**Abstract:**
In opposition to the discourse of silent compliance and the neoliberal colonisation of voice, this article shares research with parents in an English primary school. Drawing on the work of Jacques Rancière and John Macmurray, I argue that there is a need for a more relational but dissensual approach to parent engagement and voice, instead of parents being positioned by schools as support acts. Parent engagement, increasingly commodified over recent years within English school policy, has been relegated to responding to questionnaires, dutiful attendance of parents’ evenings, ensuring homework completion and choosing the correct school. Meanwhile the social mobility agenda demands that parents inculcate aspirations in their children unquestioningly. Policies and pronouncements seek to ‘close the gap’ in attainment between the poorest children and their peers in England, Australia, the United States and other neoliberalised countries. Hence a context is created in which parent engagement is now an exercise in creating ‘good’ pupils and successful economic beings. This article considers how parents have been rendered objects rather than agentic subjects within neoliberal education systems and have lost their democratic voice. It concludes that there needs to be a reanimation of Dewey’s (2013) vision of ‘education politics’ (Moutsios, 2010: 124).
Introduction

Increasingly, many aspects of western societies, notably education and health have been neoliberalised (Olssen et al., 2004; Rizvi and Lingard, 2010; Western et al., 2007). Although globally there are varying levels of privatisation, in anglophone countries such as England, Australia and the United States, both sectors have come under increasing levels of commodification. Competition between providers is claimed as essential to efficiency and good performance. Choice of provider is promoted as a responsibility to be exercised by consumers based on accountability data (Hursh, 2007). Under neoliberal education policies, choice of school has become the definition of democratic voice.

Furthermore, as the neoliberal project progresses, inequality has widened in the United States, Australia and the United Kingdom (Hills, 2015; Rizvi and Lingard, 2010). All three countries are in the top ten industrialised countries for unequal incomes. The United States is second (to Chile), the United Kingdom fifth and Australia ninth (Hills, 2015: 27). This gap in income further translates into a gap in achievement in schools between the most disadvantaged children and their peers, this is especially so in the UK (OECD, 2010). Whereas in the United States and Australia, education inequality initiatives have been largely race focussed (Hursh, 2007; Ministerial Council for Education, Early Childhood), the UK initiatives have been very much class based (OFSTED, 2013). The narratives within the discourses and policies, however, are very similar. The policies designed to close the inequality, individualise and further instrumentalise parents by reifying specific models of parenting that supposedly ensure good results and accordingly acceptable economic beings. As Ramaekers and Suissa (2011) point out, this narrow view of parenting has become an individualistic exercise in transmission from parent to child. This instrumentalisation of parent engagement within neoliberal education systems, especially within England has commodified parents and thus
removed their agency as human beings. Furthermore, there is an implied consensus as to the shape of parent engagement.

This article will draw on doctoral research that sought to counter the individualistic narrative of choice and instrumentalisation, instead embracing the agency of parents regarding the home-school relationship. Building on the work of Jacques Rancière and John Macmurray an argument will be made for a more democratic, relational but dissensual form of parent engagement. This entails a move away from an instrumentalist view of the home-school partnership towards a more Deweyian model of ‘education politics,’ in which parents, along with teachers and pupils, might be able to shape education policy rather than submit to it (Moutsios, 2010: 124).

Context

Neoliberalism connotes individualism, free markets, consumerism and minimal state intervention with competition as the final arbiter; any intervention that the state makes is for the protection and functioning of the markets rather than for the sake of the individual or community (Rizvi and Lingard, 2010). This is in direct opposition to the social democratic concept of people living in relationship with each other, negotiating power dynamics, social values and tensions (Rizvi and Lingard, 2010). In the anglophone states including the United States, Australia and England, education has become increasingly focussed on creating human capital (Connell, 2013; Olssen, 2010). The results of high stakes tests are of the utmost importance, with concepts of well-being, social skills, and political understanding being side-lined if not eviscerated.

Dewey (1922: 111) complained that too many saw education as a means to solving today's problems, rather than ‘the proper end of education: the promotion of the best realization of humanity as humanity’. This still applies today, with education policy being dictated by the apparent needs of now, by the government and employers rather than necessarily wider
social goods. As Fielding and Moss (2010:15) argue, schools are ‘at risk of being a place of regulation and normalization, tasked with producing subjects fit for the purposes of the nation state and the capitalist economy’. Similarly, parents are now positioned as subjects fit for economic purpose rather than citizens ‘empowered to influence the education that in turn shapes the political values, attitudes, and modes of behaviour of future citizens’ (Gutmann, 1987: 14).

Thus

As a consequence, education politics as the activity of teachers/academics, learners and parents to question and reflect on the purpose, the contents and the pedagogic mode of learning, is superseded by transnational policy-making, which aims primarily at generating the cognitive and human resources required by the labour markets (Moutsios, 2010: 127).

Choice

Whilst countries are competing in the global market place, and within the PISA rankings (OECD, 2015), individual schools have been forced to compete against each other within their own locality with the introduction of standardised tests and publication of their results. School performance in these tests is used as criteria for competition, as parents choose the ‘best’ school for their children. This data is readily accessible, either through government websites such as http://www.myschool.edu.au/ in Australia, a plethora of websites in the US including www.schooldigger.com, and School Performance Tables in the UK (Department for Education, 2014).
Choice is key to the market logic. As competition enables more efficient production rates (whether of factories, or indeed schools), and the ability to choose between the best school and its failing neighbour is essential. In order to promote standards, the logic ‘assumes that market arrangements will always produce better outcomes than government regulation’ (Angus, 2015: 396); if a school roll starts to drop, then the school will improve in order to regain pupil numbers.

Choice of school thus comes at the expense of social cohesion as parents are expected to choose the best school rather than the community school (Weller, 2012). Reay (2008) argues that school choice, is now understood as the act of a responsible parent and, moreover, the wrong school choice is the act of an irresponsible parent. To choose the best school has become a moral act, and thus parents have been responsibilised (Reay, 2008: 645; Shamir, 2008). This is problematic, not least because the grounds for choice are spurious and, certainly in England, the choice is not actually there. For example, there may be no local school designated ‘Good’ or ‘Outstanding’, the parents may not be allocated their first choice of school, or the parents may not have the resources to choose or transport their child to the ‘best’ school (Adams, 2017; Vincent, 1996a). Thus, as Reay (2008:643) argues, ‘the ability to take up [this] new parental [position] – as active chooser. . . – is differentially distributed according to social class’.

The logic of choice, has deposed the more social democratic concept of participation in institutional life (Beattie, 1985); it equates the choice of joining (or withdrawing) from a school to participative power (Vincent, 1996b). As Ball (2003: 32-32) argues, this notion of choice within schooling has become very utilitarian with the concept of values being relegated as old fashioned or needless. Thus, parents have been placed not as citizens involved in a shared endeavour of bringing up new citizens, but as ‘choosing subjects’ (Angus, 2015: 396). Democratic voice has become colonised by the concept choice.
Consensus

As Biesta (2016: 55) argues ‘It is, of course, important to acknowledge that parental choice in itself can hardly be called democratic if it is not a part of wider democratic deliberation about the shape and form and ends of education in society’ Neoliberal education systems, have removed the ability and space for such deliberation.

In England, some parents and parents’ groups protested in 2016 against the implementation of a new form of testing for six and seven year olds (year 2) and ten and eleven year olds (year 6); a particularly technical grammar test provoked significant consternation. Nick Gibb, the schools minister, claimed that the tests were necessary because ‘if you do not come from a home where your parents speak in a grammatically correct form and if you do not have a home surrounded by books where reading is the daily occurrence, they (those children) need that structural instruction,’ (TES, 2016).

London Free school founder and columnist Toby Young opined (Young T, 2016):

— moronic, selfish middle-class warriors [are] entrenching class divisions. . .
— it's kids from disadvantaged backgrounds who are penalised by this therapeutic approach. The children of the middle-class protestors will be fine if they spend all day finger-painting because they'll pick up the basics at home; it's their less affluent peers who will suffer.

Consequently, parental debate within the mainstream media about the rights and wrongs of these tests and the direction of the education system was shut down. Middle class parents were positioned as self-interested enemies of promise and disadvantaged parents too inept for their children to succeed at school. Democratic debate was shut down.

Brown (2015: 22) argues that neoliberalism has led to people (and I would argue schools) needing to behave in investible ways, rather than moral or democratic ways. Schools need to
be seen as succeeding in the high-stakes testing and accountability measures. In the UK, they are also expected to demonstrate parental support and consensus by way of Parent View (a questionnaire completed by parents that the inspectors from OFSTED use as part of its judgment found at [https://parentview.ofsted.gov.uk/](https://parentview.ofsted.gov.uk/)). If a school does not adhere to the required standards (i.e. fails the high stakes testing requirements), it will be disciplined by way of privatisation and reform. In the United States ‘failing schools’ are forced to become Charter schools and in the UK they are forced to convert to Academies (Burns, 2015; Hursh, 2007). A similar policy has been advocated in Australia (Zyngier, 2015). There is no room for deviation. It is unsurprising then, that parents can feel pressurised to compliantly support the school and children to succeed in tests. Hursh (2007) suggests that the real purpose of these apparent accountability procedures is to speed up the route towards privatisation, rather than school improvement.

Even the democratic role of parent governors in England is debateable with pressure to agree with the head and general education policy. The role of governors is often to maintain a harmonious consensus; as Young (Young H, 2016) maintains, ‘The conception of a singular common good and the constitution of education and governing as apolitical operate against the discussion of alternative conceptions of ‘good’ education to that of the national performative system’. The apparent need for consensus has become more a demand for silent compliance within a system, thus further removing democratic voice of parents.

**Removal of agency**

Australia, the United States and the United Kingdom have all recognised that there is a gap between the academic attainment of the poorest children and their contemporaries. They have each developed a range of policies intended to close this gap. The Australian ‘gap’ is portrayed as being between Aboriginal children and their white peers (Ministerial Council for Education, Early Childhhood Development and Youth Affairs) and the USA similarly has focussed
on a race based gap (Hursh, 2007). England however has focussed on the gap between
working class white children and their peers (OFSTED, 2013); the problematic conflation of
working class and disadvantage notwithstanding (House of Commons Education Committee,
2014: 3; OFSTED, 2013; Perry and Francis, 2010).

The UK’s 2010 Coalition government and the current Conservative government have touted
parental engagement as the panacea for the achievement gap between the poorest children
in England and their contemporaries. Michael Wilshaw (2013), the then Chief Inspector of
Schools in England, stated that ‘poverty of expectation is a greater problem than material
poverty’; the raising of aspirations is commonly purported to be key to narrowing inequality
(Baker et al., 2014; OFSTED, 2013; Sharples et al., 2011; Sodha and Margo, 2010; Vasagar,
2011). This assertion is heavily criticised by some researchers who argue that there is no
evidence for a lack of aspiration but rather there is a problem with the lack of resources and
often barriers to achieving such aspirations (Carter-Wall and Whitfield, 2012; Kintrea et al.,
2011; Perry and Francis, 2010). The policies designed to ‘close the gap’ in Australia, the
United States and England all individualise the problem of poverty through pathologising
economically poorer parents, rather than questioning the vast structural inequities.

Many models of parenting and parental engagement, advocated within these policies, mirror
those of middle class families. As Lareau (2011) describes, her ethnographic research with
parents indicated middle class families tend to use ‘concerted cultivation’ to parent; ensuring
the child experiences different activities including sports and arts to accumulate cultural
capital in order in the hope of boosting economic prospects. The working-class parents that
she worked with tended to view parenting as more ‘natural growth’ including free play and
time with family. Problematically, Lareau found that schools tended to value the concerted
cultivation more than the natural growth style of parenting. Thus, parent engagement
becomes a mechanism for ‘conversion’ of problem parents to ‘acceptable’ ones (Lumby, 2007; Reay, 2008).

Invoking Dewey’s (2013), concept of the ‘wisest parent’ Bates (2011: 314) asks how we ‘ensure the “best and wisest” parent becomes the norm?’. His question not only implies that someone other than the parent is ensuring the norm, but that there is a singular consensus as to the make-up of this best parent. As Williams (2004: 26) argues, parenthood and parenting have been subjected to increasing ‘public regulation’ and scrutiny; there have been many diktats as to how to parent, especially aimed at the most financially disadvantaged parents. This has included the need for parents to gain good jobs with an increasing pay (Social Mobility and Child Poverty Commission, 2014), which was published at a time of frozen pay within the public services in the UK.

Furthermore, a wider angst has been created as to how difficult parenting is, with ‘routes to such functioning defined by the latest research in psychology; parents are understood to be responsible for attaining a certain (preconceived) idea(l) of what “good”, well-behaved children are’ (Ramaekers and Suissa, 2011: 136). These evermore scientific answers have resulted in framing parents as simple followers of instructions which Ramaekers and Suissa (2011) argue results in removing moral agency, and voice. This is an extremely problematic; ‘treating people as if they lack that capacity is to treat them as if they were not human’ (Couldry, 2010: 1).

As Ramaekers and Suissa (2011) point out, this narrow view of parenting, has become about transmission from a parent to the child in an extraordinarily individualistic way. The neoliberal education system’s model of parental engagement has removed the democratic agency of parents, and created a narrative in which a ‘good parent’ makes responsible choices instead of voicing opinion, silently supports the neoliberal consensus and has no moral capacity to parent. Parents have not only been instrumentalised in the production of
economic beings, but have been individualised and removed from the task of ‘democratic
deliberation about the shape and form and ends of education in society’ (Biesta, 2016: 55).

**Doctoral Research**

Pring (2012: 749) argues that neoliberal education has objectified learners who are valued
for their ability to affect ‘the place of the school in the league table, the successful
attainment of targets, the supply of skilled workers.’. I argue that parents have been
objectified in the same way, valued for how they affect the overall results of a school;
behaving in in investible ways (Brown 2015). Echoing Macmurray, Pring (2012:747) advocates
‘put[ting] persons back in to education’. It is with this desire to put parents as persons back
into education that I carried out my doctoral research. The aim was to provide a space in
which parents would be able to question policy, practice and the narratives of parent
engagement within the school. Thus, trying to recreate a Deweyian dialogue in which people
with different views could ‘have equable opportunity to receive and to take from others.’

As I have argued, parental agency is often removed or relegated null and void by the
government and or education professionals, therefore Critical Participative Action Research
Methodology (Kemmis, 2008; Kemmis et al., 2014) was used to ensure participants – parents
in an English primary school – were able to shape the research, question their own practices
and those of the school. To date, the project has involved ten meetings with participants over
two years.

Five of these meetings took the form of Community Philosophy. Community Philosophy is
one of many forms of community of inquiry and philosophical communities, including
Skeptics and Philosophy Clubs (Evans 2012). It is an adaptation of Philosophy for Children
(P4C); a scheme developed by Matthew Lipman and provided in schools in the UK, through
SAPERE (2013; 2015a). More recently SAPERE (2015b) have ‘extended the 'C' to include
colleges and communities’ rather than denoting just children. Lipman built on the work of John Dewey arguing that all inquiry must be social (Dewey, 1922; Evans, 2012; Lipman, 2003).

Lipman (2003: 94) promoted ‘non adversarial deliberations and shared cognitions’; dialogue within a group building an argument rather than a partisan debate. The non-adversarial nature of Community Philosophy was attractive to participants and the headteacher, who feared the project might become a ‘moaning shop’. Participants liked the idea of exploring issues and developing arguments and in turn actions that might arise from the discussions. For example, in one meeting, the importance of being able to speak informally with teachers was explored in depth and the participants agreed to meet with the headteacher to explore how this might work in practice.

These meetings were held in an adjacent community centre and with no staff from the school present. Whilst there was initially some interest from parents, numbers soon dwindled and three regular participants attended meetings, with a handful of other parents attending different meetings throughout the project. Participants said the difficulty in maintaining numbers, was due to the expectation to do something in the meetings. It was argued that supporting each other, and sharing stories as part of the meeting was important, thus, after continual reflection and negotiation, formal Community Philosophy was gradually dropped, although the group still maintained an attitude of enquiry but with a stronger emphasis on support for parents. After five meetings and falling numbers, the remaining participants asked to meet with the headteacher to explore some of the issues raised in our discussions.

**Relationships**

A common theme throughout the meetings was for easier and more informal communication and relationships with the school, rather than more meetings or formal initiatives such as Community Philosophy. One of the most memorable moments of the project was the
excitement of a participant reporting that the headteacher had come out of his office to say hello to some of the parents; this had more impact than a variety of official initiatives to work with parents. The meetings with the headteacher have since explored different options as to how this might work, but health and safety issues are often cited as a barrier to simple parent-school relationships being built. In an attempt to counter the barriers to communication, the headteacher has instigated a new project in which surveys will be used regularly via email and social media.

Whilst home-school partnerships are claimed by the school, and parents’ voices are sought via surveys, it is difficult for parents to access staff. It is a one-sided power relationship with staff being able to open or shut the door, to agree and arrange meetings. As Lareau (1989:35) identifies it is more convenient for teachers to maintain a ‘professional-client relationship’ rather than a partnership in which ‘power and control is equally distributed.’ Parents are expected to choose the school, respond to questionnaires and feedback when asked. They are not expected to instigate relationships or question what is occurring within the wider running of the school. For example, whilst there are new events to teach parents how to help their child with maths, there is no space to question the new maths initiative.

In opposition to voice being relegated to choice and survey response, Couldry argues that narrative is essential (2010); not only does one need to tell their story, ‘to give account’ but that account needs to be heard. If it is possible for interactions between staff and parents in a more open and equal way, it might be possible as Dewey (1922:101) argues, for a breakdown of ‘those barriers of class, race, and national territory which keep men [and women] from perceiving the full import of their activity’. If staff and parents could understand their impact on others, especially regarding the education of the children, it might make for the partnership espoused by schools.
It is essential to consider how parents and schools relate to each other, if we are to move beyond the instrumentalisation of parents in education. Macmurray (2012: 667ff) argued that education was not simply about creating functional citizens but to enable children to ‘learn to be human’. For this to happen, children need to relate to others within a complex community; a school. I would argue that children need to see adults relating to each other too. As the headteacher of the school I worked with stated, ‘for a child to see a parent talking to a teacher— it’s nice but quite rare.’

Informal opportunities to relate, enable the contemplation of each other that Macmurray advocates (1950; 1961), which leads to the taking in to account of our impact upon each other that Dewey (1922) promoted. Telling our stories and hearing others stories, beyond choosing boxes in surveys allows for ‘the relation of fellowship’ rather than the ‘relation of master and servant’ (Macmurray, 1950: 29). It is through contemplating each other and taking each other into account, Macmurray (1950) argues that we can make effective decisions as to how to live, take action, and reflect on the consequences of that action. This, not choosing at the ballot box he argued, is democratic living.

**Problematic consensus and dissensual agency**

As the research project continued, participants became increasingly frustrated with the apparent need to be harmonious and the non-adversarial nature of Community Philosophy. Early on a participant left the project saying that they did not like critique of the school as it was disloyal. Other participants felt that critique was necessary to improve a situation. At a later meeting, a participant expressed anger and frustration at how they had been treated by the school but also other parents. The original design of meetings was aimed to prevent such an outburst, but we had dropped the precise format by this point. The meeting was very uncomfortable for many of us, however, it led to personal reflection on behalf of several participants and changes in behaviour and thought. After this meeting, participants
expressed the need for more grit in the oyster, and more adversarial debate rather than trying to work towards some form of consensus by the end of each meeting.

The topic of supporting children’s education was discussed at one meeting. Several participants were quite vociferous that parents must read with their children every night. One felt sad for children whose parents didn’t read with them. One felt angry that some parents seemingly neglected their children through such lack of support. Then another participant retorted that she felt her child was so exhausted after school, it was her responsibility as a good mother to not read with their child but to get them to sleep. The group then started to explore the concept of withholding support as being supportive. This intervention by one mother had challenged others as to their assumptions about what makes for the ‘best and wisest’ parent. This led to further discussions about how different parents might have different needs, priorities and values for a wide range of reasons. There was no consensus as to the best form of support.

Macmurray (1961) argues for the need of a habit of social cooperation that is developed from the experienced cooperation within families and school. In *Conditions of Freedom*, Macmurray (1950) extends this argument to a plea for a ‘universal fellowship’ united in values and friendship. Glass (2008) points out that Dewey’s thinking, and I would argue Macmurray’s thinking assumes that everyone’s values are similar. However, as the homework discussion illustrates in a micro sense, there are myriad values and ways of parenting. The ongoing Brexit debate in the UK, provides a glimpse as to how divergent values and political stances can be in the macro. Consensus is not possible, and not necessarily desirable.

In the light of participants arguing for more opportunities to informally relate to teachers and the failure to sustain regular Community Philosophy meetings, it could be assumed that Community Philosophy has no role in the democratic life of a school. However, I would argue
that while the format was not necessarily appropriate or successful, the opportunity for
philosophical thinking about the wider issues of education beyond an individual child’s
progress, is important for the school community. But such an opportunity does not need to
be formalised as with Community Philosophy. Some of the participants are planning to meet
together in a café before they next meet with the headteacher. They said this will give them
space to question and think about what they want to say rather than turn up to a meeting
and feel they should agree with everything that is being said. As one participant stated, ‘I feel
a bit ambushed when I go in, I feel I have to be nice and get on side. I think I am the only one
who feels this but it turns out I am not.’ The participants are now creating their own space in
which to question the order of things. Other parents are doing that on their own and making
their way to the headteacher to question things. The headteacher has reported other parents
doing similar and that he is now welcoming parents into the school who take issue with
policy and practice, whereas previously they had been kept at a distance.

Rancière (1999) argues that a ‘common sense’ pervades, in which there is a sense of place
and role. Within education, it might be assumed that the parents place is outside of school;
at home. The role of a parent is to choose wisely and support the school and child
appropriately. Rancière (2010: 46) argues that the simplest way to exclude people from the
demos is to ‘assert that they belonged to the ‘domestic space’ rather than public space in
which acceptable public voices are permitted to govern. This place and role, according to
Rancière (1999: 29) is allotted by the police; he explains the ‘police’ as ‘an order of bodies
that defines the allocation of ways of doing, ways of being, and ways of saying. . .’

Returning to the earlier discussion of the English parent’s protest against primary testing, one
may consider the framing of parents by Gibb (TES, 2016) and Young (Young T 2016) as
policing. This episode, along with other pronouncements about parental aspirations,
contributed to the order of apparent ‘common sense’ regarding instrumentalist, obedient
parenting. Furthermore, Rancière (2010) argued that certain people are deemed capable of membership of the police order and others are not. Those whom are excluded have their voices rendered as simply noise. The treatment of the parents’ protest’ by Gibb and Young could be argued to be rendering parent’s voices as noise, incapable of making coherent common sense arguments.

Returning to my doctoral research, we can see how a ‘common sense’ had developed regarding what a supportive parent looked like. But more importantly a participant who did not share the ‘common sense’ spoke out and ruptured the consensus. Rancière (1999; 2010) argues that this speaking out and rupturing the common sense is the political act. It is this speaking out against the common sense, and the assumption that ‘I have the capability of speaking as you do’ that establishes the assumption of equality and assumption of humanity (Bingham et al., 2010). This act of rupture or dissensus provides a counter to Ramaekers and Suissa’s (2011) concern that positioning parents as followers of instructions removes their moral agency. It is essential that parents question the’ common sense’ and disrupt the status quo if they are to maintain their agency.

Our original desire to use a non-adversarial form of discussion and aim for deliberative consensus was partly to avoid conflict. From the headteacher’s point of view, it was possibly to maintain a general supportive consensus for the school. However, Rosanvallon (2008: 313) maintains that conflict is essential to democratic life:

Conflict is inevitable in such a project, because debate brings to light the actual transfer of resources that takes place among individuals, groups, and regions, reveals hidden legacies of the past, and discloses implicit regulations. Such a debate has nothing in common with the calm, almost technical kind of discussion envisioned by certain theorists of deliberative democracy. However difficult the exercise, it is nevertheless essential as a
way of gaining practical experience of the general will. (Original emphasis).

Rosanvallon (2008) further argues that democracy needs to be kept in check; it is necessary for people to disagree, for people to question the order of things; ‘a counter policy’. Within the school it is essential that we do not try to maintain a harmonious consensus, requiring passive parents. Rancière (1999: 77) defines dissensus, ‘a division inserted in 'common sense': a dispute over what is given and about the frame within which we see something as given’. Dissensus is vital if we are to move beyond technical democracy but to continually debate and shape the ‘form and ends of education in society’ (Biesta, 2016: 55).

However, Rancière’s concept of dissensus whilst helpful, might imply a solitary initiative rather than a social action, which in the light of the participants’ need for relation and sharing stories might be problematic. However, reading his argument alongside Macmurray is helpful. Macmurray (1961: 61) argues that the ‘unit of the personal is not the ‘I’ but the ‘You and I’ and that it when we interact with each other we come into full being and realise our subjectivity. Whilst Rancière’s subjectivity is gained when the political act is made, this act follows from the initial premise, that ‘I am equal to you’ and will act as if this is true (Rancière, 1991;1999;2014). Thus, Rancière could also be said to be assuming that the unit of the personal is ‘You and I’. Whilst Macmurray reminds of the need to pay attention to our relationship with others, Rancière ensures that good relationships do not come at the cost of democracy and voice, but rather welcome dissensus.

**Conclusion**

Throughout this article I have referred to attempts to define the ‘best and wisest parent’. Dewey (2013: 19) declared that ‘What the best and wisest parent wants for his own child, that must the community want for all of its children. Any other ideal for our schools is narrow and unlovely; acted upon, it destroys our democracy’. However as I have argued sometimes
the concept of ‘best and wisest parent’ is problematic, with it often being assumed as
‘common sense’. This necessitates, the need for relationships between parents and between
staff and parents, which allow for narrative and agency of all parties. As Biesta (2016: 71)
argues, the accountability culture, has made relationships between schools and parents
distrustful from both sides. There need to be ‘mutual, reciprocal and democratic
relationships. . .based upon the shared concern for the common educational good.’ To have a
democratic form of education necessitates different views of this common good, and
different understandings of the ‘best and wisest parent’. It is vital that this does not become
a ‘common sense’, rendering some people voiceless or lacking agency.

In conclusion, I have demonstrated that neoliberal education systems have colonised
democratic voice, by promoting choice, supportive consensus and detailed parenting
structures which remove agency. This colonisation has instrumentalised and individualised
parents in education, thus domesticating parent engagement rather than understanding and
shaping of education as a joint enterprise between parents, educators and society.

If children are to learn from Dewey’s (1922) broad range of experiences, then it is necessary
to recognise and embrace the heterogenous array of family lives and values. The very
involvement of parents in questioning and debating the wider aspects of education
necessitates pluralism and dissensus. Negotiating the tensions involved in this endeavour
requires contemplating one another in a Macmurrayian sense and providing space and time
for relationships. Nevertheless, this must not demand passive harmony and ‘common sense’.
Indeed, there may be many contrary best and wise parents that trouble the common sense.
This should be welcomed for the democratic life of not only schools but of society. Thus, a
school that is prepared to relate to parents and prepared for dissensus is one providing a
counter to the neoliberal discourse of silent compliance.
