2-1)$

Clifford algebras and exceptional root systems
The Coxeter plane

The countably infinite family $I_2(n)$ and ADE

- For $A_1 \times I_2(n)$ one gets the same decomposition
  $4n = 2(1 + (n-1) + 1 + (n-1)) = 2 \cdot 2n$
- Simple roots $\alpha_1 = e_1$, $\alpha_2 = -\cos\frac{\pi}{n}e_1 + \sin\frac{\pi}{n}e_2$, $\alpha_3 = e_3$,
  $\alpha_4 = -\cos\frac{\pi}{n}e_3 + \sin\frac{\pi}{n}e_4$ give $W = \exp\left(-\frac{\pi e_1 e_2}{n}\right)\exp\left(-\frac{\pi e_3 e_4}{n}\right)$
- Gives exponents $(1, (n-1), 1, (n-1))$

The countably infinite family $I_2(n)$ and ADE

- So Arnold's initial hunch regarding the exponents extends in fact to my full correspondence
- McKay correspondence is a correspondence between even subgroups of $SU(2)$/quaternions and ADE affine Lie algebras
- In fact here get the even quaternion subgroups from 3D – link to ADE affine Lie algebras via McKay?

Viruses, root systems and affine extensions
Clifford algebras and exceptional root systems
The Coxeter plane

# The countably infinite family $I_2(n)$, finite subgroups of $SU(2)$ and ADE

- Double cover of cyclic group of order n (binary cyclic group is $I_2(n)$ as a root system – corresponding to A_n affine Lie algebras (2D root systems are self-dual – just see complex part)
- The dicyclic group/binary dihedral group is $I_2(n) \times I_2(n)$ – corresponding to D_n affine Lie algebras
- The binary tetrahedral, octahedral and icosahedral groups are D_4, F_4 and H_4 as root systems – and correspond to E-type Lie algebras E_6, E_7, E_8
- Get all of the even subgroups of the quaternions from 2D and 3D root systems and via McKay correspondence the ADE Lie algebras
- Is there a direct correspondence between the root systems and

Clifford algebras and exceptional root systems
The Coxeter plane

Conclusions

- **All** exceptional geometries arise in 3D, root systems giving rise to Lie groups/algebras etc
- Completely novel spinorial way of viewing exceptional geometries as 3D phenomena – implications for HEP etc?
- New view of Coxeter degrees and exponents with geometric interpretation of imaginaries
- A unified framework for doing group and representation theory: polyhedral, orthogonal, conformal, modular (Moonshine) etc
- Correspondence between 3D & 4D root systems (and perhaps 2D) extends to full ADE correspondence with McKay and generalising Arnold's link between trinities via 3D Weyl chamber decomposition and exponents in the 4D Coxeter plane

Projection and Diagram Foldings

$$s_{\beta_1} = s_{\alpha_1} s_{\alpha_7}, \ s_{\beta_2} = s_{\alpha_2} s_{\alpha_6}, \ s_{\beta_3} = s_{\alpha_3} s_{\alpha_5}, \ s_{\beta_4} = s_{\alpha_4} s_{\alpha_8} \Rightarrow H_4$$

- E_8 has a H_4 subgroup of rotations via a 'partial folding'
- Can project 240 E_8 roots to $H_4 + \tau H_4$ – essentially the reverse of the previous construction!
- Coxeter element & number of E_8 and H_4 are the same

4D geometry is surprisingly important for HEP

- 4D root systems are surprisingly relevant to HEP
- A_4 is $SU(5)$ and comes up in Grand Unification
- D_4 is $SO(8)$ and is the little group of String theory
- In particular, its triality symmetry is crucial for showing the equivalence of RNS and GS strings
- B_4 is $SO(9)$ and is the little group of M-Theory
- F_4 is the largest crystallographic symmetry in 4D and H_4 is the largest non-crystallographic group
- The above are subgroups of the latter two
- Spinorial nature of the root systems could have surprising consequences for HEP
