**"We are different, that's a fact, but they treat us like we're different-er": Understandings of autism and adolescent identity development.**

Journal:	<i>Advances in Autism</i>
Manuscript ID	AIA-12-2020-0071.R1
Manuscript Type:	Research Paper
Keywords:	Autism, Identity, Qualitative research, Adolescent development, Schools

## Introduction

Young people go through major biological, psychological and contextual changes in early adolescence, including puberty and the transition from primary to secondary education (Simmons & Blyth, 1987). The move into a larger, more complex school environment coincides with a key developmental period for identity construction, and typically an increased focus on the peer group over the family (Erikson, 1963; Kroger, 2004). For autistic young people, this developmental period may present challenges, as the social complexities of adolescence interact with the strengths and difficulties associated with autism (Humphrey & Lewis, 2008). For many, social communication and daily living skills develop markedly during this period (McGovern & Sigman, 2005; Smith, et al, 2012). However, research also indicates a heightened prevalence of mental health difficulties and poor quality of life in comparison with the general population (Cottenceau et al. 2012; Hebron & Humphrey, 2014; Simonoff et al. 2012). Further, in the UK context up to one in five autistic young people has been excluded from mainstream school on at least one occasion (Moore, 2016). During adolescence, increased awareness of difference and of the stigma attached to autism may contribute to negative outcomes for autistic young people (Humphrey & Lewis, 2008). The current study examines understandings of autism among autistic young people, their parents, and teachers, as they relate to identity construction and school experiences through the early years of mainstream secondary education.

A central concern of adolescence is the establishment of an individual identity; at the same time young people typically seek to fit in with recognised social and cultural groups (Blakemore & Mills, 2014; Kroger, 2004). The differences in social

1  
2  
3 interaction characteristic of autism can lead to an assumption that identity is not a  
4  
5 central concern and/or may be poorly developed. However, qualitative work indicates  
6  
7 that autistic young people engage in identity construction within social contexts,  
8  
9 positioning themselves in relation to cultural norms and expectations (Baines, 2012;  
10  
11 Ringland, et al. 2016). In an interview study, while autistic adolescent boys often  
12  
13 found self-description difficult, some described themselves in terms of core  
14  
15 characteristics associated with autism (Cridland, et al. 2015a). In a participatory  
16  
17 study, autistic teenagers articulated the complex ways in which their diagnosis  
18  
19 shaped both personal and public identity (Morgensen & Mason, 2015). It appears,  
20  
21 therefore, that identity construction is a concern for many autistic young people and  
22  
23 that negotiating the idea of “being autistic” is an important part of this developmental  
24  
25 process. Importantly, the ways in which others within the social environment orient to  
26  
27 autistic individuals impacts identity negotiation (Bottema-Beutel & Smith, 2013;  
28  
29 Ochs, et al. 2001).

30  
31  
32  
33  
34  
35  
36 Discourses of autism prevalent in the sociocultural contexts in which young  
37  
38 people grow up are likely to influence identity construction (Brownlow, 2010). Within  
39  
40 the medical model, autism is primarily conceptualised in terms of deficit with a focus  
41  
42 on amelioration towards normative standards (see O’Neil, 2008 for a critique). The  
43  
44 neurodiversity movement instead frames autism as integral to individual identity,  
45  
46 highlighting the role of person-environment fit in the presentation of  
47  
48 neurodevelopmental conditions (Baker, 2011). Both discourses are evident in the  
49  
50 way young people talk about themselves (Humphrey & Lewis, 2008). Many autistic  
51  
52 and non-autistic people appear to adopt a hybrid “deficit-as-difference” conception of  
53  
54 autism (Kapp, et al. 2013). The terminology used to describe autism has seen a shift  
55  
56 in recent years away from “person-first language” (e.g., person with autism) towards  
57  
58  
59  
60

1  
2  
3 “identity-first” language (e.g., autistic person). Identity first language was indicated in  
4  
5 a large-scale UK survey to be preferred by a majority of the autistic community  
6  
7 (Kenny et al., 2016). For autistic young people, then, identity construction involves  
8  
9 navigating multiple, often competing, discourses of autism.  
10  
11  
12

13         Diagnosis of autism in the absence of intellectual disability is often not made  
14  
15 until late childhood or beyond in the UK (Crane et al., 2015); individual responses to  
16  
17 diagnosis are complex and likely to evolve over time. For young people and their  
18  
19 families, diagnosis has several advantages, including access to support and  
20  
21 increased understanding of difference from others. However, it can also lead to  
22  
23 stigma and discrimination, and can be perceived as being of limited utility due to the  
24  
25 heterogeneous presentation of autism (Calzada, et al. 2012). Asked to explain what  
26  
27 autism meant to them, older autistic adolescents often framed the diagnosis as  
28  
29 difficult to accept initially, with differing degrees of acceptance over time (Huws &  
30  
31 Jones, 2008). The authors conclude that “whether being told that they had autism  
32  
33 was perceived as a positive or negative event, it would appear that all participants  
34  
35 had to some degree, reworked their identity” (Huws & Jones, 2008, p. 105). Some  
36  
37 young people resist autism as a public identity, reluctant for their diagnosis to affect  
38  
39 the way others perceive them, while accepting it as fundamental to personal identity  
40  
41 (Morgensen & Mason, 2015). The decision as to whether, when and how to disclose  
42  
43 diagnosis can therefore be complex; autism, once publicly disclosed, can be a  
44  
45 “totalising” social identity, dominating other individual narratives (Gilling, 2012).  
46  
47  
48 However, autistic communities - often in online spaces- increasingly offer young  
49  
50 people the opportunity to embrace autism as a positive collective identity (Bagatell,  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60 2007; Brownlow, 2010; Ringland et al. 2016).

1  
2  
3 Young people's experiences at school shape identity development (Gilling,  
4 2012; Humphrey & Lewis, 2008). In retrospective interviews, autistic young adults  
5 and their parents tended to describe the transition from childhood to adolescence as  
6 a stressful time, marked by ostracisation and bullying, as social demands increase  
7 within the school context (Portway & Johnson, 2003). A desire to avoid negative  
8 responses from others can lead young people to mask behaviours that could mark  
9 them out as autistic, a phenomenon known as "social camouflaging" that is  
10 associated with identity confusion and mental health difficulties (Cage & Troxwell-  
11 Whitman 2019; Cage, et al. 2018; Hull et al. 2021, Mandy, 2019). Increased  
12 understanding of autism in wider school communities is likely to reduce negative  
13 experiences for autistic pupils; however, access to specialist training for school staff  
14 is variable (Roberts & Simpson, 2016).

15  
16  
17 Studying the ways in which autistic young people understand their diagnosis  
18 and negotiate identity can inform understanding of mental health and wellbeing in  
19 this population. However, relatively few developmental studies of autism directly  
20 include the perspectives of autistic young people themselves (Rasmussen &  
21 Pagsberg, 2019). There is increasing acknowledgement in autism research of the  
22 need for qualitative studies that foreground the experiences of individuals (Bölte,  
23 2014). The current study aimed to address the following research questions by  
24 triangulating interview data from young people, their parents, and teachers:

- 25 1. How do autistic young people and others in their social environments  
26 understand autism?
  - 27 2. How do these understandings relate to young people's identity development  
28 in early adolescence?

17 Ethical approval was granted from the School of XXX at XXX University (Approval  
18 Code: RECPSY00019).  
19

### 20 *Participants*

21  
22  
23 The data reported here are drawn from an ongoing multi-informant longitudinal study  
24 investigating the school experiences of 14 autistic young people, between Year 6  
25 (ages 10-11) and Year 9 (ages 13-14) in various mainstream educational settings in  
26 a city in the north of England. All families identified themselves as White British and  
27 socio-economic status using the National Statistics Socio-economic Classification  
28 categories, (ONS 2020) ranged from L3 higher professional occupations to L14.2  
29 long-term unemployed. Families were recruited in three cohorts, via a specialist  
30 autism teaching team at the local council. Inclusion criteria were: (1) young person  
31 had a diagnosis of autism/Asperger's Syndrome; and (2) was in a mainstream  
32 educational setting and about to transition (or had very recently transitioned) to  
33 secondary school.  
34  
35  
36

39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49

50  
51 Parents provided informed consent for their own and their child's participation.  
52 Information on the study was also provided in age-appropriate written form and  
53 young people gave verbal assent to participate; one young person did not wish to  
54 take part in interviews at any time point. Parents and young people jointly identified a  
55  
56  
57  
58  
59  
60

1  
2  
3 teacher who had worked closely with the young person in that academic year. The  
4  
5 teacher provided their own consent.  
6  
7

8 In total we conducted 36 interviews with 13 children, 36 interviews with 31  
9  
10 teachers, and 38 interviews with 14 mothers and 2 fathers. Most families joined the  
11  
12 study when their child was in Year 6; four joined shortly after transition to secondary  
13  
14 school in Year 7. Table I summarises the demographic characteristics.  
15

22  
23

#### 24 *Data Collection Procedures*

25  
26  
27 Semi-structured interviews were conducted with young people, their parent(s), and  
28  
29 teachers, at annual intervals. Semi-structured interviews offer the flexibility to focus  
30  
31 on the specific issues and experiences that are meaningful to individuals, within an  
32  
33 overarching schedule informed by the research aims (Smith, 1995). In planning the  
34  
35 interviews, we were guided by the recommendations set out by Cridland et al.  
36  
37 (2015b) for conducting qualitative research with autistic individuals and their families.  
38  
39 For example, we prepared clear interview guides that were differentiated by  
40  
41 participant (young person, parent, teacher) and school year group, focusing on key  
42  
43 domains of daily lives at school (e.g., classroom learning, peer interactions, physical  
44  
45 school environment). Young people were given the option of participating in  
46  
47 interviews with or without a familiar adult present, in order to mitigate the  
48  
49 unfamiliarity of the situation. Young people and parents were interviewed in the  
50  
51 family home, school setting, or university according to preference; all teachers were  
52  
53 interviewed in the school setting. Interviews were conducted by researchers with  
54  
55 experience of working with autistic young people (Cridland et al., 2015b).  
56  
57  
58  
59  
60

1  
2  
3 In interviews with young people, we took care to phrase questions in an age-  
4 appropriate manner, avoiding non-literal language. The mean interview time for  
5 young people was 23 minutes, for teachers, 19 minutes and parents, 34 minutes.  
6  
7 Interviews were audio-recorded and transcribed verbatim using standard  
8 orthographic transcription by research assistants. All identifying information was  
9 redacted from interview transcripts.  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19

### 20 *Data Analytic Approach*

21  
22 We analysed the data using inductive thematic analysis with the aim of giving an  
23 account of the individual experiences of the young people and the meaning that they,  
24 their parents and teachers attach to those experiences. We adopted a contextualist  
25 analytic approach, foregrounding the impact of the social contexts in which the  
26 young people live – specifically family homes, school environments and broader  
27 sociocultural context – on these experiences and understandings (Braun & Clarke,  
28 2013; Tebes, 2005). Contextualism takes a middle ground between strong  
29 essentialist and constructionist epistemological positions. It acknowledges that, while  
30 individual experience is inevitably subject to interpretation and therefore not an  
31 objective “reality”, it nonetheless appears “real” to the individual (Willig, 2008).  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45

46  
47 We adopted the protocol for conducting thematic analysis set out by Braun  
48 and Clarke (2006). Both authors listened to audio recordings of interviews  
49 repeatedly, and iteratively read accompanying transcripts, taking note of ideas and  
50 comparing notes regularly. We generated initial codes systematically across the full  
51 dataset, reviewing each other’s coding and resolving disagreements through  
52 discussion. At this stage, we extracted those sections of the full dataset containing  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 codes that were relevant to the research questions for the current study. We then  
4  
5 began the process of collating codes that were identical or closely related from  
6  
7 across the reduced dataset into initial themes, using a thematic map to visualise the  
8  
9 analysis.  
10  
11  
12

13 We identified provisional sub-themes that were supported by a limited amount  
14  
15 of data and either discarded them, or integrated with other, related themes. When  
16  
17 refining the themes, we re-read the interview data, to identify disconfirming cases  
18  
19 and ensure that the thematic structure adequately reflected the whole dataset. We  
20  
21 named the themes and sub-themes, developed working definitions of their meaning,  
22  
23 and analysed the data assigned to each theme in further depth, integrating insights  
24  
25 from existing research literature to our analysis. At the final stage, we identified  
26  
27 excerpts from the data to illustrate the thematic structure of our analysis.

## Analysis

An overview of the thematic structure is presented in Figure 1. Throughout the analysis, pseudonyms are used (see Table 1) and the time point at which the interview was conducted is indicated in brackets (e.g., Y6 = Year 6).

<Figure 1 about here>

### Theme 1: Identifying with Autism

#### 1a: Negotiating difference

Almost all participants identified feeling 'different'. For some, an autism diagnosis had been exonerating in explaining the basis of their perceived difference and they had positively integrated the idea of 'being autistic' into their personal identity. Jenny (Y6) said "*everything sort of like clicked*", explaining further:

*"I'd rather be different and have a reason for it, than not be different. I'd rather be different and have a label for it, because a lot of people say labels are a bad thing.... I like being labelled autistic, I don't know why... Because it's the reason why I am who I am."* (Jenny, Y6)

In describing their experiences of difference, some young people drew on an autistic group identity. Lee (Y7) used the phrases "*the autism people*" and "*people like me*". Identification with other autistic young people helped them make sense of their difference favourably, at least to some extent:

*"Well me and my friend [name], we're quite different [from others]. We don't really like storybooks; we prefer fact books and statistics. And we're really similar and we almost feel as if we're outcasts, but we also feel really good because we're different and I like that."* (Richard, Y6)

1  
2  
3 Some young people publicly identified as autistic, talking openly about their  
4 differences. Justin's parent (Y6) said, "*he owns it*" and that he had recently  
5 introduced himself with "*my name is Justin, I'm ten and I'm autistic*". Gerry's teacher  
6 (Y6) described how he had delivered a training session about autism to his peers at  
7 primary school and he had "*felt very proud of it as he was telling them about how he*  
8 *is*". Conversely, others perceived difference negatively:  
9

10  
11  
12  
13  
14  
15  
16  
17  
18 "*I think he's just struggling with the idea of having Asperger's as well. ... He*  
19 *spoke to me for a long time last night saying how different he feels ... He said*  
20 *to me I wish you had not told me.*" (Tim's parent, Y7)  
21  
22  
23

24  
25 Likewise, Jonathan's parent (Y6) described him wanting to "*be like*  
26 *anybody else, he doesn't want the label*". This was described further:  
27  
28

29  
30  
31  
32  
33 "*We have to call it the 'A' ... You cannot mention the word autism at all times,*  
34 *or he'll just start shouting and kicking off*". (Jonathan's parent, Y6)  
35

36  
37 Despite differing responses to diagnosis, a commonality was the desire to be  
38 treated as 'mainstream', like everyone else. Jenny (Y6) said, "*I want to be treated*  
39 *like normal. I don't want to be treated like there is something, like I have Asperger's*".  
40  
41  
42

43  
44 Several young people had declined support at school, including additional  
45 transition visits, use of identified inclusion spaces, and teaching assistant support,  
46 sometimes with acknowledgement that it would have been helpful. David's parent  
47 (Y7) said he had told his teaching assistant to "*go away*", because he felt support  
48 identified him as being different and "*made him look weak*". Archie (Y7) felt that  
49 accepting support would "*probably ruin my already practically non-existent social*  
50 *standing even further*". Parents and teachers reported further examples of young  
51 people's reluctance to accept support:  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 “There was an option for him to have a locker within the [specialised autism]  
4 unit and he chose to have that and very quickly decided he didn’t want to. He  
5 didn’t want to be different”. (Tim’s parent, Y7)  
6  
7  
8  
9

10  
11 ...  
12

13 “I see this with a number of young people I work with, where they recognise  
14 their own differences and they don’t want to look any different. And they are a  
15 really tricky group of young people to work with, because any strategies you  
16 try to put in place to support them, they perceive as making themselves look  
17 different so they are unwilling to engage.” (Simon’s Specialist Autism Teacher,  
18 Y8)  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

### 31 **1b: Changing understandings over time**

32 The meanings young people attached to the diagnostic label changed over time.  
33  
34 Some were described as having sudden points of realisation; others showed  
35 increasing or decreasing acceptance of ‘being autistic’ with age. Jonathan’s parent  
36 (Y6) reported that he was initially accepting of the diagnosis but has since “realised”  
37 and had become “embarrassed”. Likewise, his teacher identified a change when they  
38 started planning for secondary school transition:  
39  
40  
41  
42  
43  
44  
45  
46  
47

48 “Understanding autism, that’s the thing that, Year 6 it’s suddenly hit him. He  
49 has had quite out-of-the-blue meltdowns, crying proper tears... which we’ve  
50 never seen before... He’s expressed he doesn’t understand why he got this,  
51 why he has caught this and we’ve explained that he hasn’t caught anything ...  
52 everybody is special and unique and you too. So we’ve had to read books  
53 about famous people who are autistic who’ve actually made great things of  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 *their lives....I think it has just dawned on him now that this is not going away,*  
4  
5 *I've got this forever'* (Jonathan's teacher, Y6)  
6  
7

8 In Y7, Jonathan had been uncomfortable being referred to as 'autistic', but  
9  
10 when asked about his diagnosis in Y8 said "*Yeah, I'm getting there ... I'm 50%*".  
11  
12 Conversely, Jenny had shared her diagnosis in Y7 but felt she had consequently  
13  
14 been treated differently, and in Y9 she reported she had made a new friendship  
15  
16 group, from whom she had chosen to keep her diagnosis hidden.  
17  
18

19 Adults tried to support acceptance of diagnosis by presenting autism as an  
20  
21 inherent part of the person, or by framing difference in a constructive way.  
22  
23

24 Jonathan's parent (Y7) said she kept reiterating to him that autism is "*who you are.*  
25  
26 *That's just your personality*". Simon's teacher used the analogy of different operating  
27  
28 systems attributed to neurodiversity advocate, Steve Silberman (2016):  
29  
30

31 *"I explain that it's just like two different brains, one is like a Microsoft computer*  
32  
33 *and one is an Apple computer, and you all get the same outcomes but it's just*  
34  
35 *that you think differently."* (Simon's teacher, Y7)  
36  
37

38 ...  
39  
40

41 Justin's parent (Y6) reflected that acceptance and understanding of autism  
42  
43 was a family project. As a family, they had bought books and been to talks as "*it*  
44  
45 *affects us all'* and "*it's sort of like a learning curve for all of us*".  
46  
47  
48  
49  
50

### 51 **1c: Social camouflaging at school**

52  
53

54 Many young people, even those who construed their diagnosis positively,  
55  
56 were keen to keep it private. Parents reported that their child would 'act' at school in  
57  
58 order to convince others that they were 'like everybody else'. They also described  
59  
60

1  
2  
3 the impact of camouflaging at school on emotional wellbeing and behaviour. Justin's  
4  
5 parent (Y6) said *"because he has held it together all day at school, when he is home,*  
6  
7 *he is a total wreck"*. Other parents also described distressed behaviour:  
8  
9

10  
11 *"He is storing it up and he is controlling himself and managing himself and by*  
12  
13 *the time he gets home his self-management is lost and the smallest thing, you*  
14  
15 *know if that fell on the floor, that would be enough for a flying rage,"* (Alistair's  
16  
17 parent, Y6)  
18

19  
20  
21 ...  
22

23  
24 *"He acts fine, so he goes under the radar a lot, so they actually find him*  
25  
26 *'normal' to a degree and then he comes home, and everything basically*  
27  
28 *erupts."* (Jonathan's parent Y8).  
29

30  
31 Some teachers were aware that there were differences in how young people  
32  
33 presented at school and home but, in contrast to parents, did not identify the school  
34  
35 environment as a stressor:  
36

37  
38 *"From my experience I've got several students at school who present really well*  
39  
40 *at school, and then they go home and it's absolutely chaotic.... You know, it could*  
41  
42 *be the stress that we're minimising, that kind of all floods out."* Simon's teacher  
43  
44 (Y7).  
45  
46  
47

48  
49 In Y8, following exclusion from school, Simon's teacher expressed surprise  
50  
51 that suddenly things *"seemed to go pear-shaped"* as staff had thought he was  
52  
53 managing well and had planned to reduce support. However, during the previous  
54  
55 year Simon's parent (Y7) had described him being *"really reclusive ...[he] just locks*  
56  
57 *himself away in his bedroom"* after school. Simon's case illustrates how social  
58  
59 camouflaging can contribute to poor wellbeing and educational outcomes for young  
60

1  
2  
3 people; staff in Simon's school environment were unaware of the challenges he was  
4  
5 experiencing in Y7 and reported that his transition from primary school had gone  
6  
7 'really well'. By Y8 Simon had moved to a specialist educational setting after several  
8  
9 exclusions from his mainstream school.  
10  
11

12  
13 Many young people preferred to keep home and school clearly separated. Young  
14  
15 people could 'be themselves' at home, but homework blurred the home/school  
16  
17 boundary. Richard (Y7) said "*I think maybe we should add 20 minutes to school or*  
18  
19 *something instead ... It makes me feel angry ... It makes me feel like I'm at school. I*  
20  
21 *think when you're at home it should mean you're at home.*" Bertie's parent (Y9)  
22  
23 reported that he would "*have a 25-minute meltdown over a 15-minute piece of*  
24  
25 *homework.*"  
26  
27  
28  
29

30  
31 Some children extended this self-imposed boundary to friendships. Evan's parent  
32  
33 (Y7) said, "*I mentioned to him about if there is anyone he'd like to invite round and*  
34  
35 *he said he would not want to do that, that this was a different place and a different*  
36  
37 *environment, that he would not want to mix them*". They had understood this in the  
38  
39 context of Evan being 'secretive' about his special interests and his desire to keep  
40  
41 precious possessions hidden, as "*he doesn't want [peers] to see all that and know all*  
42  
43 *that about him*". Taken together, these accounts suggest that young people often  
44  
45 experience the home environment as a sanctuary, where the 'mask' worn at school,  
46  
47 under social pressure to 'fit in', can be dropped.  
48  
49  
50  
51  
52  
53

## 54 **Theme 2: Social construction of autism**

### 55 56 57 **2a: The autism label** 58 59 60

1  
2  
3 Parents talked about autism as a 'label' which provided a route to support, but  
4 was perceived negatively by others, leading to adverse consequences for young  
5 people. For some, this had made the decision to seek diagnosis difficult:  
6  
7  
8  
9

10  
11 *"We had reservations about going through the process of diagnosis. Yes, I*  
12 *know that ... he can access services and things and if people understand then*  
13 *they can make accommodations for him, but there are negative things that*  
14 *come with a diagnosis as well. It's a label and you know.... is he going to be*  
15 *treated differently because of that?"* Evan's parent (Y6)  
16  
17  
18  
19  
20  
21  
22

23 Neurotypical peers were described as viewing autism unfavorably. Sometimes  
24 awareness of the diagnosis, or that the young person accessed support, resulted in  
25 bullying. Richard (Y7) said *"the autism people at [secondary school] are a bit targets*  
26 *to bullies,"* and Bertie (Y8) said *"They call me [autism unit name]. Sometimes they*  
27 *say get back to the [autism unit] and I just don't really like it."* Jonathan reported  
28 bullying had intensified in Y9, and he felt it happened because people saw him as  
29 *"freaky and they are just the type of people that hate different."*  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39

40 Parents had concerns about whether the diagnostic label negatively  
41 influenced teacher assessment of academic ability. Related to her school record  
42 Jenny's parent (Y7) said, *"I hope it doesn't say autistic or Asperger's and they've just*  
43 *immediately blackmarked her."* A teaching assistant for Richard (Y8) reported that  
44 they had to advocate for him to be moved up an academic set, as he had been  
45 placed in an insufficiently challenging class, which they attributed to his diagnosis.  
46 Jenny (Y9) said that some teachers had lower expectations of her compared to her  
47 peers. She explained further:  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Jenny: *"They treat me like a cute cat ... They treat us like we're not human,*  
4 *like we're less, I don't know how to put it really."*  
5  
6  
7

8 Researcher: *"That they treat you differently to other children?"*  
9

10  
11 Jenny: *"Yeah like ... we are different, that's a fact, but they treat us like we're*  
12 *different-er. Like we're more different to other people than we actually are."*  
13  
14  
15

16  
17 Some parents and teachers reported being mindful that the provision of  
18 support could have adverse consequences for inclusion. Jonathan's teacher (Y7),  
19 referring to small group teaching, said, *"they almost become defined by it."* Bertie's  
20 parent (Y7) reported school staff had tried to reduce his use of ear defenders so that  
21 he stood out less. Likewise, Gerry's teacher (Y6) said, *"If he's got someone with him*  
22 *and if he's got toys, I think he'll get picked on. It's the nature of children, isn't it?"*  
23  
24  
25  
26  
27  
28  
29  
30

31 Parents' concern about the impact of labelling influenced their choices about  
32 their child's education more broadly. Jonathan's parent (Y7) when discussing the  
33 option of a school that offered autism enhanced provision said that they *"wouldn't*  
34 *dream of putting him there,"* as they did not want him to be treated differently.  
35  
36 Similarly, Evan's parents (Y6) declined a residential school trip as it *"might kind of*  
37 *expose his differences."*  
38  
39  
40  
41  
42  
43  
44

45 Adults often constructed autism hierarchically based on perceived severity,  
46 contrasting 'extreme autism' with Asperger's Syndrome, which was referred to as  
47 'mild'. Evan's parent (Y6) reflected that Evan, who had a diagnosis of Asperger's  
48 Syndrome, would have been considered just *"a bit of a geek"* in previous  
49 generations. Several parents highlighted their child was 'not as autistic' as others:  
50  
51 *"She's not on the major spectrum... She's on the lower spectrum."* (Jenny's parent,  
52 Y8). In contrast, neurotypical children were often referred to as 'normal'.  
53  
54  
55  
56  
57  
58  
59  
60

## **2b: Individuality and sameness in autism**

Autism was presented as highly variable, but participants also anticipated there would be a degree of commonality among autistic young people, with some referred to as 'typically autistic'. In developing their own understanding of autism, some parents tried to distinguish behavior that was 'typically autistic':

*"It is difficult to know what is autism and what is him just being an eleven-year-old boy."* (Simon's parent, Y6)

Where a young person did not present as 'typically autistic', there were expressions of doubt about the validity of the diagnosis. David's parent (Y7) reported that teachers did not believe he was autistic, which prevented access to a timely diagnostic assessment. Correspondingly, following Simon's exclusion from school in Y8, his teacher reflected that *"he didn't display at all as being autistic. He seemed very sociable, mixed with his friends ... and I was saying 'are we sure he is autistic?'"*

Despite the variability in presentation, several teachers felt autism as a category was 'so well defined,' which facilitated identification of support strategies. However, the need for teachers to see autistic young people as individuals was stressed by parents and specialist teachers:

*"They said oh there's another autistic child in the class, we're used to autism, but every autistic child is unique, and they never got his uniqueness."* (David's parent, Y7)

...

1  
2  
3 *“It would be nice to put it in a little box and say right this is how this child with*  
4 *autism presents but it’s never like that ... ‘Oh yeah we’ve had an autistic child*  
5 *before its fine’. You think, you’ve not had that one, it’s not the same, you*  
6 *know you would never say that about a neurotypical child.”* (Simon’s  
7  
8 Specialist Autism Teacher, Y8)  
9  
10  
11  
12

## Discussion

This study examined understandings of autism among autistic young people, their parents, and teachers, related to identity construction and school experiences. For the young people in this study, understanding what 'being autistic' meant and their acceptance of it, changed and unfolded in the broader context of their early adolescent development as they 'grew up' with the diagnosis (Hurlbutt & Chalmers, 2002; Huws & Chalmers, 2015). The extent to which 'autism' was integrated into their developing identities was mediated by the responses of others in their social environments (Bagatell, 2007; Humphrey & Lewis, 2008).

In describing themselves, young people used terminology aligned with prevalent socio-cultural discourses of autism - both medical and neurodiversity models- often in overlapping ways (Humphrey & Lewis, 2008; Kapp et al. 2013). The idea of 'normality' was used as a benchmark from which young people described themselves as deviating. Difference was conceptualised negatively by many, a finding consistent with other studies of autism (Hebron & Humphrey, 2014; Humphrey & Lewis, 2008), but also characteristic of the desire to fit in associated with early adolescent development more broadly (Blakemore & Mills, 2014). 'Normal' and 'different' were largely presented as binary categories, with both autistic and neurotypical people characterised as homogenous groups. In this sense, autism was sometimes understood as a 'totalising identity' (Gilling, 2012), with limited appreciation of the multiple layers of difference and similarity between individuals.

Autism was similarly a 'totalising identity' for teachers, who assumed that autistic young people would be a relatively homogenous group with similar support needs and sometimes doubted the validity of the diagnosis if the person did not present as expected. Contrastingly, parents and specialist teachers identified the need for teachers to see each young person's individuality (see also Larcombe et al., 2019) This discrepancy suggests that some teachers lack understanding of the heterogenous nature of autism and have limited expertise to offer individualised support (Larcombe et al. 2019; Van Herwegen et al. 2019). In the absence of sufficient knowledge, they sometimes draw upon societal stereotypes about how autistic people behave (Humphrey & Lewis, 2008).

1  
2  
3 Participants described teachers as sometimes underestimating young  
4 people's abilities and typically developing peers as responding to the autism label in  
5 more overtly negative ways (Baines, 2012; Mogensen & Mason, 2015). Congruent  
6 with other studies several had experienced bullying (Hebron & Humphrey, 2014;  
7 Humphrey & Lewis, 2008). Research suggests bullying is associated with limited  
8 understanding of autism (Larcombe et al. 2019; Symes & Humphrey, 2012), an  
9 example of the 'double empathy problem' (Milton, 2012).

10  
11  
12  
13  
14  
15  
16 Several young people, engaged in social camouflaging to avoid 'appearing  
17 autistic' at school (Huws & Jones, 2015; Mogensen & Mason, 2015). Research  
18 suggests that social camouflaging is a response to stigma and is used to avoid  
19 bullying and discrimination, but is costly to mental health (Hull et al., 2017, Cage &  
20 Troxell-Whitman, 2019; Hull et al. 2021). Consistent with this, parents in this study,  
21 described how social camouflaging took a toll on young people's mental health, and  
22 it is notable that a third of the young people were excluded from school following  
23 behavioural misdemeanours and/or referred to mental health services. Keen et al.  
24 (2016) identified that mental health difficulties in autistic young people are associated  
25 with poorer educational outcomes. These findings therefore underline the importance  
26 of increased awareness of social camouflaging in school as part of efforts to  
27 increase positive educational outcomes (Mandy, 2019) and improve mental health.

28  
29  
30  
31  
32  
33  
34  
35  
36  
37 Cooper et al. (2017) suggest that opportunities to experience group belonging  
38 and develop a positive social identity may offer protection against mental health  
39 difficulties. Parents in this study discussed the perceived benefits of autistic young  
40 people interacting in school, to develop a group identity and some young people  
41 positively discussed their shared difference with autistic friends. Stevenson et al.  
42 (2016) found that facilitating opportunities for autistic young people in a special  
43 school, to reflect on their diagnosis together, helped develop understanding of  
44 autism as a difference to be accepted, which 'thickened' their identity. However, our  
45 study raises the question of whether such peer support mechanisms could be  
46 facilitated in mainstream settings, where young people may be reluctant to engage  
47 with activities that makes their difference visible.

48  
49  
50  
51  
52  
53  
54  
55  
56  
57 Parents and teachers in this study, also seem to be negotiating the competing  
58 socio-cultural discourses of autism (Baron-Cohen, 2019; Kapp et al., 2015). They  
59  
60

1  
2  
3 positioned 'difference' positively, but like young people, also used language that  
4 indirectly, and likely unintentionally, communicated negative conceptualisations of  
5 autism. For example, when parents refer to neurotypical children as 'normal,' the  
6 young person might infer that they are 'abnormal.' Similarly, when parents express  
7 concern that engaging in extracurricular school activities or accessing specialist  
8 support may expose their child's 'difference,' this may inadvertently suggest that  
9 difference is better hidden. Several parents also described autism hierarchically,  
10 positioning their child on a scale as 'not as autistic as others'. While the intention  
11 may be to support children to perceive their diagnosis more favourably, it could  
12 reinforce the idea that being 'more' autistic is undesirable.  
13  
14  
15  
16  
17  
18  
19

20 Many of these examples can be understood as parents seeking to protect  
21 their child. However, it is possible that the conflicted messages result in unintentional  
22 pressure for young people to 'act normally' and camouflage their difference  
23 (Bagatell, 2007). Parents are similarly subject to and part of a neurotypically-  
24 dominated social world, in which negative characteristics associated with autism are  
25 foregrounded and positive attributes hidden (Brownlow, 2010). Post-diagnostic  
26 support in the UK has been identified by families and professionals as inadequate  
27 (Crane et al 2016; Crane et al 2018; Rogers et al., 2016), which leaves parents  
28 limited opportunity to explore the diagnosis, its impact on their family, and ways to  
29 talk about difference. Perhaps then, opportunities for young people to reflect on their  
30 diagnosis should extend to parents too.  
31  
32  
33  
34  
35  
36  
37  
38  
39

40 There were examples of teacher interventions that could also encourage  
41 social camouflaging. Attempts to limit the use of successful supports such as ear  
42 defenders and fiddle toys in order to reduce the visibility of difference, indirectly  
43 communicates that difference is undesirable. Whilst these interventions aim to  
44 safeguard young people from difficulties with neurotypical peers, the focus on  
45 changing the behaviour or appearance of the autistic person to help them 'fit in,'  
46 originates from a deficit-orientated perspective (Brownlow, 2010).  
47  
48  
49  
50  
51  
52

53 An alternative approach would be grounded in the social model of disability  
54 (Oliver, 1990), situating the 'problem' with peer relationships within the wider social  
55 context. Interventions would focus on increasing understanding of autism and  
56 acceptance of diversity in the wider school community, which research indicates can  
57 promote more positive judgements (Sasson & Morrison, 2019). This may require a  
58  
59  
60

1  
2  
3 cultural shift for schools, which currently offer support mostly in the form of one-to-  
4 one classroom input. It would also require consideration of who facilitates whole-  
5 school interventions, given that demands on teachers are perennially high, they do  
6 not always know how to promote peer acceptance and inclusion (Lindsay et al.,  
7 2013) and autism training is not widely available (Roberts & Simpson, 2016).  
8  
9

10  
11  
12 Strengths of this study include its longitudinal design, which allows analysis of  
13 identity development and school experiences over time. The multi-informant data  
14 collection further enables consideration of young people's perspectives in relation to  
15 those of important others in their social environment. Limitations include a low  
16 response rate to recruitment letters (~10%) and consequent small sample, which  
17 included only one female adolescent. The school experiences discussed are specific  
18 to one local authority area in the north of England and should not be viewed as  
19 representative at a national level. However the analytic structure may be transferable  
20 to other studies. Finally, the dataset included some missing interviews (Table I) due  
21 to constraints on the time of participating families and teachers.  
22  
23  
24  
25  
26  
27  
28  
29

### 30 **Conclusion**

31  
32  
33 The current study enhances understanding of identity construction in  
34 young adolescents with autism and the influence of mainstream school  
35 experiences on this process. To promote positive identity development and wellbeing  
36 in autistic young people, two recommendations for further research and  
37 practice are made. School-based interventions could focus on the whole-school  
38 system to increase understanding of autism and acceptance of diversity, in  
39 order to promote a better person-environment fit for autistic young people. Extended  
40 post-diagnostic support for young people and families to include opportunities to  
41 reflect on the diagnosis with others, and exploration of the best ways to talk  
42 about autism is also recommended.
