Icosahedral symmetry Tiling theory Extended structures Giant viruses

## What is a Virus?

- Transported piece of genetic information that e.g. can run a programme in a host cell
- Genome: RNA or DNA
- Fragile needs to be protected by a protein shell: capsid
- Gene  $\rightarrow$  mRNA  $\rightarrow$  protein (transcription and translation)
- Each protein = amino acid chain folds into a 3D shape: one geometric building block

Pierre-Philippe Dechant

Recent developments in mathematical virology

イロト イポト イヨト イヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Watson and Crick: The Icosahedron

- Crick&Watson: Genetic economy → symmetry → icosahedral is largest
- Rotational icosahedral group is  $I = A_5$  of order 60
- Full icosahedral group is the Coxeter group H<sub>3</sub> of order 120 (including reflections/inversion); generated by the root system icosidodecahedron

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Many viruses are icosahedral

・ロト ・回ト ・ヨト ・ヨト

æ

Icosahedral symmetry Tiling theory Extended structures

## Assembling an Icosahedron

- Assemble from 20 identical triangular building blocks
- The order of addition gives a Hamiltonian path on the dual dodecahedron

イロト イヨト イヨト イヨト

Icosahedral symmetry

Tiling theory Extended structure Giant viruses

## Assembling a dodecahedron

イロン イヨン イヨン イヨン

æ

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## More than just icosahedral symmetry?

イロン イヨン イヨン イヨン

æ

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Caspar and Klug: Triangulations

- Mathematical upper limit of 60 for equivalent subunits, but biologically want to do better!
- Gene  $\rightarrow$  can already make a triangle  $\rightarrow$  might as well make many!
- Caspar-Klug ideas of quasi-equivalence and triangulations

Icosahedral symmetry Tiling theory Extended structures Giant viruses

Viruses: Caspar-Klug triangulations  $T = h^2 + hk + k^2$ 

integer steps *h* and *k* in hexagonal directions give allowed triangulation numbers  $T = h^2 + hk + k^2$ *T* orbits so 60*T* proteins, 60 of which form 12 pentamers, and 60(T-1) form 10(T-1) hexamers

Icosahedral symmetry Tiling theory Extended structures Giant viruses

Viruses: Caspar-Klug triangulations  $T = h^2 + hk + h^2$ 

æ

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Viruses: Caspar-Klug triangulations

Pierre-Philippe Dechant

Recent developments in mathematical virology

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## The status quo for 40 years

• New insights in the 2000s from Reidun Twarock who essentially founded the field and other mathematical physicists (e.g. Anne Taormina etc)

#### Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Fullerenes

- other icosahedral objects in nature: football-shaped fullerenes
- Different shells with icosahedral symmetry: e.g.  $C_{60}$ ,  $C_{240}$ ,  $C_{540}$
- Follow Caspar-Klug-like layouts (e.g.  $T = h^2$  and  $T = 3h^2$  families)

イロン イヨン イヨン イヨン

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Vibrations of capsids and fullerenes

- Normal modes/vibrations of icosahedral capsids given by representation theory of the icosahedral group
- E.g.  $\Gamma_{\text{Icos}}^{\text{disp}} = \Gamma^1 + 3\Gamma^3 + \Gamma^{3'} + 2\Gamma^4 + 3\Gamma^5$
- Pioneered by Anne Taormina, Kasper Peeters and Francois Englert

Pierre-Philippe Dechant

Modelling

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## More general icosahedral tilings

Other tile shapes can also give icosahedral tilings: pentagons (dodecahedron), rhombuses (rhombic triacontahedron), kites (deltoidal hexecontahedron)

・ロト ・回ト ・ヨト ・ヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## triangulations vs other quasi-equivalent tilings

Two viral surface layouts: a T = 4 triangulation (e.g. HBV) and a rhombus tiling (MS2) for a pseudo T = 3 triangulation

・ロト ・日本 ・モート ・モート

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Other quasi-equivalent tilings

Three T = 3 capsids: Polio, MS2 and Pariacoto

イロン 不同と 不同と 不同と

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## A puzzle: non-quasiequivalent tilings – Penrose

More general icosahedral tilings: Cryo-EM reconstruction of HPV, a kite-rhombus tiling and a pseudo T = 7 triangulation.

・ロト ・日本 ・モート ・モート

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Architecture

- Triangulations: Buckminster Fuller geodesic domes
- kite-rhombus tiling: the new Amazon HQ

・ロト ・日本 ・モート ・モート

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Self-assembling protein nanoparticles

Quantized e.g. in mass spec - predict units by symmetry. Particles eg. for vaccine design

イロト イヨト イヨト イヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

# More general symmetry still?

- Improves the limit to 60*T*, but only in terms of surface structures (12 pentagons and rest hexagons).
- Making the symmetry non-compact might allow more general symmetry, simultaneously constraining different 'radial levels'
- Non-compact generator is a translation motivates looking into affine extensions of icosahedral symmetry
- There is an inherent length scale in the problem given by size of nucleic acid/protein molecules

## Overview

#### Virus structure and dynamics

- Icosahedral symmetry

# Other ideas

- Project symmetry orbits in 6D to get finite extended icosahedral point arrays (Emilio Zappa)
- Use projection to find 3D tiles to model viruses (David Salthouse)
- Use projection to model transitions between capsids via lattice transitions in 6D (Giuliana Indelicato)

イロト イポト イヨト イヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Use in Mathematical Virology

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## New insight into RNA virus assembly

- There are specific interactions between RNA and coat protein (CP) given by icosahedral symmetry axes
- Essential for assembly, as only this RNA-CP interaction turns CP into right geometric shape for capsid formation
- Hamiltonian cycle visiting each RNA-CP contact once dictated by symmetry
- Even the RNA has an icosahedrally ordered component

- 4 同 6 4 日 6 4 日

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Extension to fullerenes: carbon onions

- Extend idea of affine symmetry to other icosahedral objects in nature: football-shaped fullerenes (with Jess Wardman)
- Recover different shells with icosahedral symmetry from affine approach: carbon onions  $(C_{60} C_{240} C_{540})$

Pierre-Philippe Dechant

Recent developments in mathematical virology
Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Extension to fullerenes: carbon onions

- Extend idea of affine symmetry to other icosahedral objects in nature: football-shaped fullerenes
- Recover different shells with icosahedral symmetry from affine approach: carbon onions  $(C_{80} C_{180} C_{320})$

イロト イポト イヨト イヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

Viruses and fullerenes – symmetry as a common thread?

 Get nested arrangements like Russian dolls: carbon onions (e.g. Nature 510, 250253)

・ロト ・回ト ・ヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Two examples

- Non-compact symmetry that relates different structural features in the same polyhedral object when there is an additional length scale
- Novel symmetry principle in Nature, shown that it seems to apply to at least fullerenes and viruses

イロト イポト イラト イラト

Recent developments in mathematical virology

Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Trisymmetrons and Pentasymmetrons – how to count

э

Icosahedral symmetry Tiling theory Extended structures Giant viruses

Trisymmetrons and Pentasymmetrons – how to count

- Each has I(I+1)/2 or L(L+1)/2 hexamers
- So in total 20(3/(l+1)/2 + L(L+1)/2)
- Caspar-Klug theory predicts  $10(T-1) = 10(h^2 + hk + k^2 1)$
- So for which *h*, *k*, *l*, *L* can there be equality?
- Turns out for h = 2l + 1 and k = L l this holds identically
- So can have odd h and any k

イロト イポト イヨト イヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Major capsid protein

T is an area, so  $\sqrt{T}$  gives size of triangle and thus also particle diameter

э

Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Decorations – threefold and giants

・ロト ・回ト ・ヨト ・ヨト

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Decorations – threefold and giants

Use hexagonal tiling unit with decorations that partially break the symmetry: 6, 3, 2, 1 If respect the 3-fold axis, then still have partial lattice symmetry! Defects/domain walls at the other symmetry axes

Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Decorations - twofold case

Symmetric with respect to 2-fold axis – quasi-lattice symmetry Looks like a rhombic triacontahedron all over again

Icosahedral symmetry Tiling theory Extended structures Giant viruses

### Decorations - twofold and Zika

This is exactly what Zika looks like

イロン イヨン イヨン イヨン

Icosahedral symmetry Tiling theory Extended structures Giant viruses

## Trisymmetrons and Pentasymmetrons

Icosahedral symmetry Tiling theory Extended structures Giant viruses

# Major capsid protein - trimer, pseudohexamer

Pierre-Philippe Dechant Recent developments in mathematical virology

Icosahedral symmetry Tiling theory Extended structures Giant viruses

Build from prearranged blocks? Back to Hamiltonian paths

- Are the trisymmetrons and pentasymmetrons preformed? (or is that just what virions fall apart into?)
- If trisymmetrons are assembled then we're back to a Hamiltonian path for the icosahedron
- If pentasymmetrons then get a slightly new polyhedron

イロト イポト イヨト イヨト

MS2 and Packaging Signals Virus-like Particles Anti-virals

## Need to bind RNA in 60 places

The TR sequence is known to initiate assembly by associating with the maturation protein. It forms a <u>stemloop</u> and it has been shown that the <u>stemloop</u> changes the conformation of the <u>symmetric C/C</u> dimer to the <u>asymmetric A/B</u> dimer (allosteric switch).

Peter Stockley (Leeds), Neil Ranson (Leeds), Eric Dykeman (York)

Pierre-Philippe Dechant

Recent developments in mathematical virology

MS2 and Packaging Signals Virus-like Particles Anti-virals

# MS2 Hamiltonian path

# New insight into RNA virus assembly

- More realistic examples for MS has 60 vertices with 41,000 paths
- The RNA is actually circularised by Maturation Protein: only 66 cycles
- With thermodynamical assembly kinetics and 5-fold averaging experiments uniquely idenfied an evolutionarily conserved cycle
- Patents for new antiviral strategies and virus-like nanoparticles e.g. for drug delivery (Twarock group)

Intracellular – Replication Immunological – Infection Dynamics Modelling

# Summary of mathematical virology

- a truly diverse interdisciplinary endeavour: group theory, tiling theory, dynamical systems, graph theory, computational modelling, biophysics, bioinformatics, biochemistry, cell biology, structural biology, immunology
- curiosity-driven and impactful: from understanding a structural puzzle to a new generation of anti-virals – by accident

Intracellular – Replication Immunological – Infection Dynamics Modelling

# Other algebraic interests

- exceptional root systems/geometries
- (reflexive) polytopes
- Clifford algebras
- ADE correspondences

# Symmetry averaging

- As an example use the symmetry of a cube
- (axes of 4-fold, 3-fold and 2-fold symmetry)
- Dice have approximately cubic symmetry, but have slightly asymmetric features (the faces)

Intracellular – Replication Immunological – Infection Dynamics Modelling

# Symmetry averaging

- As an example use the symmetry of a cube
- Approximately cubic symmetry, but have slightly asymmetric features (the faces)
- Experiment averages over all orientations
- Washes out all asymmetric

features

Intracellular – Replication Immunological – Infection Dynamics Modelling

# Symmetry averaging

- Assume we have a distinguished face, e.g. 1 is always at the bottom
- The 6 can be in two configurations
- Average over the other 4 faces

Intracellular – Replication Immunological – Infection Dynamics Modelling

### Root systems

Root system  $\Phi$ : set of vectors  $\alpha$  in a vector space with an inner product such that

$$1. \Phi \cap \mathbb{R}\alpha = \{-\alpha, \alpha\} \forall \alpha \in \Phi$$
$$2. s_{\alpha}\Phi = \Phi \forall \alpha \in \Phi$$

Simple roots: express every element of  $\Phi$  via a

 $\mathbb{Z}$ -linear combination.

er groups 
$$s_{\alpha}: v \to s_{\alpha}(v) = v - 2 \frac{(v|\alpha)}{(\alpha|\alpha)} \alpha$$

Intracellular – Replication Immunological – Infection Dynamics Modelling

### Affine extensions

An affine Coxeter group is the extension of a Coxeter group by an affine reflection in a hyperplane not containing the origin  $s_{\alpha_0}^{aff}$ 

whose geometric action is given by

$$s^{aff}_{lpha_0} v = lpha_0 + v - rac{2(lpha_0|v)}{(lpha_0|lpha_0)} lpha_0$$

Non-distance preserving: includes the translation generator

$$Tv = v + lpha_0 = s_{lpha_0}^{aff} s_{lpha_0} v$$

# Non-crystallographic Coxeter groups $H_2 \subset H_3 \subset H_4$

$$\bigcirc \qquad \bigcirc \qquad \bigcirc \qquad \bigcirc \qquad \bigcirc \qquad \qquad 5 \qquad \qquad A = \begin{pmatrix} 2 - 1 & 0 & 0 \\ -1 & 2 - 1 & 0 \\ 0 & -1 & 2 - 7 \\ 0 & 0 - 7 & 2 \end{pmatrix}$$

 $H_2 \subset H_3 \subset H_4$ : 10, 120, 14,400 elements, the only Coxeter groups that generate rotational symmetries of order 5 linear combinations now in the extended integer ring

$$\mathbb{Z}[\tau] = \{a + \tau b | a, b \in \mathbb{Z}\} \text{ golden ratio } \tau = \frac{1}{2}(1 + \sqrt{5}) = 2\cos\frac{\pi}{5}$$

$$x^{2} = x + 1 \qquad \tau' = \sigma = \frac{1}{2}(1 - \sqrt{5}) = 2\cos\frac{2\pi}{5} \qquad \tau + \sigma = 1, \tau \sigma = -1$$
