**Background:** Mental disorders have been identified as the greatest social and economic burden to society; however, resourcing for service provision and research is disproportionately low in Europe (ROAMER, 2015). The World Federation of Occupational Therapists' Master Plan for Mental Health aims to establish and maintain a significant position for occupational therapy in mental health services. This requires accessible, critical summaries of the evidence base underpinning practice.

**Aim:** Conduct a critical review of evidence (published within last 5 years) to explore the role and effectiveness of occupational therapy mental health practice with children and adolescents. This is a 3<sup>rd</sup> year "Students as Co-Researchers" project. This age group is highlighted as a priority for research because early experience and wider social influences affect health across life (ROAMER, 2015).

**Method:** A systemised search and critical appraisal methodology is applied to evaluate literature published in the last five years that relates to occupational therapy and mental health of children and young people.

**Results:** A critical and thematic analysis related to the effectiveness of interventions and role of occupational therapists will be presented.

**Conclusion:** The quality of the evidence base will be considered and any evidence gaps identified.

**Application to Practice:** The findings will contribute to the evidence base underpinning occupation-focused interventions for health promotion and prevention of mental illness with children and adolescents.
