Methods: This paper applied a documentary research design involving an analysis of school-based hiv intervention programs that affect girls in Kenya, South Africa and Zimbabwe as a representative subset of sub Saharan Africa. An analysis of school-based HIV intervention programs affecting girls. It included data sources such as peer reviewed articles, as well as articles from authoritative sources. The analysis included both qualitative and quantitative data. The documentary review analyzed all evidence from collected data that included the information needed to identify lessons learned, best practices and program performance.

Results: Findings revealed systemic barriers to safe participation. It exhibited the issues pertaining access to quality hiv education. Social norms and moral expectations based on culture and religion remained significant barriers to girls education.

Conclusion: One of the ways to achieve the 90-90-90 targets as well as the sustainable development goals, is through education strategies. The findings in this study revealed the importance and impact school-based HIV education can have in assisting girls. In order for health promotion to be enabled, collaboration is key. There is also a need for a multi-sectoral approach to achieve the set targets and reduce prevalence of HIV/AIDS among agyw.

Competencies of family practice for providing integrated care for people living with HIV

Gabriel Velloso¹, Gisela Cardoso², Valéria Romano³

¹Secretaria Municipal de Saúde do Rio de Janeiro, Coordenadoria Geral de Atenção Primária 3.3, R. Manuel Martins, 53 - Madureira, Rio de Janeiro, CEP 21310-240, Brazil, ²Fundação Oswaldo Cruz, ³Universidade Federal do Rio de Janeiro, Departamento de Medicina em Atenção Primária à Saúde, Av. Carlos Chagas Filho, 373, Edifício do Centro de Ciências da Saúde, Bloco K, 2° andar, Sala 49 - Cidade Universitária - Ilha do Fundão, Rio de Janeiro - Brasil - CEP: 21.941-902, Brazil

Background and Objective: Since the decentralization of Human Immunodeficiency Virus (HIV) treatment to Primary Healthcare, Family Practice has a growing role in providing integrated care for people living with HIV. While having medical

residency as its gold-standard for graduate education, the specialty has been structuring its curriculum with competency-based education, but there are still fragilities in the curriculum in being capable of providing integrated care for people living with HIV. Based on Philippe Perrenoud's Theory of Competencies, this study proposes the analysis of competencies of Family Practice for providing integrated care for people living with HIV through the perception of graduates from Family Practice Residency Programs in Rio de Janeiro.

Methods: For this purpose, the focal group technique was used, through which was collected the data, complemented by documental analysis.

Results: Based on Perrenoud's concept of competence, 38 competencies were identified, from which 11 were considered transversal, 10 were knowledge, 11 were practices and 6 were attitudes. The concept and application of each of these competencies were then discussed, prioritizing most neglected topics such as recognition of social markers of difference, clinical communication, medical privacy and community interventions. As a result of this study, a table was organized to present Family Practice's competencies in integrated care for people living with HIV, to be shared with education institutions related to the specialty.

Conclusion: This study is expected to support instruction of future family doctors, in order to orient the specialty to a wider view, to challenge the hegemonic paradigms and to truly oppose serophobia.

Mental health and citizenship: understanding and fighting prejudice through education

Alexandre Maia¹, Pedro Zamprogno¹, Daury Fabríz¹, Tammy Motta²

¹FDV - Faculdade de Direito de Vitória, Rua Sergipe, 247, 202, CEP: 29101-400, ES- Espírito Santo, Brazil, ²CRP - Conselho Regional de Psicologia ES, Brazil

Background and Objective: This project aims to promote understanding, social tolerance, and mental health, as provided for in the Universal Declaration of Human Rights, articulating the fundamental right to mental health with the principles of education, as set out in the Federal Constitution and in Brazilian's Law of Guidelines and Bases of National Education (LDB). It seeks to combat prejudice and misinformation historically observed in relation to therapeutic processes, often considered as "things of unbalanced people". Such prejudice generates two problems that need to be fought: first, the lack of access to therapies capable of improving the quality of life of individuals; secondly, to ensure respect for those seeking treatment.

Methods: Recognition of the complexity of the problem requires an integration of fields of study, a search that goes beyond restricted research in the field of Medicine, Psychology or Law. The methodology is rhetoric, seeking convincing through reasonable discourse, based on ethical and legal principles. The proposal consists in two steps:

The first stage is the elaboration of a class plan and expository video, guided by professionals in the fields of psychology, medicine, law and pedagogy. It can be incorporated into the high school curriculum of any school in the national territory, as it is in accordance with the precepts of the Constitution and the Brazilian's Law of Guidelines and Bases of Education (LDB).

The second stage is aimed at researching interaction with students, using active methodologies as a basis.

Results: Both a lesson plan and the class were produced, and are available for presentation and integration into schools.

Conclusion: It is concluded that the material produced, according to ethical and legal sources, is effective as a way of producing greater acceptance and understanding necessary for the reality of mental health. Substantive citizenship demands education as a formative element.

Are trained family planning service providers competent? analyzing the results of diagnostic workshops to improve capacity building in family planning

Jaime Bonifacio Jr¹, Rosario Benabaye²

¹RTI International, USAID ReachHealth, Pasig City, Philippines, Philippines,

²RTI International

Background and Objective: Family planning (FP) service provider's competence is critical to delivering quality FP counselling and services. Hence, the necessity of continuous trainings that capacitate FP providers until they become proficient in FP service provision. However, in many parts of the Philippines, most capacity building activities end with the training itself. USAID ReachHealth found in 2019 that only 302 of 1,969 FP-trained primary care providers in 12 cities and provinces

in the Philippines have undergone a post-training evaluation. To address this gap, local governments conducted diagnostic workshops (DW) to efficiently assess, evaluate, certify, and mentor FP providers.

Methods: The DW for FP gathers 15 to 25 nurses and midwives to undergo knowledge assessment through written tests, and skills assessment through objective structured clinical examination. It allows program managers and trainers to identify providers' weaknesses and address them purposefully. USAID ReachHealth analyzed the results of DWs from 2018 to 2022 to identify the concepts and skills that must be emphasized or reinforced during trainings and succeeding coaching activities, and inform the strengthening of FP capacity building interventions.

Results: Twenty-one workshops attended by 371 participants were reviewed. Fifty-three percent were found competent and endorsed for certification while 47% either had to be coached or retrained. While most of the evaluated providers had strong interpersonal skills, they needed coaching in addressing missed contraceptive pills and providing information on lactational amenorrhea method, among others. These aspects also need to be reinforced in basic FP courses offered by the Philippine Department of Health.

Conclusion: Not all trained providers are competent in FP services. Hence, continuous capacity building, including mentoring that specifically targets their weaknesses, is necessary. The DW is an effective and efficient way to assess the knowledge and skills of providers. It is also a viable approach to strengthening FP capacity building interventions.

Midwives' self-efficacy during the COVID-19 pandemic

Elena Capitani¹, Agnese Casucci², Lucia Alaimo³, Nicola Nante¹

¹University of Siena, Italy, Post Graduate School of Public Health, University of Siena, Italy, ²University of Siena, Italy, ³University of Siena, Italy, Degree Course in Obstetrics, University of Siena, Italy

Background and Objective: Self-reflection skills enable us to analyse experiences and reflect on our thought processes, generating new capacities for action. The study aims to investigate the extent to which Italian midwives are able to use self-efficacy in the professional and working environment during the covid-19 pandemic.

Methods: A cross-sectional study was conducted on a sample of midwives enrolled through an online questionnaire from July to October 2022. The questionnaire consists of socio-demographic data and work experience data. It was used as a psychometric instrument, "Scale of perceived self-efficacy in the management of complex problems" (Farnese ML, 2007) with four dimensions investigated (emotional maturity, finality to action, relational fluency, context analysis) and scored from 6 to 30. Statistical analysis was performed by STATA 17.

Results: The sample consists of 835 midwives. The following mean dimensions were obtained "emotional maturity" 18.1 (CI:17.8-18.3), "finalisation of action" 20.5 (CI: 20.2-20.7), "relational fluidity" 20.8 (CI: 20.5-21.1), "context analysis" 20.7 (CI 20.4-21.0). Those who are slightly/not at all satisfied with their professional fulfilment are more likely to have a low emotional maturity score (OR:2.1;CI:1.4-3.3). Those who are fairly/very satisfied with their professional fulfilment are more likely to score highly on action finalisation (OR:1.45; CI:1.1-2.0). Those who feel that the covid-19 pandemic has greatly affected their emotional experience are less likely to have a high score on emotional maturity. (OR:0.6;CI: 0.4-0.9). Those who believe that the covid-19 pandemic had little influence on their emotional experience are more likely to have a high emotional maturity score (OR:1.6; CI:1.1-2.5)

Conclusion: Our study shows that personal fulfilment in the care setting strongly influences the perception of midwives self-efficacy and that the covid-19 pandemic has left an indelible scar on healthcare professionals by conditioning their perception of their self-efficacy.

Association of study- and health behavior-related factors with university students' health and health literacy - A monocenter cross-sectional study in Germany

Alexandra Löwe¹, Martin Lange², Andrea Schaller³

¹IST University of Applied Sciences, Department of Fitness and Health, Erkrather Straße 220 a-c, 40233 Düsseldorf, Germany, ²IST University of Applied Sciences, ³German Sport University Cologne, Working Group Physical Activity-Related Prevention Research, Institute of Movement Therapy and Movement-oriented Prevention and Rehabilitation, Am Sportpark Müngersdorf 6, 50933 Köln, Germany

Background and Objective: University students (US) face challenging times characterized by home detachment, identity exploration, academic demands, and additional stressors due to the current global situation that can negatively impact health. Health behaviors (HB) and health literacy (HL) are important resources for maintaining health. The objectives are to evaluate the current health status (HS), HB, and HL of US and to identify study-related and health behavior-related factors associated with HS and HL.

Methods: A cross-sectional study was conducted at a University of Applied Sciences in Germany. Data were collected online between November 2020 and March 2022, using validated instruments to assess HS, HB and HL. HS, HB and HL were presented by descriptive statistics. Multiple linear regression analysis were performed to evaluate the associations between HS, HL, study-related and behavioral factors.

Results: N= 550 participants (♂: 74%) were included. HS was positive, stress levels were high, sleep scores, physical activity, and HL were low. A high HS ($p = <.004$, adjusted R^2 : .254; f^2 : .34) was associated with male gender ($b = .124$, $p = .031$), higher life satisfaction ($b = .050$, $p = <.001$), better sleep ($b = -.044$, $p = <.001$) and nutrition ($b = .016$, $p = .005$). HL ($p = .022$, adjusted R^2 : .076; f^2 : .08) was positively associated with the target graduation 'master' ($b = .082$, $p = .051$), better sleep ($b = -.132$, $p = .004$), healthy nutrition ($b = .094$, $p = .031$), lower alcohol intake ($b = -.099$, $p = .017$) and higher life satisfaction ($b = .108$, $p = .022$).

Conclusion: Students perceive themselves as healthy but exhibit critical HB and low HL, revealing potential for health-promoting interventions. Universities can draw on existing resources to implement the measures efficiently.

Background: Virtual reality (VR) has been widely used in medical education. Little research exists on the deployment of VR in clinical reasoning training. This study aimed to explore experience and perspective of medical students on the usability of VR to facilitate clinical reasoning skills in a blended learning course.

Methods: This is a quasi-experimental study using a pretest-posttest design with 200 fifth-year medical students. Presence Questionnaires in VR (values 1-7), Technology Acceptance Model (values 1-7), and set questions of satisfaction of blended learning using VR were used to evaluate the experience of participants in VR. The total scores of pre- and post-test OSCEs (valued 0-10) were analyzed to examine the improvement in clinical reasoning skills of participants.

Results: Student acceptance of the VR application for clinical reasoning training was high, with a high intention to use it in the future (5.27 ± 1.15). Most students

were highly satisfied with the blended course integrating VR (81.5%). Findings showed the fidelity of VR facilitating clinical reasoning, with 88.0% of students stating that working through the VR case was a worthwhile learning experience. The improvement in clinical reasoning skills after the course was statistically found, with a mean difference of performance scores between pre-and post-test of 3.14 ($p < 0.001$). Some students experienced minor difficulties in navigating within the virtual cases and the limitation of time taken to complete the case. Gender, ocular conditions, and cybersickness symptoms were found statistically associated with students' acceptance and experience in VR ($p < 0.05$).

Conclusions: Incorporating VR into a blended learning course is an applicable promising innovative format to facilitate the clinical competence or reasoning ability of medical students. Further efforts to develop multiple cases in VR and apply augmented reality to provide higher fidelity of simulation and complete virtual patients exhibiting expressions and disease symptoms are highly recommended.

Indian experience of tetanus - a study from South India

Dr V S¹

¹ AFH India

Introduction: Tetanus is an old world disease where 2 centuries ago people had realised the link between wound leading to muscle spasm and fatality. Even today there are many cases fatalities of tetanus being reported from different parts of the country even after viability of a Tetanus toxoid and Immunoglobulin injections. This one of very few recent studies done in India on Tetanus. As there is very less data available on Tetanus so we are trying to share our experience on Tetanus, so it will help the physicians to get a better understanding.

Materials and Methods: This a retrospective study done collecting patients detail from 2017- 2019, detailed case sheet review was done and the patients clinical presentation and prognosis was noted in predesigned format. Inclusion criteria – All diagnosed case of tetanus, Exclusion criteria – patient already received treatment from local hospital. The patient details were kept confidential during all times

Results: The total of 58 cases -35 males and 23 females, The average duration of hospital stay was 15 days. The most common occupation were farmers (bare foot workers). The site of injury was foot in 65% cases followed by injuries to the fingers or the hand in 30% and 5% cases due to injury while tooth picking with pin, splinter removal using pins. Clinical symptoms - Trismus "Lock jaw" (41), difficulty in walking (2), limb pain/stiffness (17), back muscle, pain/stiffness (12), Dysphagia (7), 72% autonomic dysfunction. Opisthotonus position and Riscus sardonius developed after 7-8 days of infection. 20% cases were vaccinated still developed diseases. 18% mortality was noted most cases were unvaccinated cases.

Conclusion: Tetanus is preventable diseases; If TT vaccination and immunoglobulin are administered on time. In all primary health care levels cold chain should maintained for vaccines. The patients should be made sensitized about the consequence of the diseases process.

DOI: 10.18332/popmed/164095

What training and competencies are required for public health practitioners to support the digital transformation of public health? A rapid review

Ihoghosa Iyamu¹, Mark Gilbert¹, Andre Kishniruk², Swathi Ramachandran³, Hsiu-Ju Chang³, Francisco Ibáñez-Carrasco⁴, Catherine Worthington⁵, Hugh Davies¹, Geoffrey McKee³, Adalsteinn Brown⁴

¹School of Population and Public Health (SPPH), University of British Columbia (UBC) British Columbia Centre for Disease Control Canada,

²School of Health Information Science, University of Victoria, BC, ³British Columbia Centre for Disease Control Canada, ⁴Dalla Lana School of Public Health, University of Toronto, Ontario, ⁵School of Public Health and Social Policy, University of Victoria, BC Canada

Background: The COVID-19 pandemic highlighted the importance of digital technologies (DTs) in sustaining health systems especially in crises but emphasized gaps in the workforce's capacity to deploy DTs, while upholding ethical, social justice and health equity principles. Current practice and competency frameworks have not adequately considered prominent roles DTs play in contemporary public health. Many public health training institutions have struggled to integrate DTs in their curricula. To support updates to Canadian public health curricula, we are conducting a rapid review to identify training and practice competency recommendations to enhance public health practitioners' capacity to support the digital transformation of public health.

Methods: Following the World Health Organization's (2017) guidelines for rapid reviews, we searched OVID Medline, OVID Embase, ERIC, and Web of Science for peer-reviewed articles using search terms related to public health, digital health, and training and practice competencies. We also searched Google scholar, public health agency and public health training associations' websites. We included articles proffering training and practice competencies recommendations for DTs among population and public health practitioners, published in English between January 2010 and December 2022. We excluded articles exploring a solely medical perspective.

Results: Our search returned 1695 titles and abstracts. Screening will occur in two phases. First, we are reviewing titles and abstract based on above inclusion and exclusion criteria, before repeating the process with full texts. We will extract recommendations for training and practice competencies, and disciplinary perspectives and educational approaches required to facilitate identified recommendations.

Conclusion: This review is a first step in efforts to fill human resource capacity gaps related to DTs. Considering this review synthesizes training and practice competency recommendations worldwide, we will further conduct environmental scans and focus groups with Canadian public health practitioners and researchers to identify recommendations that can be integrated in the Canadian context.

Tobacco as a threat to the environment: an experimental awareness campaign targeted at youth

Martina Antinozzi¹, Nicola Calcavecchia², Maria Assunta Donato¹, Caterina Ferrari¹, Giulia Gatti², Giusy La Fauci³, Francesco Mondera¹, Raffaella Sibilio⁴, Maria Sofia Cattaruzza⁴

¹Sapienza University of Rome Department of Public Health and Infectious Diseases Piazzale Aldo Moro, 5, 00185, Rome, Italy, ²University of Genoa,

³University of Bologna Unit of Hygiene, Department of Biomedical and Neuromotor Sciences Italy, ⁴University of Genoa Department of Health Sciences Italy

Background: we wrote short informative articles on each one. Meanwhile, we developed two different 7-question surveys to be answered: before reading the ebook (t0) to analyze baseline knowledge and after reading it (t1), to assess possible improvements.

Results: The campaign is still ongoing. At the moment 579 people read the ebook in 7 different countries (EU and US area). We collected 163 answers for t0 and 149 for t1. Respondents are university students with a mean age of 20.8 (DS±1.62), 73.6% are females, 69.9% come from central Italy. Only 4% already hold a university degree and 92.6% are studying in the healthcare sector. At t0, the mean of correct answers was 2, whereas at t1 it became 4, with a median value of 5 correct out of 7 total.

Conclusion: This ebook is just a first step in digital scientific dissemination on tobacco control. As a pilot project, it underlines the importance of content sharing and brainstorming in digital science communication and paves the path to a new concept of health promotion in the digital era.

DOI: 10.18332/popmed/164240

Integrated case management: a tool capacitating the resident trainees on the six roles of primary care provider

Anna Limpoco¹, Reggiena Lachica¹, Aileen Espina¹

¹Philippine Academy of Family Physician Philippines

Background and objective: Primary care provides the first contact, comprehensive, coordinated and continuity of care in the context of a patient centered, family focused, community oriented (PFC) lens. There is a need to capacitate health care providers on the roles of a competent health care provider, researcher, leader, educator, navigator and coordinator for a successful delivery of primary care. To present an innovation in training to capacitate residents on the roles of a primary care provider.

Method: The integrated case management is an innovation from the usual clinical case management. The resident trainee are required to present one actual patient encounter in the integrated case management session. The integrated case management is an interactive case discussion that is divided into four parts. Part I is the PFC matrix table which highlights the patient centered management using biopsychosocial approach, wellness and prevention. Family focused management are based on the analysis of family assessment tools. Community oriented care is based on the analysis of community resource awareness, access and utilization. Part II is the identification of the six roles applied to the patient, family and community management. Part III is the critical appraisal of an article that

best answers the clinical dilemma encountered by the resident during the actual patient encounter or course of management. Part IV is the overall insight of the experience using the DSAQ (discoveries, surprises, affirmations and questions) format.

Results: There is acceptability and positive feedback from the resident trainees on the utilization of the integrated case management. The competencies on the six roles of a primary care provider vis a vis in the context of a patient centered, family focused and community oriented lens is further enhanced.

Conclusion: Integrated case management is one innovation that include experiential and reflective learning via facilitated case discussion.

DOI: 10.18332/popmed/164268

Training, qualification and title of health professional specialists in Brazil

Cristiana Carvalho¹, Cristiana Carvalho², Ana de Assis Chagas³, Ana de Sousa van Stralen⁴, Samuel da Silva⁴, Fabiana Pimenta³, Valéria Goulart⁵, Leda de Oliveira⁵, Sabado Girardi⁴

¹Pontifical Catholic University of Minas Gerais (PUC-MINAS) and Federal University of Minas Gerais (UFMG) Brazil, ²Pontifical Catholic University (PUC-MINAS) and Federal University of Minas Gerais (UFMG) Brazil, ³Federal University of Minas Gerais, ⁴Federal University of Minas Gerais Brazil, ⁵Oswaldo Cruz Foundation Brazil

Background and objective: The growing demand for health professional qualifications and new skills for the job market has expanded the requirements and possibilities for specialist training. In this scenario, different postgraduate education modalities have emerged. This study aimed to raise the different formative, normative, and potential arrangements for specialist training for health professionals in Brazil.

Methods: We carried out documentary research in which we consulted the legislation referring to the training and qualification of health professional specialists, including norms of regulatory councils of the following professions: dentistry, medicine, nursing, pharmacy, physiotherapy, and psychology.

Results: In Brazil there are different modalities of postgraduate training, including specialization courses, residencies, masters, and doctorate degrees. These modalities are different in workload, pedagogical requirements, and credentials, which may or may not be recognized by the regulatory bodies of each profession. Title and professional registration show significant differences, without any standardization regarding the recognition of specialists, which vary from completing residency programs to proving work experience and title examination. However, professionals can freely exercise any specialty, regardless of registration by the regulatory body. There is also a significant difference in the number of specialties recognized by the respective regulatory bodies. Ranging from 13 for psychology, 55 for medicine, to 142 for nurses, defined independently of the actual need for health services.

Conclusions: In Brazil, training for specialists includes different modalities, but most health professionals practice their specialty regardless of having a course and/or specialist title recognized by their regulatory body. Health activities require adequate training of professionals with a high degree of qualification and a profile suited to meet the health needs of the population. However, the different postgraduate modalities available and the requirements of the regulatory bodies are not always in tune with each other in order to meet society's demands and train qualified professionals.

DOI: 10.18332/popmed/164435

Lessons from India: outcomes of an overseas field trip for public health students

Ranjit Khutan¹, Bhawna Solanki², Himanshu Mittal³, Ranjit Khutan¹

¹University of Wolverhampton United Kingdom, ²University of Wolverhampton, United Kingdom, ³Stride Education, India

Background and objective: Working in partnership with education and health organisations in India, this field trip aimed to enhance public health students' knowledge and experiences of working with diverse communities.

Methods: Focussing on public health needs, students could reflect and relate these to their own needs and experiences. This experiential learning programme provided students with an opportunity to compare and contrast how public health practitioners addressed health needs in India and explore the impact of policy and funding on practice.

Results: Five groups of around 20 students have been on the field trip since 2014. Students learned about government-initiated public health approaches as well as those coordinated and delivered by NGOs and local populations. The outcomes

were assessed through reflective accounts, video diaries and interviews. These highlighted that they were able to appreciate how culture influenced health beliefs and public health practice; they were also able to understand the role the government, NGOs, faith organisations and the collective efforts of society to protect and promote health. This experience enhanced students' understanding of public health and gave them experiences and insights into practice that could not have been gained from reading alone.

Conclusions: The COVID-19 pandemic has reminded us that public health education needs to be global and not bound by national or geographical boundaries, so we are maintaining connections with our partners in India to support learning for public health students in both countries. We are providing a virtual experience through the reflective accounts that were gathered on the field trips and through online discussions with practitioners and public health students in India.

Popul. Med. 2023;5(Supplement):A708

DOI: 10.18332/popmed/164447

Education A powerful tool for combatting health effects of climate change

Laurent Chambaud¹, John Middleton², Tara Chen³, Rana Orhan⁴, Robert Otok⁵

¹Association of Schools of Public Health in the European Region France, ²Association of Schools of Public Health in the European Region United Kingdom, ³Association of Schools of Public Health in the European Region, ⁴Association of Schools of Public Health in the European Region Netherlands, ⁵Association of Schools of Public Health in the European Region Belgium

Background and Objectives: There are calls for urgent climate action to combat climate change, usually focused on mitigation such as renewable energy sources, protection of coastal wetlands, and agroforestry measures. However, we often ignore one of the most important tools for climate action: education. ASPHER aims to foster learning and knowledge about the relationship between health and climate change, by training not only the future health workforce but also stakeholders to develop effective climate change responses and engage in a societal transformation for a healthier future.

Methods: ASPHER conducted an online survey to look at the implementation of climate education and climate action taken by public health institutions to provide a baseline assessment. This supported the development of ASPHER's climate-Health implementation strategy for action through partnership-building for collective impact.

Results: The survey results found a lack of a systematic approach and ad hoc actions by public health academic institutions. ASPHER has embodied the findings to deliver actions in practice by leveraging the EU Health Policy Platform; developing a joint climate-health education statement, and hereby receiving institutional support at various levels. This has triggered the formal development of a working group of ASPHER members to synergize climate-health education activities to support knowledge-sharing and lessons learned across institutions adopting climate-health education to its curricula.

Conclusions: Supporting the call for climate-health education at the workforce and trainee level can catalyze long term transformation as it fosters behavioural change in traditional operations and roles. Climate-health education is more than ensuring environmental literacy but supporting the role of public health and health professionals of the most effective ways to act on climate change and to build a climate resilient health system.

Popul. Med. 2023;5(Supplement):A709

DOI: 10.18332/popmed/164683

Training in health promotion for nurses

Manon Duay¹, Nathalie Déchanet²

¹HES-SO University of Applied Sciences and Arts Western Switzerland Rte des Arsenaux 16a, 1700 Fribourg, Switzerland Switzerland HES-SO University of Applied Sciences of Western Switzerland / School Nursing Fribourg Rte des Arsenaux 16a, 1700 Fribourg Switzerland, ²University of Applied Sciences of Western Switzerland (HES-SO), Fribourg, Switzerland HES-SO University of Applied Sciences of Western Switzerland / School Nursing Fribourg Route des Arsenaux 6a, 1700 Fribourg Switzerland

Background and objective: Nurses have an important role to play as health promoters (Donaghy et al., 2022), however the concept of health promotion is not always well understood. In nursing practice, it is sometimes reduced to prevention, pitting health against disease, or focusing on individual determinants of health without considering socio-environmental determinants, or sometimes focusing on a health education approach where the professional already knows what is good for others.

The objective of the presentation will be to illustrate a health promotion training

course for public health professionals (PHPs) using a participative approach, considering the determinants of health as a whole and identifying opportunities for health promotion practice through community immersion.

Methods: Creation of a teaching method during an undergraduate degree of Science in Nursing at HES-SO University of Applied Sciences and Arts Western Switzerland, by a socio-constructivist approach that aims to do a community assessment with a population concerned by a health challenge. This 12 day-course over 3 weeks seeks to enhance group empowerment and participation of stakeholders based on a salutogenic approach.

Results: In this course, students are divided into groups of 4-5 and are invited to carry out a health promotion project, with a population/community. This project-based approach enables the development of their health promotion posture, which is based on the principles of empowerment, health determinants perspective and community participation, with a view to transferring it to more conventional fields of practice (hospital, home care, ...). To encourage their success, a partnership is established with actors in extra-hospital settings (schools, neighbourhoods, communities).

Conclusion: The presented course on health promotion gives the opportunity to improve community engagement and to improve partnerships between actors in the health system.

Framing public health education to meet the needs of professionals for war and peacebuilding

Colette Cunningham¹, Lisa Wandschneider²

¹School of Public Health, University College Cork ASPHER Western Gateway Building 4.31, University College Cork. Ireland, ²Bielefeld University

Background and Objectives: Public health plays a crucial role in restoring, protecting, and promoting health of affected populations in times of war and armed conflict. Even though health effects of war are well explored, the development of competencies to address the public health impact has received little attention in public health curricula. Evidence shows that displacement of people and medical staff and attacks on healthcare facilities is on the increase in wars putting the provision of healthcare under pressure. Therefore, public health professionals need to adapt to new ways of working in times of war and peacebuilding.

Methods: To strengthen War and Peacebuilding specific competencies, we suggest building upon the WHO-ASPHER Competency multi-dimensional Framework. It provides an already established framework for Schools of Public Health and additional public health organizations and, at the same time, can be extended to understand and prevent the political, economic, social, and cultural determinants of war.

Findings

We explore and highlight linkage points for adapting public health curricula and defining competencies specific to war and peacebuilding in public health in the respective Framework categories. For example, international frameworks on war, peacebuilding, and healthcare as well as potential ethical dilemmas need to be addressed in law policies and ethics competencies. As for leadership and systems thinking, public health emergency management and risk communication in times of war need to be addressed.

Conclusions: To equip the public health workforce for times of war and peacebuilding, training resources and curricula need to catch up. Our proposed adapted competency framework could help as a first step with that adaptation and highlights synergistic effects with related fields such as outbreak control, disaster management and humanitarian work.

Community-based strategy for peer education on sexual and reproductive rights in the community of basurú istmina, chocó colombia, 2021-2022

Jhon Patiño Rueda¹, Jovana Cañas¹, Honoria Rengifo¹

¹Research Line on Health Systems, Childhood, Gender, Interculturality and Tropical Diseases, Research Group on Public Health, Medical Education and Medical Professionalism, School of Medicine, Universidad de los Andes, Bogotá DC, Colombia

Background and Objective: The Afro-Colombian community of Basurú is in the department of Chocó, Colombia. Several reports show that the Sexual and Reproductive Health (SRH) situation of women in this department is not the best. Knowledge of Sexual and Reproductive Rights (SRHR) has been associated with increased SRH. Peer Training Strategies (PTS) have been shown to be effective in improving SRHR knowledge. The objective of this study was to implement

a community-based PTS on SRHR of Basurú, Municipality of Istmina, Chocó, Colombia, 2021-2022.

Methods: A study with qualitative methodology and Participatory Action Research design was conducted. We co-worked with the women of the Basurú community. Three phases of work were carried out: research, education and design, and action. In the research phase, the work methodology was contextualized, adjusted, and adapted, community leaders were identified and SRH work topics were prioritized. In phase two, the PTS was designed through various design cycles and iconographic and thematic validation with community. A Before/After evaluation was conducted to assess the increase in knowledge given the PTS through linear regression.

Results: Five workshops, with a participation between 4 and 40 women, were held to co-construct a flip chart based on 14 topics. For each topic, introductory questions, a definition, recommendations, and questions for discussion were developed. These topics were organized along three thematic lines: cross-cutting topics, sexual rights, and reproductive rights. A facilitators guide was created with didactic and playful activities for each practice. The pilot was carried out with a group of 36 women from Istmina. It was shown that the strategy improved knowledge about DSDR by 1.85 correct answers ($p=0.001$).

Conclusion: The PTS co-constructed in the Basurú community could be used in other similar contexts to train in SRHR as it proved to improve knowledge on this topic.

Is public health education and training adequately responding (or not) to emerging priorities?

Christina Severinsen¹, Geri Seeley², Leanne Coombe³, Priscilla Robinson⁴

¹Massey University New Zealand, ²World Federation of Public Health Associations George Washington University United States, ³World Federation of Public Health Associations, ⁴World Federation of Public Health Associations La Trobe University United Kingdom

Background: Work by the World Federation of Public Health Associations' Professional Education and Training (WFPHAPET) working group has identified several areas of the current public health environment in which practitioners need to have a basic understanding to prepare them for the future of the field but are not necessarily included in public health competency sets or curriculums. The emerging and important public health issues identified were OneHealth, Systems Thinking, Public Health Ethics, and Disaster and Emergency Health.

Methods: A panel was organized and moderated by John Middleton (Association of Schools of Public Health in European Region), with Laura Khan (OneHealth), Carol Stewart (Disaster and Emergency Health), Helen de Pinto (Systems Thinking), Michael Moore (Political Engagement), and Jim Thomas (Public Health Ethics) invited to discuss challenges in integrating these specialties into public health education, training, and practice.

Results: Common threads across the discussion included:

- * The current pace of change seen in these areas of public health
- * 'Nimble' ways of identifying emerging problems
- * Imaginative ways of teaching
- * The need for sophisticated communication systems
- * Understanding current political imperatives and political realities
- * Training 'public health practitioners who understand political thinking'.

Conclusion: To enable better capacity in public health workforce means updating course materials and finding ways to integrate new materials without losing core content. Opportunities exist for a range of imaginative and nimble teaching strategies to adapt current and future training materials, including short courses; case-based approaches; and the integration of emergent public health topics. As teachers we must be mindful of the need to teach enough of everything versus a lot of nothing, losing the ability to teach specialist topics in any depth. The SARS-CoV-2 pandemic brought us a unique experience to reflect on how we teach, and learn new teaching techniques, and not spend time teaching material which is easily available online.

Citizen diplomacy for incidence and advocacy in public health, a new model

Eliana Martínez-Herrera¹, Gonzalez Liliana², Liliana Escobar³, Eliana Martínez-Herrera¹

¹National School of Public Health UA Professor Colombia, ²National School of Public Health Advisor on international affairs & diplomacy Colombia, ³National School of Public Health UA Advisor on international affairs &

diplomacy Colombia

Diplomacy is becoming a word of public domain which is usually described by an adjective to indicate its area of emphasis, generally with mere academic rigor. However, understanding diplomacy and its possibilities require the consideration of two broad categories: State diplomacy and Citizen diplomacy; but also needs to be regarded as a discipline, as a profession and, as such, it should maintain several elements inherent to its nature. State diplomacy is reserved for the heads of State and Government, as well as Ministers, who follow very specific rules to promote their national interest; whereas Citizen diplomacy is allowed to the civil society to promote the social agenda by following very specific rules while using more flexible mechanisms. In order to develop a Model of Diplomacy for a School of Public Health which allows for political incidence, sanitary and health advocacy, opinion leadership and social control, in the framework of Sustainable Development Goals, climate change, common good and peace, this literature review considered State Diplomacy, Health Diplomacy, Global Health Diplomacy, Science Diplomacy, and Citizen Diplomacy taking the most valuable elements to create a new model of Citizen Diplomacy for Public Health and Higher Education. Furthermore, the proposal intends to draw a path of action by adapting to the possibilities given to civil society, on the one hand the principles, pillars and elements of State Diplomacy, as well as the qualities of a diplomat, the ranks, and the functions of diplomacy; on the other hand, the characteristics of Health Diplomacy and the attributes of Science Diplomacy; and finally the mechanisms of Citizen Diplomacy. As a results, a methodic route for Citizen Diplomacy for Public Health and Higher Education is possible to better influence, advocate, lead, and control by means of soft power on behalf of a more mature and sensitive public health.

Effect of therapeutic education on the adherence to nicotine replacement therapy in a smoking cessation center

Cyrine Nasrallah¹, Hela Abroug¹, Amani Maatouk¹, Amal Gara¹, Manel Fredj¹, Wafa Dhouib², Mariem Kacem¹, Imen Zemni¹, Ines Bouanene¹, Asma Sriha²
¹Department of Preventive Medicine and Epidemiology, Fattouma Bourguiba University Hospital, University of Monastir, Monastir, Tunisia, ²Department of Preventive Medicine and Department of Preventive Medicine and Epidemiology, Fattouma Bourguiba University Hospital, University of Monastir, Monastir, Tunisia

Background: Reducing the use of tobacco is currently the most important public health measure that developed countries can implement. Adherence to treatment is an important determinant of the success of smoking cessation programs. Therapeutic patient education (TPE) might play a key role to improve treatment adherence and smoking cessation rates. Our study aimed to compare the effect of intensive and minimal TPE sessions on Nicotine Replacement Therapy (NRT) adherence and smoking cessation rates. **Methods:** A prospective cohort study was conducted at the smoking cessation center of the University hospital of Monastir. The population study involved the attendees of the center who consulted during the period from 2009 to 2013. Two groups were defined: A group received only two TPE sessions: "Minimal intervention"; and the other benefited of 3 and more: "Intensive intervention".

Results: In total, 48.7% of included patients were adherent to NRT. The level of adherence was significantly associated with the number of TPE sessions (p -value<10-4). Patients with intensive intervention documented higher rates of treatment adherence (Adjusted Relative Risk RRs: 10.98; 95% CI: 4.42-27.02). The smoking cessation rates at one year and five years of follow-up were also associated with the number of TPE sessions with a higher probability of smoking cessation among those who received intensive intervention. Crude Relative Risks were (RRc=2.6; 95% CI :1.3 - 5.4) and (RRc = 2.8; 95% CI:1.3-6.4) at one year and five-years of follow-up, respectively. **Conclusions:** Intensive TPE sessions are more effective on NRT adherence and on continuous smoking cessation. TPE improves smoking cessation clinics outcomes. A continuous attendance of the counseling sessions with intensive TPE sessions should be recommended as a best practice in smoking cessation programs.

Changes in the food consumption of university students during the years 1992-2019

Jana Babjakova¹, Zuzana Stefanikova², Katarina Vargova³, Ivana Kachutova³, Lenka Matejakova³, Martin Samohyl², Katarina Hirosova⁴, Jana Jurkovicova², Lubica Argalasova²

¹Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava,

Bratislava, Slovakia, ²Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava, Slovak Republic, ³Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava, Slovakia, ⁴Institute of Hygiene, Faculty of Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava, Slovak Republic

Background and Objectives: Despite decades of dietary changes, Slovaks do not consume a balanced diet and morbidity on chronic nutrition-related diseases remains high. Our research's objective was to assess university students dietary habits over 28-year period in relation to gender and trend differences, and to compare them with Slovak RDAs (recommended dietary allowances). **Methods:** The group consisted of 8,184 medical university students with an average age of 22.7 years (2,723 men-33.3%, 5,461 women-66.7%). This was a quite homogeneous group of young people with potential above-average knowledge of nutritional prevention and principles of healthy eating. Using a 24-hour recall, we annually obtained information about the nutritional consumption of fourth-grade students in the period from 1992 to 2019.

Results: The students consumption of fats, potatoes, legumes, sugar, and especially fruit decreased. On the contrary, the consumption of meat, meat products, poultry, eggs, vegetable fats and vegetables increased, as did the consumption of milk and dairy products and pasta among women. Fish and grain products consumption remained mostly unchanged. In comparison to women, men consume more meat, milk, dairy products, fish, eggs, cereals, potatoes, and legumes. Women consume more fruit and fruit products. The consumption of total fats, vegetables and sugar is approximately the same for both genders. **Conclusions:** Among students, we observe similar trends as in the general Slovak population, with significant intersexual differences. The consumption of meat is quantitatively sufficient, but the structure is unbalanced, the consumption of milk, dairy products and especially fish is insufficient, the consumption of poultry, cheese and eggs is excessive. The consumption of potatoes, vegetables and particularly fruits is critically low, even though the structure has improved. The nutritional consumption of students was not in accordance with the RDAs and intervention is needed. This work was supported in part by the grant KEGA 015UK-4/2022.

Using popular education in health during the COVID-19 pandemic with women who suffered violence: an experience report

Bárbara Miranda¹, Ana Ferreira¹, Andressa Souza¹, Alice Andrade¹, Carol Luiz¹

¹State University of Campinas - UNICAMP, Brazil

This research reports the experience of Paulo ferries itinerary, carried out in cultural circles, in Campinas/Brazil with women who suffered violence. During the new coronavirus (COVID-19) pandemic, the number of cases of domestic violence increased and the access to support services for victims, in particular in health, social assistance and public security sectors reduced. Popular health education becomes a powerful strategy in the sense of promoting actions and proposals for educational practices. Therefore, it is a priority to design and create specialized intervention programs to prevent and reduce complications that arise from violence exposure. **Objectives:** to report the experience of hosting culture circles through research into implementation of care for people exposed to violence, by group interfaces, from the faculty of medical sciences at Unicamp, Brazil. **Method:** two cycles of groups composed of 8 meetings were carried out from June to December 2021, inspired by the Freirean perspective, with women over 18 years old exposed to violence, living in the city of Campinas, Brazil. A qualitative description of the preliminary results of the intervention performed will be presented.

Results: the impact, implications and scope of violence in the participants lives was revealed in the identification of the themes: chauvinism, racism, future, dreams, being a woman, resilience, women's health, social inequality, trust issues, rights and justice, fear and self-image. The participants showed an interest in perpetuating the circle of culture among the women of the community. **Conclusions:** popular health education favored the exchange and reflection on what was experienced, and it was also understood in its collective dimension. The culture circle proved to be a potential tool for the empowerment of participants, based on the democratic sharing of knowledge and experiences about violence, becoming an emancipatory space for continuous learning, freedom, resistance and affective constructions.

The use of social media to facilitate student-led initiatives in

undergraduate medical education

Leonard Lim¹

¹College of Medicine, University of the Philippines, Manila, Philippines

Introduction: Despite the shift to online learning brought about by the covid-19 pandemic, existing studies on social media (some) use in medical education have primarily focused on educator-led initiatives. Our study thus described student-led some initiatives and elicited perceptions of undergraduate medical students towards such initiatives.

Methodology: An online survey was sent out to first- and second-year undergraduate medical students from the university of the Philippines manila college of medicine. Descriptive statistics were calculated, while qualitative data from open-ended questions were grouped into prominent themes. Results of the 258 participants of the survey, 228 (88.4%) recommended the continued use of some. The most popular some platforms for different tasks were as follows: discord for studying together (71.3%) and for conducting peer tutoring sessions (33.3%); Facebook messenger for reading reminders (55.4%); telegram for reading announcements related to academics (88.4%) and administrative requirements (72.9%), and for accessing material provided by classmates (60.1%) and professors (52.3%). The high uptake of some is due to the several advantages cited, such as accessibility and cost-efficiency. Some disadvantages were cited, such as their capacity to serve as distractions and sources of social media fatigue.

Conclusions: Some platforms were useful for student-led initiatives, and their use should be continued and explored further. Students use of a particular some platform was dependent on their needs and the platforms features. By analyzing the perceptions of students, medical schools will be able to better integrate these initiatives into medical curricula.

Training of health management students in Workplace health promotion

Stela Georgieva¹, Mariela Kamburova¹, Dima Tsanova¹

¹Medical University, Pleven, Bulgaria

Background: Training in health management requires analytical thinking of students, proactivity and practical skills. Health managers are responsible for strict organization and best Results of the health institutions' work. Creating safe and healthy working environment for the staff is also their priority task. Concept of Workplace Health Promotion (WHP) has been discussed as an innovative and effective approach in caring for health of working population. These facts justify the inclusion of an optional discipline "WHP" in the curriculum of the masters degree "Public Health and Health Management", in Medical University – Pleven, Bulgaria. The objectives of this paper is to analyse the exam success rate, students' interest to the subject and their opinion to the usefulness of the acquired knowledge and skills.

Materials and Methods: Data were collected by document review of the educational documentation and interviewing students about their motivation to study this subject.

Results: Although in the curriculum the subject is optional but not obligatory, students appreciate its importance and show a great interest in it. They want to extend specific knowledge on Holistic workability model and to develop competencies of health promotion practitioners. The relative share of students who choose to study this subject increases each academic year from 30% in 2017 to 72% in 2021. Training outcomes are also improving from very good (4.62) to excellent (5.50) for both theoretical and practical part of the exam. More than 90% of students assess the acquired knowledge as very useful and applicable in their future professional work, and appreciate that the accent is on practice rather than theory.

Conclusions: Education and training in WHP helps students to acquire competencies for their future professional performance. The wide applicability of health promotion concept and positive experience of the training make the subject relevant to the curriculum of other specialties too.

Educational video to guide parents and caregivers of children using a clean intermittent bladder catheter

Lorita Pagliuca¹, Antonia Sampaio¹, Marília Lima¹, Cristiana Rebouças¹

¹Federal University of Ceará, Brazil

Background and Objective: Neurogenic lower urinary tract dysfunction has a considerable impact on the quality of life and daily activities of individuals and their families. Intermittent Urethral Catheterization (UIC) is the most used therapy in these cases. Aimed to evaluate the effectiveness of the educational

video "Intermittent Urethral Catheterization in children: How to do it?" in the performance of UIC by parents and caregivers of children with neurogenic bladder. **Methods:** Quasi-experimental study, from June to October 2021, at Pediatric Hospital in Fortaleza, Brazil. The sample consisted of 30 mothers who were starting or in continuous use of the UIC, divided into two groups: Intervention Group (IG) and Comparison Group (CG). After signing the informed consent, the sociodemographic and clinical form and the King's Health Questionnaire (KHQ) was applied to both groups, as well as the pre-test, which consists of 10 questions about the content of the educational video. CG received routine guidelines from the outpatient clinic and the IG, in addition to the service guidelines, received information through the educational video.

Results: Sample composed mostly of women who are married or in a stable union (83%), did not work (86.6%), income of up to R\$1100.00 (67%), lived in the countryside (80%), p value 0.017. After the intervention, post-test detected a significant difference between the values of the groups, p = 0.013, where the intervention group had higher scores of correct answers with an average of 9.67 of the 10 questions. Regarding the KHQ, in the Emotions domain, the IG participants declared level 3, meaning emotional state moderately affected by the child's problem, with a standard deviation of 0.93. **Conclusions:** Intervention with an educational video is effective and contributes to family guidance, in addition to facilitating the understanding, visualization and execution of the procedure by parents/caregivers of children with this disorder.

DOI: 10.18332/popmed/165282

Postgraduate Education in Health: A Case Report from Cabo Verde

Isabel Araujo¹, António Delgado², Deisa Semedo³, Celeste Fortes⁴, Francisca Monteiro⁴, Elen Castanheira⁵, Paulo Ferrinho⁶

¹Faculty of Science and Technology, Universidade de Cabo Verde, Cape Verde, ²Faculty of Science and Technology, Universidade de Cabo Verde, Ilha de Santiago, Cape Verde, ³Faculty of Science and Technology, Universidade de Cabo Verde, Palmarejo, Cape Verde, ⁴Faculty of Social Sciences, Humanities and Arts, Universidade de Cabo Verde, Cape Verde, ⁵Faculty of Medicine, Universidade Estadual Paulista Júlio de Mesquita, Botucatu, Brazil, ⁶Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Lisboa, Portugal

Background and Objective: Cabo Verde is a small island country in West Africa, composed of 10 islands, 9 of which are inhabited and with about 500 thousand residents. The first Public University was established in 2006, based on the pillars of training, research, and extension, to provide qualified professionals and knowledge that support good health practices and promote the health of the population. In 2009 the first post-graduate course in health was implemented - Master of Public Health aligned with the objectives of the United Nations, with the National Strategic Plan for Human Resources in Health, to expand scientific research and provide the country with a Public University with quality, qualified and internationally recognized masters and doctors. The partnership with universities from Brazil and Portugal has contributed to this process.

Methods: Case report based on the experience of the teachers involved, annual academic reports and consultation of other relevant documents.

Results: From 2010 to the present date, the Uni-CV has started 3 class of masters courses in Public Health, with a total of 84 entrants. Of these 21 (25%) have completed the course, 25 (30%) are in dissertation preparation phase, 18 (21%) are in the 1st academic year, and 20 (24%) have abandoned the program. The dissertations defended and those in preparation address different areas of knowledge, aligned with the National Agenda for Health Research 2020-2024. Of the 21 students who completed the masters degree approximately 45% are full-time or part-time faculty at Uni-CV and 52% work in the ministry of health.

Conclusions: The local training of a contingent of masters in Public Health, contributed to research in population health, public policies, and health services evaluation, made scientific studies available to the country, and supported the creation of research groups, as well as the qualification of professionals, lecturers, and researchers.

DOI: 10.18332/popmed/165304

The use of multidimensional scales for the evaluation of computing students' digital health literacy

Kalinka Kaloyanova¹, Elitsa Kaloyanova², Nikoleta Leventi³

¹Faculty of Mathematics and Informatics, Sofia University, Bulgaria, ²365 Company LTD, ³Medical University, Sofia, Bulgaria

Background: The importance of digital health literacy (DHL) for people to better manage their health and well-being is undeniable and last confirmed during the

COVID-19 pandemic. The study aims to analyze the relations between the health literacy (HL) scales and the levels of digital competencies. Both are required for competent DHL.

Methods: A web-based questionnaire based on the COVID-19 HL Survey was distributed among students at the Faculty of Mathematics and Informatics (FMI) at Sofia University St. Kliment Ohridski, with the approval of its ethics committee. Data was evaluated using cross-referencing of a digital competence framework - DigComp 2.2 and a health literacy framework - Health Literacy Questionnaire (HLQ). Qualitative and quantitative analyses were provided.

Results: The answers of 221 students (13 % of 1690 asked) were received. All participated voluntarily and anonymously. Searching and filtering information are reported as the easiest tasks: easy (40 % and 31%) and very easy (52 % and 39%). Evaluation of information, based on criteria of how much information is verified, up to date, and coming from official sources is posed as very important (79%, 78%, and 69%). These results correspond to the Advanced proficiency levels of "Browsing, searching and filtering data, information and digital content", and "Evaluating data, information and digital content" DigCOMP 2.2 competence areas and upper level of HLQ areas "Ability to find good health information" and "Appraisal of health information".

Conclusions: DHL is a cross-disciplinary effort. Its evaluation requires using advanced multidimensional tools. A combination of DigCOMP 2.2 and HLQ was applied for the evaluation of computing students' DHL. The study reveals the presence of high levels of digital skills is essential for the acquisition and use of valuable health information, which is a prerequisite for well-being. Fostering digital skills should be an integral part of complex HL education.

DOI: 10.18332/popmed/165367

Factors associated with knowledge for the prescription of exercise in patients with cardiovascular risk in health personnel at the first level of care

Luis Luis¹, Sol Sanchez², Carlos Texson¹, Iant Reyes¹, Carolina Pérez¹, Josue Villegas-Dominguez¹

¹Universidad Veracruzana, Mexico, ²Mexico

Background: Chronic diseases are considered a public health problem, especially those that facilitate cardiovascular diseases such as overweight, high blood pressure and alterations in glucose and lipid metabolism. Physical exercise is essential for the prevention of complications and the reduction of care costs for health institutions. Objective: To analyze the factors that are associated with the degree of knowledge of first level care personnel about the prescription of physical exercise in patients with cardiovascular risk. Methods: An observational, cross-sectional and prospective study was carried out applying the "Knowledge about Prescription of Physical Exercise" test, validated in Spanish by Ortín et al., which has a maximum of 100 points in each item and a global score, obtained from averaging the evaluation of knowledge about exercise, its prescription in general, prescription in dyslipidemia, diabetes mellitus and arterial hypertension. Primary care doctors and nurses from Veracruz, Mexico were included. The variables age, sex, profession, perception of their knowledge, number of patients to whom they indicate exercise, training on the subject and institution where they work were studied.

Results: 170 participants were included, 67. % doctors, 92.9% indicate exercise to their patients and 22.9% do not have specific training to do so. The global knowledge score of the participants was 43.9(±14.1). Being a doctor showed a difference (p<0.05) compared to nursing in the level of knowledge for the prescription of exercise in patients with hypertension (42.11±22.6 vs 34.3±19.9), diabetes (75.4±24.3 vs 58.9±29.1) and in global knowledge (46.2±13.9 vs 39.5±13.7), the rest of the factors did not show statistically significant values (p>0.05). Conclusions: The level of knowledge of the first level care personnel is below half of the score, except for diabetes, for which training is required for the prescription of exercise, since these personnel are a fundamental part of the prevention process. of cardiovascular diseases.

DECLIC patient education program: assessment through a population health intervention research approach (LE DECLIC EPRI)

Evelyne Renault-Tessier^{1,2}, Aurelie Bourmaud³, Edith Nebenzahl⁴

¹Patient Education Unit, Team Share Institut Curie, Paris, France, ²Université PSL (Paris Sciences & Lettres), University Paris, France, ³Clinical Epidemiology Unit, A. University Hospital Robert-Debré, Université de Paris, Paris, France, ⁴Patient Education Unit Institut Curie, Paris, France

Background and Objective: The effect of patient education on pain has been shown to be comparable to that of certain analgesics. LE DECLIC EPRI intervention, developed according to the Behavior change wheel theory of S. Michie, aims to respond to avenues for improvement in order to increase the effectiveness and scope of these interventions with the painful population followed in cancer centers.

Methods: This is a randomized stepped wedge trial carried out in the five participating hospitals for three and a half years. Two randomized groups are compared for all outcomes: an experimental group with centers providing the LE DECLIC EPRI intervention versus a control group providing usual care. The transition from the control group to the experimental group will take place every 6 months, in order to implement the intervention gradually in the centers. 270 patients are expected, 54 per center. The achievement of the multiple objectives of this study is assessed with the corresponding analytical methods, and a mixed qualitative-quantitative method will be used.

Results: The expected results will relate to the understanding in vivo and over time of the necessary transformations, in particular through the analysis of the follow-up notebooks collating the events and experiences, filled out by each team: training in patient education, local influencer module, general practitioner module and the teams of educators in each center.

Conclusions: Concomitantly constructing interventional research makes it possible to implement care while analyzing it. The corrective measures that leave room for all the creativity of the care teams combined with the patient experience are thus captured. A toolbox and recommendations for the optimal transfer and implementation of the intervention can be produced.

DOI: 10.18332/popmed/165532

Barriers to breast self-examination among Tunisian women

Imen Bannour¹, Rania Bannour¹, Badra Bannour¹

¹Farhat Hached Sousse, Tunisia

Introduction: Breast cancer remains the most frequent female cancer in Tunisia. The prevalence rate of breast cancer has shown a peak in recent years and represents 20-25% of malignant tumors in women with an incidence in 2017 estimated at 50.17/100000 cases with a female mortality significantly high with 14.04 deaths per 100000 women per year. Breast cancer can be diagnosable at early stage using inexpensive, accessible, and easy screening programs. Usually culture, beliefs, and opinions of women affect adoption of screening techniques. Objective: This study aims to investigate barriers to breast self-examination (BSE) among Tunisian women.

Materials and Methods: A cross-sectional descriptive study was performed among women consulting the Reproductive Health Center of Sousse spread over a period of 2 months (February, March 2018). Data was collected using self-administered questionnaires.

Results: The mean age of the participants was 34 years with extremes ranging from 18 to 64 years. 47% of surveyed women have already performed BSE at least once during the last year. The main barriers found were lack of awareness about the importance of breast examination (p = 0.03), lack of knowledge about BSE techniques (p < 0.001), and lack of training by personnel of healthcare centers (p = 0.016). The score of the practice of women surveyed was average; mostly, women have intermediate results for the technique of self-examination breast. No woman had a score of 15/15. Conclusions: A better education of the practice of self-examination is essential in order to improve the screening program for breast cancer. The role of the gynecologist, general practitioner or midwife is therefore essential in education and training.

Keywords: breast self-examination, Tunisia, barriers

Professional training in health was marked by numerous inducing initiatives aimed at the process of reorienting training and qualifying health professionals with a view to meeting the principles of the SUS and promoting solutions to the population's health problems. The professional master's degree (MP) has become a field of worker specialization and the production of fundamental knowledge for health services and systems, emphasizing the Professional Master's Degree in the

National Network in Family Health (PROFSAÚDE), one of the programs created in the last decade for professional qualification for the Health Unic System. Studying the modality and bringing evidence that uniquely configures the MP in the training proposals contribute to the programs fulfilling the purpose for which the model was called to exercise: professional qualification. This work aimed to analyze the norms and guidelines that regulate the professional master's degree identifying the requirements that give identity to this modality; contextualize the background to the creation of PROFSAÚDE and present its organizational and academic management characteristics; analyze PROFSAÚDE from the perspective of the identity requirements of the MP. It was a descriptive-exploratory study with a qualitative-quantitative approach, developed in two phases: the first focused on PM, as a stricto sensu modality, and the second phase with a specific focus on PROFSAÚDE. In this study, unique characteristics were identified in this type of course, requirements such as a curricular structure consistent with the purpose of the course, pertinent methodological strategies applied to the professional field, faculty with a profile for the professional area, and final products oriented to solving problems were identified as essential for MP proposals. It is evident in the findings that articulating teaching and application in the field of professional activity is a motto for MP. The study brought evidence that makes PROFSAÚDE a proposal that supports the MPs identity.

Integrating health sector reform strategies in developing the national training manual for community health volunteers in the Philippines

Alberto Ong¹, Eunice Mallari¹, Jervey Vergara¹

¹Culion Foundation, Mother Ignacia Avenue, Paligsahan, Quezon City, Metro Manila, Philippines

Community health volunteers (CHVs) in the Philippines, known as barangay health workers (BHWs), are important part of health system in ensuring that the health programs and services are accessible to all Filipinos. Therefore, it is important to ensure that their knowledge and skills are not only updated but also aligned with the Philippine national health sector reform strategies. This project, supported by World Health Organization Philippines, aimed to update the 2014 BHW Reference Manual, integrating different training initiatives and policies concerning them. Consultations were done with different bureau directors of the health ministry to solicit guidance on the policies that must be considered in the development of the training manual. Recent manual of procedures of different health programs and policy issuances were reviewed to identify tasks expected from BHWs. Key informant interviews, including BHWs in select urban and rural areas, were interviewed to determine the actual tasks expected from BHWs. Training manuals from different reputable institutions were also gathered and reviewed. An initial draft was developed, and disseminated to different health ministry program managers for comments. The second draft, translated into local language, with accompanying facilitators guide was pilot tested by 20 BHWs in two urban and two rural areas for 10 days.

The national policies on BHW roles (as indicated in a legislation), competency training standard, national reorientation on health promotion, and integration of health services were incorporated in the BHW training manual. The amount of content per topic was determined by the prescribed number of hours of training in the BHW competency training standard. Compared to the 2014 version, the new manual was well received by pilot trainees because of the use of conversational national language. The manual and the facilitators guide was released by the health ministry on October 2022 for public use.

Group work in a health promotion subject: the role of compassion for oneself, toward others, and from others

Lisa Buckley¹, Withanage Perera¹

¹The University of Queensland, School of Public Health, Australia

Background and Objective: It is argued that health promotion knowledge is developed through active participation. A key component of group work is to promote such active and engaged thinking through shared problem-solving. Our research objective was to understand students' experiences of group work in an undergraduate health promotion subject, particularly how they were related to experience of a multi-dimensional conceptualisation of compassion.

Method: Two cohorts of a health promotion subject within an Australian Bachelor of Health Sciences program were surveyed (online, N=42); from Semester 1, 2020 and 2021. Measures included feelings towards group work (preference for group work, individual work, and discomfort with group work) as well as compassion

(towards oneself, others, and from others) reflecting both motivation to engage with the distress and to take action and to cope with the distress.

Results: Positive feelings towards group work was associated with perceiving greater compassion from others as well as primary language, English. A preference for individual work was associated with avoiding classes with group work (though discomfort with group work was not). Discomfort was associated with a desire to stay quiet in groups, though preference for either group or individual work was not associated with staying quiet. Positive feelings toward group work was associated with more self-compassion but not to provide compassion or to receive compassion.

Conclusion: While complicated by pivoting from online to face-to-face through the semesters (due to COVID-19 lockdowns) and a small sample, we find that it is compassion for oneself, and the motivation to sit with one's own difficult feelings, that are associated with positive perceptions of group work in a health promotion subject. Suggesting that student services and support may play a key role in engagement with tasks that encourage shared problem-solving and which might help develop skills ultimately needed in multi-disciplinary practice.

A literature review of recovery from different disasters for developing future trainings

Vesna Karadzic¹, Dragana Jovanovic¹, Milena Vasic¹, Biljana Kilibarda¹, Miljan Ljubicic¹, Verica Jovanovic¹, Svetlana Vrga¹

¹Institute of Public Health of Serbia, Dr Subotica 5, Serbia

Background and Objective: In the scope of the Joint Action on Strengthened International Health Regulations and Preparedness in the EU (SHARP JA), WP8 is focusing on trainings, local exercises and exchange of working practices. Training needs assessment pointed out that recovery management is one of the topics of great interest for training and practice exchange. The aim of this study is to explore existing practices in recovery management to set up the scope of recovery management training (RMT).

Methods: Methodology used to fulfil the aims of this study was a literature review of scientific articles published in leading international journals in past 20 years. Key words in searching of scientific literature were: recovery, disaster, disaster management, community. In this review, two aspects were considered: recovery process after different type of disasters and areas of recovery.

Results: According to the type of disaster, the majority of research articles dealt with the recovery process after earthquakes (45,79%), floods (14,95%), hurricanes (14,02%), and tsunamis (14,95%), while the most prevalent areas of recovery were: households (46,15%), business (21,15%) and critical infrastructures (including energy, transport, WASH) (13,46%). Additionally, reviewed articles also considered and pointed to the potential barriers in the recovery process, as well as challenges and outcomes.

Conclusion: Recovery is not extensively explored in scientific literature and currently is mostly focused on narrow areas. Lessons learned on challenges and barriers from previous recovery processes should be addressed in future trainings. In building capacities in recovery management, it is of great importance to apply holistic approach.

Importance of motor development in the training of young athletes

Marta Wilhelm¹, Marta Wilhelm¹, Ágnes Nagy²

¹University of Pécs Institute of Sport Sciences and Physical Education, University of Pécs, Faculty of Sciences, Pécs Ifjúság u. 6.7624 Pécs, Hungary, ²University of Pécs

Methods: 120 Hungarian athletes under the age of 12 took part in this research. We have developed our own test system to measure motor development level, including 6 track tests, 3 fundamental movement tests, 5 functional movement tests, 4 movement maturity tests.

Results: Assessed athletes have a significant degree of motor development deficiencies affecting their performance measured with field tests. Functional movement patterns show a significant correlation with field tests ($r=0.324$). Athletes who had better indicators in movement maturity tests, performed significantly better in field tests ($p=0.020$).

Conclusions: Results support our theory that a special movement development program is necessary to incorporate into already existing young athlete trainings. Coaches need to possess knowledge of age-specific training, to be able recognizing movement literacy deficits. If those deficiencies are not recognised in time, we risk to significantly impair the effectiveness of movement learning and motor control, thus also risking the development of sport talents. Ágnes Virág Nagy is a recipient

of the PhD Student Scholarship of the Cooperative Doctoral Program supported by the National Research, Development and Innovation Fund.

Popul. Med. 2023;5(Supplement):A730
DOI: 10.18332/popmed/164050

Incorporating the Sustainable development goals into the undergraduate medical curriculum

Sinead Hurley¹, Freya Molloy¹, Maisoon Mairghani¹, David Sklar², Debbi Stanistreet¹

¹Royal College of Surgeons in Ireland Ireland, ²Arizona state university United States

Methods: Semi structured interviews were carried out with key stakeholders at RCSI to investigate their perspectives on approaches to incorporating SDGs into the medical curriculum. A sample of 11-15 participants with diverse backgrounds across a broad range of specialities were selected, using purposive sampling. Transcripts were coded and thematically analysed by adapting Brawn and Clarke thematic analysis.

Results: Five main themes emerged from the analysis on stakeholder perspectives: 1. Faculty Awareness, 2. Challenges of curriculum change, 3. Recognition of sustainability as a fundamental health issue, 4. Opportunities and challenges of a multicultural University and 5. Leadership needs. Both barriers and facilitators to integrating SDGs into the curriculum were explored such as an overloaded curriculum and competing agendas. Recommendations from the study were to incorporate SDG content into the RCSI medical graduate profile, into case based learning (CBL) using a standardised socio-ecological framework, provide staff with educational resources and include SDGs in future research, publications and outputs. These results will help shape the medical curriculum to incorporate sustainability concepts which is fundamental for the future of healthcare and medical education.

Health Literacy with the project "Pathways to Longevity" at the Social Service of Commerce - Rio de Janeiro, SESC RIO DE JANEIRO

Denise Anjos¹, Suzana dos Santos², Denise Anjos¹

¹Sesc RJ Brazil, ²Sesc Rio Brazil

Background and Objectives: The Social Service of Commerce (Sesc) is an institution founded in 1946, which started with health activities only, but over the years it has expanded to many areas such as culture, sports, among others. In the 1970s, the first instrument was developed to systematize health education activities, the "Policy of Education for Health at SESC". Later, in the 2000s, the Activity Model of "Health Education" was created, a guiding document for educational practices and Health Literacy (HL) at Sesc. HL deals with the ability to access, recognize, process and understand information about health, considering that HL permeates formal instruction and people may not be able to understand health information. **Methods:** The "Pathways to Longevity" project emerged from the need to meet the demands of the population that is assisted by SESC Rio. Such activities seek to reflect on aging, and over the years with HL practices, we have seen that walking towards longevity must start in childhood. In November 2022, SESC promoted the launch of "Monica's Gang comic book", with a large publisher to bring the children's audience closer to HL. The comic book was developed as a methodological instrument in health actions.

Results: The cartoon was distributed and discussed with 3500 children participating in the activities, through the health themes contained in the comic book. The children's good receptivity and understanding of the presented content showed how effective this method is for HL activities with this audience.

Conclusion: HL is a new subject in Brazil, and these discussions, actions and studies need to be expanded. With the project and use of the comic book, we realized that we need to improve the HL instruments, so that the relationship between the understanding and the applicability of the HL can be observed.

Bringing comprehensive sexuality education into Italian lower secondary schools' practice: A pilot study

Eleonora Torri¹, Rosario Galipò², Domenico Martinelli¹, Alice Chinelli¹, Paolo Meli³, Antonella Camposeragna⁴, Laura Rancilio⁵, Massimo Farinella⁶, Ludovica Colaprico⁷, Sabrina Bellini⁸, Maria Salfa⁹, Marco Ubbiali¹, Barbara Suligoi⁹, Anna Palamara¹⁰, Lara Tavoschi¹

¹Università di Pisa Italy, ²ANLAIDS, ³CICA, ⁴CNCA Italy, ⁵Caritas Ambrosiana Italy, ⁶Mario Mieli Italy, ⁷Croce Rossa Italiana Italy, ⁸LILA Italy, ⁹Istituto

Superiore di Sanità Italy, ¹⁰Istituto Superiore di Sanità; University di Roma La Sapienza Italy

Background: Theoretical and research evidence indicates that comprehensive sexuality education (cse) positively impacts on behaviour and attitudes of young people, by improving sexual and reproductive health outcomes and empowering them to make free and informed choices. This study aims to describe the creation and development of a pilot cse activity in lower secondary schools (lss) within the context of eduforist project. Eduforist is funded by the Italian Ministry of Health and involves academics, the Italian National Institute of Health and HIV/AIDS civil-society organisations (csos).

Methods: Evidence was collected through a desk review on regional and national normative documents, international literature and guidelines regarding sexually transmitted infections (stis), relationships and sexuality education (se). An online survey was developed to collect information on duration, content and methods used to implement school-based se (sbse) in Italian secondary schools from 2016 to 2020. The results of the survey and desk review, along with focus groups and open discussions involving all partners were used to define objectives, contents, methods of delivery and evaluation of the pilot activity. Additional information was added after feedback from an expert advisory board.

Results: A pilot activity was designed targeting lss students, in 4 different geographical regions, for a total of 11 schools involved. The activity consisted of 5 interactive interventions per class: 4 theoretical and practical modules (each consisting of a syllabus, a theoretical slides deck and a list of activating tools) and 1 intervention focusing on evaluation and deepening topics requested by the students. The evaluation has been carried out on educators' (swot analysis, diary of the field) and students' level (pre/post-tests and satisfaction questionnaires). **Conclusions:** This pilot activity represents a first step towards the implementation of an evidence-based and integrated approach to sbse, to be promoted and implemented equally across the country.

Comparison of conventional cardiopulmonary resuscitation (cpr) training course versus video-based simulation on nursing students of Dow University of Health Sciences

Dr. Abbasi¹, Muhammad Hydrie²

¹Dow University of Health Sciences SUPARCO Road Gulzar-e-Hijri oja campus Pakistan, ²Dow University of Health Sciences

Background and Objectives: Conclusion:

Methods: This prospective experimental study recruited 60 nursing undergraduate students and were randomly divided into two groups 30 each; one group received CPR training only and other group received both CPR video and training.

Pretest: Students were given CPR knowledge questionnaire before the training session which comprises of 20 knowledge based questions.

Training: Instructor demonstrated all the necessary steps needed to perform effective CPR on a mannequin, use of airway adjuncts and step of AED. In second group video component was added, they were shown a CPR training video.

Post-test: After the session post-test were taken from all the students.

Post-training skill evaluation: All students performed hands-on performance one by one on mannequins.

Results: Knowledge scores in post-test were higher than in pretest. Our findings showed no difference in knowledge scores found between two groups in pretest and post-test [p-value 0.410, p-value 0.705] respectively. Analysis of skills were done by chi-square and findings showed no significant difference in steps; scene safety, check response, call for help, initiation of CPR, breathing, open the airway, steps of AED, post resuscitation care and disposition of pt in both groups [p-value >0.05].

Funding: The findings of this study showed that both CPR training methods were effective in improving knowledge. However, more researches are needed to be done to assess the effectiveness of video training only.

Permanent education as a strategy to strengthen multidisciplinary teams to work in indigenous health in Brazil

Patrícia Silva¹, Rosana Antunes², Janete Lago¹, Whitney Oliveira¹, Emmanuel Junior², Alenka Bermudez¹, Sabrina Soares¹, Midya Targino¹, Virgília Gomes¹

¹Ministry of Health in Brazil Brazil, ²Ministry of Health in Brazil

The National Policy for Permanent Education in Health was established as a strategy of the Unified Health System for the training and development of workers. Permanent Education in Health constitutes a fundamental strategy for the transformation of work so that it becomes a place of critical, reflective,

propositional and technically competent action. In the field of indigenous health, the Special Secretariat for Indigenous Health (SESAI), created in 2010, is responsible for managing the Indigenous Health Care Subsystem (SASISUS). The Subsystem is made up of 34 Special Indigenous Health Districts (DSEI), which are units inserted in indigenous lands, enabling the organization of health care services. The Multidisciplinary Teams of Indigenous Health (EMSI), are responsible for operating in these territories and for organizing services in the DSEI and the Permanent Education activities of health professionals who work in indigenous territories, are based on the National Policy for Permanent Education in Health and by the guidelines of the National Policy for Health Care for Indigenous Peoples (PNASPI), training professionals to align their actions and offer health care services in accordance with the reality of indigenous peoples, as well as preparing them to act in context intercultural. Data from spreadsheets sent by the 34 DSEI in the year 2021 were used and according to the goals defined in the District Plan for Indigenous Health for the period 2020-2023, it was verified the reach of 76.4% and 22.5% referring to the number of qualified workers in the improvement of health work and for acting in an intercultural context, respectively. In view of this, the results achieved demonstrate that Permanent Education actions with the aim of incorporating interculturality in the health actions of professionals working in the DSEI are of great relevance for the improvement of these professionals, contributing to the improvement of health care.

Role of professional training institutes in building Health Workforce Capacity: example of IAPH

Abdullatif Hussein¹, Faris Lami²

¹International Academy of Public Health (IAPH), Amman, Jordan,

²International Academy of Public Health (IAPH), Jordan

The public health systems success depends critically on the availability of a competent workforce. As a Results, building the capacity of a public health workforce is critical to strengthening national health systems ability to address current and future population health challenges. Continuous Professional Development (CPD) for the public health workforce is essential to ensure best practices in a discipline that involves multi-professional, multi-disciplinary, and multi-organizational activities. Particularly in the wake of the COVID-19 pandemic, the significance of practice-based public health has been emphasized. So, to effectively promote, protect, and improve the population's health, public health professionals need to have a broad range of knowledge and skills. A long-standing observation has been that the public health workforce is in jeopardy, and the health workforce generally lacks adequate public health competence. In the Eastern Mediterranean Region (EMR), most countries already face an overall shortage of healthcare workers, with weak competencies, geographical maldistribution, and a lack of specialized health workers. As a specialized public health educational institution in the region, The International Academy of Public Health (IAPH) Aims at responding to current and anticipated public health training needs and forging effective partnerships and synergies to scale up public health education and capacity for more robust health systems and better population health. IAPH offers accredited training programs in various public health disciplines in different modalities, face-to-face, blended and online. In this workshop, IAPH, in collaboration with its partners, will demonstrate a model capable of sustaining capacity building and responding to public health needs during times of turmoil. Workshop Objectives: This workshop Aims to highlight the importance of capacity building for the public health workforce and how professional training institutes respond to the need of the public health workforce. The specific Objectives of the workshop are to: 1.Highlight the importance of CPD for the public health workforce, 2.Present IAPH as a model for providing multidisciplinary professional training, 3. Explain the IAPH model of online training. Key questions: 1. How to maximize the value of CPD for the health workforce? 2. How can regional training institutes contribute to filling the gap in the quantity and quality of competent professionals? 3.How does IAPH contribute to building health workforce capacity in the EMR?Workshop Topics: 1. CPD concepts and approaches, 2. IAPH training model, 3. LMS demonstration

Methods: The workshop will be started with a presentation that covers the three topics and meets the set Objectives. The facilitator will engage attendees to actively participate in the Discussion through questions and answers, sharing experiences, and providing comments and suggestions on the presented topics. A considerable time will be allocated for the wrap-up and Conclusions: Workshop evaluation: At the end of the workshop, an evaluation form will be filled out by the participants to assess the participants' satisfaction.

DOI: 10.18332/popmed/164879

Sharing good practice from global accreditation in public health education

Friday Okonofua¹, Nick Viggiani^{2,3}, Haitham Bashier⁴, Colleen Fisher^{5,1,6}

¹Agency for Public Health Education Accreditation (APHEA), Nigeria,

²University of the West of England, Bristol, United Kingdom, ³Agency for Public Health Education Accreditation (APHEA), United Kingdom, ⁴Agency for Public Health Education Accreditation (APHEA), Jordan, ⁵School of Population and Global Health, The University of Western Australia, Perth, Australia, ⁶Department of Public Health and Preventive Medicine, Second Faculty of Medicine, Charles University, Prague, Czech Republic

In 2012 The World Health Organization (WHO) estimated a shortfall of 7.2 million professional health workers (1) and in 2022 this prediction was revised upwards to a 10 million deficit by the year 2030 (2). There is universal agreement that low and lower-middle income countries will bear the brunt of these shortfalls, referred to as an 'inverse care law where areas in most need are least served. Previously in 2006, the World Health Organization had argued that "shortfalls will require building new institutions - for example, more schools of public health are needed" (3). More recently in 2022 the strategy focussed on building the "capacity of vocational and educational institutions, including related to faculty, competency-based curriculum, clinical learning opportunities, infrastructure and technology for learning, accreditation, and regulatory mechanisms to enable increased student intake and improve and maintain the quality of education." Furthermore, these activities should be strengthened through harnessing global partnerships, financing, and technology (4). Aims and Objectives: The aim of this workshop is to transfer knowledge of some of the latest innovative practices in public health education and training identified through accreditations in four WHO regions. The objective is to increase audience knowledge and understanding of pioneering practices in public health, continuous professional development (CPD) training, curricula, programmes and schools. The longer term objective is to encourage use of online resources where examples of good practice can be shared and discussed. The format will allow for brief presentations of activities followed by discussion: 1.Integrating community outreach – Nigeria, 2. Engaging students in quality improvement - United Kingdom, 3. COVID-19 response: online workforce training – Jordan, 4. Innovating student research routes – Australia. Key question: How can accreditation and regulatory mechanisms help build and strengthen capacity of vocational and educational institutions to improve and maintain the quality of education through global partnerships and technology? Preparing the public health workforce though credentials, certificates and certifications

Allison Foster¹, Laura King², Kaye Bender¹

¹National Board of Public Health Examiners, Washington, United States,

²Council on Education for Public Health, Silver Spring, United States

This workshop will focus on the differences and relative benefits of degrees (credentials), certificate programs and certification programs from a perspective when resources such as time and money are limited. Degrees are a time-intensive course of study designed to provide students with a balanced education and the skills necessary to pursue a specific career field. Certificates provide a relatively simple way to ensure regional workforce have learned a very specific set of skills or area of knowledge at a specific point of time. Because certificates are commonly offered online, they are a convenient short-term option for continuing education. Certifications provide employers with a reliable way to identify qualified staff who have demonstrated their knowledge in their field, their commitment, and a willingness to stay current through recertification. Certified individuals have positive incentives to life-long learning as well as marketable evidence of their competency. Certifications also provide assurance that certified employees are competent across various domains, not only in their area of specialty. The COVID-19

pandemic has highlighted the need for assurance of workforce competency and also for the ability of the workforce to learn new skills quickly. The panel will discuss the difference between certifications, degrees and certificate programs. It will explain how certification programs are developed and how employers and governments can use certifications in workforce development. The workshop will also include individuals with degrees and certifications to provide firsthand accounts of their experience. Participants will actively participate by sharing their thoughts on the advantages and barriers of degree programs, certificates and certifications in their region. They will then compare benefits of each with the needs in their country/region and will work with session leaders to develop a recommendation by the end of the session. Learning outcomes by the end of the workshop, participants will be able to: 1. Distinguish between certificates, degrees and certifications, 2. Explain how certifications ensure the workforce has the skills knowledge and abilities needed to perform in their field, 3. Understand how each option can increase employee recruitment and retention and strengthen the public health workforce

Popul. Med. 2023;5(Supplement):A738

DOI: 10.18332/popmed/165573

Closing the gap: the distribution of postgraduate medical specialty training posts to narrow health inequalities

Kate Atkinson¹, Ginny Bowbrick¹, Jack Haywood¹, Adrian Brooke¹, Aidan Fowler¹

¹NHS England United Kingdom

Outline: In England, postgraduate specialty training posts have often been distributed based on historical arrangements, meaning posts are not always best aligned with patient needs. This has resulted in an imbalance in specialty training posts. In addition, we know that around 80% of specialty trainees completing their training settle within 50 miles of where they trained, meaning there is a resultant shortage of specialist senior clinicians across the country. This imbalance of specialists contributes to health and healthcare inequalities.

In 2018, Health Education England (HEE) and NHS England (NHSE) collaboratively commenced a programme to work towards an equitable distribution of specialty training places across the country. This will result in a fairly distributed medical workforce for the future which will in turn take a step towards addressing health inequalities. The programme will both redistribute current posts as well as allocate any new posts to underserved areas.

The redistribution is based on both HEE and NHSE workforce, current and projected healthcare demand, and regional deprivation modelling. However, "receiving" regions must also be able to accommodate these additional trainees, such as providing adequate supervision.

The programme was implemented in August 2022 in three specialties – cardiology, haematology, and obstetrics and gynaecology. There is a plan to redistribute most of the remaining specialties starting in the next 7 years in 3 phases.

The workshop's purpose is to specifically discuss the programme as a form of healthcare public health policy and its resultant impact on reducing health and healthcare inequalities.

Aims/Objectives: The aim of this workshop will be to collaborate regarding the Distribution of Postgraduate Medical Specialty Training programme, with a focus on reducing health inequalities.

The objectives to meet this aim are:

To describe the drivers and background of the programme, including the evidence base informing the programme, To describe the modelling methodology of deciding how to redistribute specialty posts, which focus on the relationship of workforce, current, projected, and changing patterns in healthcare demand, and regional deprivation, To discuss with international partners if there are similar initiatives in different parts of the world, learning from best practice and lessons learnt, particularly in attracting and retaining the workforce in hard to recruit areas such as remote, rural and coastal locations. To discuss the intended impact on reducing healthcare inequalities in the context of other factors also contributing to unequal health, and To develop key parameters to measure the success of the intended outcome of reducing health inequalities.

DOI: 10.18332/popmed/163686

Advancing and building infodemic management training for public health: introducing the Society for Infodemic Management (SIM)

Dilek Aslan¹, Lucie Bucci², Craig Thompson², Neville Calleja³, Craig Thompson⁴, Lucie Bucci⁴

¹Hacettepe University, Department of Public Health, 06100 Sıhhiye, Ankara, Turkey, ²Society for Infodemic Management, France, ³Ministry for Health, Department for Policy in Health - Health Information and Research,

DHIR, 95, Telghet Gwardamanga, PIETA', Malta, ⁴Society for Infodemic Management, Les Calimottes, 44 Rue de la Capelette, 62231 Coquelles, France

Brief Outline of the Overall Workshop

The reverberations of the pandemic, magnified by the accompanied infodemic, was and remains multifaceted for both the public, and public health staff. We have learned from this crisis, the fragility and the vulnerability the public are to misinformation, affecting health outcomes, and confidence and trust with public health programs. In addition, all health care staff struggle(d) with extreme stress, fatigue, and burnout.

In September 2022, the World Health Organization (WHO) responded by publishing a policy brief calling for more training opportunities in the management of health infodemics. Unfortunately, and to date, public health workers have not benefited widely. While Governments and public health agencies wrestle and are continually challenged with the onslaught of the information, ever changing, from a multitude of trusted and untrusted sources facilitated by global interconnectivity and digitization, societally we are becoming more divided and suspicious of once trusted organisations and sources of information. It has become imperative to act with a new allied organisation with an objective to facilitate Infodemic training for professionals. With additional organisation of these trained professionals we can then rebuild/strengthen trust in public health interventions. The Society for Infodemic Management is poised to develop and lead opportunities to train and organise public health professionals.

Specific AIMS/Objectives and Component Parts

Education and training modules are an efficient strategy for building capacity and maintaining competencies in the public health workforce and have shown effective by the WHO at delivering infodemic management curricula to a wide audience. Despite their effectiveness, the integration of infodemic management education and training programs into public health systems has not occurred in a systematic and pedagogical method. Teaching how to use infodemic management to the public health workers is an opportunity to overcome public health issues at the global level. The objectives of this workshop are to: 1) describe the importance of infodemic management education and training for public health staff; 2) review professional competencies and public health policies required for broad acceptance of infodemic management certification; and 3) discuss the activities of the Society for Infodemic Management (SIM), an international non-governmental organization, in facilitating the integration of infodemic management education, training into public health practice.

School-based comprehensive sexual health education - from evidence to implementation and evaluation: case study from Italy

Alice Chinelli¹, Lara Tavoschi², Johanna Marquardt³, Domenico Martinelli⁴, Marco Ubbiali⁵, Alice Chinelli¹, Lara Tavoschi¹

¹University of Pisa Italy, ²University of Pisa, Italy, ³Bundeszentrale für Gesundheitliche Aufklärung (BZgA), Germany, ⁴University of Foggia Italy, ⁵University of Verona Italy

Brief outline of the overall workshop

Sexual and reproductive health (SRH) is a key dimension of health and well-being of individuals, especially relevant for young people. Global health organisations (e.g. WHO, UNESCO, E/CDC) and multicountry reviews recognise school-based sexuality education (SBSE), as one of the most important means of promoting sexual well-being of adolescents and a key component of HIV and sexually transmitted infections (STIs) prevention. International evidence recommends that SBSE should be addressed with a global approach to sexuality, that UNESCO defines as comprehensive sexuality education (CSE). SBSE, however, is still not available for many young people around the world, including Italian adolescents. Italy, in fact, is one of a few European countries that still lacks a comprehensive approach to SBSE coherently and equally implemented across the country, or included in schools' curricula. EduForIST project, funded by the Italian Ministry of Health in 2019, aims at providing an overview of SBSE in Italy and to develop and implement two pilot projects in secondary schools across the country.

Specific aims/objectives and component parts

Introduction: Sexuality and education: how to address this dimension in schools? Sexuality education represents an educative action that, nurtured by medical and scientific information, is aimed at making people flourishing in all the directions of their existence.

* School-based sexuality education in Europe and central asia: 2016 IPPF and BZgA initiated a scope review to get an overview of the progress made in developing and integrating SBSE into formal school settings in 26 countries of the WHO European Region. The main key findings and recommendations as well as a

global overview will be addressed.

* Co-creation of sbse interventions in lower and upper secondary schools in Italy: EduForIST is a multidisciplinary and intersectoral project that aims at providing theoretical and practical tools for SBSE to be implemented in Italian schools.

* Implementing comprehensive sbse interventions in Italy-experiences from the field: report on the results and evaluation of EduForIST pilot projects in secondary schools.

* How to evaluate a sbse intervention: experience from an Italian pilot project: starting from an epistemological reflection on the concept of evaluation in education, we proposed a framework that enable sexual educators in evaluating the implementation of the pilot project, using a qualitative approach. The written texts have been analysed through a phenomenological approach, showing the strengths and weaknesses of the project, the favourable conditions of the setting/institutions and the postures requested to a competent educator.

Conclusions: Future perspectives and recommendations for sbse in Italy
Key questions

The workshop aims at enhancing public health interest and to foster debate on the topic of SBSE and the need to promote its implementation in the school context. The following questions will be addressed: which role can school play in promoting SRH? what is CSE and which topics should address? which stakeholders should be involved in the creation and implementation of SBSE interventions? which outcomes can be evaluated and which results can be expected? how can a SBSE intervention be evaluated?

Updated ecdc core competencies in applied infectious disease epidemiology: Processes, outcomes and opportunities for international academic collaboration

Mary Codd¹, Karl Conyard², Katarzyna Czabanowski³, Nadav Davidovitch⁴, Ralf Reintjes⁵, Mary Codd⁶, Karl Conyard⁷

¹University College Dublin ASPHER / University College Dublin "School of Public Health, Physiotherapy & Sports Science, Woodview House, Belfield, Dublin. D004 V1W8" Ireland, ²School of Public Health Physiotherapy and Sports Science, University College Dublin, Association of Schools of Public Health in the European Region (ASPHER), Dublin, Ireland, ³Maastricht University, The Netherlands, ⁴Ben Gurion University of the Negev, Israel, ⁵Hamburg University of Applied Sciences, Hamburg Germany, ⁶University College Dublin University College Dublin, Ireland "School of Public Health, Physiotherapy & Sports Science, Woodview House, Belfield, Dublin, Ireland D004 V1W8" Ireland, ⁷University College Dublin ASPHER / University College Dublin, Ireland "School of Public Health, Physiotherapy & Sports Science Woodview House, Belfield, Dublin. D004 V1W8" Ireland

Workshop context

In 2008 the European Centre for Disease Prevention and Control (ECDC) published Core competencies for public health epidemiologists working in communicable disease surveillance and response. There followed Core competencies for infection control and hospital hygiene professionals (2013); Core competencies for vaccine-preventable diseases and immunisation (2017); and Core competencies on public health emergency preparedness (2017). The COVID-19 pandemic identified the need to Update ECDC Core Competencies in Applied Infectious Disease Epidemiology (UCCAIDE) to capture developments in diagnostic methods, understanding transmission dynamics, genomic analysis, disease modelling and vaccinology.

Workshop specific aims/objectives

This workshop will profile the PROCESSES and OUTCOMES of UCCAIDE. OPPORTUNITIES for collaboration to harmonise and advance public health education transnationally will be proposed and POTENTIAL USES of UCCAIDE will be discussed.

Workshop component parts

* UCCAIDE PROCESSES: A steering group comprising ASPHER (Association of Schools of Public Health in the European Region) Executive Board and COVID-19 Task Force members, ECDC Technical Advisory Group (TAG) and selected experts undertook a comprehensive literature review of competency frameworks from ASPHER, ECDC, CDC, OECD, PAHO and WHO to develop a preliminary set of core competencies. Qualitative interviews with 42 nominated experts, supplemented by workshops with the ECDC TAG, contributed to early revisions. A survey designed using the preliminary version was distributed to public health professionals in Europe and beyond. Further revisions based on 212 responses and consultation resulted in an agreed competency framework.

* UCCAIDE OUTCOMES: The final set of core competencies for applied infectious disease epidemiology was published in April 2022 in all European

languages (<https://www.ecdc.europa.eu/en/news-events/competencies-applied-epidemiologists-now-available-all-eueea-languages> [1]). The framework consists of 157 competencies organised in 23 domains, mapped to 6 subject areas (A-F). The subject areas, to be described in the Workshop, are: A: Essential methods for applied infectious disease epidemiology (4 domains/28 competencies); B: Preparedness, surveillance and response to infectious disease outbreaks (3 domains/29 competencies); C: Communication and advocacy (4 domains/25 competencies); D: Practice of infectious disease epidemiology (5 domains/34 competencies); E: Contextual influences on infectious disease management (4 domains/21 competencies); F: Leadership and management (3 domains/20 competencies).

* OPPORTUNITIES FOR COLLABORATION ARISING FROM THIS WORKSHOP: To facilitate use of the competency framework a self-assessment tool (S-AT) developed by ECDC permits individuals to analyse their proficiency in each competency and to access training resources, if desired. The strengths, limitations and opportunities for using the S-AT will be profiled. A pilot project of its application in a 2022/23 Master of Public Health class will be described as a prelude to a potential collaborative project between Schools of Public Health. The objectives of the project will be to identify proficiency levels of students, thereby highlighting public health education components that contribute well to proficiency levels and those for which improvement and development may be advisable.

* POTENTIAL USES OF THE UPDATED ECDC COMPETENCY FRAMEWORK, e.g. individual proficiency assessment; training needs-assessment in public health schools and programmes; professional development planning; potential uses in accreditation; job description development; and the complementarity of ECDC UCCAIDE with other frameworks e.g. ASPHER and UK Faculty of Public Health, will be discussed. World café on the health promotion posture of public health professionals

Manon Duay¹, Nathalie Déchanet²

¹HES-SO University of Applied Sciences of Western Switzerland / School Nursing Fribourg Rte des Arsenaux 16a, 1700 Fribourg, Switzerland Switzerland, ²School Nursing, University of Applied Sciences of Western Switzerland (HES-SO), Fribourg, Switzerland HES-SO University of Applied Sciences of Western Switzerland / School Nursing Fribourg Rte des Arsenaux 16a, 1700 Fribourg, Switzerland Switzerland

Methods: The course at the HES-SO University of Applied Sciences and Arts Western Switzerland is "Enhance his/her health promotion posture". It covers health promotion principles and the role of the nurse in various contexts: schools, health institutions, neighbourhoods, communities. The "health promoter" role is developed through the "patient-centred" approach that guides the training programme. It enables students to become aware of their health promotion posture, with a population-based approach in concrete projects in the field. Health is considered in a global and positive way, in terms of well-being and quality of life rather than risks and pathologies according to Ottawa Charter (WHO, 1986). In this workshop, we will discuss how a community diagnosis can be used in health professional training. It is inspired by the Pedagogy of the Oppressed (Freire, 1968).

The Key Questions That The Workshop Will Address Are:

* How can health promotion be taught within the basic training of health professionals?

* How can PHPs adopt the role of facilitators to promote community health? What experience do the workshop's participants have regarding community engagement and health promotion?

* How to raise awareness of the health promotion posture among the participants?

Public health ethics in the education and training of our public health workforce

Tarun Weeramanthri¹, Farhang Tahzib², James Thomas³, Kasia Czabanowska⁴, Leanne Coombe⁵, Priscilla Robinson⁶

¹Public Health Association of Australia Australia, ²European Public Health Association, United Kingdom, ³American Public Health Affiliation, United States, ⁴Maastricht University Netherlands, ⁵World Federation of Public Health Associations Public Health Association of Australia Australia, ⁶World Federation of Public Health Associations La Trobe University United

Kingdom

Outline

Whilst the idea of the need for an ethical approach to public health practice has been around for many years, over the last 20 years there has been a specific body of work directed at identifying and defining the scope of ethical public health and getting it into practice, which is the focus of other workshops on the program.

As public health is concerned with the health of whole populations and ecosystems, rather than individuals, the conventionally described pillars of clinical ethics – autonomy, beneficence, non-maleficence, and justice – do not align with public health practice, because of the communitarian nature of public health.

Public health is concerned with populations and communities and not individuals, and with wide range issue such as disease prevention and health protection (such as screening and pandemic preparedness), risk identification and harm reduction (such as smoking and seatbelt use), and environmental protection (such as overuse of antibiotics and climate change). As a discipline it is considered as "science of social justice" and well placed to advocate for equity of access to safe health care and therapeutics, and for policy decisions which affect the health of whole populations in both health care and other areas which of direct concern to social determinates aspects of life, such as safe and secure housing, equal education, access to employment, safe food, clean air and water, not just for now but into the future.

Therefore, it is time that Public Health Ethics are incorporated into every-day public health work, taught in schools of public health, and made the business of the whole public health workforce.

In this workshop we will build on the content of other related public health ethics in practice workshops to consider how to embed public health ethics into public health curricula.

Aims and objectives: The aim of this workshop is to outline the current work being undertaken to define public health ethics, to identify ways in which public health ethics can be incorporated into public health education and training.

In particular, the three objectives of this workshop are to Identify the behaviours that constitute public health ethics Consider what competencies for public health ethics might inform public health education curricula, beyond merely "using codes of ethical practice" as a core competency Prioritise what public health ethics content should be taught in public health curricula.

Key questions: How can public health ethics content be taught in public health education and training programs AND What public health ethics teaching and learning resources need to be developed to support public health educators?

Decolonizing approaches to transforming public health, valuing indigenous knowledges and human rights

Emma Patu¹, Summer Finlay², Christina Ore³, Adrian Patu⁴

¹WFPHA Indigenous Working Group WFPHA New Zealand WFPHA PHANZ New Zealand, ²Indigenous Working Group, World Federation of Public Health Associations, Australia, ³United States, ⁴ManuKahu Associates Limited Indigenous Working Group WFPHA New Zealand

Indigenous Peoples globally have been practicing Planetary Health Population Health Health Promotion and Public Health for Millenia. In is embebbd in our ways of knowing doing and being.

This workshop will feature Indigenous Public Health Experts who will share their knowledge and insight on how to engage, work with and for Indigneous Populations. This work shop will also serve to offer education to our broader public health community on how Indigenous knowledge underpins public health and how we can understand Indigenous knowledge systems and approaches, aligned heavily with Human rights approaches and values to strengthen public health practice and how to decolonise Public Health.

Participants with go away with practical actions and ability to apply ideas and frameworks in their practice which will help to increase efficacy in systems change approaches to address inequities for the most vulnerable populations, many of whom are Indigenous. In a world where climate change and planetary health are key to the survival of human kind it is essential that we step beyond the boundaries of what we think we know and engage in practices and knowledges that exsist and work in harmony with the environment, natural and built and are founded on the notion of the survival of the collective.

Spatial patterns and inequalities in skilled birth attendance and caesarean delivery in sub-Saharan Africa

Firew Bobo¹, Augustine Asante², Mirkuzie Woldie³, Angela Dawson⁴, Andrew

Hayen⁴

¹University of Technology Sydney, Sydney, Australia, ²School of Population Health, University of New South Wales, Sydney, Australia, ³Harvard T.H. Chan School of Public Health, Addis Ababa, Ethiopia, ⁴School of Public Health, Faculty of Health, University of Technology Sydney, Sydney, Australia

Background: Improved access to and quality obstetric care in health facilities reduces maternal and neonatal morbidity and mortality. We examined spatial patterns, within-country wealth-related inequalities and predictors of inequality in skilled birth attendance and caesarean deliveries in sub-Saharan Africa.

Methods: We analysed the most recent Demographic and Health Survey (DHS) data from 25 sub-Saharan African countries. We used the concentration index (CCI) to measure within-country wealth-related inequality in skilled birth attendance (SBA) and caesarean section. We fitted a multilevel Poisson regression model to identify predictors of inequality in having SBA and caesarean section.

Results: The rate of SBA ranged from 24.3% in Chad to 96.7% in South Africa. The overall coverage of caesarean delivery was 5.4% (95% CI: 5.2% to 5.6%), ranging from 1.4% in Chad to 24.2% in South Africa. The overall wealth-related absolute inequality in having a skilled attendant at birth was extremely high, with a difference of 46.2 percentage points between the poorest quintile (44.4%) and the richest quintile (90.6%). In 10 out of 25 countries, the caesarean section rate was less than 1% among the poorest quintile, but the rate was more than 15% among the richest quintile in nine countries. Four or more antenatal care contacts, improved maternal education, higher household wealth status, and frequently listening to the radio increased the rates of having skilled attendant at birth and caesarean section. Women who reside in rural areas and those who have to travel long distances to access health facilities were less likely to have skilled attendant at birth or caesarean section.

Conclusions: There were significant within-country wealth-related inequalities in having skilled attendant at birth and caesarean delivery. Efforts to improve access to birth at the facility should begin in areas with low coverage and directly consider the needs and experiences of vulnerable populations.

Mortality from chronic noncommunicable diseases in Portuguese-speaking countries and sustainable development goals targets in 2030

Deborah Malta¹, Crizian Gomes¹, Guilherme Veloso², Juliana Souza¹, Patrícia Oliveira³, Paula Freitas³, Filipe Santos¹, Albano Ferreira⁴, Paulo Ferrinho⁵, Mohsen Nagavi⁶, António Ribeiro¹

¹Universidade Federal de Minas Gerais, Brazil, ²Universidade Federal Fluminense, Brazil, ³Ministerio da Saude, Brazil, ⁴Universidade Katavala Bwila, Benguela, Angola, ⁵Universidade Nova de Lisboa, Instituto de Higiene e Medicina Tropical, Portugal, ⁶Institute for Health Metrics and Evaluation, Seattle, United States

Non-Communicable Diseases (NCDs) are one of the main global health problems, being responsible for a large number of premature deaths, disabilities and loss of quality of life. There are still few studies on the performance of the Portuguese Language Community in the 2030 Agenda, making it an opportunity to advance in this diagnosis and thus contribute to the strengthening of partnerships that allow monitoring progress in achieving the goals of the SDGs.

Objective: We analyzed trends in premature mortality from chronic non-communicable diseases (NCDs) between 1990 and 2019, the projections until 2030 and the risk factors attributable to these diseases in the Community of Portuguese Speaking Countries (CPLP).

Methods: Estimates from the Global Burden of Disease study and analysis of the burden of premature mortality from NCDs were used for nine CPLP countries, using age-standardized rates, using RStudio.

Results: Portugal, Brazil, Equatorial Guinea, Angola and Guinea Bissau have declining premature mortality rates from NCDs and; East Timor, Cape Verde, São Tomé and Príncipe and Mozambique showed an increase in rates. Projections indicate that none of the countries is expected to achieve the goals of reducing premature mortality from NCDs by one third by 2030. The attributable burden of disease showed that the most important risk factors in 2019 were: high systolic blood pressure, tobacco, dietary risks, high body mass index and air pollution.

Conclusions: here are many differences in the burden of NCDs in CPLP member countries. In addition, none of these countries is expected to achieve the goal of reducing deaths from NCDs by one third by 2030. Portugal and Brazil presented the best performances and, Angola, Guinea-Bissau, Mozambique and Equatorial Guinea, the worst. In order to make effective progress, it is imperative to build partnerships and exchanges between CPLP member countries.

Popul. Med. 2023;5(Supplement):A747

DOI: 10.18332/popmed/164931

Exploring health equity in Lesotho's child grants programElodie Besnier¹, Thandie Hlabana^{2,3}, Celine Sieu⁴, Virginia Kotzias⁵, Kathryn Beck^{6,7,8}, Kimanzi Muthengi⁴¹Centre for Global Health Inequalities Research (CHAIN), Department of Sociology and Political Science/ Department of Public Health and Nursing, Norwegian University of Science and Technology, Norway, ²National University of Lesotho, Lesotho, ³University of Hull, United Kingdom, ⁴UNICEF Lesotho country office, Lesotho, ⁵Centre for Global Health Inequalities Research (CHAIN), Department of Sociology and Political Science, Norwegian University of Science and Technology, Norway, ⁶Centre for Global Health Inequalities Research (CHAIN), Norway, ⁷Centre for Fertility and Health, Norway, ⁸Norwegian Institute of Public Health, Norwegian University of Science and Technology, Norway

Despite their growing popularity, little is known about how cash transfers can affect health disparities in targeted communities. Lesotho's Child Grant Program (CGP) is an unconditional cash transfer targeting poor and vulnerable households with children. Started in 2009, the CGP is one of Lesotho's key programs in developing the country's social protection system. Using the CGP's early phases as a case study, this research aims to capture how program stakeholders understood and operationalized the concept of health equity in Lesotho's CGP. The qualitative analysis relied on a desk review and semi-structured key informant interviews with program stakeholders. The program documents were coded deductively while the interview transcripts were coded inductively. Both materials were analyzed thematically before comparing their findings. When differences or disagreements arose within a theme, we explored potential determining factors for these variations according to the program's chronology, the stakeholders' affiliations and their role(s) in the CGP. The definitions of health equity in the context of the CGP reflected the complexity and multi-dimensional (or even debated) nature of the concept. This concept was overwhelmingly defined as focusing on children's access to health services for the most disadvantaged households. There was less agreement about other definitions of the concept, which seemed to be terminologies primarily used by specific stakeholders. These discrepancies in the definitions were further reflected in the role this concept played in the CGP, as the least common definitions were also comparatively less integrated into the program. Even the most common definitions of this concept didn't seem fully operationalized throughout the program, especially in the day-to-day operations and reporting at the local level. This operationalization gap not only affected the study of selected health spillover effects of the CGP but also might have undermined other program impacts related to specific health disadvantages or gaps.

Popul. Med. 2023;5(Supplement):A748

DOI: 10.18332/popmed/164942

Gypsies and Travellers' health status, access to healthcare and health prevention in relation to their environmental and living conditions in Nouvelle Aquitaine, France 2019-2022Aude Mondeilh¹, Stephanie Vandentorren^{2,3,4}, Gilles Brabant⁵, Sahar Haidar², Elodie Richard^{6,4}¹Bordeaux Population Health Centre, University of Bordeaux, France, ²Santé publique France, Saint Maurice, France, ³Bordeaux Population Health, Université de Bordeaux, France, ⁴PHAREs, Centre Inserm U1219, Bordeaux, France, ⁵Fédération Nationale des Associations Solidaires d'Action avec les Tsiganes et les Gens du Voyage (FNASAT-GDV), France, ⁶Bordeaux Population Health, Université de Bordeaux, Bordeaux, France

Background and Objectives: Although crucial role of social determinants on health is well known; such as precarious living conditions, some underserved population remains under-investigated in France such as Gypsies and Travellers. We aimed to describe for the first time in France, Gypsies and Travellers' living conditions – including environmental exposure, and factors associated with their health status and their access to healthcare and prevention.

Methods: A cross-sectional study with a three-stage random sample design (living area, household, individual) was conducted between October 2019 and March 2022, in Nouvelle-Aquitaine. Trained social workers administered face-to-face questionnaires to collect data on adults and children including demographics and socioeconomic situation, living conditions, mobility, health status and access to healthcare and prevention (vaccination, screening, literacy). Anthropometric measurements, vaccination records and environmental exposure questionnaire were also collected.

Results: 1030 adults and 337 children were included with a very high participation rate (73.6%). For children, 77.8% had full measles-mumps-rubella vaccination

coverage, 16.2% were overweight and 7.6% suffered from behavioural and emotional difficulties. Over 74% of the households had housing insecurity, 22.2% did not have a drinking water supply, and 43% were located less than 200 meters from a major road. 71.3% of the adults were overweight (including obesity), 14.4% reported diabetes, 24.7% hypertension, and 14.0% depressive disorder. The prevalence of depressive syndrome was significantly higher in adults living in precarious and unauthorized housing than in those with adequate housing (19.2 vs 14.7%, $p=0.04$). Concerning access to healthcare, 82.6% had visited a general practitioner in the previous year.

Conclusions: Traveller children and adults faced deleterious environmental and living conditions potentially affecting their health and their access to healthcare and prevention. These Results demonstrate the need for urgent action targeting underserved populations, taking into account their specific needs.

Popul. Med. 2023;5(Supplement):A749

DOI: 10.18332/popmed/164951

Changing scenario of economic dependency and self-rated health among older adults in India from 2004 to 2018Jyoti Das¹¹International Institute for Population Sciences, Mumbai, India

Introduction: The demographic structure is changing with a continuous increase in the proportion and number of older adults. Complementary to it, the proportion of younger cohort is decreasing, levying a more significant challenge to the care and well-being of older population.

Methodology: This study is based on the 60 and above population using two rounds of the National Sample Survey, the 61st, 2004-05 (34,831) and the 75th, 2017-18 (42,762). For analysis, Descriptive statistics and the Probit regression model were employed.

Results: The Results show that although the highest proportion of elderly was completely dependent (61st round: 52% and 75th round: 47%), partial dependence had increase by 10% in 15 years. Poor SRH was higher among economically dependent older adults and remained so after considering socio-economic factors.

Conclusions: This study recommends policy interventions related to social-welfare schemes for geriatric health—further, consideration of providing pensions to economically vulnerable social sections.

Popul. Med. 2023;5(Supplement):A750

DOI: 10.18332/popmed/164973

The socio-economic inequity in child nutritional status in Low- and Middle-income countriesFrehiwot Zurga¹, Kiddus Kehali², Firew Bobo³, Mirkuzie Woldie⁴¹Mizan-Tepi University, Southwest Ethiopia, Ethiopia, ²Jimma University, Ethiopia, ³Wollega University, Nekmet, Ethiopia, ⁴University of British Columbia, Addis Ababa, Ethiopia

Objectives: Child undernutrition is a persistent public health problem contributing to about half of under-five child death in low-income countries, and it is severe among the poorest communities. The extent of socio-economic-related inequity in undernutrition within and between countries of different economic standing is still a question. This paper, therefore, aimed to examine the wealth-based inequity in nutritional status among 24 low, lower-middle, and upper-middle-income countries.

Methods: The most recent demographic and health survey data of children under five years got included. Inequity in child undernutrition measured by concentration index (C) values; and concentration curves. Subgroup analysis by place of residence; and sex of the child was done. We then fit bootstrapped Mata regression to check whether there is a variation in inequality of child undernutrition across different income category countries.

Results: The overall prevalence of child undernutrition was 35%. The figure was highest in India (47%); and Ethiopia (38.9%), while it was lowest in Turkey (8.5%). Wealth-related inequalities in child undernutrition got detected in about half of the countries and all three economic categories. Child undernutrition was highly abundant among the poor households of Turkey [C:-0.26, 95% CI, -0.31 to -0.20]; and Cameroon [C:-0.19, 95% CI, -0.22 to -0.17], and relatively it was less concentrated among the poor in Liberia [C: -0.07, 95% CI -0.11 to -0.04], and Gambia [C:-0.07, 95% CI -0.11 to -0.04]. Meta-regression analysis revealed no difference in the inequality levels between the three economic categories of countries.

Conclusions: The socio-economic-related inequality in child undernutrition within many of the included countries is still very significant. However, the economical category of countries made no difference in explaining socio-economic-related inequality in child undernutrition. Inter-sectoral collaboration to fight poverty and render special attention to the disadvantaged population segments would

potentially help to address the observed inequity.

Popul. Med. 2023;5(Supplement):A751

DOI: 10.18332/popmed/164985

Whistleblowing as an anti-corruption strategy in health and pharmaceutical organizations: a scoping review

Taryn Vian¹, Brianna Agnew², Keith McInnes^{3,4}

¹World Health Organization Collaborating Centre for Governance, Accountability, and Transparency in the Pharmaceutical Sector, University of Toronto, United States, ²Public Health Program, Orange County Campus, University of San Francisco, San Francisco, United States, ³Center for Healthcare Organization and Implementation Research (CHOIR), VA Medical Center, Bedford Massachusetts, United States, ⁴Department of Health Law, Policy, and Management, Boston University, United States

Background and Objectives: Whistleblowing can bring suspected wrongdoing to the attention of someone who is in a position to rectify the problem. This can help deter corruption and promote health equity. The objective of this research is to understand the extent and type of evidence on whistleblowing as an anti-corruption strategy in health and pharmaceutical organizations in low- and middle-income countries (LMICs) and to inform future research agendas.

Methods: This scoping review searched the PubMed, Scopus, and Embase databases from 2005-2020, limited to English language. We also searched websites of multilateral agencies or international non-governmental organizations for policy documents, guidance and reports. Titles and abstracts were screened to remove those where the focus was not health, pharmaceuticals, whistleblowing, or LMIC context. Articles focused on research misconduct were excluded. Full text articles were assessed for eligibility on these same criteria. Included sources were analysed thematically, based on five categories including definitions and models; evidence of reporting frequency; factors influencing whistleblowing; cultural context; and outcomes.

Results: The review found 22 sources including reports, policies, and guidance documents (12, 55%), news articles (4, 18%), policy analyses/reviews (3, 14%), commentaries (2, 9%), and empirical studies (1, 5%). Most sources described whistleblowing policy and system components such as how whistleblowing is defined, who can report, and how confidentiality is assured. Few articles documented types and frequency of corruption identified through whistleblowing or factors associated with whistleblowing. Several studies mentioned cultural norms as a potential limitation to whistleblowing effectiveness. About one-third of the sources described fear of retaliation and noted the need to strengthen protection for whistleblowers. **Conclusions:** Research on whistleblowing is scarce in health and pharmaceutical organizations in LMIC. Documentation of policies, factors associated with whistleblowing, and whistleblowing outcomes is needed and could help countries to mainstream whistleblowing as a sectoral anti-corruption strategy.

Models of COVID-19 vaccination services in prison in six European countries: translating emergency intervention into routine life-course vaccination

Sara Mazzilli¹, Lara Tavošchi¹, Nicola Cocco², Davide Petri³, Vlad Busmachiu⁴, Iakovos Stylianou⁵, Fadi Meroueh⁶, Babak Moazen⁷, Alicia Rosello⁸, Roberto Ranieri⁹

¹Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Italy, ²Penitentiary Infectious Diseases Service, Santi Paolo e Carlo Hospital, University of Milan, Italy, ³Department of Clinical and Experimental Medicine, University of Pisa, Italy, ⁴National Administration of Penitentiaries, Republic Of Moldova, ⁵Cyprus Prison Department, Ministry of Justice and Public Order, Cyprus, ⁶Centre Hospitalier Universitaire Montpellier, France, ⁷Heidelberg University, Germany, ⁸UK Health Security Agency, United Kingdom, ⁹ASST Santi Paolo e Carlo Presidio Ospedale San Carlo Borromeo, San Paolo Hospital, Italy

Introduction: Vaccinations are one of the most powerful preventive tools discovered by modern medicine. Although expanded programs of immunization are well established in EU/EEA, significant immunity gaps and suboptimal coverage are registered among specific populations, including people living in prisons (PLP). PLP are also at increased risk of vaccine-preventable diseases (VPD) with potential outbreaks in prison, e.g. Flu, covid-19, as well as other VPDs such as HBV. The EU-funded project rise-vac, aimed at collecting models of care developed during the pandemic to design tailored vaccine delivery strategies that could be extended beyond the sole covid-19 vaccine.

Methods: Through a survey administered to healthcare staff working in prisons

in six countries of the EU/EEA (Cyprus, France, Germany, Italy, Moldova, up) we collected information on the implementation of covid-19 vaccination program. The following areas were investigated: challenges and barriers encountered, workload distribution, education and training activities for prison staff and PLP, referral strategies after release, and immunization information system.

Results: The respondents reported that in prisons covid-19 programs have been implemented efficiently. Strategies for optimal management of the vaccination campaign included: week-days dedicated to vaccination services when vaccines were delivered and immediately administered to overcome cold chain challenges; new staff recruitment and task shifting; administration of booster doses within prison premises for released individuals; distribution of informational material both to PLP and prison staff.

Conclusions: Our results show that universal immunization campaigns are feasible, acceptable and effective in places of detention when there is the commitment to implementing them. Evidence from the pandemic situation may inform the future provision of expanded immunization programs.

¹⁰Laboratory for Integrative and Translational Research in Population Health (ITR), University of Porto,

Portugal

Background and Objectives: The sustainability of a diet is difficult to measure and requires a holistic approach that accommodates the multi-criteria nature of this concept enabling more integrated measures that better reflect its complexity. Therefore, we aimed to identify multicomponent measures derived from individual food consumption data to assess the sustainability of diets in healthy adult populations.

Methods: We conducted a systematic review following the PRISMA guidelines. The protocol was registered in PROSPERO (registration number: CRD42022358824). Articles were identified via PubMed, Scopus, and Web of Science. The final search was conducted until September 19th, 2022, selecting references from peer-reviewed journal articles in English, Spanish, and Portuguese. The search strategy consisted of both keywords and MeSH terms. After the removal of duplicates, reviewers independently applied the eligibility criteria and, then, performed the data extraction and the methodological quality assessment of the included studies. A study was included in this review if it met the following criteria: 1) conducted in healthy adults, 2) assessed individual food consumption data, and 3) evaluated at least two components of sustainability (e.g., health/nutrition, economic, environmental, socio/cultural).

Results: The literature search generated 5663 references. After the duplicates were removed, 3869 references remained. Subsequently of the screening of the title and abstract, 144 references were selected for full-text review. Of these, 5 studies already met the inclusion criteria. Different multicomponent measures were observed: 2 diverse Sustainable Diet Indexes, the World Index food Sustainability and Health, the Affordability of foods, and the Ecoefficiency of foods. **Conclusions:** Different multicomponent measures were found, all of them using approaches that could be useful to easily and holistically assess diet sustainability, to follow sustainability-related changes in individual or population dietary patterns, and to study the link with long-term health outcomes in order to help in guiding future public health policies.

Use of child restraint systems in the Gulf region: a systematic review.

Marguerite Sendall¹, Nejoood Nasher¹, Shouq Baker¹, Huda Almotawa¹

¹Qatar University, Qatar

Background: The United Nations General Assembly has a target to half the number of worldwide deaths and injuries from road traffic accidents by 2030. Globally, road traffic injuries and deaths are the leading cause of death for children and young adults aged 5-29 years (WHO, 2022). Child Restraint Systems (CRS) have been identified as a preventive measure. **Objective:** The Objective of this systematic review is to review the evidence about the use of CRS in the Gulf region.

Methods: PRISMA guidelines were used to conduct a review of the evidence-based literature about the use of CRS in the Gulf region. The search for literature was conducted on PubMed, Web of Science, Public Health ProQuest, and Cochrane. The date range was 1 January 2019 to 31 August 2022. MeSH terms were used to narrow initial search terms. Retrievals were stored in Endnote. Before manual screening, 31 duplicates were eliminated using the Al-Rayyan web tool. Three reviewers manually screened the remaining 188 studies; 12 studies were excluded. Next, 176 studies were sought for retrieval; 12 studies were not retrieved. Then, 164 studies were assessed for eligibility; 159 studies were excluded because they were not relevant, conducted in the Gulf region, older than 2019 or the population was not relevant.

Results: Five studies will be included in the final review. All studies are cross-sectional. Two studies were conducted in Qatar, two studies were conducted in Saudi Arabia and one study was conducted in the United Arab of Emirates. Preliminary Findings suggest the use of CRS in the Gulf region is influenced by a suite of different factors including lack of knowledge about risks and proper usage and the influence of local culture and attitudes. **Conclusions:** The authors will complete the final analysis and draw conclusions in time for the conference in May 2023.

Teaching and learning of social determinants in health in the region of the Americas

Maria Gómez¹, Maria Gómez², Erwin Hernández³, Camilo Correa³

¹University of La Sabana, Sweden, ²Karolinska Institutet, Sweden, ³University of La Sabana, Colombia

Introduction: The Americas region is currently considered the most unequal in the world; therefore, to overcome these inequalities, human resources in health play a central role, that is why, it is considered necessary to strengthen in the health science programs, the teaching and learning of Social Determinants in Health to promote their intervention and approach.

Methodology: A review of the literature on the teaching and learning of Social Determinants in the Americas was carried out, by searching for official documents and articles in databases (Web of Science, Clinicalkey, PubMed, Science Direct and Lilacs). 68 documents were selected and organized in the teaching and learning of Social Determinants, their relationship with Interprofessional Education, and their importance and social responsibility.

Results: The region of the Americas has made significant progress in several countries in terms of the inclusion of public policies that act on determinants and that help human health resources to be formed with a primary care approach; However, the health sciences faculties in the region must deepen their knowledge of research and pedagogical strategies that facilitate the teaching and learning of determinants; in turn, progress is observed in the inclusion of Interprofessional Education in the region.

Conclusions: The comprehensive approach to determinants in the region plays a fundamental role in reducing social inequalities and improving the health of its inhabitants.

Employment conditions and mental health of female migrant domestic workers in Hong Kong: a parallel mediation analysis

Timothy Sumerlin¹, Jean Kim¹, Roger Chung²

¹The Jockey Club School of Public Health and Primary Care, The Chinese University of Hong Kong, Hong Kong, China, ²The Jockey Club School of Public Health and Primary Care, Chinese University of Hong Kong, Shatin, Hong Kong

Background and Objective: Female migrant domestic workers (MDW), approximately 8.5 million globally, often live in their employer's home under vulnerable conditions. In Hong Kong, MDWs currently comprise 5% of the population. This study was conducted to assess the association between employment conditions and mental health, and the mediating roles stress and job satisfaction have, among female MDWs in Hong Kong.

Methods: Participants completed an online cross-sectional survey. A total of 1,965

survey were collected between August 2020 and August 2021. Questions in the survey were related to MDWs Background: information, employment conditions, stress, job satisfaction, and two mental health outcomes: anxiety (General Anxiety Disorder-7) and depression (Patient Health Questionnaire-9). An employment conditions score was created to assess the cumulative effect poor employment conditions had on mental health. A multicategorical parallel mediation analysis was used to assess the direct effect employment conditions have on mental health and the indirect effects through stress and job satisfaction.

Results: Overall, 17.7% of MDWs were reported to be suffering from anxiety and 30.8% from depression. An increase in poor employment conditions was statistically significantly associated with an increase in both outcomes, while stress levels and job satisfaction mediated this association.

Conclusions: The findings call for increased scrutiny of employment conditions and mental wellbeing of MDWs.

Associated factors of interventions promoting COVID-19 vaccination among underserved population in the Greater Paris area and Marseille

Sahar Haidar¹, Stephanie Vandentorren¹, Elodie Richard², Thomas Roederer³

¹Santé Publique France, France, ²University of Bordeaux, Bordeaux Population Health Center, France, ³Epicentre MSF-OCP, France

Background and Objective: Homeless people have an increased risk of infection of COVID-19, linked to several social, economic and environmental determinants, frequent comorbidities, as well as difficult access to social and health rights, medical coverage and overall insufficient use of healthcare. However, there is a lack of data not only concerning vaccination coverage but also the evaluation of interventions promoting COVID-19 vaccination among this underserved population in France. This study Aims to identify the associated factors of COVID vaccination uptake among people experiencing homelessness in the Greater Paris area and Marseille.

Methods: This multi-center cross-sectional survey took place in Marseille and in the greater Paris area. The survey, conducted from 15/11/2021 to 22/12/2021, included a representative sample of 3811 precarious people. A conceptual framework for vaccine uptake among underserved populations was proposed by integrating the behavioral model for vulnerable populations and the COM-B model (capability, opportunity, motivation and behaviour). The model included one measured variable (mobility) and nine latent variables: health literacy, information, attitudes towards vaccination, perceived needs, social support from associations and from relatives, discrimination, competing needs and accessibility to healthcare.

Results: Among the 3811 participants included in the sample, 74,5% had taken at least one dose of the vaccine. The main factors associated with vaccine uptake were attitudes towards vaccination, type of housing, vaccination history, journals and posters as a source of information, mobility, having a personal practitioner, having a healthcare coverage and having an accompaniment for an appointment. **Conclusions:** Disparities in vaccination coverage exist following a social gradient vulnerability. The public health system and national strategies needs to emphasize the importance to include vulnerable population from the begging on their decision-making.

Conditional cash transfer programs and HIV/AIDS incidence in Guatemala: an exploratory analysis

Ernestina Tecu¹, Ernestina Tecu¹, Cristian Figueroa²

¹Universidad Rafael Landívar, Guatemala, ²Instituto de Saúde Coletiva (ISC-UFBA), Guatemala

Background and Objectives: HIV/aids incidence rose 40% during the COVID-19 pandemic in Guatemala. Previous scholarly work shows that targeting social and economic vulnerabilities reduces HIV incidence rates. Thus, this study aimed to analyze the relationship between conditional cash transfer programs (CTP) and HIV/aids incidence in Guatemala. **Methods:** This work is part of a larger study titled: "conditional cash transfer programs (CTP) and HIV/aids incidence in Guatemala: 2013-2021". We conducted a cross-sectional exploratory analysis for 2018. HIV/aids incidence rates, coverage of the CTP, amount of cash received, and health assistance rates were calculated for the 340 municipalities. Data was collected from Guatemala's Ministry of Health, and Ministry of Social Development. We used direct standardization method for rates comparability. We categorized incidence rates and CTP coverage for risk estimation. Finally, we investigated association through bivariate analysis.

Results: Highest coverage of the CTP was 5.2%. Municipalities in the Northeast had the higher coverages of both CPT and health assistance, and those in the metropolitan area had the lowest. Medium-sized cities in the Northern and Central regions had the highest standardized rates of HIV/aids and had no coverage of CTP. We found that HIV incidence rates were negatively correlated to CTP coverage ($p: -0.113$ $p<0.05$) and the amount of cash received ($p: -0.123$ $p<0.05$); and positively correlated with health assistance rates ($p: 0.144$ $p<0.01$). Lastly, municipalities with CTP coverage $<1\%$ had greater odds for having high HIV incidence rates (OR: 1.76 IC95%: 1.1 – 2.8). Conclusions: Conditional cash transfer programs are associated with the reduction of HIV/aids incidence rates. This evidence remarks the urge to include public policies targeting programmatic vulnerabilities in the HIV/aids prevention programs, in order to achieve the global agenda goals for reducing HIV transmission rates. The study's second phase will include longitudinal and multivariate analysis to better describe this association.

Enhancing health equity and public health infrastructure

Kelly Morning¹, Gerold Dermid²

¹School of Public Health, University of Nevada, Reno, United States, ²School of Public Health, University of Nevada, Reno, United States

The Nevada Public Health Training Center (NVPHTC) and Larson Institute for Health Impact and Equity (Larson Institute) have worked with health officials throughout Nevada to implement multiple workforce development assessments and create action plans based on survey findings. In 2019, NVPHTC re-launched a Workforce Development Survey to examine the status of Nevada's current public health workforce as well as competencies changes since 2015. With over 800 responses, Findings were used to identify distinctions within different populations of the public health workforce. Analysis highlighted key findings and significant differences in competencies, training preferences, and other characteristics between survey participants based on demographics such as ethnicity and race. In early 2021, the Larson Institute developed and implemented another needs assessment survey. This assessment was aimed at identifying opportunities to enhance health equity within public health programs, clinics and organizational settings. The Larson Institute leveraged its partnerships with state and local health authorities, healthcare systems, and non-profit partners to disseminate the first statewide Public Health Workforce Health Equity Needs Assessment and had nearly 600 responses. Key findings from the equity survey showcased a need for action within the public health workforce. Workforce development findings helped the Larson Institute develop Nevada's workforce by recognizing the unique needs of different members and encourage efforts to further diversify all public health roles, from support staff to directors and senior leaders. With each needs assessment, the Larson Institute supported development of comprehensive strategies for enhancing health equity and public health infrastructure. This included the development of individualized action plans and recommendations for best practices, including enhancing knowledge and promoting equity-driven conversations that address the environmental, social, and economic conditions impacting health. Beyond Nevada, this presentation will emphasize the need to act and support the advancement of health equity initiatives for healthier communities everywhere.

Measuring health equity in the ASEAN region: conceptual framework and assessment of data availability

Bryanna Mariñas¹, Capucine Barcelon¹, Si Ying Tan²

¹Yale-NUS College, National University of Singapore, Singapore, ²Saw Swee Hock School of Public Health, National University of Singapore, Singapore

Background: Existing research on health equity falls short of identifying a comprehensive set of indicators for measurement across health systems. Health systems in the ASEAN region, in particular, lack a standardized framework to assess health equity. This paper proposes a comprehensive framework to measure health equity in the ASEAN region and highlights current gaps in data availability according to its indicator components.

Methods: A comprehensive literature review was undertaken to map out a core set of indicators to evaluate health equity at the health system level. Secondary data collection was subsequently conducted to assess current data availability for ASEAN states in key global health databases, national health accounts, and policy documents.

Results: A robust framework to measure health equity was developed comprising 143 indicators across Health System Inputs, Outputs, and Outcomes. Across the ASEAN region, the Inputs sub-component of Health Financing had data available

for all indicators (160/160, 100%), while Access to Essential Medicine had the least data available (6/30, 20%). Under Outputs and Outcomes, Coverage of Selected Interventions (161/270, 59.63%) and Population Health (350/350, 100%) had the most data available, while other indicator sub-components had little to none ($\leq 38\%$). Cambodia had the most complete data overall (79.72%) while Vietnam had the least (66.43%). Figure 1. Proposed conceptual framework for measuring health equity

Conclusions: The data availability gaps highlighted in this study underscore the need for a standardised framework to guide data collection and benchmarking of health equity in ASEAN. There is a need to prioritise regular data collection for overlooked indicator areas and in countries with low levels of data availability. The application of this indicator framework and resulting data availability analysis could be conducted beyond ASEAN to enable cross-regional benchmarking of health equity.

Understanding the non-use of harm reductions services by socially included women who use drugs

Sarah Perrin¹

¹Bordeaux Population Health - ISPED, University of Bordeaux, France

Women who use drugs represent 20% to 30% of those who visit harm reduction structures in Europe. Socially included people are also a minority in these services. Socially included women who use drugs are therefore doubly invisible in harm reduction structures. This communication Aims to explain the lower attendance by socially included women of harm reduction structures, in France and in Quebec. The results presented are based on 97 interviews carried out with socially included women and men who use drug, with harm reduction professionals and actors in drug-related public policies, in Bordeaux and Montreal. Harm reduction structures are, in both cities, more designed to meet the needs of a precarious men who use drugs. In Bordeaux as in Montreal, non-mixed spaces dedicated to women are rare, whereas non-mixed spaces have been shown to encourage the arrival of women in the services. The services and schedules proposed by the structures also correspond more to the needs of precarious drug users. However, structures exist which could better meet the needs of women and socially included people, but the drug users interviewed do not seek them either. This non-use can be explained by four main reasons: first, the participants believe that they do not need help. Secondly, some have already spoken about their drug use to professionals who are not specialized in the management of drug consumption, and they have felt judged or misunderstood, which subsequently constitutes an obstacle to health care. Third, most participants are unaware of the existing services. Fourth, the interviewees refuse to be assimilated to the marginalized public targeted by most of the harm reduction structures, in a strategy of avoiding stigma. Several recommendations can be considered to improve harm reduction among a female and socially included population, their non-use of the services constituting a public health problem.

DOI: 10.18332/popmed/165271

Application of health equity audit to emergency care for acute myocardial infarction

Anna Acampora¹, Laura Angelici², Teresa Spadea³, Nicolás Zengarini³, Giulia Cesaroni⁴, Nera Agabiti²

¹Dipartimento di Epidemiologia del Servizio Sanitario Regionale del Lazio, Rome, Italy, ²Dipartimento di Epidemiologia del SSR del Lazio, ASL Roma 1, Rome, Italy, ³Servizio Sovrazonale di Epidemiologia ASL TO3, Regione Piemonte, Torino, Italy, ⁴Dipartimento di Epidemiologia del SSR del Lazio, ASL Roma 1, Rome, Italy

Background and Objective: Identifying and addressing health inequalities is a public health priority for Health Services to guarantee equitable access to effective care and health opportunities. Health Equity Audit (HEA) is a systematic methodology to evaluate inequalities in the distribution of health determinants, in the access to healthcare services and in the outcomes across the population, to define and implement actions to reduce them and to evaluate their impact. The objective of this work was to apply the HEA to in-hospital emergency care for Acute Myocardial Infarction (AMI) in Lazio Region, Italy.

Methods: A multidisciplinary group of different professionals was identified and an equity profile was defined. A conceptual framework was elaborated, the entry points for possible inequalities were identified. According to the framework, indicators, health determinants and data sources were identified. After data elaboration, results were fed back to relevant professionals in the participating hospitals (cardiology, emergency, health management) with the invitation to

organize audit meeting and to identify improving actions.

Results: The identified entry points include risk for AMI, access to timely health procedure, access to diagnosis and/or treatment, adherence to post-acute treatment, outcomes. Health determinants included sex, education, socioeconomic position, occupation, geographical area and country of origin. The sources of data were health information systems of the Lazio Region. Data firstly elaborated regard the inequalities in access to timely Percutaneous-Transluminal-Coronary-Angioplasty (PTCA) for patients with ST-elevation myocardial infarction(STEMI) and 30-days mortality after AMI, according to sex and education. The access to timely PTCA is lower in female while the 30-days mortality is higher in less educated patients.

Conclusions: HEA allowed to identify possible mechanisms for inequalities generation. Returning results to professionals involved in the care-pathways we expect to increase their awareness about the problems and to stimulate the adoption of improving actions and finally to reduce the gaps.

DOI: 10.18332/popmed/165309

Australian child and youth health and education wellbeing policy: are we addressing the social determinants of health?

Clare Littleton¹

¹Torrens University Australia, Adelaide, Australia

Background: Children and youth are an important population group requiring specific policies to address their needs. In Australia, most children and youth are doing well, however, certain equity groups are not. To address health equity in policy, applying a social determinants of health approach is considered best practice. For over 10 years governments in Australia have been called upon to address the social determinants of health, however, there has been limited action. Health and education departments are typically most involved in policy development for children and youth. To date, there have been limited systematic analyses of Australian child and youth health policies, and selected education wellbeing policies, with a social determinants of health and health equity focus and this study aims to contribute to addressing this gap. **Methods:** We conducted a policy analysis study across 26 Australian child and youth health policies, and selected education wellbeing policies. We used an existing prior coding framework with a social determinants of health and health equity lens to understand the extent to which the social determinants of health and health equity were addressed. Policies were dated 2009 onwards.

Results: Across 26 selected policies only 10% of strategies addressed the social determinants of health. We report on the social determinants of health addressed, to some degree, which includes early childhood development, education, parental workplace conditions, healthy settings, and housing, and to a lesser extent, public transport and regulation. **Conclusions:** This study demonstrates a lack of policy action on the social determinants of health. Rather, the application of a siloed, and predominantly acute care approach. However, there is recognition of equity across all policies; an emphasis on housing as a determinant of health; and a link between health and education departments through education wellbeing policies, specifically addressing the issue of mental health.

DOI: 10.18332/popmed/165326

Defining rural surgery: the Philippine perspective

Brent Viray¹, Michael Leon^{2,3}, Crisostomo Arcilla^{4,5}, Anthony Perez^{4,5}, Rodney Dofitas^{4,5}, Jose Marfori^{4,5}, May Viray⁶

¹Aurora Memorial Hospital, General Emilio Aguinaldo Memorial Hospital, Philippines, ²School of Health and Related Research, University of Sheffield, United Kingdom, ³Institute of Public Health, Jagiellonian University Medical College, Krakow, Poland, ⁴University of the Philippines, Philippines, ⁵Philippine General Hospital, Philippines, ⁶Rural Health Unit, Dingalan, Aurora, Philippines

Rural Surgery (RS) has been practiced and defined in developed countries (i.e., USA, Canada, and Australia) comprised largely of a huge land mass as general surgery practice done outside of their urban communities. It is characterized as a surgical practice that is rewarding as the surgeon is placed in professional isolation cloasely-knit personally in the community as he/she is expected to deliver even in the absence of more sophisticated health technologies and surgical techniques. The authors subscribed to these descriptions but would like to advance a more progressive and bottom-up approach of defining RS especially in an archipelagic developing country like the Philippines with 7107 islands. RS practice is generally defined as general surgery with heightened inclination on incorporating the social determinants of health on the Rural Surgeon's management algorithms and surgical Methods. While he/she performs the common appendectomies,

cholecystectomies, inguinal hernia repair and wound debridement, half of his/her management plan is formulated before and after the patient's admission. A keen inclination on how the health systems work and referral system is a large component of the plan. Rural Filipino patients are unique in the sense that mostly sought consult after initial presentation or complications of their disease because of compounding social factors like limitation in geographical access, financial capability, health-seeking behavior, and education as compared to their urban counterparts. The authors would suggest that defining RS in developing country as the practice of general surgery performed in disadvantaged areas with surgical management concocted with heightened considerations in the social determinants of health and the surgical health system of the area. Thereby, the authors also advocate that RS in the Philippines be more inclusive and should be aligned in the ongoing implementation of the Universal Health Care Act while it embraces the inevitable facets of challenging social determinants of health.

DOI: 10.18332/popmed/165327

Catastrophic injury related disability - A social determinant-based approach to achieving optimal community rehabilitation outcomes

Chebiwot Kipsaina^{1,2}, Angelita Martini^{1,3}

¹Brightwater Research Centre, Brightwater Care Group, Inglewood, Australia,

²Curtin Medical School, Curtin University, Bentley, Australia, ³The University of Western Australia, Crawley, Australia

Background and Objectives: Disability constitutes a major social problem. Globally, 1 billion people - approximately 15% of the population- live with some form of disability, of which one-third is as a result of preventable injury. Furthermore, nearly 4% of this population experience significant difficulties in functioning often requiring health care services. In recognizing the urgent need to attenuate the social and health inequalities associated with disability, 74th the World Health Assembly in 2021 adopted a resolution to provide the highest attainable standard of health for persons with disabilities by making the health sector more disability-inclusive and therefore ensuring no one is left behind in achieving the Sustainable Development Goals. The social determinant-based approach to disability related to catastrophic injury has seldom been applied in this area. We aim to describe the impact of health determinant approach on injury related disability rehabilitation outcomes not otherwise documented.

Methods: Prospective, mixed methods study within a Participatory Action Research approach with three-phase design: Phase 1: Scoping review of existing literature on catastrophic injury and disability. Secondary data review about injury and disability. Phase 2: Participants with catastrophic injury and disability: Development and implementation of a comprehensive general assessment database (demographics, injury details, social determinants measures, quality of life, knowledge and skills on disability), Open-ended survey; Clinical assessments. Data analysis. Phase 3: Key experts working with participants and/or with specialised knowledge: Qualitative interviews.

Results: The results will showcase the impact of applying a health determinants approach that has the potential to inform improved community-based rehabilitation and health service delivery of injury related disability.

Conclusions: New evidence will be generated regarding effective health determinants approach for addressing injury related disability and reducing health inequalities. Such information will be important to instigate the needed paradigm shift from conventional approach to disability to a social- determinant one.

Popul. Med. 2023;5(Supplement):A766

DOI: 10.18332/popmed/165329

Inappropriate and inedible: public health insights into supermarket donations to an Australian food bank

Sharonna Mossenson¹, Roslyn Giglia², Claire Pulker³, Christina Pollard⁴

¹Curtin University, Australia, ²Foodbank of Western Australia, Australia, ³East Metropolitan Health Service, Australia, ⁴Enable Institute, Curtin University, Australia

Background and Objective: Food banks provide food to people experiencing food insecurity, supporting the Sustainable Development Goals (SDGs) 2 and 12 (reducing hunger and waste by 2030). They source, warehouse and distribute food to community agencies and individuals, relying largely on donated food from major supermarkets. The donation of unwanted or surplus products is publicly framed as a food waste solution: rescuing tonnes of surplus food from landfill and feeding the needy. The quantity (kilograms) of donated food is well documented, but the quality is unknown. This study measured the quality of supermarket food donated to an Australian food bank. **Methods:** An audit of all donated food over five consecutive weekdays in May 2022 was conducted at a major food bank warehouse in Australia. All deliveries were documented using digital imagery on

a hand-held mobile device. Photographs were manually annotated to capture pre-determined public health and nutrition quality measures: type, brand and variety of product; delivery details (donor, weight of product, date marking); food safety and product quality.

Results: 1500 images collected for 72 donations, of which 36 were 'mixed loads' containing miscellaneous product lines in a single delivery. Supermarkets donated 61% of all mixed loads comprising 790 food products. Sixty-eight percent of products were categorised as ultra-processed (according to the NOVA level of processing), 9% were 'unsatisfactory' due to damaged packaging (ripped, dented +/- product exposed/leaking), compromised product (overripe, contaminated, blown or visible mould), or donated on/past the 'best before' or 'use by' dates. Products were sorted for distribution to clients and unsatisfactory items sent to landfill. Conclusions: The quality of foods donated by Australian supermarkets was predominantly inappropriate in terms of nutrition and safety for human consumption. There is an urgent need for a system to improve the efficiency, equity and effectiveness of food donations to food banks.

DOI: 10.18332/popmed/165339

Equity and gender orientation of antimicrobial resistance policy formulation in Australia and Germany

Victoria Saint¹, Clare Littleton²

¹School of Public Health, Bielefeld University, Germany, ²Torrens University, Australia

Background and Objective: Antimicrobial resistance (AMR) is one of the biggest contemporary threats to population health, food security and sustainable development globally. Significant progress has been made to tackle AMR, especially through a One Health approach. In line with the World Health Organization call to consider how AMR affects "people in their daily lives at work, home and in their communities", greater focus is needed on equity, social determinants of health (SDH) and gender dimensions of AMR. Methods: This study explored national AMR policy formulation in Australia and Germany with a focus on health equity, SDH and gender. We analysed national AMR policies in both countries and interviewed key stakeholders about the development and implementation of these policies, using a cross-disciplinary (public health and political science) approach. Results: We present cross country analysis of the two policies including conceptualisation of health and AMR, types of goals and strategies pursued, and the extent to which health equity, SDH and gender are recognised or targeted for action. We then present findings of semi-structured interviews that explore stakeholder perspectives about how health equity, SDH and gender are embedded into current policy and opportunities for expanding this focus in future AMR policies. Conclusions: While the emphasis and styles of the policies differ, in both policies equity, SDH and gender are only considered in a limited manner. The policies predominantly reflect a biomedical framing, with a narrow understanding of prevention and a focus on awareness raising and behavioural change. We discuss areas for expansion and provide insights on how the policy agenda in the future could reflect a stronger consideration of these dimensions of AMR. This cross-country study in Australia and Germany provides real-world insight into the state of the AMR policy environment and policy makers' perspectives on formulating equity-oriented AMR policy in the future.

Assessing community barriers exacerbating viral non-suppression in children living with HIV (CLHIV) in Mangochi, Malawi

Ndifanji Namacha¹, Henry Nsona², Clement Udedi²

¹Malawi AIDS Counseling and Resource Organization (MACRO), Malawi,

²Malawi AIDS Counseling and Resource Organization (MACRO), Lilongwe, Malawi

Background: According to the National HIV/AIDS policy 2022-2027, Malawi achieved the 90:90:90 treatment targets in 2020 and is on course towards achieving 95:95:95 targets by 2025. This means viral suppression must in the least be at 95% among HIV positive clients. Though remarkable progress has been made towards HIV mitigation and prevention clinically, community barriers have stalled progress by invigorating poor ART adherence and/or treatment failure. The aim of this study was to identify and mitigate the root causes of high viral load in CLHIV in Mangochi district.

Methods: A cohort of 2146 CLHIV with an initial suppression rate of 73% (1566) was enrolled under a case management program and assessed at household level to establish the factors that affect their adherence to ART. Standard questionnaires were administered and analysis was done using DHIS2.

Results: The assessment revealed factors such as parental neglect, misleading

religious counsel, food shortages, long distances to health facilities and sharing of medication with other HIV positive clients as some of the underlying causes of viral non-suppression in CLHIV. The program responded with interventions such as case conferences, identification of treatment supporters, provision of nutritional support and transport support to needy clients, active viral load tracking, frequent household visits and virtual reminders via phone calls. As a result, an additional 148 CLHIV attained viral suppression to bring the total number of CLHIV with suppressed viral load to 1714 (80%) within six months.

Conclusions: Clinical support provided to CLHIV in health-facilities is insufficient to achieve viral suppression. A coordinated approach with community structures is required to ensure CLHIV receive a continuum of care in their communities to achieve viral suppression as part of epidemic control.

The emerging field of legal epidemiology and its global potential for better health

Scott Burris^{1,2}

¹UK Faculty of Public Health, American Public Health Association (APHA), Philadelphia, United States, ²Temple University, Philadelphia, United States

Background/Objectives: Legal Epidemiology (LE) is the scientific study of the health effects of laws and legal practices. In the past decade, it has gained a strong foothold in US public health, and is growing as a field globally. It builds on robust methods of policy surveillance to measure law, and a range of method for quasi-experimental evaluation prevailing in epidemiology, economics and other social sciences. LE provides useful tools for transdisciplinary research, but also a vocabulary and specific competencies that public health professionals can use to increase their comfort and effectiveness in engaging legal factors in their work. The objective of this presentation is to demonstrate the range and utility of LE for global public health.

Methods: Review of prior research, existing competencies, available methods and tools, and effective applications of LE in policy development and advocacy.

Results: LE research includes evaluation of: 1) the effects/side effects of "interventional" public health laws such as road safety or tobacco control laws; 2) the relationship of "infrastructural" health laws (establishing the powers and duties of health agencies) and health system effectiveness; and 3) "incidental" public health laws (the many laws that shape the social determinants of health, such as income support, anti-discrimination, tax, housing and education laws). All these areas are important, but law is a particularly potent and malleable tool for addressing social determinants. Clear method of legal measurement and the use of modern software and AI tools has improved "policy surveillance," the scientific tracking of laws of public health importance. The presentation will describe CityHealth.org, a successful intervention using legal data to promote the spread of healthy policies in the largest US cities.

Conclusions: Legal epidemiology provides a range of effective methods, tools and concepts for helping improve the use of law and legal change for better health globally.

Complementary medicine approaches among homeless individuals in Switzerland: Desirable? Relevant? A mixed-method descriptive study

Véronique Grazioli¹, Laurent Hyvert¹, Chantal Berna², Hangartner Evelyne¹, Luana Schaad¹, Justin Nikles¹, Tshahé Anongba³, Patrick Bodenmann⁴

¹Center for Primary Care and Public Health, Unisanté, Switzerland,

²Lausanne University Hospital, Switzerland, ³Sleep-in, Lausanne, Switzerland,

⁴Center for primary care and public health, Unisanté, Switzerland

Background and Objectives: Despite their important health needs, homeless individuals (HomI) face barriers to healthcare, including lack of trust due to negative experiences. Whereas emerging Findings from the US suggest that complementary medicine (CM) may help engage this population into the healthcare system, there is a dearth of research exploring this thematic in Europe. This study aimed to explore CM interests and needs among HomI in Switzerland.

Methods: Participants (N= 123) were HomI in French-speaking Switzerland who completed a questionnaire assessing interests in 17 CM approaches. A subset of participants (n= 19) and 13 professionals (healthcare and social workers, shelter watchers) participated in semi-structured interviews exploring their perceptions of CM. Descriptive statistics and conventional content analysis were used to analyze quantitative and qualitative data.

Results: The top 5 most endorsed approaches included osteopathy, (61.5% interested), therapeutic massage (59.2%), nutritional supplements (57.1%)

music therapy (50.8%) and acupuncture (49.1%). Three themes emerged from the qualitative analysis: 1) CM meets HomI' interests and might help address several of their health needs; 2) Importance to follow specific rules to engage HomI in CM interventions; 3) Setting priorities (CM interventions vs. more basic needs). According to both professionals and HomI, CM interventions, such as music therapy, osteopathy or animal therapy might lead to improvements in self-confidence, well-being, social isolation and chronic pain. All participants recommended offering CM interventions in existing structures and involving professionals to promote them. Finally, a few participants questioned the relevance to develop a CM offer, highlighting more urgent social needs to be fulfilled first. Conclusions: Main findings suggest that developing CM approaches, such as osteopathy or music therapy might meet HomI interests and health needs. Using a community-based participatory paradigm would ensure following the recommendations to develop the offer within existing structures and involve professionals to promote the intervention.

From evidence to practice: implementing effective nutrition and high-quality early childhood education in low resource settings, the successful case of the Guatemala city municipal nurseries

Ana Palacios¹, Erik Parker², Lisa Villanueva³, Matthew Flynn¹, Helen Bland¹, Stephanie Dickinson², Dziyana Nazaruk¹, Joseph Telfair¹, Gregory Reinhart¹

¹Georgia Southern University, United States, ²Indiana University Bloomington, United States, ³The Mathile Institute for the Advancement of Human

Nutrition, Guatemala

Background: In Guatemala, the IV National Maternal and Child Health Survey 2014-2015 indicated that about one every two children < 5 years-of-age are stunted (length-height-for-age z-scores<-2). Childcare programs offer a cost-effective opportunity to deliver early education and learning opportunities, health, and nutrition services in a safe environment, especially for children in poverty or suffering from neglect. The purpose of this study was to compare growth outcomes, math performance, fluid intelligence, and receptive vocabulary between 8-year-old children in second grade that attended the Guatemala City Municipal Nurseries (GCMN) and received micronutrient supplements vs. sex, grade, and age-matched children (controls) that did not attend the municipal preschools. **Methods:** A cross-sectional design nested in a retrospective cohort between 2015-2019 was performed. Both GCMN children and control participants were asked to complete a math-, a receptive language- and a fluid intelligence test. Primary caregivers completed a sociodemographic survey. General and generalized linear mixed effect models were constructed to compare children that attended the GCMN vs. controls prior to elementary school. Models were adjusted by maternal education, sex, asset score, and school, data collection year, and case/control pair were included in the models as random effects.

Results: Children that attended the GCMN exhibited greater math and fluid intelligence scores relative to controls in adjusted models [$\beta = 6.48$; 95% CI (2.35–10.61)] and [$\beta = 1.20$; 95% CI (0.12–2.29)], respectively. Lower odds of stunting were significant for children who went to any childcare institution [AOR = 0.28; 95% CI (0.09–0.89)]. **Conclusions:** Our findings support the effectiveness of integrating high-quality early nutrition and education via childcare programs serving low-resourced populations, in child's nutritional status and academic performance. This model may be scalable and prove effective in improving children wellbeing from impoverished backgrounds.

Rapid methods to monitor nutrients in sustainable healthy diets of collective catering systems

Giulio Barocco^{1,2}, Elenora Croci³, Paolo Bogoni⁴, Antonella Calabretti⁴, Francesco Bucci⁵, Tiziana Longo⁶, Andrea Pernarcic⁶, Arianna Marsi⁶, Sofia Scalisi³, Jacopo Sepe³, Gabriela Guzzo³

¹The Local Health Agency of Trieste, Trieste, Italy, ²Faculty of Medicine, Trieste University, Trieste, Italy, ³Faculty of Medicine, The Local Health Agency of Trieste integrated with Trieste University, Italy, ⁴Department of Economic, Business, Mathematical and Statistical Science, Trieste University, Italy, ⁵Faculty of Medicine, Local Health Agency of Trieste integrated with Trieste University, Italy, ⁶Faculty of Medicine, The Local Health Agency of Trieste Integrated with Trieste University, Italy

Background: The WHO and FAO in the "Sustainable Healthy Diet guiding principles" (SHD) underline synergies among foods, nutrients present in dietary patterns and their bioavailability, degree of food processing, and subsequent health impact, even on non communicable disease, reported in target 3.4.1 of SDGs. In Italy almost

one in 10 people eat a meal in collective catering (CC) every day. In accordance with SHD, the Italian Ministry of Health (MH) in the national guidelines for CC indicate activating procedures for the conservation of nutritional qualities (NQ) of micronutrients and bioactive substances. The central purchasing bodies of the Region of Friuli Venezia Giulia have applied these criteria, introducing the process of critical control points of nutrient analysis (NACCP) in the Public Procurement for the school catering of 26 municipalities and for all 18 regional hospital CC with more than 3 million meals per year served. The aim of the project was to develop rapid and cheap methods for monitoring the NQ of meals by applying the NACCP process.

Methods: 80 samples of vegetables, meat and fish with different degrees of processing were taken from the CC and analysed both with chemical techniques and with optical rapid techniques (600 analyses).

Results: The samples were subjected to conventional analyses to determine the oxidation state and the content of characterizing molecules such as polyphenols, histamine, and total compounds of Maillard. The same samples were then analyzed by color measurements. The results showed a good correlation between the two analytical systems, in particular the color measurements and the Maillard compounds and the color measurements and the oxidation state.

Conclusions: Project findings can be applied in the NACCP process to rapidly cost-effectively monitor the nutritional quality of CC meals, and adhere to WHO and FAO the SHD guiding principles and MH guidelines for CC.

Unemployment status subsequent to cancer diagnosis and therapies: a systematic review and meta-analysis

Martina Chimienti¹, Giustino Morlino¹, Martina Chimienti¹, Giustino Morlino¹, Leonardo Palombi¹, Leonardo Gialloreti¹, Francesco Torino¹

¹Roma Tor Vergata, Italy

Background and Objective: In the years to come, cancer cases are expected to increase by 60%; for this reason, and due to improved treatments, the number of cancer survivors will increase considerably. Therefore, it is important to assess the social impact cancer and treatments will have on these individuals, especially those of working age. The purpose of our study is to examine whether cancer and subsequent treatments are associated with job loss or change in employment status.

Methods: Eight prospective studies were included in the systematic review and meta-analysis, with a total of 11,495 individuals aged 18-65 years, analyzing treatment regimens and psychophysical and social status in a post-cancer follow-up of at least 2 years. In the meta-analysis, a comparison was made between recovered unemployed cases and cases from a standard reference population. The Results are summarized graphically using forest plot.

Results: The study found that cancer and subsequent treatment are risk factors for unemployment with an overall Relative Risk of 7.24 (ln RR: 1.98, 95% CI: 1.32 - 2.63). Individuals undergoing chemotherapy and/or radiation treatment or those with brain and colorectal cancers are more likely to develop disabilities that negatively affect the risk of unemployment. Finally, variables such as: low educational level, female sex, older age, overweight and obesity before the start of therapy are associated with a higher risk of unemployment.

Conclusions: In the future, it is necessary for people with cancer to have greater access to specific health, social welfare and employment support programs. In addition, it is desirable that they become increasingly involved in the choice of therapeutic treatment.

Observed neighborhood physical disorder and health behaviors in a large urban area

Jesse Plascak¹, Tatyana Desire-Brisard², Darren Mays³, Brittney Keller-Hamilton¹, Andrew Rundle⁴, Emma Rose⁵, Electra Paskett⁶, Stephen Mooney⁷

¹College of Medicine, The Ohio State University, United States, ²School of Public Health, Rutgers University, United States, ³College of Medicine, The Ohio State University, United States, ⁴Mailman School of Public Health, Columbia University, United States, ⁵Brigham Young University, United States, ⁶College of Medicine, The Ohio State University, United States, ⁷School of Public Health, University of Washington, United States

Neighborhood physical disorder is an indicator of urban disinvestment that may act as a psychosocial stressor. This study tested associations between observed neighborhood physical disorder and tobacco use, alcohol bingeing, and sugar-sweetened beverage consumption among a large population-based sample. Individual-level data of this cross-sectional study were from adult

respondents of the New Jersey Behavioral Risk Factor Surveillance System, 2011-2016 ($n = 62,476$). Behavioral Risk Factor Surveillance System is the largest continuously conducted health survey system in the world. Aggregated area-level observed neighborhood physical disorder were from virtual audits of 23,276 Google Street View streetscapes. Tobacco use (current cigarette smoking or chewing tobacco, snuff, or snus use), monthly binge drinking occasions (5+/4+ drinks per occasion among males/females), and monthly sugar-sweetened beverages consumed were self-reported. Logistic and negative binomial regression models were used to generate odds ratios, prevalence rate ratios (PRR), 95% confidence intervals (CI) by levels of physical disorder. Compared to the lowest quartile, residence in the second (PRR: 1.16; 95% CI: 1.03, 1.13), third (PRR: 1.24; 95% CI: 1.10, 1.40), and fourth (highest) quartile of physical disorder (PRR: 1.24; 95% CI: 1.10, 1.40) was associated with higher monthly sugar-sweetened beverage consumption. Associations involving tobacco use and alcohol bingeing were mixed. Observed neighborhood disorder might be associated with unhealthy behaviors, especially sugar-sweetened beverage consumption. Studies across globally diverse urban setting are needed to explore external validity and motivate urban policy recommendations.

Maintaining personal health in a complex environment: how slum dwellers in Nigeria use lay consultation networks to make personal treatment decisions

Chinwe Onuegbu¹

¹Division of Health Sciences, Warwick Medical School, University of Warwick, United Kingdom

Background and Objective: Poor healthcare in urban slums in developing regions represents a complex humanitarian crisis requiring innovative and bottom-up solutions. How slum dwellers manage their health despite huge health risks and poor healthcare access, by utilising their social connections and social capital, is poorly understood. Drawing on social network theory, this study examined how slum dwellers in Nigeria used their Lay Consultation Networks (informal and naturally occurring networks with whom people discuss illness symptoms and health problems) to make treatment decisions.

Method: A mixed-method approach was adopted. Surveys ($n=480$) and semi-structured interviews ($n=30$) were conducted among working-age adults in two slums in Ibadan (large south-Western city), Oyo state, Nigeria. A public reference group comprising community members and researchers at the University of Ibadan was constituted to guide the study.

Results: Most participants consulted 1 to 3 informal network members during illness. Those consulting non-family members were significantly more likely to use alternative medicine than formal care. Use of online-based networks was scarce mainly due to poor digital literacy, and lack of digital devices. Network members shared advice about prescriptions and treatments (learnt from others or through their own experiences) with ill persons, some useful and some not. Limited neighborhood trust, busy work schedules, discrimination, and stigmatization of certain groups contributed to shaping who participants could talk to. Participants displayed a strong sense of agency when implementing advice or support from others.

Conclusions: Lay consultation networks can be an integral part of the overall health system. They can be incorporated into health policies and programmes to increase coverage and effectiveness of health interventions in slums and disadvantaged communities in low-and-middle-income countries.

Household food security and household dietary diversity in rural Bangladesh during the COVID-19 pandemic - baseline results from a community-based cluster randomized controlled trial

Tanvir Huda¹, Michael Dibley¹, Tazeen Tahsina², Afrin Iqbal², Mohammad Hasan²

¹Sydney School of Public Health, The University of Sydney, Australia,

²International Centre for Diarrhoeal Disease Research, Bangladesh

Background: There has been a limited decline in undernutrition rates in Bangladesh. Household food security is one of the major factors. Despite Bangladesh's remarkable progress in agricultural production, household food insecurity persists, especially in rural areas. This study examined household food insecurity and household dietary diversity in the rural areas of northwest Bangladesh during the COVID-19 Pandemic.

Methods: The study used data from baseline assessment of a large cluster randomized trial on social protection and child undernutrition. The data were

collected from December 2020 to October 2021 from 2756 households. The Household Food Insecurity experience scale (FAO 2018) was used to assess household food insecurity, while the household dietary diversity was measured by the household dietary diversity score (FAO 2006).

Results: Nearly 35% of all households were moderately or severely food insecure. The prevalence of food insecurity among land-rich farmers or professionals was much lower (26%) than among families of other occupations (42%). The prevalence of food insecurity among families with educated women was almost half (22%) compared to families with uneducated women (45%). The mean HDDS was six food groups indicating that families had, on average, access to 6 out of twelve food groups daily. The dominant consumed food groups were cereals (90%), fish (75%), and vegetables (79%), while the lesser consumed food groups were eggs (28%), legumes (22%), meat (25%), milk (38%). We did not find any significant seasonal variation in household food security and dietary diversity.

Discussion: Our findings showed that the percentage of households experiencing moderate to severe food insecurity during the pandemic was more significant than the pre-pandemic national average (15%). Most families relied on less expensive food choices during the pandemic period. The seasonal poverty period (Monga in the local language) did not further affect food security and dietary diversity.

A posteriori derived dietary patterns of adults in Italy: results from the third Italian National Food Consumption Survey, INRAN-SCAI 2005-06

Nicolò Scarsi¹, Nicolò Scarsi¹, Angelo Pezzullo¹, Cosimo Savoia¹, Roberta Pastorino¹, Gian Raspolini¹, Stefania Boccia¹

¹Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy

A large body of literature showed the importance of dietary patterns (DPs) analysis in nutritional epidemiology. The objective of this research was to derive and characterize adults dietary patterns in a large Italian population-based cohort and to assess individuals' diet adherence with z-scores. Participants to the third Italian National Food Consumption Survey (INRAN-SCAI 2005-06) were included. We classified all food items ($N = 878$) into 24 pre-defined food groups according to a modified version of the updated food classification system FoodEx2. Dietary patterns were obtained through principal component analysis, after adjusting log-transformed input variables, without minimum values, using the residual method. Relying on data from 2831 subjects (median age 47, IQR 35-60), five principal components (PC) were retained, explaining 35.63% of the overall variance. PC1 was similar to the high-fat diet characterized by positive loadings for vegetables, starchy roots, eggs products, fat and oils, and low amount of alcoholic beverages. PC2 was a picture of a carnivorous eating behavior, positively charged by processed meat, offals, other meats, juices, special nutritional, composite food, and snacks. PC3 was representative of a health conscious, positively loaded by vegetables, fruits and water, negatively associated with the consumption of pork meat and alcoholic beverages. PC4 showed similarities with a vegetarian diet, positively loaded by grain products, vegetables, herbs, and spices. The last PC represents an unhealthy dietary pattern, positively charged by sugar and confectionery, non-alcoholic beverages and negatively correlated with vegetable consumption. According to z-scores, 69% of our cohort showed high DPs adherence. These findings are valuable for understanding the dietary habits of adults in Italy, to orient public health policies and promote healthier food behaviors in the future.

Health literacy related to health care, disease prevention, and health promotion in the Italian adult population

Luigi Palmieri¹, Luigi Palmieri^{1,2}, Chiara Lorini³, Chiara Cadeddu⁴, Aldo Rosano⁵, Chiara Donfrancesco¹, Guglielmo Bonaccorsi⁶, Paola Castro⁷, Cinzia Noce¹, Claudia Meduri¹, Matilde Bocci¹, Daniela Galeone⁸, Graziano Onder⁴, Brigid Unim¹

¹Department of Cardiovascular, Endocrine-metabolic Diseases and Aging,

Italian National Institute of Health, Rome, Italy, ²Istituto Superiore di

Sanità, Italy, ³Department of Health Sciences, University of Florence, Italy,

⁴Università Cattolica del Sacro Cuore, Rome, Italy, ⁵National Institute for

the Analysis of Public Policy, Rome, Italy, ⁶Department of Health Sciences,

University of Florence, Florence, Italy, ⁷Scientific Communication Unit, Italian

National Institute of Health, Rome, Italy, ⁸Ministry of Health, Rome, Italy

Background and Objective: Health Literacy (HL), defined as the ability to access/obtain, understand, appraise/judge/evaluate, apply/use health-related information, has a direct impact on the capacity of managing three main domains

of health-relevant information: Health Care (HC), Disease Prevention (DP), and Health Promotion (HP), which are fundamental for improving individual and population health.

Methods: In 2021, a national survey of a representative sample of the Italian population aged 18+ years (N=3,500) was conducted in the framework of the WHO M-POHL (Measuring Population and Organizational Health Literacy) network. The validated HL questionnaire at 12 items (HLS-Q12) included general HL, sociodemographic characteristics, risk factors, lifestyles sections. For each of the 3 HL domains, 4 items were analysed. For each HL-item, a 4-point Likert scale was applied: very easy, easy, difficult, very difficult. For the 3 HL domains (healthcare, disease prevention, health promotion), the percentage of very easy+easy answers was used as a score and classified in 5 groups (0%, 25%, 50%, 75%, 100%).

Results: For all the 3 HL domains, the majority of participants were in the 75% and 100% groups (63.1% for HC, 56.8% for DP, 70.7% for HP). They were mostly in the 18-29 age group (72.3% for HC, 59.9% for DP, 72.7% for HP), women for HP only (72.5%), with a high educational level (66.6% for HC, 59.0% for DP, 72.4% for HP), living in north Western regions (65.1% for HC and 58.4% for DP) and central Italy (74.2% for HP).

Conclusions: The results on HL domains of the general HL highlighted the need to improve HL especially in adult and elderly population, in those with a lower level of education, and in the Southern and Central areas of the country. Better HL level could improve the general population's ability to manage health information regarding care, prevention, and promotion of health.

DOI: 10.18332/popmed/165720

The relationship between blood pressure variability and cognitive function

Yang Zhao¹, Lili Song¹

¹The George Institute for Global Health, Beijing, China

Background and Objective: It has been well-established that long-term blood pressure variability (BPV) plays an important role in the progression of cerebrovascular vascular damage and the incidence of cardiovascular diseases. Knowledge about the association between long-term BPV and cognitive performance was scarce and ambiguous. This study aims to systemically examine the potential association between BPV and the trajectory of cognitive decline among Chinese adults, by using nationally representative population-based data from an 8-year prospective cohort.

Methods: We used four waves (2011-2018) of the China Health and Retirement Longitudinal Study, including 5696 participants aged ≥45 years. BPV was measured using the within-individual standard deviation (SD) of mean systolic blood pressure (SBP) obtained from three waves visits, and the coefficient of variation (CV). The cognitive function was measured as the total score of episodic memory and mental status, with a higher cognition score indicating superior cognitive functions. Multivariable linear regression models were applied.

Results: The mean value of SBP, mean SD of SBP and mean CV of SBP was 128.05 mm Hg and was 10.28 and 0.08, respectively. Both the SD (coefficient= -0.092, 95% CI= -0.144, -0.040) and CV of SBP variability (coefficient= -0.085, 95% CI= -0.137, -0.034) significantly decreased the risk of cognitive function. Subgroup analyses revealed significant relationships in both females and males.

Conclusions: In middle-aged and older Chinese adults, higher long-term SBP variability could be an independent predictor of accelerated cognitive decline. Further high-quality studies are warranted to evaluate and confirm the benefit of BPV-lowering strategies for preventing cognitive impairment.

Disentangling the multigenerational transmissions of socioeconomic disadvantages and mental health problems by gender and across lineages: findings from the Stockholm Birth cohort multigenerational study

Baojing Li¹, Ylva Almquist¹, Can Liu¹, Lisa Berg¹

¹Stockholm University, Sweden

Background and Objective: There is a paucity of research examining the patterning of socioeconomic disadvantages and mental health problems across multiple generations. The significance of research on multigenerational processes is based on a concern with how socioeconomic, mental health, and gender inequalities evolve over a longer period of time. The current study therefore aimed to investigate the interconnected transmissions of socioeconomic disadvantages and mental health problems from grandparents to grandchildren through the parents, as well as the extent to which these transmissions differ according to lineage (i.e., through matrilineal/patrilineal descent) and grandchild gender.

Methods: Drawing on the Stockholm Birth Cohort Multigenerational Study, the sample included 21,416 unique lineages by grandchild gender centered around cohort members born in 1953 (parental generation) as well as their children (grandchild generation) and their parents (grandparental generation). Based on local and national register data, socioeconomic disadvantages were operationalized as low income, and mental health problems as psychiatric disorders. A series of path models based on structural equation modelling were applied to estimate the associations between low income and psychiatric disorders across generations and for each lineage-gender combination.

Results: We found a multigenerational transmission of low income through the patriline to grandchildren. Psychiatric disorders were transmitted through both the patriline and matriline, but only to grandsons. The patriline-grandson transmission of psychiatric disorder partially operated via low income of the fathers. Furthermore, grandparents' psychiatric disorders influenced their children's and grandchildren's income.

Conclusions: We conclude that there is evidence of transmissions of socioeconomic disadvantages and mental health problems across three generations, although these transmissions differ by lineage and grandchild gender. Our findings further highlight that grandparents' mental health problems could cast a long shadow on their children's and grandchildren's socioeconomic outcomes, and that socioeconomic disadvantages in the intermediate generation may play an important role for the multigenerational transmission of mental health problems.

Educational trajectories and inequalities in longevity: a comparison across 14 European countries

Cornelia Wagner¹, Stéphane Cullati¹, Stefan Sieber², Tim Huijts³, Arnaud Chiolerio¹, Cristian Carmeli¹

¹University of Fribourg Switzerland, ²University of Lausanne Switzerland,

³Maastricht University Netherlands

Background: While educational gradients in longevity have been observed consistently in adult Europeans, these inequalities have been understudied within the context of family- and country-level influences. We utilized population-based multi-generational multi-country data to assess the role (1) of parental and individual education in shaping intergenerational inequalities in longevity, and (2) of country-level social net expenditure in mitigating these inequalities.

Methods: We analyzed data from 52,271 adults born before 1965 who participated in the Survey of Health, Ageing and Retirement in Europe, comprising 14 countries. Mortality from all causes (outcome) was ascertained between 2013 and 2020. Educational trajectories (exposure) were High-High (reference), Low-High, High-Low, and Low-Low, corresponding to the sequence of parental-individual educational attainment. We quantified inequalities as years of life lost (YLL) between the ages of 50 and 90 estimated via differences in the area under standardized survival curves. We assessed the association between country-level social net expenditure and YLL via meta-regression.

Results: Inequalities in longevity due to educational trajectories were associated with low individual education regardless of parental education. Compared to High-High, having High-Low and Low-Low led to 2.2 (95% confidence intervals: 1.0 to 3.5) and 2.9 (2.2 to 3.6) YLL, while YLL for Low-High were 0.4 (-0.2 to 0.9). A 1% increase in social net expenditure led to an increase of 0.01 (-0.3 to 0.3) YLL for Low-High, 0.007 (-0.1 to 0.2) YLL for High-Low, and a decrease of 0.02 (-0.1 to 0.2) YLL for Low-Low.

Conclusion: In European countries, individual education could be the main driver of inequalities in longevity for adults older than 50 years of age and born before 1965. Further, higher social expenditure is not associated with smaller educational inequalities in longevity.

Masculinities in focus: how can the consideration of gender roles pave the way for gender-transformative healthcare services and improve health for all?

Céline Miani¹, Sudeepa Khanal-Bhattarai¹, Stephanie Batram-Zantvoort¹, Jan Morawe¹, Emily Finne¹, Melanie Boeckmann¹, Julia Zielke¹

¹Bielefeld University Germany

Background and objective: How are men addressed by healthcare services? How is the role of men understood in the construction of gender-equitable health? Through a mixed-methods project on masculinities and health, we investigated the gender-transformative potential of reflecting on and taking into account gender roles in the design and implementation of healthcare services.

Methods: We conducted a systematic review on smoking cessations interventions

for expecting and new parents, narrative interviews on the construction of masculinities in relation to family planning and contraception decisions, and a scoping review on masculinities and health in gender-transformative interventions. Results: With regard to smoking cessation (n=9 studies), we found that current healthcare structures tend to not engage specifically with fathers, and that men are forced into rather classic and passive gender roles that leave little room for change. Yet, in the interviews (n=13), we found that men consider their roles in reproductive health, contraception and family planning as complex and would like to take on more responsibility, be more proactive and engaged. This finding echoes the results of the scoping review (n=24 studies), which shows that a more critical approach to masculinity is possible and can lead to concrete and measurable improvements in health outcomes, especially in the fields of domestic violence, AIDS/HIV, sexual health and general well-being.

Conclusion: Not taking into account masculinities in the design and implementation of healthcare services appears as a missed opportunity that reinforces stereotypes and traditional gender roles. Although transfer from theory to practice on the one hand, and from lived experiences to interventions on the other hand, remains challenging, men themselves and a handful of promising and innovative approaches point toward the potential of gender-transformative healthcare services to improve health for all.

Monitoring health in the Brazilian municipalities for the Sustainable Development Goals (SDGs)

Rômulo Paes-Sousa¹, Fabrício Silveira¹, Gabriela Silva¹

¹Fiocruz Minas, Brazil

Background and Objective: This study proposes a summary index for monitoring the health-related SDG's indicators in Brazilian municipalities, enabling both the interiorization of the 2030 Agenda in the territory, reducing inequalities in the space, and its effective adoption in policymaking.

Methods: The ecological study comprises 23 SDGs health indicators for the 5570 municipalities of the country analyzed in the period between 2015-2021. The empirical Bayesian rate was adopted to smooth each data series due to the spatial effect previously detected. The annual municipal index and 7 thematic subindexes (maternal health; infant health; non-communicable diseases; infectious diseases; injuries/violence; environmental; coverage) were standardized from 0 (worse performance) to 100 (best performance). Each are weighted by symmetrical regional-level indexes. The municipalities are ranked according to the level of sophistication of the local health equipment.

Results: Four main regional health profiles were identified in the country: (i) the north region is characterized by low technological complexity and huge gaps in most health topics; (ii) the Northeast presents the highest spatial disparities in the country; (iii) the south the highest thematic disparities, with the country's best profile on maternal and child health themes and the worst in some infectious diseases and topics of violence and injuries; finally, (IV) the Southeast and Midwest regions present the best overall infrastructure of health in the country, which reflects on the index.

Conclusion: The evaluation of the health SDGs at disaggregated levels requires the recognition of the spatial dependence of health phenomena. Indeed, both health and disease seem less local than a regional phenomenon in the country's territory. By enabling the continuous monitoring of the indicators over time, the methodology developed opens new paths for the achievement of the SDGs.

Post-pandemic health inequalities: global estimates of the evolution of the health-related SDG indicators

Rômulo Paes-Sousa¹, Wanessa Miranda², Fabrício Silveira¹

¹Fiocruz Minas Brazil, ²Fiocruz Minas / UFMG, Brazil

Background and objective: The world has entered a critical period for accelerating the responses to the main global challenges expressed in the Sustainable Development Goals (SDGs), from the elimination of poverty and hunger to improving health to tackling climate change. Much of the previous efforts, however, have been hampered by the direct and indirect impact of the COVID-19 pandemic. Against this backdrop, this study estimates the impact of the COVID-19 pandemic on the health-related indicators, making it possible to size the countermeasures necessary to keep the commitments of the 2030 Agenda.

Methods: We explore the evolution of 40 health-related SDGs indicators, covering seven major health themes, using the information available for 185 countries in the period between 2000 and 2019. A global counterfactual evolution curve is estimated by using panel data models. The curves allow the extrapolation of the

impact of revisions of the expected growth of the Gross National Product per capita on the potential evolution of each indicator for all countries.

Results: The disproportionately greater economic losses in the poorest countries may increase global health inequalities in the aftermath of the COVID-19 pandemic. Although the average expected loss in the evolution of the health-related indicators is around 5', in some countries the damage is five times worse, amplified by the indirect impact of economic losses on maternal and children health indicators. At the same time, the greater fiscal room to accommodate increases of expenditures in the developed world should also contribute to increase global disparities.

Conclusions: The study's findings reveal the importance of incorporating the fight against health inequalities in the global development agendas, which can be oriented by the SDGs.

"We've been portrayed as commodities who because of their age are a bit of a nuisance": A qualitative analysis of older people's socio-ecological determinants of health and well-being during the COVID-19 pandemic in Ireland

Viveka Guzman¹, Frank Doyle¹, Ronan Foley², Penny Wilson¹, Noelene Crowe¹, Peter Craven¹, Ailbhe Smith¹, Gerry Hegarty¹, Maria Pertl¹

¹Royal College of Surgeons in Ireland, Beaux Lane House, Mercer Street Lower, Dublin, Ireland, ²Maynooth University, Maynooth, Co. Kildare, WE23 HW31, Ireland,

Background: Evidence indicates that older people with biological and social vulnerabilities are at high risk of short- and long-term consequences related to the COVID-19 pandemic. However, studies have also highlighted that the crisis may present opportunities for personal growth if individuals are met with appropriate resources and support. This study's aim was to explore the perceptions of older people regarding how individual, social, and environmental factors supported or hindered their well-being and health during COVID-19.

Methods: We analyzed data collected between April-May and October-November 2021 from the Well-being, Interventions, and Support during Epidemics (WISE) study, a qualitative investigation of community-dwellers based in Ireland and aged 65 years or over. Participants (n=57) completed written submissions, narrative interviews, and/or go-along interviews detailing their experiences during the pandemic. Framework analysis was carried out in NVivo 12 to identify determinants, linkages, and explanations within Bronfenbrenner's socio-ecological model.

Results: Mean age of participants was 74.9 years, 57% were female, 45% lived alone, and 88% lived in urban or suburban areas. Our findings highlight the heterogeneous effect of COVID-19 across diverse older individuals who held distinct concerns, capabilities, and roles in society before and during the pandemic. Contextual characteristics such as housing, access to nature and neighbourhood social and built environments had an influential role in participants' well-being and supports. We identified mixed views regarding public health restrictions, but a consensus emerged questioning the suitability of one-size-fits-all approaches based on chronological age. Moreover, respondents suggested that some negative consequences could have been avoided by collaborating with older people and with the provision of clearer communications.

Conclusion: Our analysis identified interdependencies between individual characteristics and socio-ecological factors that influenced participants' development of adaptive strategies, coping mechanisms, and availability of supports. These represent areas of opportunity for the development of age-friendly interventions during and beyond public health crises.

Food choices and nutrient intake of workers in the hospital canteen of San Daniele del Friuli, Italy

Diana Menis¹, Federica Fiori¹, Daniela Zago¹, Peter Cautero¹, Lucia Lesa², Alessandro Conte³, Laura Brunelli^{4,5}, Maria Parpinel¹

¹Department of Medicine, University of Udine, Udine, Italy, ²Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy, ³Medical Directorate, University of Udine, Hospital of San Daniele-Tolmezzo, Azienda Sanitaria Universitaria Friuli Centrale, San Daniele del Friuli, Udine, Italy, ⁴Department of Medicine, Azienda Sanitaria Universitaria Friuli Centrale, University of Udine, Udine, Italy, ⁵Accreditation, Quality, and Clinical Risk Unit, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy

Background and Objective: Recently, the awareness of the role that food play in human and planetary health has grown. Although the nutritional and environmental benefits of plant-based diets are widely recognized, little is known about the availability of healthy foods in workplaces. Our aim was to evaluate food choices

and nutritional composition of the meals consumed in a hospital canteen in Italy. Methods: An observational study was conducted in San Daniele del Friuli hospital on 5 working days in September 2022; photos of lunch trays of all workers who agreed to participate were taken before and after the meal. Energy and nutrient intakes were assessed after visual estimation of wastes using the Italian food composition database for epidemiological studies (bda-ieo.it). Recipes and portions were provided by canteen staff. Intakes were compared to the Italian Dietary Reference Values (DRVs).

Results: 480 photos of 240 meals were analyzed. Overall, the lunch met the DRVs. The meals contained a median of 642 (511–826) kcal (men: 781 kcal; women: 607 kcal), of which 18 (15–23)%E came from proteins, 34 (27–39)%E from fats, 44 (37–50)%E from carbohydrates, and 2 (2–4)%E from fiber. About half of the participants consumed high fats and low carbohydrates. Vegetarian meals (N=30; 13%) contained high amount of fats (41; 37–48%E) and saturated fatty acids (10; 8–17%E), as meat was usually replaced with cheese. Vegan options (N=15; 6%) consisted mainly of soups, rice, vegetables, and fruits and were low in energy (599; 449–645 kcal) and protein (13; 9–15 g/tray vs. 34; 25–42 g/tray in omnivorous meals).

Conclusion: We observed inadequate nutrient composition in vegetarian and vegan meals. Dietary education interventions are needed to promote healthier behaviors. However, poor food choices may be partially attributed to the lack of variety of vegetarian/vegan alternatives offered in the canteen.

DOI: 10.18332/popmed/163792

Women's collectives address health determinants in urban slums of Indore, India

Kanupriya Kothiwala¹, Siddharth Agarwal¹, Shabnam Verma¹

¹Urban Health Resource Centre, Research Associate, Humaypur, Safdarjung Enclave, New Delhi, India

Background and Objective: Accessing timely, affordable services is a crucial health determinant urban for urban poor in India.

Urban Health Resource Centre (UHC) mentors slum-based women's savings groups in slums of Indore, India. Each group comprises of 10-12 members. We studied how collective savings and loans help families of women's groups in addressing health determinants.

Methods: Interviews were carried out during 2022 with 2 women office-bearers each from 10 women's groups formed between 2010 to 2015. Interviews covered reasons for borrowing from saving's group and how the collectives contributed to meeting their family's health needs.

Results: Women borrowed to meet medical costs and prevent delay in seeking care. This involved arranging for cost of emergency transportation to the health facility by borrowing from collective pool at midnight. Women borrowed in advance for planned expenses including birth-preparedness, delivery, other surgical or medical treatment and repay in instalments. Being part of women's groups contributed to enhanced knowledge of health care including pregnancy care, facilities for delivery, other treatment at Government/low-cost private health facilities. Improved access to outreach services such as Antenatal check-up and registration, vaccination during pregnancy and childhood. Women drew loans to purchase grains at harvest time to cater to families' nutritional requirements.

Conclusions: Women's groups in slums can address several determinants of health in slums and contribute towards fulfilling SDG 3. Group meetings also helped women in establishing stronger social cohesion and gain knowledge about healthcare. Continuous mentoring by CSOs plays a crucial role in smooth functioning of savings groups. Government policies in India such as National Urban Health Mission (NUHM) mandate formation of women's health groups but the implementation remains weak on ground. UHC's approach can potentially guide policy implementation to sustain savings groups in slums with effective Government-CSO partnerships.

Access to COVID-19 prevention, diagnosis and care for migrants and ethnic minorities in the WHO European Region: a systematic review

Chiara De Marchi¹, Arianna Bellini¹, Angela Gatta¹, Maria Tosti¹, Franca D'Angelo¹, Silvia Declich¹, Elena Mazzalai¹, Salvatore Scarso¹, Giulia Marchetti¹, Caterina Ferrari¹, Francesco Mondera¹, Giancosimo Mancini¹, Igor Aloise¹, Marise Sabato¹, Leonardo Siena¹, Dara Giannini¹, Anissa Jaljaa¹, Federica Turatto¹, Maurizio Marceca¹

¹Department of Public Health and Infectious Diseases, Sapienza University, Rome, Italy

Background & Objective: The COVID-19 pandemic has had a major impact on Migrants and Ethnic Minorities (MEMs) population in terms of risk of SARS-CoV-2 infection, morbidity, and mortality. The COVID-19 pandemic was defined as a syndemic for its interaction with pre-existing socio-economic determinants of health, widening health inequalities and worsening health outcomes. The aim of this study is to investigate inequalities in access to healthcare for COVID-19 among MEMs compared to the general population. Migrants represent almost 10% of the population living in the WHO European Region, so the issue is of particular interest to this region.

Methods: A systematic review was conducted, collecting studies on MEMs' access to healthcare for COVID-19 in the WHO European Region in terms of access to prevention, diagnosis, and care, published from January 2020 to February 2022, on the following databases: Medline, Embase, Biosis, Scisearch, Esbiobase.

Results: Of the 19 studies identified, 11 were about vaccine hesitancy, 5 about vaccine execution, 2 on access to COVID-19 testing and 1 was about access to information on COVID-19. Around 65% of the studies were conducted in UK. Overall, MEMs population faced higher barriers to the access to vaccination, turned out to be more vaccine hesitant and faced more difficulties in access to COVID-19 information and testing.

Conclusion: These findings highlight the inequalities MEMs population faced accessing healthcare services for COVID-19. Social determinants of health are one of the main factors involved in the genesis of health inequalities: a framework of structural racism leading to lower trust in government choices, together with a disadvantaged socio-economic status, determined inequalities in accessing healthcare services and health information. These findings underline the need for policymakers to prioritize strategies for building trust and engage ethnic minorities, and to overcome the socio-economic barriers when designing health promotion programs.

Evaluating the intersectionality of social determinants of health on AIDS using a cohort of 28.3 million Brazilians

Davide Rasella^{1,2}, Iracema Lua¹, Andrea Silva¹, Priscila Pinto¹, Laio Magno³, James Macinko⁴, Ronaldo Coelho⁵, Luis Souza⁶, Ines Dourado⁶

¹Institute of Collective Health at the Federal University of Bahia (ISC/UFBA); Center for Integration of Data and Knowledge for Health (CIDACS), Gonçalo Moniz Institute, Oswaldo Cruz Foundation, Brazil, ²ISGlobal, Hospital Clinic - Universitat de Barcelona, Barcel, Spain, ³Department of Life Sciences, Bahia State University (DCV/UNEB), Brazil, ⁴Department of Health Policy and Management, University of California, Los Angeles, USA, ⁵Department of Chronic Conditions Diseases and Sexually Transmitted Infections, Ministry of Health, Brazil, ⁶Institute of Collective Health at the Federal University of Bahia (ISC/UFBA), Brazil

Background and Objective: Societies that live with socio-structural inequalities and health inequities need to better understand these processes. In that regard intersectionality theory becomes fundamental to public health. The scientific literature on HIV/AIDS presents associations and isolated effects of some social determinants of health (SDH), but the intersection between them is still poorly addressed.

Thus, our objective was to evaluate the intersectional effects of SDH on AIDS outcomes: incidence, mortality, and case-fatality rates.

Methods: A retrospective cohort of 28.3 million individuals was evaluated over a 9-year period (2007-2015). The multivariable Poisson regression were estimated using robust standard errors clustered on the municipality of residence, for each outcome. The intersections and combined effects were evaluate from the dummy variables of interaction of the highest exposure categories of the variables race/skin color, education, and wealth. Interactions additive was estimated from the index of synergy (S).

Results: The risk of getting sick and dying from AIDS was higher in the intersection groups of the 3 highest exposure categories: black people, lower wealth, and lower education, had the highest AIDS incidence (34.33/100,000py; RRA:3.07, 95%CI:2.68-3.52) mortality (14.10/100,000py; RRA:5.01, 95%CI:4.04-6.22) and case-fatality rates (7.53/100py; RRA: 1.62; 95%CI:1.18-2.21). This intersection represents a positive additive interaction for the risk of getting sick (S:1.60) and dying (S:2.40) from AIDS. Among people living with AIDS the synergistic effect for case-fatality was even greater (S:2.95).

Conclusion: The intersections of identities that mark socio-structural inequalities, amplify the risks of getting sick and dying from AIDS, exceeding the sum of the risks of each exposure separately. The skin color stands out, since the (sub) groups with the combination of black color were those with the worst outcomes. Since this is an unchangeable characteristic, it highlights the need for social

rate associated with diabetes. Crude mortality rate associated with cardiovascular disease. Infant mortality rate. Percentage of women (between 50-69 years) who undergo breast cancer screening. Road accidents per capita. Results: 231 HAZs were identified (111 between provincial capitals and 120 in inner areas) with an average population of 22,000 inhabitants. Conclusion: This tool can contribute to the Evidence-Based-Policy-Making process, promoting health-service development and improving effectiveness of Sicilian Health System in reducing inequalities.

Exploring the determinants of demand for solar systems in Ghanaian Healthcare Facilities - a choice experiment

Ana Perez Arredondo¹, Kennedy Alatinga², Evelyn Ewere³, Callistus Agbam¹, Katja Bender¹

¹International Centre for Sustainable Development (IZNE) of the University of Applied Science Bonn Rhein-Sieg (HBRS), Sankt Augustin, Germany,

²Faculty of Planning and Land Management at SD Dumbo University of Business and Integrated Development Studies, Wa, Ghana, ³Center for Development Research (ZEF), University of Bonn, Bonn, Germany

Background: Access to electricity is one of the enabling factors for healthcare service provision. From the sustainable development perspective, an essential requirement for improving health and caring for our environment is to assure that health facilities have sufficient and reliable access to the supply of clean and sustainable energy. The objective of this work is to investigate the users' perceptions of electricity needs and electricity sources and the way those influence different attributes and their relevance for the diffusion of renewable electricity systems in healthcare facilities.

Methods: To identify preferences and choices, Stated Choice modelling was applied as the use of solar PV systems in health facilities is not widespread in Ghana. This method allows to present the respondents with hypothetical options, which have attributes close to the real world. Four attributes were considered, namely electricity system configuration, initial investment cost, monthly costs, and improvements to the reliability of the electricity supply.

Results: The largest share of the 200 health facilities interviewed reported services provision as outpatient treatment, provision of maternity services and family planning, which are relatively low electricity-intensive services. However, there was a general perception that increased reliability on the electricity supply can improve the health service provision and operation of the facilities. Moreover, despite that preferences towards the solar systems, the initial investment costs of the solar systems is still perceived as preventing the adoption of this technology. Conclusion: From this study we can conclude that health facilities in Ghana rely greatly on the national supply which has issues with reliability, compromising the delivery of healthcare services. However, the adoption of alternative electricity technologies based on renewable sources is not likely to occur at the facility level without the engagement of other actors that can help bridging the barriers for adoption, as initial investment costs.

What does the world think about working or not? World Values Survey 2017-2022

Elif Yüce Yörük¹, Aslı Ata Teneler², Ceren Varer Akpınar³

¹Muğla Provincial Health Directorate, Orhaniye, İsmet Çatak Cd. 22- 6, Muğla Merkez/Muğla, Türkiye, ²Giresun Community Health Centre, Çınarlar, Sokakbaşı Cd., Giresun Merkez/Giresun, Türkiye, ³Public Health Department, Giresun University Faculty of Medicine, Türkiye

Background and Objective: By using the 7th wave of World Value Survey (WVS), we investigated the cross-region differences in opinions about working life and the relations with sociodemographic determinants.

Methods: In current descriptive/cross-sectional study, WVS data which contains 78 countries from 6 World Health Organization (WHO) regions (African Region (AFR), Region of the Americas (AMR), South-East Asian Region (SEAR), European Region (EUR), Eastern Mediterranean Region (EMR), Western Pacific Region (WPR)) with 87760 participants were pooled for the analysis. Opinions about working life were selected as dependent variable. Their relation with age, sex, place of residence, marital status, education level, sector of employment, status of employment, social class, income level, immigration status, feeling of happiness, self-rated health, satisfaction with life and country region by WHO classification were evaluated. Descriptive and the chi-square analysis were conducted ($p < 0.05$). Results: Mean age was 42.85±16.35, 52.5% were female. The distribution of the regions were 26.2% of AMR, 23.0% WPR, 22.3% EUR, 13.6% EMR, 9.3% SEAR, 5.6%

of AFR.

It was determined that 60.3% of the participants were full-time employees and the highest rate was 71.2% in SEAR. The highest income level was 11.5% in SEAR. Being an immigrant was reported mostly in the EUR (10.0%). According to regions, opinions about working life differ significantly ($p < 0.001$).

In terms of opinions on working life; those who stated work is important (88.5%) and those who thought work is a duty to society (89.8%) were highest in the AFR. Additionally, those who reported men should have more right to a job was 74.2%, those who agreed that native people should have the job priority was 89.2% which were the highest in the EMR.

Conclusion: Differences of opinions between regions regarding the place of women and immigrants in working life are quite evident. Discrimination in working life is an important issue concerning public health.

Knowledge and practice of biosafety among laboratory staff in Tunis governorate, Tunisia

Sondes Derouiche¹, Nissaf Bouafif ep Ben Alaya¹, Mohamed Makhoulouf², Salah Amor³, Hejer Letaief¹, Aicha Hechaichi¹

¹National Observatory of New and Emerging Diseases, Tunis, Tunisia, ²DRS Sfax, Tunisie, Minister of Health, Tunisia, Sfax, Tunisia, ³CO-Coordinateur scientifique du programme FETP Tunisia

Background: Developing countries often lack biosafety standard operating procedures. A need to study biosafety practices among staff of state and private laboratories has been identified. This study aimed to assess the knowledge and practices of laboratory standard precautions (LSP) among laboratory staff in human and animal laboratories in the governorate of Tunis.

Methods: A cross-sectional descriptive study was conducted using a standardized questionnaire administered between December 2021 and January 2022. Data were collected among laboratory staff who agreed to participate in this study. Answers were judged according to the score granted to each item and used during a face-to-face interview.

Results: Among the 152 staff interviewed, 70% were from the public sector. The majority of staff was vaccinated against hepatitis B (84.5%). The overall level of knowledge was satisfactory in 51% of cases. In the area of proper use of personal protective equipment, 95% wore the mask and 80% the gloves. On a practical level, 66% of the staff questioned, regardless of their categories, had an adequate overall perception of biosafety.

Conclusion: Although this study revealed several limitations such as the reluctance and unavailability of laboratory staff during the study period, significant gaps affecting both knowledge and practice among laboratory staff in Tunis region have been identified. Continuous staff training based on behavior and on application of universal and specific hygiene measures as well as periodic evaluations of these laboratories is recommended.

The 2008 economic crisis' impact on perinatal and infant mortality in Southern European countries

Julia Doetsch¹, Ricardo Almendra², Teresa Leão³, Eva Pilot⁴, Thomas Krafft⁴, Henrique Barros³

¹Institute of Public Health, University of Porto (ISPUP), Epidemiological research Unit (EPIUnit) Germany, ²CEGOT-Centre of Studies on Geography and Spatial Planning; Department of Geography and Tourism, University of Coimbra Milton Severo EPIUnit - Instituto de Saúde Pública da Universidade do Porto, Portugal, ³EPIUnit - Instituto de Saúde Pública da Universidade do Porto, Portugal, ⁴Faculty of Health, Medicine and Life Sciences, Care and Public Health Research Institute, Maastricht University, Maastricht, the Netherlands

Background and objective: The study of crises events provides important lessons to prepare for upcoming events. The Great Recessions impact on perinatal health in Europe can provide relevant insights on the healthcare and social protection systems' response in the protection of the health of the most vulnerable groups. To assess time trends and international disparities in perinatal (PMR) and infant mortality (IMR), following the Great Recession, and their association with socioeconomic indicators in Portugal, Greece, Italy and Spain.

Methods: Associations were assessed through generalised linear models for all four countries. A Poisson joinpoint regression model was applied to explore PMR and IMR trends changes between 2000 and 2018. Country disparities were analysed using Mixed Effect Multilevel models.

Results: IMR and PMR have decreased overall in the four selected countries

between 2000 and 2018. Still, whereas in Spain, Italy and Portugal the decreasing pace was attenuated after 2009, in Greece a positive trend was found after the 2008 crisis. IMR and PMR were significantly associated with socioeconomic indicators in all four countries. National disparities in the evolution of IMR and PMR were significantly associated with most socioeconomic indicators between 2000 and 2018.

Conclusion: Our results confirm the impact of the Great Recession on PMR and IMR trends in all four countries, taking recurring associations between macroeconomic cycles, variations in mortality trends, macroeconomic volatility, and stagnation of IMR and PMR into account. The association with socioeconomic indicators stresses the necessity to strengthen social protection systems and healthcare systems to better protect the population health from the earliest days.

Cancer-related incidence and mortality among children and adolescents in the MENA region countries: Gap between rich and poor countries

Basema Saddik¹, Ankita Shukla², Rouba Georgi Zeidan³

¹College of Medicine, University of Sharjah United Arab Emirates, ²Research Institute for Medical and Health Sciences "806, Al gurg 212 building al nahda 2" United Arab Emirates, ³Research Institute for Medical and Health Sciences, University of Sharjah

Background: Cancer is among one of the leading causes of death in children and adolescents and majority proportion of these cases are clustered into low and middle income countries. Previous studies have shown discrepancy in all age cancer incidence and mortality by country's level of development. The MENA region comprises of countries with heterogeneous income and development level. Present study aims to assess if discrepancies exist for cancer incidence and death rates among children and adolescents in the MENA region countries. **Material and Methods:** Data on cancer incidence and mortality rates were drawn from the Global Burden of Disease Study (GBD) 2019 for all malignant neoplasms (including non-melanoma skin cancers) excluding benign neoplasms. The analysis is restricted to children and adolescents aged less than 20 years. Mortality Incidence rates (MIR) are calculated as proxy measure of survival for each cancer type and country. Moreover, Pearson's correlation coefficient is calculated for association between socio development index (SDI) and MIR.

Results: A marked difference is observed in cancer-related death rates in low income vs high income countries. MIR is higher in low income countries, especially for males and certain types of cancer such as liver, colon and rectum, brain and central nervous system, and non-Hodgkin lymphoma among others. There is a negative correlation between country's SDI and MIR i.e. the higher the SDI of the country, the lower the MIR values.

Conclusion: Present discussion calls for evidence-based action to reduce cancer-mortality and burden of disease in this age group. The updated data on cancer incidence and mortality at the national level is missing for countries in the region. Reliable estimates of the cancer burden can provide a comprehensive picture of how the impact of cancer varies between geographic areas and between economies. Such estimates, can inform the development of cancer control strategies.

Living in poverty is associated with accelerated biological aging

Andrea Dalecká¹, Albert Ksinan¹, Anna Polcova¹, Hynek Pikhart², Martin Bobák²

¹Masaryk University RECETOX Kamenice 34, Brno, Czech Republic,

²University College London, Masaryk University Department of Epidemiology and Public Health, RE CETOX 1-19 Torrington Place, London, United Kingdom

Background and Objective: Biological aging reflects a decline in the functions and integrity of the human body that is closely related to chronological aging, but it is also driven by many external factors. A variety of biomarkers have been found to predict biological age. Biological age higher than chronological age (biological age advancement) indicates an accelerated state of biological aging and a higher risk of premature morbidity and mortality. This study investigated how socioeconomic disadvantages influence biological aging.

Methods: The data from the National Health and Nutrition Examination Survey (NHANES) IV, including 10 nationally representative cross-sectional surveys between 1999-2018, were used. The analytic sample was N = 54,168 (20-85 years). We used a total of 11 biomarkers for estimating the biological age. Our main outcome was biological age advancement (BAA), calculated as biological age minus the chronological age, where positive values indicate worse health. Poverty

was measured as a ratio of family income to the poverty level (5 categories). The BAA was regressed on poverty levels, age, their interaction, education, sex, race, and a data collection wave. Sample weights were used to make the estimates representative of the US adult population.

Results: The results showed that BAA was positively associated with poverty (B = 0.16 per 1 category, p < .001), above and beyond other covariates. The association between BAA and age was U-shaped. Importantly, the interaction of poverty and age was significant (B = .017 per year, p < .001), as the effect of poverty was the greatest in middle-aged categories, while limited in younger and elderly groups.

Conclusion: In a nationally representative US adult population, we showed that higher poverty enhances the acceleration of biological age, particularly in middle-aged persons. It might be hypothesized that the social stressors accumulated at younger age can promote health inequalities later in life.

Reframing Health in Urban Airport Regions

Evelyn de Leeuw¹, Alana Crimeen¹, Robert Freestone²

¹University of New South Wales Australia, ²University of New South Wales

Background and Objectives: The COVID-19 pandemic has elevated awareness of the role of airports in public health. However, the influence of airports on health goes beyond the spread of infectious diseases. In cities, airports have increasingly complex relationships with transportation networks, economies and industries, built and natural environments and social systems. A new international airport in Sydney, Australia, is being developed alongside an airport-focused city plan, creating the opportunity to interrogate the considerations given to determinants of health within urban airport planning.

Methods: A literature review was conducted to identify research, policies and programs of urban airport development relevant to health and health-adjacent planning approaches such as green infrastructure, sustainability, liveability and wellbeing. A content analysis of strategic planning documents for the Western Sydney Airport region was then conducted, identifying the presence and framing of these concepts at a local, regional and state level.

Results: There is a growing global trend towards airport policies and programs that, at a strategic level, align with the Sustainable Development Goals, reduce environmental impacts and promote urban integration. Many of these programs adopt health-adjacent goals. Health-explicit approaches primarily focus on environmental protection and pollution management. These findings are reflected in the Western Sydney Airport regional planning documents. However, the strategic plans of the near-airport area have a reduced presence of the health promoting planning priorities of the greater region and an increased focus on the airport-specific planning requirements.

Conclusion: More consideration needs to be given to the broader public health implications of the airport. This includes problems such as disruptions to local transportation, presence of community spaces and the equitable distribution of economic benefit. Centralising a comprehensive focus on public health creates an opportunity to develop solutions to the conflict between urban airports and communities.

Background and Objective: Health literacy is a key enabler to accelerating progress towards noncommunicable diseases targets in the Sustainable Development Goals. Gaining an understanding of people's health literacy strengths, needs and preferences provides insight into whether individuals can access, understand, appraise, remember or use health information or engage with health services. Using health literacy as a measurable multidimensional concept, we aimed to identify priority groups of migrants at risk of poor health and equity outcomes.

Methods: We combined quantitative and qualitative cross-sectional data of 1126 migrants living in Portugal. Quantitative assessments used the Health Literacy Questionnaire (HLQ), with nine distinct dimensions and sociodemographic variables. Descriptive and hierarchical cluster analyses were performed to characterise and generate profiles of groups with similar health literacy patterns. Semi-structured interviews were conducted with 15 migrants, stratified by the identified clusters.

Results: We found 16 distinct profiles with different patterns of health literacy strengths and needs. While 11 profiles revealed strengths in 'finding health information' (74.8% of migrants) and 'understanding health information' (73%), 75.4% of the participants from 13 profiles experienced difficulties (low to very low scores) regarding 'health provider support'. Notably, 36.8% (6 profiles) exhibited challenges across many health literacy domains. The interviews revealed that migrants experienced multiple barriers regarding accessing information and services, including service responsiveness, trust and rapport with health care professionals, cultural safety, stigma, and language. A key enabler in relation to health information and service access and engagement was the perceived support from family and peers.

Conclusion: The identification of profiles proved useful to target underserved groups of migrants that are being left behind and not receiving or easily accessing health information or health care. Tailored health literacy-informed strategies that use strengths-based approaches and are informed by peoples needs and preferences can potentially be more effective and equitable.

IQOS marketing to points-of-sale in Israel: a cross-sectional survey with Arab and Jewish retailers

Amal Khayat¹, Amal Khayat¹, Hagai Levine², Carla Berg³, Daniel Elbaz¹, Lorian Abroms⁴, Yael Bar-Zeev¹

¹Braun School of Public Health and Community Medicine, Hadassah Medical Organization, Faculty of Medicine, Hebrew University of Jerusalem Ein Kerem, Jerusalem, Israel, ²Hebrew University of Jerusalem, Israel,

³Milken Institute School of Public Health, George Washington University, Washington, United States, ⁴George Washington University, United States

Background and Objectives: IQOS is a heated tobacco product (HTP). It is the global HTP market leader and the only HTP in Israel. Smoking rates, as well as IQOS and/or electronic cigarette use, are higher in the Arab than the Jewish population in Israel. The point-of-sale (POS) environment is one of the under-studied marketing channels. The way IQOS is promoted to merchants might affect their direct-to-consumer approach. This study aimed to assess and compare POS merchants' attitudes towards IQOS and IQOS marketing strategies at POS between Arab and Jewish neighborhoods.

Methods: We used publicly available data on IQOS Israel website to identify IQOS POS locations in 5 large cities in Israel, Arab, Jewish and mixed. A cross-sectional survey with the POS owner or manager was conducted via phone or in-person. Bivariate analysis was performed using Chi-Square and Fischer's exact test.

Results and Conclusion: 69 surveys were filled - 21 Arab and 48 Jewish. More merchants from Arab POS perceived IQOS as an e-cigarette and that it has appealing flavors ($p < 0.05$ for all). IQOS marketing has been mostly uniform, but with more personal communication with Arab merchants (80% vs. 50% among Jewish POS, p -value < 0.05). In Arab POS, a higher proportion of merchants were given branded items and invited to IQOS parties, and/or had any interaction with a PMI salesperson ($p < 0.05$ for all).

Conclusion: IQOS marketing strategies were similar across Arab and Jewish POS, with more personal communication marketing efforts directed at Arab POS. Surveillance of marketing strategies at the POS should include also those serving minority populations.

Socioeconomic disparities of life expectancy: Analysis of 34 provinces in Indonesia as of 2019

Syarif Hasibuan¹, Ede Darmawan², Vetty Permanasari³

¹Indonesian Public Health Association, Faculty of Public Health, Universitas Indonesia, Kampus UI Depok, Indonesia, ²Indonesian Public Health Association (IPHA), Research and Community Service Center, Faculty of Public Health, Universitas Indonesia, Kampus UI Depok, Indonesia,

³Department of Health Policy and Administration, Faculty of Public Health Universitas Indonesia, Indonesian Public Health Association (IPHA) Kampus UI Depok, Indonesia

Background: Life expectancy at birth is one of the Human Development Index (HDI) that measure human development. More than half of Provinces in Indonesia have average of life expectancy at birth lower than the average of national life expectancy at birth (71,3 years). The range of gap is 10 years between Provinces with the lowest and highest life expectancy average at birth.

Objective: To analyze the effect of socioeconomic disparities to Life expectancy at birth among provinces in Indonesia based on data 2019

Methods: We used aggregate data of Province and Districts Government Budget

Allocation for Health from Ministry of Finance and other socioeconomic data form the Central Bureau of Statistics. Dependent variables included average life expectancy of people in each Provinces. Independent variables included the socioeconomic aspect from each Province such as availability of healthcare and physicians, dependency ratio estimates, government budget allocation for health and proportion of people with income below half of the median. Pearson correlation test used to see the correlation between dependent and independent variables.

Results: We found significant correlation between life expectancy average at birth with dependency ratio ($r = -0.467$, p -value $= 0.00$), proportion of people with income below median ($r = -0.386$, p -value $= 0.02$), and hospital ratio per 1.000 people ($r = 0.355$, p -value $= 0.04$). While there are no correlation between life expectancy average at birth with the other independent variable such as physician ratio per 100.000 people, public health center ratio per 100.000 people, poverty percentage and government budget allocation for health.

Conclusions: There are significant disparities of life expectancy average at birth in socioeconomic aspect among Provinces in Indonesia. This study could be evidence-based input for the policymakers to reduce the disparities among Province or evermore to increase life expectancy average at birth.

The geographical access of users with diabetes and hypertension to the 'there's a people's pharmacy here' programme (atfp), Brazil

Marcio Natividade¹, Kionna Bernardes Santos², Juracy Bertoldo¹, Vinicius Mendes³, Daniela Morato⁴, Samilly Miranda¹, Luís Portela¹, Erika Aragão¹

¹Institute of Collective Health / Federal University of Bahia Brazilian Collective Health Association (ABRASCO) R. Basílio da Gama, s/n - Canela,

Salvador - BA, 40110-040 Brazil, ²Faculty of Medicine - Federal University of Bahia, ³Faculty of Economics - Federal University of Bahia Brazilian Collective Health Association (ABRASCO) Praça da Piedade, 06 - Dois de

Julho, Salvador - BA, 40070-010 Brazil, ⁴Institute of Collective Health / Federal University of Bahia

Introduction: Access to medication constitutes one of the most important socio-economic challenges to treatment continuity. In Brazil, one initiative to expand access to the medication available through primary healthcare is the 'There's a People's Pharmacy Here' Programme (Programa Aqui Tem Farmácia Popular: ATFP), created in 2004; a partnership between the federal government and the private sector, which, since 2010, has dispensed medication to patients with hypertension and diabetes, free of charge. AIM: To identify the factors associated with geographical access to medication for the treatment of Diabetes and Hypertension in Brazil.

Methods: An individualized, descriptive study involving all the dispensation of medication, between 2001 and 2017, for diabetes and hypertension treatment to the users of pharmacies in the Primary Healthcare Network and private retail pharmacies accredited by the ATFP Programme. We calculated the travel patterns from user households to dispensing sites, adopting 3 measures (800, 1,000 and 1,250 metres) to infer "geographically hard to access." To obtain the differences and their respective significance, we applied Pearson's Chi-Squared test, while Estimates of Prevalence Ratios (PR) were used to ascertain the associations between the independent variables.

Results: Between 2010 and 2015, 961,862 medication dispensations were undertaken to treat diabetes and 3,270,635 to treat hypertension, distributed through the Primary Healthcare Network and the accredited retail pharmacies of the ATFP Programme. Across the country, the median distance travelled by users to collect their diabetes medication was 1.5 km, while for hypertension medication, it was 1.3 km. The findings reveal that most users find their medication geographically hard to access regardless of pathology and distance cut-off point. Considerations: An analysis of access to ATFP medication allowed us to identify that in the North, Northeast and Central-West regions, users travel greater distances to collect medications. The first two regions are the poorest in Brazil.

Intergenerational transmission of self-reported body mass index in the context of social mobility - evidence from german longitudinal data

Michael Porst¹, Alexander Rommel¹

¹Robert Koch Institute, Epidemiology and Health Monitoring, Health Reporting General-Pape-Str. 62 - 66 12101 Berlin Germany

Background: There is evidence of robust intergenerational correlates of body mass index (BMI) suggesting that health is persistent across generations. Since

BMI is closely related to health behaviors that become healthier with higher socioeconomic status (SES), this raises the question of inequalities when poor health persists. We assume that social mobility (SoM) is associated with changes in health behaviors and hypothesize that the degree of transmission varies between mobile groups.

Methods: We use longitudinal household-level data from the German Socio-Economic Panel. It provides information on self-reported height and weight, starting in 2002 (two-year cycle). We build a sample of individuals aged 15 to 35 years (12,108 person-years; 50.7% male) and link information on their parents. We calculate BMI as body weight (in kilograms) divided by height (in meters) squared. We measure SoM using offspring and parental education. Comparison leads to three groups: downward mobile (D), no mobility (N), and upward mobile (U). We estimate fixed effects panel models to obtain elasticities by SoM groups. **Results:** After controlling for sociodemographic and household characteristics, we obtain elasticities of 0.156 (D; standard error (SE): 0.043), 0.050 (N; SE: 0.022), and 0.047 (U; SE: 0.025) between mothers and offspring. A comparison with the father-offspring results shows similarities: Elasticities range from 0.137 (D; SE: 0.046), 0.022 (N; SE: 0.023), and 0.068 (U; SE: 0.036). The F-test shows significant group differences between the elasticities of downward and immobile individuals ($p < 0.05$).

Conclusion: We obtain differences in BMI elasticities between SoM groups. While elasticities of immobile and upwardly mobile individuals are modest and not significant at the 5% level, a considerable degree of persistence can be found for downwardly mobile ones. For the downward movers, the change in BMI of the offspring is still influenced by the shared family environment, highlighting the need for behavioral prevention.

Sleep disorders among medical students in the Middle East and North Africa: a systematic review and meta-analysis

Sonia Chaabane¹, Karima Chaabna¹, Salina Khawaja¹, Jasmine Aboughanem¹, Dhruv Mittal¹, Ravinder Mamtani¹, Sohaila Cheema¹

¹Institute for Population Health, Weill Cornell Medicine - Qatar

Background and objective: Medical students appear to experience high-level academic load and clinical duties and are a high-risk population for sleep disorders (SDs). Multiple sleep disturbances have been identified among medical students in the Middle East and North Africa (MENA) countries. However, the SD epidemiology is still unclear. Quantifying SD proportion in medical students and assessing the associated factors can help inform the development of targeted interventions to reduce SDs. Our objective is to synthesize SD prevalence and assess associated factors among medical students in MENA countries.

Methods: PubMed, Web of Science, Google Scholar, and reference lists of relevant studies were searched by two independent reviewers for grey and non-grey relevant literature. Studies reporting SD prevalence with or without associated factors among medical students in any MENA country were included. Meta-analyses were performed using random-effects models.

Results: Twenty-two studies were included in the meta-analysis ($n=19,955$, mean age \pm SD [range: 20.5 \pm 1.67 to 23.1 \pm 3.8 years]; sample size [range: 122 to 1,041]). Hypersomnolence was the most prevalent SD [prevalencepooled range: 30.9% (Jordan) to 62.5% (Saudi Arabia)], followed by insomnia [prevalencepooled range: 30.4% (Jordan) to 59.1% (Morocco)], circadian rhythm disorders [prevalencepooled range: 13.5% (Jordan) to 22.4% (Saudi Arabia)], breathing-related sleep disorders [prevalencepooled range: 12.2% (Jordan) to 22.5% (Pakistan)], sleep-related movement disorders [prevalencepooled range: 5.9% (Egypt) to 30.6% (Saudi Arabia)], and parasomnias [prevalencepooled range: 5.6% (Jordan) to 17.4% (Saudi Arabia)]. SD were associated with female sex, studying in the senior years of medical school, anxiety, excessive internet use, and poor academic performance. **Conclusion:** SDs are prevalent among MENA medical students. Further investigation is required to understand SDs for which there is limited data. Public health interventions that are culturally appropriate to the local context of the academic setting are necessary to mitigate SDs and improve the health, well-being, safety, and productivity of MENA medical students.

A gender equality assessment tool for the prevention plan of five Italian regions

Clara Mazza¹, Arianna Bellini¹, Alessandro Berti², Ester Bonanno¹, Virginia Casigliani¹, Francesca Grosso², Veronica Gallinoro³, Giusy Fauci³, Aurelia Salussolia³, Giorgia Soldà³

¹Italian Society of Hygiene and Preventive Medicine, Department of Public

Health, Experimental and Forensic Medicine, University of Pavia, Pavia, Italy, ²Italian Society of Hygiene and Preventive Medicine, Italy, ³Italian Society of Hygiene and Preventive Medicine School of Hygiene and Preventive Medicine, University of Florence, Florence, Italy

Background and objective: According to the World Health Organization (WHO), sex and gender interact in complex ways to affect health outcomes. In Italy, the most important document regarding planning of prevention strategies is the "Regional Prevention Plan" (RPP), developed by each region according to the national recommendations. All RPPs have 10 mandatory programs that focus on specific Public Health areas. The study aimed to develop a Gender Equity assessment tool for the 10 RPPs programs, to evaluate how gender is included in the plans and raise awareness for future implementations.

Methods: The WHO "Checklist for assessing the gender responsiveness of sexual and reproductive health policies" was identified as the main reference after a narrative synthesis of literature. The adapted Gender equality assessment tool is composed of 5 domains, analyzing the dimension of gender in the context, the objectives, the actions, the expected impact, and the monitoring indicators of each program contained in the plans.

Results: Five RPPs, representative of Northern (Lombardia, Emilia-Romagna), Central (Lazio, Marche) and Southern (Puglia) Italy, were analyzed. In the context analysis, gender was included in 7 programs in Emilia-Romagna, 10 in Lombardia, 6 in Lazio, 5 in Marche and 4 in Puglia. When considering the objectives, the actions, and the expected impact, no plan had a score higher than 2/10, 5/10 and 1/10, respectively. In Puglia, Marche and Lazio, gender was never detected as having influence on the access to care and on chosen monitoring indicators.

Conclusion: In the RPPs investigated, there was never a clear distinction between sex and gender; they were considered mainly in the context analysis, but this did not translate in their consideration in other parts of the plans. These findings underline the need for policymakers to give greater attention to gender and account for its potential impact on health policy outcomes.

Social sustainability of healthcare systems: a scoping review

Gianluca Paparatto¹, Vera Benedetto², Luca Gori², Sabina Nuti²

¹Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Italy Health Science Interdisciplinary Research Centre, Sant'Anna School of Advanced Studies, Pisa, Italy,

²Sant'Anna School of Advanced Studies, Italy

Introduction: Sustainability of healthcare systems has become a central issue during recent years. However, most of the research that performed so far focuses on economic sustainability, overlooking other key dimensions such as social and environmental. A scoping review to synthesize the available evidence on social sustainability of healthcare systems was conducted.

Methods: We searched Scopus (from 2015 to 2022) for all English, free full text articles and reviews addressing social sustainability strategies and measures applied on or by the healthcare systems. We excluded articles that were not focused on healthcare systems WHO building blocks: health service delivery, health workforce, health information systems, access to essential medicine, health system financing, leadership and governance. Additionally, we separated the articles based on the criteria identified by the literature as measures of social sustainability in healthcare.

Results: A total of 210 articles were retrieved. After screening, 34 articles met the inclusion criteria. Number of articles has increased over the past few years. The included studies explored the following dimensions of social sustainability in healthcare: 16 (47%) articles focused on sustainable health, 8 (23%) on patient education or satisfaction, 8 (23%) on workforce education, training or satisfaction, 5 (14%) on availability, affordability or accessibility, and 1 (3%) on employment.

Conclusion: Our scoping review has highlighted how research in recent years has focused on sustainable health issues. A minority share concerns sustainability through the assessment of human resources, patients wellbeing and healthcare building construction. Therefore, the findings of this study provides evidence about the necessity of designing a comprehensive, flexible framework to assess and program social sustainability of healthcare systems and programs, including dimensions of community activation and involvement.

DOI: 10.18332/popmed/164287

COVID-19, breast cancer care, and social determinants of health: a cross-sectional study to investigate the impact of a pandemic on health and health care

Charlotte Myers¹, Kathleen Bennett², Caitriona Cahir¹

¹Royal College of Surgeons, Ireland, ²Royal College of Surgeons, Ireland

Background: Health services for non-communicable diseases, including cancer, were significantly disrupted during COVID-19. Breast cancer (BC) is the most common cancer for women and the on-going impact of the pandemic on BC care needs to be established. The aims of this study were to explore the impact of COVID-19 stressors on healthcare services and quality of life (QoL) in women living with and beyond BC in Ireland and whether the impact varied by social determinants of health (SDH).

Methods: This cross-sectional study was conducted from September 2020 to April 2021. Questionnaire data was collected on predictor variables (e.g. COVID-19 impact, SDH, and clinical characteristics) and outcome variables (e.g. disrupted health services and QoL). The association between COVID-19 impact, disruption to BC services, and QoL was assessed using multivariable regression models. The interaction between COVID-19 impact and health insurance status was assessed within each model.

Results: Of the 387 women who completed the survey, 30.5% reported a high COVID-19 impact and most women reported disrupted BC care. Women who reported a high COVID-19 impact reported significantly more disrupted BC services ($p<0.001$) and a lower QoL ($p<0.001$) compared to women who reported a low COVID-19 impact. Private health insurance was found to significantly moderate the impact of COVID-19 on BC services and QoL. Women with a high COVID-19 impact and no insurance experienced significantly more disruption to BC services and lower QoL compared to women with low COVID-19 impact and private insurance ($p<0.05$).

Conclusions: There was a large disruption to BC services and low QoL for women with BC in Ireland, however, the impact of COVID-19 was not the same for all women. It is important to identify the women who experienced a larger impact during the pandemic so they can be reintegrated into proper BC care, along the entire cancer continuum.

Exploring the association between covid-19 vaccination coverage and socioeconomic factors in high income countries

Angelica Gris¹, Leonardo Villani¹, Valerio Corona², Maria Gualano³, Walter Ricciardi⁴

¹Section of Hygiene, University

Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²Università Cattolica del Sacro Cuore, Italy

³School of Medicine, UniCamillus-Saint Camillus International University of Health Sciences, Rome, Italy

Background: COVID-19 vaccination is currently the most effective tool to contain the spread of the pandemic and drastically reduce the number of hospitalizations and deaths. Despite the efficacy demonstrated in clinical trials, ecological studies, and real-world data, two years after the beginning of the vaccination campaign in many countries adherence is low, sometimes with coverage rates < 50%. The aim of the study is to explore the association between socioeconomic factors and COVID-19 vaccination coverage worldwide.

Methods: High income countries with a population of more than 350,000, were included, for a total of 49 countries. Vaccination coverage (single dose and complete cycle at September 2021, and booster at November 2022) was extracted from OurWorldinData and WHO database. From WorldBank website we obtained 12 indicators related to education, economic development, and health governance. To evaluate the associations between these indicator and Covid-19 vaccination coverage, we used Spearman's rank correlation coefficient with 95% bootstrapping confidence interval. P values <0.05 was considered statistically significant.

Results: Of the 12 indicators analyzed, 5 are significantly correlated ($p<0.05$) with vaccination coverage in the countries analyzed. Percentage of population using internet is correlated with entry into the vaccination cycle ($r=0.296$). Instead, percentage of population with primary education ($r=-0.370$; $r=-0.271$) and with secondary education ($r=-0.497$; $r=-0.412$) are inversely correlated with first dose and full cycle coverage. Human Development Index ($r=0.400$; $r=0.283$; $r=0.231$) and GDP per capita ($r=0.231$; $r=0.283$; $r=0.255$) are both correlated with coverages of the primary cycle and booster dose.

Conclusions: Socioeconomic factors have played significant roles in influencing vaccinations coverage worldwide even during Covid-19 pandemic. Public health professionals in national prevention campaigns should take these factors into account in order to design more effective interventions based on the socioeconomic characteristics of population subgroups

Universidad Católica del Ecuador Ecuador, ⁸Instituto Nacional de Salud

Pública Mexico, ⁹Swiss Tropical and Public Health Institute, Department

of Public Health and Epidemiology Swaziland, ¹⁰Institute of Global Health (ISGlobal), Barcelona, Spain Spain

Objective: Evaluate the relationship between the social determinants of health (sociodemographic and health system resources) and the under-five mortality rate (TMM5).

Methods: Municipal-level data was obtained from 2000 to 2019 from 9,142 municipalities in three Latin American countries: Brazil, Ecuador, and Mexico. To explore the relationship between social determinants and U5MR, we trained a Random Forest (RF) algorithm, and to assess model robustness, we also trained a Gradient Boosting Machine and a Model Generalized Additive. Finally, we present the mean square error (MSE), root mean square error (RMSE), and mean absolute deviation (MAD) and r-squared to compare the performance of the trained algorithms.

Results: The most important variables to predict the MMR5 according to the RF were illiteracy, poverty, and the Gini index according to the random forest algorithm. We found positive relationships between illiteracy and poverty with U5MR. Nonlinear relationships were also observed between the Gini index and the U5MR. The RF results were MSE = 60626.96, RMSE = 246.22, MAD = 125.61, r-squared = .14, from the Gradient Boosting Machine were MSE = 61956.91, RMSE = 248.91, MAD = 129.49, r-squared = .12 and, from the Model Generalized Additive were MSE = 65813.03, RMSE = 256.54, MAD = 135.87, r-squared = .07.

Conclusions: According to the results obtained, long-term public policies to reduce the MMR5 should focus on reducing illiteracy, poverty, and inequality. Information on modifiable social factors can be useful in planning intervention programs to promote child survival in Latin America and other low-income countries.

³Projeto Temático "Desigualdades Sociais em Saúde nos municípios sedes de duas metrópoles paulistas: mensuração, monitoramento e análises".

Brazil, ⁴Faculdade de Ciências Médicas da UNICAMP Brazil, ⁵Faculdade de Medicina da Universidade de São Paulo Brazil

Background and objectives: Homicides have a profound meaning, as they are a reflection of inequality and social inequity. The highest homicide mortality rates have been observed in areas of greater social vulnerability (SV). The objective of this study is to analyze the trend in homicide mortality and the magnitude of inequality in this indicator, in the population aged 10-69 years, according to strata of social vulnerability (SSV) in the municipality of São Paulo (MSP), Brazil, between 2006 and 2019.

Methodology: Ecological study of time series, developed in five strata of areas of residence of the MSP, according to level of social vulnerability, considering the São Paulo Social Vulnerability Index of 2010. Homicide mortality rates were calculated for each of the SSV, for each year of the selected period and for the first and last five years. As a measure of inequality, rate ratios (RR) between SSV were used. For trend analysis, the Prais-Winsten regression model and the Annual Percentage Change (APC) were used.

Results: There were significant declines in homicide mortality rates, in both sexes and in all SSV. Mortality inequality in males increased significantly between the analyzed five-year periods (RR from 2.51 to 3.18; $p=0.028$) between the high and low SV stratum, while in females, inequality remained stationary (RR=2.41 for RR=2.28; $p=0.615$).

Conclusions: Despite the reduction in homicide mortality rates observed, the

values remain very high, especially for men. The increase in inequality observed among men points to the need to strengthen multisectoral public policies to reduce social inequality and the determinants of violence, with the adoption of intervention measures aimed especially at those who live in areas of high SV, and it is up to the sector health the production of knowledge to show who these people are and where they live.

An intervention program to promote sustainable healthy consumption in foodservice

Margarida Martins¹, Rita Rodrigues²

¹Coimbra Health School, Polytechnic Institute of Coimbra Portugal, ²Faculty of Nutrition and Food Sciences, University of Porto Portugal

Background and Objective: The impact of animal source food consumption and food waste on the food sustainability reinforce the adoption of more sustainable diets, being essential to reduce animal protein sources consumption. This study aims to implement an intervention program in order to increase the consumption of vegetable-based meals and reduce food waste in foodservice.

Methods: The program was implemented in two business companies. Before intervention, weighing of the individual portions of animal-protein sources and food waste evaluation (leftovers and plate waste) were performed during 8 days. In order to improve the food supply, a guide of vegetarian recipes was prepared and training was given to the foodservice teams by dietitians and a Chef. Awareness materials and videos were developed and posted in the canteen and social networks to encourage adhesion to a more sustainable diet. The consumption of vegetarian dishes and food waste was monitored before and during the intervention.

Results: The food waste obtained before intervention was 245.8kg, presenting the animal-protein sources a total of 80.3 kg for plate waste and 10.8 kg for leftovers. Plate waste per consumer varied between 12g and 125g, being the most wasted dishes, those that use more natural resources in their production, such as cow and pork-based dishes. Regarding consumption, 2.1% of participants reported to be vegetarians, 34% never consume the vegetarian dish in the canteen, and 28% consume less than once a month. Only 23% of the participants reported consuming vegetables at least once a day. During intervention, it was observed an 45% increase in the choice of vegetarian dishes replacing animal protein sources. **Conclusion:** The intervention program leads to an increase in the consumption of vegetarian dishes and a decrease in animal-protein sources food waste. This intervention must be reproduced in other canteens contributing to a more sustainable food system.

Analysis of Emergency Room accesses at IRCCS Ospedale Policlinico San Martino, Genoa, north-west Italy: differences between Italian and foreigner Liguria residents

Erica Baldoni¹, Elvira Massaro¹, Oriana Ferrante¹, Erika Zumerle¹, Nicola Calcavecchia², Elisabetta Costa¹, Stefano Mosca³, Giancarlo Icardi⁴

¹University of Genoa Dipartimento di Scienze della Salute (DiSSal), ²Università di Genova Italy, ³University of Genoa, ⁴Centro Interuniversitario per la Ricerca sull'Influenza e le altre Infezioni Trasmissibili CIRI-IT Dipartimento di Scienze della Salute (DiSSal), Università di Genova Italy, ⁴University of Genoa Dipartimento di Scienze della Salute (DiSSal), Università di Genova, Hygiene Unit, Ospedale Policlinico San Martino IRCCS Genoa, Genoa, Italy

Introduction: Several recent studies deal with health inequity regarding the access to health services. Is it possible to use emergency room access as an indirect index of health status of the migrant population? What is the status of inequity in the emergency room of Policlinico San Martino, Genoa? Trying to answer these questions was the goal of our study.

Methods: We retrospectively analyzed the characteristics of 265'341 ED accesses from January 1, 2019 to April 12, 2022. 233'926 were of Italian nationality, whereas 31'415 were foreigners. We then considered only people with a residency in Liguria. They were 247'457, and 24'841 were non-Italian (10% vs. 90%). The median age of the two groups was 38 and 59 years respectively, while the gender composition was similar: 52.9%F and 47.1%M the former and 52%F and 48%M the latter.

The analysis shows that 17'647 (71%) people of non-Italian nationality accessed the emergency department for not-urgent color codes (white and green). All of them were below the median age of the population considered. In comparison, 122'999 (55%) Italians accessed the emergency department for not-urgent complaints. Of these 77'702 (63.2%) were below the median age.

Multivariate analysis shows that residents with non-Italian nationality have 4% higher chances than residents with Italian nationality of accessing the emergency room for eye diseases, which is the second most frequent diagnosis out of total accesses (19'406.8%).

Similarly, non-Italian women were 30% more likely than Italians to access the emergency room for pregnancy-related complications.

Conclusions: The results show that a different use of services is a potential indication of health and gender inequity. A qualitative epidemiological analysis should be conducted to study the real causes of this dissimilarity.

In the meantime, we will deepen our analysis including additional social and demographic aspects.

Self-reported vs measured body mass index in the Italian adults within cuore project 2018-19

Chiara Donfrancesco¹, Laura Iannucci², Emanuela Bologna², Elisabetta Profumo², Cinzia Lonoce², Brigitta Buttari², Anna Lonardo², Serena Vannucchi², Luigi Palmieri¹

¹Istituto Superiore di Sanità Department of Cardiovascular, Endocrine-metabolic Diseases and Aging, Italian National Institute of Health Via Giano della Bella 34 00161 Rome Italy, ²Italian National Institute of Statistics

Background: The body mass index (BMI) is often assessed within national surveys from self-reported height and weight rather than measured values for the monitoring population health and the effectiveness of public health strategies. The discrepancies between measured and self-reported values were assessed using data collected within a health examination survey (HES) on the general adult population, and correction models were estimated and implemented on national interview survey data.

Methods: The Italian National Institute of Health conducted the HES 2018-2019 within the CUORE Project measuring weight and height and collecting data on self-reported values in random samples of general population aged 35-74 years residing in ten (of 20) Italian regions distributed in the North, Centre and South: 1033 men and 1061 women.

Results: Self-reported and measured data comparison showed greater differences in mean values of height than weight and in women than in men (height +2 cm in men and +3 in women; weight -1 kg and -1 kg, respectively) corresponding to an underestimation of BMI (-1 kg/m² and -1 kg/m², respectively). Stable differences were found across age groups and educational levels, except for height, which discrepancy was greatest in women aged 65 years and over. Self-reported vs measured prevalence were: normal weight 40%-33% in men and 55%-45% in women, overweight 46%-46% and 26%-29%, obesity 14%-20% and 16%-24%. Linear regression models were assessed for height and weight adjusting by sex and age classes ($R^2 \geq 0.92$); they were implemented to estimate adjusted BMI and normal weight/overweight/obesity prevalence on the national multi-purpose interview survey data collected by the Italian National Institute of Statistics.

Conclusions: CORRECTED Self-reported values, adjusted using correction models developed on the basis of the relationship between self-reported and measured height and weight values, could be considered to provide more accurate prevalence of normal weight, overweight and obesity.

Social determinants and diagnosed non-communicable disease in the adult Indonesian population: Longitudinal study from Indonesia family life survey 2007 and 2014

Kamaluddin Latief¹, Kamaluddin Latief¹, Dieta Nurrika², Wayne Gao³

¹Taipei Medical University "250 Wu-Hsing Street Taipei Medical University" Taiwan, ²Ministry of Research, Technology and Higher Education, Higher Education Service Institution (LL-DIKTI) Region IV, Indonesia, ³Taipei Medical University Taipei Medical University Taiwan

Background: Social determinants factors, such as education level, socioeconomic, smoking, and nutritional status on non-communicable disease have been known; however, such an association among adults in developing countries remains unclear. The present study was to investigate the social determinants factor and diagnosed non-communicable diseases (NCDs) in the adult's Indonesian population.

Methods: A 7-year prospective longitudinal study based on the 2007 and 2014 Indonesia Family Life Survey (IFLS) was conducted on 6,225 adult Indonesian population (≥ 40 years). The exposure variables were social determinant factors (i.e., employee, smoking, monthly per-capita expenditure (PCE), education level, health insurance, and visited health facility). The outcome variable was diagnosed

NCDs by a health worker, the NCDs defined according to the following 4 diseases: diabetes, coronary heart disease, cancer, or asthma. A multivariate-adjusted logistic regression model was used to investigate association between social determinants factors and diagnosed NCDs

Results: Among 6,225 participants, 9.4% were discovered diagnosed NCDs by health worker. The odds ratios (ORs) and 95% confidence intervals (CIs) of diagnosed NCDs were significantly higher among those who live in an rural area (OR, 1.22; 95%CI 1.01-1.47), who have lower monthly PCE (OR, 1.80; 95% CI, 1.46-2.22), who had BMI ≥ 23.0 kg/m² (OR, 1.79; 95% CI, 0.48-2.16), and who did not visit health facilities (OR, 1.38; 95% CI, 1.11-1.72), than those who live in a urban area, who have higher monthly PCE, had BMI <23.0 kg/ m², and who did visited health facilities.

Conclusions: There was an association between diagnosed NCD and living in rural areas, low monthly PCE, high BMI and not visiting health facilities. Our study suggests that NCD programs, especially surveillance, are more focusing on the rural areas for those who have low socioeconomic status, overweight or obese and relatively rarely visit health facilities.

Pathways towards zero hunger - food security, safety and sustainability in India

Pankaj Patel¹, Bishwajeet Beshra¹

¹International Institute for Population Sciences Mumbai, India

The Indian population is adding 17 million people to the worlds total yearly, with an annual growth rate of 1.6 percent. Despite rapid economic growth in the past two decades, India is unlikely to meet the 2nd SDG Goal of cutting the proportion of hungry people almost to zero by 2030. Per capita availability and consumption of food grains in India have declined since 1996. Global Hunger Index (GHI-2022) ranks India 107th out of 121 countries, which placed it in the category of nations where hunger is at a serious level on the GHI severity scale. Worse, Indias score was poorer than that of many sub-Saharan African counties with a lower GDP than Indias.

In recent years India has made considerable progress in tackling hunger and undernutrition. The pace of change has been uneven in the past two decades, and many have been left behind. This paper examines Indias hunger and nutrition situation due to the rising population and food scarcity through a broad literature review and statistical analyses using four rounds of NFHS data. Findings suggest the proportion of underweight children changed insignificantly between 2015-16 and 2019-21 (from 35.8 to 32.1 percent for the age group of 0-5 years). The latest NFHS 2019-21 shows that 35.5% of children under five years are stunted (height-for-age), 19.3% of children under five years are wasted (weight-for-height), and 7.7% of children under five years are severely wasted (weight-for-height). These are appalling figures.

Our study suggests policy measures for ensuring adequate food security at the household level, particularly for marginalized groups, women, and children. It will be an essential input to a broader international discussion of hunger, food security, nutrition, and food system under UN sustainable development goals, including eradicating hunger.

Community mobilization in preventing non-communicable diseases through pbri model among older adults dwelling in Thailand

Sukjai Charoensuk¹, Yupawan Thongtanunam², Vichai Tienthavorn³

¹Praboromarajchanok Ministry of Public health Praboromarajchanok Institute, Ministry of Public health, Tiwanon Road, Nonthaburi Province, Thailand. Thailand, ²Boromarajonani College of Nursing

Chonburi Praboromarajchanok Institue, Ministry of Public health 69/1 Sukhumwit Road, Muang District, Chonburi Province, Thailand. Thailand, ³Praboromarajchanok Institue

Background and Objective: NCDs are the leading health threat in Thailand. The prevalence of NCDs in Thailand has been increasing for several years, with about 320,000 deaths due to NCDs each year During 2014-2018, it was accounting for 75% of all Thai mortalities. The top three NCD-related causes of deaths were cancers, cerebrovascular diseases, and ischemic heart disease. The objective of this study were to assess the health status of older adults dwelling in the community and to test the feasibility of using community mobilization through PBRI Model to prevent and control NCDs.

Methods: Sample were 2000 older adults living in the Ban-suan Sub-district, Thailand. The health screening was conducted during March 15th - September

30th, 2022. Health data including BMI, blood sugar level, blood pressure, and health behavior related to exercise, diet, emotion, alcohol consumption, cigarette smoking, and obesity were collected using questionnaire. The health care workers in the community were trained to use PBRI Model, which provided the meaningful interpretation to older adults and guideline to control their health risk behaviors based the 7- colors of the balls which represented their health status

Results: The results showed that of 2,000 older adults, 30.80% were in the hypertension patient's group and 4.25% were at risk of hypertension. Additionally, 15.45% were diabetic patients and 2% were at risk of diabetes. The older adults at risk of hypertension or diabetes were invited to the PBRI model conducted by health care volunteer as a part of community mobilization to promote health of these orders. The older adults who participated in this preventing scheme were able to statistically significant improved their blood sugar and blood pressure at p-value .05.

Conclusion: The PBRI model should be used to advocate older adults and caregiver's abilities to assess health problems and able to promote healthy behavior.

Intervention strategies and techniques to promote health literacy among socioeconomically disadvantaged groups - a systematic review with albatross plots

Hunny Singh¹, Florence Samkange-Zeeb¹, Ruben Herrmann¹, Jonathan Kolschen¹, Barnils Pedrós¹, Tilman Brand², Hajo Zeeb², Benjamin Schüz¹

¹Institute of Public Health and Nursing Research, University of Bremen, Bremen, Germany, ²Department of Prevention and Evaluation, Leibniz

Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany

Background: Health literacy comprises the ability to identify, obtain, interpret and act upon health information. Low health literacy is a major risk factor for morbidity, premature mortality, and increased use of emergency care. Systematically developing interventions to increase health literacy using effective techniques is an important public health task. The aim of this systematic review therefore is to summarize interventions to increase health literacy in socioeconomically disadvantaged groups and identify the most effective techniques.

Methods: Following PRISMA guidelines, we searched the databases SCOPUS, Pubmed, Web of Science and CINAHL. We included intervention studies with a quantitative study design and a control group aiming to promote health literacy or health knowledge in socioeconomically disadvantaged populations between 18 and 65 years. Where possible, we converted effect sizes into cohen's d and compared mean differences of intervention and control groups. Using p-values, sample sizes and effect sizes we created albatross plots to summarize the results according to different outcomes (health knowledge on childfeeding and maternal nutrition, diabetes, food, cancer screening, functional health literacy, HIV knowledge, mental health literacy).

Results: We screened 3696 titles and abstracts and 206 full-texts. In total, 86 articles were included of which 57 were summarized in seven albatross plots. The majority of the studies had a randomized controlled study design (n=50). More effective intervention approaches used focus group discussion prior to intervention, used multilingual educational materials and included professionals as intervention deliverers who were fluent in the first languages of the study population. Additionally, the use of educational materials in video, and text form, fotonovelas and interactive group education sessions with role playing exercises were effective as well.

Conclusion: Effective interventions to improve health literacy and knowledge in socioeconomically disadvantaged populations should take into account the background of participants, use multiple languages and if possible professional intervention delivery personnel.

Primary care organisation in remote rural municipalities in Brazil

Lucas Cabral¹, Ronaldo Teodoro², Márcia Fausto²

¹State University of Rio de Janeiro Brazil, ²Oswaldo Cruz Foundation

Results: Health measures to surmount barriers to access were identified in all RRM, while other measures differed to suit the characteristics of the territories. RRM generally showed improved PHC infrastructure, non-routine itinerant activities and PHC teams taking services into the interior, particularly in the work of CHWs and nursing personnel. In areas of the Amazon region, where access is predominantly by river, floating PHC facilities and ambulance launches were found; in areas accessed mainly by road, in addition to itinerant activities, nurses played an expanded role and worked call-shifts. In the semi-arid, PHC facility

opening hours were organised differently and PHC teams travelled daily to visit support stations in remote communities. In a region of traditional populations, where agribusiness was expanding, there were itinerant "task force" activities and health care for priority groups. The CHWs' role was crucial to continuous, routine monitoring in remote areas of municipalities. Conclusions remote rural territories displayed specific and differing populational, geographical, climatic, economic, social and cultural features to be considered when organising health services, as they demand differing models to guarantee universal access with equity. Primary health care organisation in remote rural municipalities in Brazil demand differing models to guarantee universal access with equity.

Social inequality in smoking in Mongolia

Enkhjargal Batbaatar¹, Javkhlanbayar Dorjdagva², Munkhjargal Dorjradvan³, Naranzul Dambaa⁴, Tsolmon Boldoo⁵

¹University of Eastern Finland Department of Social Sciences Finland Kuopio Campus, Yliopistonranta 1 E, Snellmania P.O.Box 1627 FI-70211 Kuopio, Finland, ²Institute of Public Health and Clinical Nutrition, ³Department of Hygiene and Public Health, Kansai Medical University Japan, ⁴Tuberculosis Surveillance and Research Department, National Center for Communicable Disease Mongolia, ⁵Tuberculosis Surveillance and Research Department, National Center for Communicable Disease

Background and Objectives: Smoking is one of the main public health problems as it is one of leading causes of preventable disease, disability, and death. However, socioeconomic inequality in smoking is less studied in developing countries such as Mongolia. The aim of the study is to examine socioeconomic inequality in smoking in the adult population in Mongolia.

Methods: This study analyzed the data of 41,777 adults from the Mongolian National Tuberculosis Prevalence survey conducted between 2014 and 2015 by the National Center for Communicable Disease and the Ministry of Health Mongolia. Self-reported smoking was used as an outcome variable. Socioeconomic status was measured by educational level. We employed the Ereygers concentration index to assess the degree of socioeconomic inequality in smoking.

Results: Smoking prevalence in females and males in Mongolia was 7.5% and 52.9%, respectively. Smoking was concentrated among the lower-educated males (-0.057 , $p<0.01$). The higher-educated women tended to smoke more but it was statistically insignificant. Ereyger's concentration index for smoking in the general population was significantly negative (-0.047 , $p<0.01$), indicating that the lower educated people tended to smoke more. The decomposition results show education level, alcohol consumption level, location, and employment status were the main contributors to social inequality in smoking in Mongolia.

Conclusion: Social inequality in smoking exists in Mongolia and its pattern and magnitude vary between females and males. Further public health policies on smoking should consider the characteristics of social inequality in smoking in the country.

The changing burden of disease: causes of death and social inequality, Amsterdam; from 1854

Dr. Elands¹, Prof. Janssens²

¹Radboud University The Radboud Group for Historical Demography and Family History Erasmusplein 1, Nijmegen, the Netherlands Netherlands,

²Radboud University

According to the epidemiological transition theory, the dominant pattern of causes of death due to infectious disease began to give way from approximately 1870 onwards to a pattern dominated by degenerative diseases which include various forms of cancer, cardiovascular diseases and strokes. Although the general outline of this theory is widely accepted, there are two limitations. First, the theory is based on highly aggregated data, such as national statistics. Second, the theory does not take into account socioeconomic gradients within populations. Possibly, the epidemiological transition of disease occurred at a different pace and timepoint for designated socioeconomic groups, confounded by the spatial distribution of these groups in a given city. Within this scope, the socioeconomic and nutritional determinants that have driven the modernization of the health system in the Netherlands were spatially reconstructed. In the Amsterdam Health and Disease Database Crowdsourcing Project, individual-level determinants of death and disease at the city level in Amsterdam from 1854-1940 were collected and digitized for 625,563 individuals. Apart from the cause of death, the registers state age, sex, address, marital status, rental price, and occupation of each individual. With this unique data, the epidemiological

transition theory can be tested with more accuracy. To what extent, was the decline in the burden of infectious disease socioeconomically and nutritionally patterned across the city? A spatial analysis of individual-level cause of death data was employed to understand diffusion mechanisms linked to the spread and variation of sociodemographic behaviors. This novel approach promises to make a breakthrough in the current academic debate on the determinants of the great leaps in life expectancy before the 1940s, thereby offering prevention strategies for countries currently undergoing the epidemiological transition of disease.

Background and Objectives: Inequalities in life expectancy and years of life lost (YLL) are key measures of disease burden within a population. Although European countries aim for convergence in health status, few comparative studies have addressed health inequalities at the sub-national level. This study aimed to examine all-cause YLL by sub-national NUTS2 regions in the European Economic Area (EEA) and assess level of regional inequality in YLL rates through the Gini Coefficient (GC), between males and females in 2019.

Methods: To quantify existing inequalities, we extracted from Eurostat (2019) socio-economic data, age-standardised population, and deaths by all causes for 296 NUTS2 regions across the EEA. Residual life expectancy was retrieved from the Global Burden of Disease study (2019). Age-standardised YLL (expressed as rate/100,000 inhabitants) and GC of sub-national inequalities in YLL rates were calculated with 95% Confidence Intervals (CI) using STATA.

Results: The highest YLL in 2019 for females were observed in Bulgaria (Severozapaden), with 24,102 (CI 20,769–27,434), followed by Hungary (Észak-Magyarország) with 22,532 (CI 20,100–24,963). For males, the highest YLL values were again in Bulgaria (Severozapaden) with 43,523 (CI 38,854–48,192), followed by Romania (Southeast region), with 42,390 (CI 39,717–45,062). Overall, there were higher GC for sub-national YLL rates across countries in males (0,15; CI 0,14–0,16) compared to females (0,12; CI 0,11–0,13). France (0,08; CI 0,02–0,14) and Portugal (0,08; CI 0,04–0,11) had the highest GC for females, whereas the highest GC for males were estimated for Belgium (0,08; CI 0,06–0,11) and Portugal (0,08 CI 0,05–0,11).

Conclusion: Our comparative analyses showed that regions located in Eastern and Central European countries had the highest YLL, while Western European countries had the highest GC values, indicating larger inequalities in premature mortality within these countries. Public health strategies need to take into account these regional health inequalities for future policies and interventions.

Integral strategy for the strengthening of agrifood practices and knowledge, and income generation for afro-colombian, indigenous and migrant communities in colombia, during the pandemic

Mariana Gallego¹, Laura Chiquillo¹, Jovana Cañas¹, Diego Lucumí Cuesta², Yenny Rueda Guevara², Jhon Patiño Rueda¹

¹Research Line on Health Systems, Childhood, Gender, Interculturality and Tropical Diseases, Research Group on Public Health, Medical Education and Medical Professionalism, School of Medicine, Universidad de los Andes, Bogotá DC, Colombia Colombia, ²School of Government, Universidad de los

Andes Colombia

Background and objective: In the world, 820 million people suffer from malnutrition. The COVID-19 pandemic, and its socioeconomic repercussions, have deepened the nutritional status of the most vulnerable population groups. The objective of this study was to propose recommendations for a strategy to strengthen agro-food practices and knowledge and income generation for Afro-Colombian, indigenous and migrant communities in Colombia, 2021.

Methods: A quantitative-qualitative methodological study was conducted. Several national databases (2017-2019) were analyzed in order to analyze the food and nutritional situation baseline of Afro-Colombian populations, indigenous populations and migrant population in Colombia. Thirty two semi-structured interviews were conducted in order to learn about the food and nutritional situation during the COVID-19 pandemic in six municipalities of Colombia. Quantitative and qualitative analyses were carried out with STATA and Nvivo software, respectively. **Results:** Statistically significant differences in proportions between the ethnic and non-ethnic populations were found in the following variables: moderate and severe acute malnutrition, less than three meals a day due to lack of money, inadequate drinking water source, and food insecurity. In the qualitative analysis, populations had difficulty in obtaining the food of the basic family food basket given the scarcity and lack of money. For Afro-descendant and indigenous populations, the lack of territory (due to forced displacement or national boundaries) has become a factor that increases food insecurity. Finally, the communities demonstrated the importance of practices such as bartering, food exchange and community cooking pots.

Conclusion: Four recommendations were proposed for guiding a food strategy in the context of humanitarian crises: Permanent adaptation of the humanitarian response for food security to changing circumstances and contexts; Maintenance of conditions that guarantee a balanced diet; Adoption of a differential approach at each stage of the food strategy in humanitarian crises; and Establishment of spaces and means to discuss interests and expectations.

Education and inequities in mortality: a global systematic review and meta-analysis

Claire Henson¹, Mirza Balaj², Joeseeph Friedman³, Terje Eikemo⁴, Emmanuela Gakidou⁵

¹Institute for Health Metrics and Evaluation United States, ²Norwegian University of Science and Technology, ³Caltech-UCLA Medical Scientist Training Program United States, ⁴Norwegian University of Science and Technology Norway, ⁵Institute for Health Metrics and Evaluation

Background: Education is a critical determinant of health, and thus access to quality education through tertiary levels is included in Sustainable Development Goal (SDG) 4. This study aims to estimate the reduction in all-cause adult mortality risk that is associated with increased education globally and in distinct regions.

Methods: We conducted a systematic review and meta-analysis of all studies capturing the effects of education on adult mortality. Mixed-effects Bayesian meta-regression models were implemented to address heterogeneity in referent and exposure measures and to adjust for study-level confounders including age, sex, wealth, marital-status, and race/ethnicity.

Results: The review produced 9,750 effect measures extracted from 557 studies spanning 56 countries. The data biased towards High-income countries (HIC) at 86% of the sample, with 0.54% of results from Sub-Saharan Africa and none from North Africa and the Middle East. There was a dose-response relationship between education and adult mortality resulting in an average reduction in mortality risk of 1.42% (95%CI 1.24-1.59) per additional year. Compared to 0 years of education, achieving 6 years of education reduced mortality risk by 3.15% (1.5-4.89), improving to 8.83% (6.11-11.65) at 12 years and 25.56% (22.36-28.7) after 18 years. There were distinctly different effects of education on mortality risk in HICs compared to others, with an additional average yearly protective effect of 0.88% (0.16-1.44) among non-HICs.

Conclusion: We identified an unequal distribution of studies estimating the impacts of education on mortality, particularly in Africa and the Middle East. We quantified the global impact of education on adult mortality and showed that lower education is a risk factor for premature mortality across regions even after controlling for other markers of socioeconomic status. This study provides robust evidence that SDG goals to keep learners in school through secondary and tertiary levels are a mechanism to improve long-term population health.

Palestinian health care providers' barriers to ask about violence: a qualitative study

Amira Shaheen¹, Amira Shaheen², Nagham Joudeh³, Abdulsalam Alkhayyat²

¹Department of Biomedical Science Faculty

of Medicine An-Najah National University Nablus Occupied Palestinian Territory, ²An-Najah National University, Occupied Palestinian Territory, ³An-

Najah National University, Occupied Palestinian Territory

Background: Health care providers (HCPs) have regular contact with women in a variety of circumstances. This includes routine appointments, and childbirths visits. Nurses and midwives, in particular, are in an ideal position to screen women for domestic violence (DV). It is recommended that HCPs should ask about DV when there is an identified risk, or assessed condition that may have been caused by DV (1). Guidelines in different countries required HCPs to routinely screen for DV (1). Yet, some HCPs are reluctant to undertake this important role. The current study aims at assessing barriers that face Palestinian HCPs and limit their chance to ask about violence.

Methods: Four primary health care clinics, that serve disadvantaged populations in the West Bank, were purposely chosen. HCPs views about barriers that limited their chance to ask about violence were assessed through semi-structured interviews. Those were audio-recorded, translated and transcribed verbatim into Arabic. A sample of the transcribed interviews was checked against the Arabic recording by the first author, to ensure accuracy. Transcripts were then translated into English. Data from the transcript were anonymized and analyzed thematically. Ethical approval was obtained from An-Najah National University.

Results: Twenty four HCPs were interviewed. Individual, community, and managerial barriers were commonly viewed by HCPs as barriers to ask about DV. At individual level, lack of knowledge about the availability of DV protocols in the clinics, and experience, and fear of family retaliation. were reported as barriers by most of HCPs. At community level, women refuse to disclose violence as well as views around family privacy. At managerial level, heavy workload and lack of support.

Conclusion: Reproductive health care services are an important setting, where most women can easily visit. Assessing and eliminating barriers that limited the chance of HCPs to help survivors of violence is crucial.

Population health and burden of disease profile of south african women between 1990 and 2019

Inge Kleinhans¹, Flavia Senkubuge^{1,2}, Alfred Musekiwa¹, Mahloko Flavia Mogashoa¹, Tom Achoki^{1,3}

¹School of Health System and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa

²Kofi Annan Global Health Leadership Fellowship, Africa CDC, African union commission, Addis Ababa, Ethiopia

³Africa Institute for Health Policy, Nairobi, Kenya

Background: South Africa faces a quadruple burden of disease and women are affected disproportionately. Understanding the epidemiological trends and burden of disease profile of women is important for targeted implementation of public health programs. This study describes the trends and burden of disease of communicable, maternal, neonatal, nutritional diseases (CMNNDs), non-communicable diseases (NCDs), and injuries of women in South Africa between 1990 and 2019.

Methods: In this descriptive cross-sectional study we used the open-access secondary data from the Institute for Health Metrics and Evaluation (IHME) from 1990 to 2019. We measured population health as per the World Health Organization (WHO) standards using age-standardized disability-adjusted life years (DALYs), years of life lost (YLLs), years lived with disability (YLDs) and age-specific death rate (ASD). Level 1 and 2 causes and risk factors for all ages and sexes were clustered into CMNNDs, NCDs, and injuries respectively.

Results: Findings for women over the 29-year period revealed that the leading causes of death, DALYs and YLLs were, HIV/AIDS, sexually transmitted infections (STIs) and cardiovascular disease. The leading cause of YLDs in women was other non-communicable diseases. Trend analysis showed a decline in prevalence as follows NCDs from 93 544,9 cases per 100 000 population in 1990 to 93 377,4 cases per 100 000 population in 2019 (-0,18%); CMNNDs from 87 668,61 cases per 100 000 population in 1990 to 80 101,36 cases per 100 000 in 2019 (-8,63%); and Injuries from 15 404,4 prevalent cases per 100 000 population in 1990 to 12 225,37 prevalent cases per 100 000 population (-20,64%). Considering the provincial mortality rates among women, in 1990 the Gauteng province had the highest mortality rate at 1000,09/100 000 population whilst the Limpopo province had the lowest (697,71/100 000 population) amongst women. However, in 2019, the Free-State province had the highest mortality rate among women (1188,48/100 000 population) and the Limpopo province the least (801,60/100 000 population). **Conclusion:** HIV/AIDS, STIs and cardiovascular disease are the leading causes

of death, DALYs and YLLs among women in South Africa. Strengthening national policies and implementing public health programs with a gender lens is recommended to address the burden of disease among women.

Is it acceptable to consume alcohol at scientific events?

Francisca Valente¹, Ana Baptista, Diogo Lopes¹, Dinis Loyens¹, Francisco Barcelos¹

¹Public Health Unit of Amadora Portugal

Background: In 2022, alcohol continues to dominate public health conference venues nationally and internationally and is indirectly promoted by the same public health experts fighting NCDs and alcohol-related diseases. This study aimed to determine whether and why scientists wish to keep alcohol in scientific events and potential alternatives to alcohol consumption.

Methods: Using keywords, a non-systematic narrative search was conducted in PubMed. Grey literature was also included.

Results: A MINIMAL number of studies were found. According to a survey, 70% of scientists favour the continued presence of alcohol at scientific events. Alcohol consumption is believed to facilitate networking and break down barriers, and alcohol bans are thought to restrict drinkers choices. There may be a way to change this pattern by providing limited non-exchangeable drink tickets, providing more non-alcohol drinks, substituting food for alcohol, and going out for drinks afterwards.

Conclusion: Conference venues, scientific meetings, and university spaces are not alcohol-free zones. Alcohol availability can facilitate excessive behaviour, overconsumption, and peer pressure and undermine efforts to prevent alcohol epidemics.

Considering that there is not much data available, more research must be done on this topic. In addition, peers must be made aware of its significance.

Results of the social innovation workshops developed in dispersed rural territories, using the phases of the desing thinking methodology

Marta Jaramillo-mejia¹, Marta Jaramillo-Mejía¹, Lina Marcela²

¹Universidad Icesi Departamento de Gestión Organizacional Calle 18 # 122-135 Cali, Valle del Cauca Colombia, ²Rivas Tafurt Universidad Icesi Helena Cancelado Carretero Universidad Icesi Departamento de Ingeniería Industrial Calle 18 # 122-135 Cali, valle del Cauca Colombia

Introduction: Dispersed rural communities have social determinants that hinder access to health services; therefore, it is necessary to use effective, diverse, flexible and innovative methodologies to develop transformational processes that generate positive impacts, from territorial perspectives and worldviews, with a differential approach that is maintained over time. This article aims to present the results derived from health workshops, carried out in dispersed rural territories with social innovation tools.

Methods: Operational and descriptive study. We used participatory methodologies of scorecards developed in six (6) municipalities with high rurality located in Colombia. The workshops had a participation between 30 and 40 people in each territory. This information was collected and analyzed in three phases (empathize, define and devise) which correspond to the method of problem/challenge solving with a creative base, called desing thinking.

Results: The results obtained in the territories show that people have a concept of health that is related to: well-being, absence of disease, fundamental right and living in harmony. On the other hand, the community actors recognize as health resources the health institutions and Western health resources, ancestral knowledge. The rain of problems in the territories reflected: the loss of ancestral knowledge, lack of access to quality health services, lack of a primary health care model, environmental problems and poor use of free time, which were analyzed through a problem tree. In the visioning exercises, attendees recognized the importance of empowering processes, intersectoral work and collective actions. Workshop attendees were able to propose achievable and measurable challenges to reach the future vision.

Conclusions: It is necessary to develop projects with innovation methodologies to involve communities in a timely manner and generate social transformation processes that truly embrace the worldviews, concepts and perceptions of all types of actors

Violence against women by intimate partners in the COVID-19 pandemic: an analysis of reported cases

Margareth de Almeida¹, Dinair machado¹, Rayene Cunha²

¹São Paulo State University Comendador Pedro Stefanini, 373, Botucatu Brazil, ²São Paulo State University

Background and objective: From the perspective of gender and patriarchy, as dialectical processes, the objective was a broader understanding of intimate partner violence against women in the context of the COVID-19 pandemic.

Methods: A study with a quantitative and qualitative approach was carried out, in two stages: survey of cases of violence against women by partner, formalized in police reports at the Police Station for the Defense of Women, in a city in the interior of the state of São Paulo/Brazil, from March 1, 2020 to October 31, 2020, eight (8) months. After the characterization and identification of women (first stage), interviews were conducted with some of these women, based on guiding questions, aiming to learn about the experience of intimate partner violence during the period of social isolation.

Results: The material was recorded, full transcribed and systematized for thematic analysis. In the first phase, 254 police reports were analyzed, predominantly women with working and reproductive age, aged between 20 and 44 years (63%), white women (73%) and were separated from the partner (63%). Psychological violence was the most reported in 73% of cases and 77% of women requested protective measures. The in-depth analysis of the interview with twelve women made it possible to understand how previously existing situations of violence were even more tense during the COVID-19 pandemic, skin worsening of living and working conditions and/or the intensification of coexistence due to isolation. **Conclusion:** Therefore, the study indicated a complexity and diversity of situations, a "new experience" of women in the face of violence, enabling them to denounce the violence suffered, even in the midst of the pandemic.

Describing the occurrence of Hypoxic Ischemic Encephalopathy disease in Huye district, Rwanda, 2021

Kizito Habakurama¹

¹Rwanda

Background: Hypoxic Ischemic Encephalopathy (HIE), a brain dysfunction that occurs when the brain does not receive enough oxygen or blood flow, remains a problem of great concern worldwide especially in developing countries. The incidence of HIE ranges from 1.5 to 8 per 1000 live births and from 2 to 26 per 1000 live births respectively in developing and underdeveloped countries including Rwanda. Despite the above information there is paucity of data about the magnitude of HIE in Rwanda. We analyzed HIE data to describe characteristics of HIE patients in Huye district during the period of 2021.

Methods: This a descriptive study by conducting a retrospective review of surveillance data. HIE case was defined as neonate admitted in Kabutare hospital for HIE as final diagnosis in 2021. We described demographic characteristics of HIE cases as well as maternal underlying factors contributing to the occurrence and calculated Incidence and case fatality (CFR) rates. Results were presented in frequency and proportions.

Results: In total, 956 neonates were recorded by Huye district including 120 HIE cases (Incidence rate 125 per 1000 births in 2021). Of them, 64.2% were males, 13.3% died (CFR=19.2%); gestation age was (GA) 73.3% at term and 20.8% unknown; 62.5% were born at the Hospital and 36.6% at Health center; 80% of HIE neonates were from mothers aged between 18-35 years and 52.5% from mothers with Gravida one.

Conclusions: Incidence and CFR were higher than in developing countries. Lack of knowledge on last menstrual period, delivery at the hospitals, primigravida mother and gestational age should be analytically studied to set up preventive measures as recommended during the provision of feedback to the decision makers in Huye district.

Health literacy for Tunisian youth: What should we do for effective prevention of hemoglobinopathies?

Foued Maaoui¹

¹Pasteur Institute of Tunis, Tunis, Tunisia

Background and Objective: Health education in secondary school plays a critical role in anticipating hemoglobinopathies transmission risks. Nonetheless, there are only a few research studies examining the health literacy level of adolescents under age 19. The Objective of our study is to explore the knowledge and skills related to the prevention of hemoglobinopathies.

Methods: A cross-sectional investigation was conducted among Tunisian youths attending public secondary schools and learning about human genetics (n = 356;

male 28.1 %, female 71.9 %).

Results: The Results show that concerning literacy to hemoglobinopathies, significant differences in knowledge, risk perception, and behavioral attitudes were found by gender, age, and school level (Sig < 0.05). 65,4 % has not identified the hereditary nature of diseases and confuse it with dietary iron anemia 41,6 %. Although 55,3 % of respondents recognized severe anemia as a symptom, however, 71,3 % did not link jaundice to thalassemia, almost 30% said this disease causes rash, fever, dry cough and sore throat. The Results show low levels of the difficulties of youths to consider the hereditary transmission risks of haemoglobinopathies and to understand the importance of screening and genetic counseling. 36,8% of students (59% Male vs 28 % Female) do not consider it necessary to inform their partner of their carrier status. 59.5 % (67% Male vs 56.64 Female; Sig = 0.04) do not see the benefit of genetic counseling and prenatal diagnosis even if the family of one of the two partners has a history with disease.

Conclusions: Knowledge acquisition in human genetics remains insufficient to actively engage adolescents in the primary prevention of hemoglobinopathies. It is essential to plan health promotion and education interventions in conjunction with genetic learning. Messages based on real-life stories can help in understanding these diseases and promote health literacy.

Comparing characteristics of food insecure and food secure patients in an underserved heart failure clinic

Sachi Patel¹

¹University of Alabama at Birmingham, United States

The HRTSA (HearT-Transitional Services for Adults) clinic at the university of Alabama at Birmingham Hospital serves uninsured and underinsured individuals with heart failure (HF). In this study, we examined the differences in sociodemographic factors, clinical characteristics, depression and anxiety scores, health literacy scores, and health status perception scores among food secure and food insecure patients who established care in clinic. Between January 2018 and April 2021, 575 patients established care in the HRTSA clinic post-hospitalization. Patients were adults ≥ 18 years of age with heart failure. At the first clinic visit, baseline sociodemographic and medical history were obtained. Through descriptive statistics, t-tests, and chi-square tests conducted using SAS we compared demographic and clinical characteristics of food insecure and food secure clinic patients. Among all of the sociodemographic factors, clinical characteristics, depression and anxiety scores, health literacy scores, and health status perception scores that were assessed, none were found to be statistically significant. Although none of our Results were statistically significant, food insecurity is still an important social determinant of health that has previously been found to be associated with higher depression and anxiety. The difference in Results from previous studies can be due to change in study population size.

Health determinants related to low levels of Vitamin D, in women of childbearing age and older people in the Chilean population, according to the National Health Survey 2016 - 2017

Rodrigo Contreras¹, Sandra Alvear¹

¹University of Talca, Chile

Introduction: Vitamin D is a fat-soluble compound, which is obtained by the body from sunlight and intake through the diet. The deficiency of this vitamin causes disorders in both children and adults, ranging from rickets to osteoporosis, depending on the age range analyzed. **Objective:** To explain the social determinants involved in low levels of Vitamin D in women of childbearing age and older people in the Chilean population, according to the National Health Survey 2016 - 2017. **Methodology:** The present study constitutes a quantitative research carried out from secondary data, which were obtained from the Third National Health Survey 2016-2017, ENS 2016-2017. The statistical analysis of the data was performed using the STATA tool, from which a Logit Multinomial Logistic Regression Model was designed, to determine if there is an association of variables, in which the variable explained or under study (dependent) will be related with those that, presumably, are related to it or directly affect it (independent). **Conclusions:** in both study groups, the low levels of circulating Vitamin D exceed 80%, which makes this condition dangerously abnormal for the development of infants and for optimal quality of life when age is advanced; Most of the social determinants of health analyzed point to higher probabilities of finding low levels of Vitamin D in the population studied. **Keywords:** Vitamin D, Social Determinants, ENS 2016-101.

The determinants of the acceptance of restrictions on unhealthy food advertising

Mariusz Duplaga¹, Urszula Zwierczyk²

¹Department of Health Promotion and e-Health, Institute of Public Health, Jagiellonian University Medical College, Krakow, Poland, ²Department of Health Promotion and e-Health, Institute of Public Health, Jagiellonian University Medical College, Poland

Background and Objective: The last decade faced the re-discovery of commercial determinants of health (CDoH). Significant research is currently conducted on the corporate aspects of CDoH. This study aimed to assess society's readiness to adopt restrictive measures against unhealthy food advertising.

Methods: The analysis was based on data from an online survey in 2008 Polish adults aged 18-65. The questionnaire comprised 86 items, including instruments measuring health literacy (HL) and e-health literacy (eHL). The multivariable logistic regression model (MLRM) was developed for the variable reflecting respondents' acceptance of the ban on unhealthy food advertising.

Results: 46.9% (n=943) of respondents supported introducing some form of ban on advertising unhealthy food products. MLRM revealed that HL and eHL were significantly associated with the support of such measures. Persons with higher eHL (more likely than those with lower eHL supported such restrictions (all following Results were given as odds ratio and 95% confidential interval: 1.05, 1.03-1.07). Respondents with an undetermined level of HL were less prone to support the ban on advertising than those with inadequate HL (0.57, 0.40-0.82). Older persons supported the adoption of restriction in comparison to younger ones (1.03, 1.02-1.04), persons with the highest level of education compared to those with the lowest level (1.76, 1.10-2.82), and students compared to employees (1.60, 1.03-2.48). Singles compared to married (0.68, 0.52-0.88) and persons who did not reveal their income compared to those from the lowest income group were less likely to support restrictions (0.69, 0.49-0.98).

Conclusions: The views of public opinion about adopting more restrictive measures against the consumption of unhealthy food products depend on the complex interplay of various determinants. However, the development of skills and attitudes encompassed in health literacies seems to be an essential intervention in preparing society for the introduction of countermeasures to the impact of commercial determinants.

Evaluation of the health rights of sex workers: overview of rights violations

Kadir Simsek¹, Nuray Özgülner²

¹Institute for Collective Health, Silopi District Health Department, Türkiye,

²Istanbul Faculty of Medicine, Istanbul University, Türkiye

Background and Objective: The purpose of this research is to evaluate the violations of the right to health of sex workers in Turkey with historical comparison.

Methods: The research was designed as a qualitative, phenomenological study and was conducted in Istanbul. A total of 24 people was interviewed including 19 sex workers and 5 physicians. A semi-structured interview form was used in the interviews. The Findings were obtained by conducting a content analysis on the MAXQDA program. Ethics committee approved the research.

Results: In this study, the main findings are grouped into 6 themes: violations of the right to health, negative attitudes of health personnel (transphobia/discrimination/indifference/stigmatization), quality of health care, historical change in health care, behaviours developed because of negative experiences, and positive attitudes. Transphobia generally occurs in the form of addressing people with their deadname (assigned/identity name), sarcastic looks, and being admitted to the service according to the assigned gender, while stigmatization occurs in the form of associating sex work with various STIs, especially HIV/AIDS. Violations of rights mostly occur when physicians do not perform examinations in accordance with the Istanbul Protocol during assault examinations. Difficulties encountered in accessing health care lead people to radical methods such as hesitating to receive health care services.

Conclusions: The 90s were years when the health rights of sex workers working in Turkey were frequently violated for many reasons. In the intervening years, although the medical literature has developed in a more inclusive way, the perspective of the young physicians who grew up with these developments has changed in a positive way; in particular, it is necessary to ensure that health personnel receive training against discrimination, to regulate the social rights of sex workers, and to contribute to the change of society's perspective with egalitarian and inclusive policies.

Knowledge, attitude and practice of healthcare providers who may come in contact with women who have experienced intimate partner violence: qualitative research

Zaruhi Arakelyan¹

¹American University of Armenia, Armenia

The most common form of violence that women experience is initiated by intimate partners. IPV includes physical and sexual violence, stalking and psychological aggression by a current or former intimate partner. A multi-country study conducted by WHO on reporting domestic violence shows that the prevalence of women who have experienced violence ranges from 15% to 59%, while the prevalence of women ever experiencing intimate partner violence ranges from 22% to 47%. IPV may require regular, repeated messages from physicians to convince battered women to end their involvement with their abusive partner. Although a number of surveys have discovered the burden of domestic violence in Armenia since 2007, Armenia still has gaps in statistics on domestic violence clarifying time trends due to the lack of a surveillance system for domestic violence. This study assessed the knowledge, attitudes, and practices of general practitioners, gynecologists/obstetricians and emergency department clinicians regarding intimate partner violence among their patients in Yerevan, Armenia. The study investigator conducted 3 in-depth interviews and 3 focus group discussions in polyclinics and hospitals, where overall 17 healthcare providers participated. Directed content analysis was used to analyze the data. The study findings showed that Armenian healthcare providers are knowledgeable of domestic violence and its types. They can recognize violence through physical and non-physical signs; but because of the lack of practice, skills and knowledge on how to deal with victims, they are not able to manage those cases. A number of barriers and facilitators was identified, which either help or impede the healthcare provider to ask about violence and to support the victim. A new study should be conducted, which will be able to cover both rural and urban areas of Armenia. Healthcare specialists need to be trained in order to identify and deal with domestic violence, including Intimate Partner Violence.

The childhood-adolescence transition in a poverty area in Brazil: promoting Public Health actions and integrating university and community

Fernanda Germano¹, Rubens Bedrikow¹, Fernanda Germano², Carolina Novo³, Helenice Nakamura³

¹School of Medical Sciences, State University of Campinas, Brazil, ²State University of Campinas (UNICAMP), Brazil, ³University of Campinas (UNICAMP), Brazil

Background and Objective: the wide prevalence of teenage pregnancy and sexual violence in Brazil is a common scenario in poverty areas of the country, known as "favelas". With that in mind, the Vila Paula third mission program, carried out by professors and medical students from state university of Campinas (UNICAMP), since 2018, promotes dialogic interactions between residents of a favela in Campinas and the university, which stimulated students to create the growing in favela, a project that addresses themes related to the childhood-adolescence transition, integrated to public health actions in the territory, as the vulnerability of children and adolescents living in the area was realized as a health determinant. The objective is to welcome children and adolescents and guarantee safe information about the transition process between childhood and adolescence, marked by vulnerabilities and violences observed in the territory and not addressed in school or families. Methods: The project promotes talks, with participants from 8 to 12 years of age, about puberty, sexuality, pregnancy, STIS and sexual and gender violence. After each activity, a discussion group is held, with teaching specialists, addressing the corresponding topic in an integrated way with public health, in addition to a report. With these materials, the quality of the activity, its relation with health practices and the construction of relationships are evaluated.

Results: It was observed the engagement of children and adolescents in the proposed activities, with drawings, texts and dialogues, given the possibility of safely expressing their own experiences and perceptions on the topics addressed. Conclusions: the interaction between university and children and adolescents living in areas of high vulnerability highlights the construction of public health actions jointly with university and community. The execution demonstrates that this interface promotes dialogic relationships, collaborating for enriching interventions and bonds through the exchange of information in health.

University third mission program: contributions to the care of socially vulnerable communities

Rubens Bedrikow¹, Maria Vilela²

¹School of Medical Sciences, State University of Campinas, Brazil, ²Nursing Faculty, State University of Campinas, Campinas, Brazil

Background and Objective: The increase in poverty, unemployment and social inequality in Brazil in recent years has led to an increase in the number of people living in new urban slums. The Objective of this work was to analyze studies linked to an ongoing university third mission program in an urban slum in São Paulo - Brazil. Methods: Content analysis of the results of 15 surveys conducted over 5 years with urban slum dwellers.

Results: The research themes emerged from the dialogical interaction between students, teachers and community in the territory of the slum. It was found that social inequality, increased poverty and unemployment determine health problems related to food insecurity, low education, precarious housing, prejudice, and greater difficulty in access to health services and treatments, which intensified after the beginning of the COVID-19 pandemic. Primary Health Care, in the way it is organized, is not able to adequately perceive the suffering of highly vulnerable and poorly organized communities, such as the women who live in the shantytown studied who revealed suffering related to precarious housing, transience, social isolation, silencing and violence. The residents choose unique therapeutic itineraries, preferring emergency services to primary care health units near the slum, because of the uncertainty about their definitive permanence in the new territory. Rules and norms for combating the spread of COVID-19 that are effective for other groups in society may not be appropriate for communities living in slums with high social vulnerability that must therefore be approached uniquely. Conclusions: University third mission program of the academic social type is crucial for the university to realize the main problems that affect poor communities living in new slums, and to be able to envision more effective and unique forms of care.

The social determinants associated with the advanced stage diagnosis of breast cancer in Egypt in the previous ten years: a single-center quantitative retrospective cohort study

Madonna Fekry¹, Hamdy Azim^{2,3}, Loay Kassem², Justin Yang¹

¹Centre for Public Health, Wolfson Institute of Population Health, Queen Mary University of London, United Kingdom, ²Clinical Oncology Department, Kasr Alainy School of Medicine, Cairo University, Cairo, Egypt, ³Cairo Oncology Center, Egypt

Background: Breast cancer (BC) is the most common cancer among women worldwide. Most BC patients are diagnosed late in Egypt. This study aims to observe the socio-demographic inequalities associated with the advanced stage diagnosis of BC in Egypt in the previous ten years. Methods: This is a retrospective cohort study of patients with BC who presented to Cairo Oncology Center between 2011 and 2020.

Results: This cohort included 1953 patients. Logistic regression analyses revealed that most socio-demographic factors affected the stage of BC diagnosis. Single patients had 21% lower odds of being diagnosed at advanced stages than married ones (odds ratio [OR]=0.79; 95% CI 0.638 – 0.979, p=0.031). Unemployed patients had 27.5% higher odds of getting diagnosed late than employed ones (OR=1.275; 95% CI 1.062 – 1.531, p=0.009). Patients who live in rural areas were 89.1% more likely to present with advanced disease than those who live in urban areas (OR=1.891; 95% CI 1.314 – 2.722, p=0.001). Patients with three children or less had 29.3% lower odds of presenting with advanced disease than those with more than three children (OR=0.707; 95% CI 0.572 – 0.873, p=0.001). In contrast, there was no significant difference in odds of presenting with advanced BC between males and females and between Muslims and Christians (OR=1.936; 95% CI 0.686 – 5.641, p=0.212, OR=1.180; 95% CI 0.804 – 1.732, p=0.399, respectively). There was no difference in the mean age at diagnosis between advanced and early disease patients (52.3 vs. 51.233, p=0.057).

Conclusions: This 10-year single-center study highlights the socio-demographic disparities among BC patients. The study concluded that marital status, employment status, residence, and the number of children are highly associated with the stage of BC diagnosis. In contrast, religion, gender, and age at diagnosis are not associated with the stage of BC diagnosis.

Sexism and the intention to use the male contraceptive injection

Vanessa Jiménez¹, Lesly Baltazar¹, Rebeca Ontiveros¹, Angelica Marin¹, Felix Celedonio¹, Josue Villegas-Dominguez¹

¹Universidad del Valle de Mexico, Mexico

Background: In Latin America, sexism is a situation that is still frequently experienced, especially in Mexico, where culture promotes this situation by giving them certain roles and responsibilities, including family planning.

Objective: To determine the sexism as factor associated with the intention to use the contraceptive injection in adult men in the state of Veracruz.

Methods: An observational, analytical, cross-sectional and prospective study was carried out during January-April 2022. Men between the ages of 18 and 45 from Veracruz were included, excluding transsexual and homosexual participants, patients with a diagnosis of psychiatric illness that conditions the functions mentally superior or with a diagnosis of any type of dementia, patients with diagnosed infertility and vasectomy performed. Incomplete surveys were removed. A probabilistic sample size was calculated, with convenience sampling. The main independent variables were machismo (EMSsexism-12 test, α .Cronbach 0.83), family function (family APGAR test, α .Cronbach 0.83), type of family and knowledge about the contraceptive injection, while the dependent variable was the intention of use the contraceptive injection. For the statistical analysis, absolute and relative frequency measurements were made using the SPSS software for X2 test with Odds Ratio and confidence interval (95%).

Results: 263 were obtained, being single in 89%. The factors (OR/CI) with a significant association ($p < 0.05$).

Conclusions: Age, number of children, and marital status are associated with the intention to use the contraceptive injection, while machismo, schooling, and family function are not.

Cross-sectional analysis of family determinants of lifestyle habits in a sample of Italian primary school children: the I-MOVE Project

Francesco Esposito¹, Francesco Esposito², Francesco Sanmarchi³, Alice Masini³, Carolina Poli⁴, Anna Kawalec⁵, Susan Scrimaglia³, Lawrence Scheier⁶, Laura Dallolio³, Rossella Sacchetti⁷

¹Dipartimento di Scienze Biomediche e Neuromotorie (DIBINEM), Alma Mater Studiorum, Università di Bologna, Italy, ²Dipartimento di Scienze Biomediche e Neuromotorie, Università di Bologna, Italy, ³DIBINEM, Alma Mater Studiorum, Università di Bologna, Italy, ⁴(DIMEC), Alma Mater Studiorum, Università di Bologna, Italy, ⁵Department and Clinic of Paediatric Nephrology, Wrocław Medical University, Poland, ⁶LARS Research Institute, Inc., Arizona and Prevention Strategies, North Carolina, United States, ⁷Department of Education Studies Giovanni Maria Bertin, Alma Mater Studiorum, University of Bologna, Italy

Background and Objective: Several authors showed how the acquisition of healthy habits during childhood is essential for maintaining them during adulthood. Most children's eating and physical behaviors are acquired in two main contexts: school and family. The present study aimed to explore families' determinants as potential predictors of healthy lifestyle habits (adherence to the Mediterranean Diet (MD), Leisure Screen Time (LST), Moderate to Vigorous Physical Activity (MVPA), and engagement in organized sports (SE)) among a sample of primary school children. **Methods:** This cross-sectional study was conducted among 106 children (mean age 7.92 ± 1.40 ; 50% male, 50% female) enrolled in a primary school in Imola (Italy). Data were collected from October to December 2019 using an interactive tool to assess parental features and children's lifestyle (zoom-8 questionnaire) and actigraph accelerometers, to analyze children's activity levels and sedentary behavior over a seven-day period. Multiple linear regression models with backward stepwise selection were employed to identify the independent factors associated with the continuous outcome variables.

Results: Adherence to md (expressed by Kidmed index) was positively associated with fathers' educational level ($\beta = 1.0$; 95%ci 0.10, 1.9), parental sport participation ($\beta = 1.0$; 95%ci 0.17, 1.9) and parental health literacy nutritional knowledge score ($\beta = 0.45$; 95%ci 0.10, 0.81). Moreover, higher mothers' educational level was negatively related to LST. Among the parental characteristics, nutritional knowledge is positively related to children's average daily minutes of se ($\beta = 2.8$; 95%ci 0.15, 5.4). However, MVPA was not related to parents' characteristics.

Conclusions: The present study emphasizes the importance of parental determinants that affect the lifestyle of primary school children. In this context, we can underline how health promotion actions aimed at the adult target can also have an important impact on the younger populations.

Estimation of the correlation between the social determinants and the obesity during the pre-adolescent age of the apulian population in Southern Italy

Maria Balducci¹, Osvalda De Giglio², Alessia Quaranta², Pasquale Pedote³, Maria Montagna²

¹Department of Precision and Regenerative Medicine and Ionian Area (DiMePRe-J) Italy, ²Interdisciplinary Department of Medicine, University of Bari Aldo Moro, Italy, ³Epidemiology Unit, Brindisi Local Health Authority Italy

Even in Italy, the people with the poorest resources and skills get sick more, heal less and die earlier. This requires a more incisive approach to combat avoidable inequalities, also in consideration of the fact that social disadvantage represents the main risk factor for health and quality of life. It is known that the health outcomes related to chronic diseases are mainly derived from specific risk factors, and the social determinants can often be the "causes of the causes" of these risk factors. The aim of the study was to estimate the extent to which the effects of some social determinants (economic difficulty and the parental level of education) can influence obesity in primary school children residing in the Apulia region and to evaluate the potential health gain that children could have, by improving the those social determinants.

The contribution of social determinants to the onset of the obesity risk factor in children (unknown factor) was calculated with arithmetic proportion software called CoEsDi Children (Contribution to the Exposure of Inequalities). This software used as a data source the regional survey, Okkio alla SalutePuglia 2019, which studied the prevalence of obesity in children and the social determinants of their parents. The data analysis was mainly aimed at estimating the prevalence of the detected variables, setting the confidence interval at 95%.

Forty-three percent of obese Apulian children who have parents with low levels of education and severe economic difficulties would be able to reduce their weight status if social inequalities were changed, and 7% would not be able to develop obesity if they were raised in a family without social inequalities.

Obesity in children is closely related to the socio-economic status of the parents: the higher the level of income inequality is, the more overweight the children are.

Challenges in Public Health: SARS-CoV-2 vaccination of hard-to-reach population during COVID-19 pandemic. Experience of a local health authority in Lazio Region (Italy)

Francesca Mosaico¹, Emanuele Bottosso¹, Giammarco Aceti¹, Vincenzo Locciano¹, Raffaele Catapano¹, Giovanna Russo¹

¹Azienda Sanitaria Locale (ASL) Roma 6, Italy

Background and Objective: International literature suggests that disadvantaged groups are at higher risk of morbidity and mortality from SARS-CoV-2 infection due to poorer living/working conditions and barriers to healthcare access.

In Lazio region (Italy), from June 2021, proximity health initiatives, such as mobile health unities (MHU), were put in place to ease the access to COVID-19 vaccinations, outside clinical settings (outreach), of irregular migrants, some of them without health coverage from Italian Health System (SSN).

Methods: Data from 2021/2022 local Vaccination Centers of ASL Roma 6 and from the Regional Vaccination Registry (AVR) were integrated and analyzed. Demographic variables and those relating to administrative-welfare data were analyzed using descriptive methods.

Results: 272 irregular migrants were vaccinated from July 2021 to April 2022: 58,5% were male, average age was 34.6 years. 512 vaccine doses (primary series and booster doses) were administered.

Most of them came from European area, in particular from Ukraine (30,1%).

77% has completed a primary series of vaccination and 53% of doses were provided by the MHU.

All people found without health coverage during vaccination sessions (n.170, 62,5%) were regularized.

Conclusion: In Italy, during the first year of campaign, SARS-CoV-2 vaccination avoided about 8 million infections, over 500,000 hospitalizations, over 55,000 ICU admissions and approximately 150,000 deaths, with a positive cost-effectiveness ratio.

Through this local outreach initiative, a fragile population towards COVID-19 was able to benefit from the most effective form of primary prevention against the infection and administrative barriers to healthcare coverage have been removed. Migratory flows and recent COVID-19 pandemic, challenge health systems to find and strengthen innovative approaches in health services offering.

Substance use among Serbian adolescents -prevalence, trends and comparison with European countries

Biljana Kilibarda¹, Jelena Gudelj Rakic¹, Mirjana Tosic¹, Verica Jovanovic¹, Milena Vasic^{1,2}

¹Institute of Public Health of Serbia "Dr Milan Jovanovic Batut" Serbia,

²Faculty of Dentistry, Pancevo, Serbia

Background and Objective: Adolescents substance use is public health challenge and changing phenomenon that requires regular monitoring in order to provide adequate interventions. The aim of this study was to explore prevalence and trends in substance use among Serbian school students and compare it with other European countries.

Methods: This is a secondary analysis of data obtained through the European School Survey Project on Alcohol and Other Drugs (ESPAD), a repeated, cross-sectional study of substance use and other forms of risk behavior among students in European countries aged 15-16 years. The ESPAD is carried out every 4 years at European level and Serbia participated in this study in 2008, 2011 and 2019. Descriptive statistic was used for this analysis.

Results: Data from ESPAD 2019, show that lifetime prevalence (LTP) of any illicit substance use among Serbian school students 16 years old (8.6%) is lower than ESPAD average (17%) with only three ESPAD countries reporting smaller prevalence in 2019. Cannabis is the most used substance with LTP 7.3% which is more than twice lower than ESPAD average (16%). Prevalence of high-risk cannabis users in total sample of students (2.0%) is also lower than ESPAD average (4.0%), but higher among last 12 months cannabis users (38.0% in Serbia compared to ESPAD average (36%). In total, there is a slight increase in LTP cannabis use (from 7% in 2008 to 8% in 2019) with stable trend among boys and slight increase among girls. **Conclusions:** LTP of all explored illicit substances stance use is lower in Serbia compared to EU average that correspond with lower prevalence of substance use among adult general population. There are no major changes in the trends for the period 2008-2019. In depth analysis is needed to determine the wider determinants related to differences in substance use among countries.

DOI: 10.18332/popmed/164102

Prevalence of alcohol consumption in the population of the municipality of Mitú 2022: cross-sectional study applying the audit test

Holman Vega¹, Jovana Ocampo Cañas¹, Jhon Patiño Rueda²

¹Universidad de Los Andes Cra. 1 #18a-12, La Candelaria, Bogotá, Cundinamarca, Colombia. Colombia, ²Universidad de Los Andes

Introduction: Problematic alcohol consumption in indigenous communities has been documented in numerous countries in the Americas. In the department of Vaupés, 81.7% of the population is indigenous and this phenomenon has not been rigorously quantified. The purpose of this article is to measure the prevalence of risky, harmful and dependent alcohol consumption in the urban population of the municipality of Mitú, in the department of Vaupés, Colombia in 2022.

Methodology: An observational study of cross-sectional design was carried out through the application of the AUDIT survey in the urban population of the municipality of Mitú in the year 2022. Alcohol risk consumption was quantified through the Alcohol Use Disorders Identification Test (AUDIT), whose cut-off point was 8 units. Descriptive analysis of the information was performed in Microsoft Excel and STATA.

Results: A total of 397 people participated, aged between 18 and 95 years with a median of 34 years (RIQ 23 years). Within the population evaluated, the majority were women (50.6%), of indigenous race (89.6%), belonging to the Cubeo, Desano and Tucano ethnic groups. Problematic alcohol consumption was more prevalent in men than in women (PR 2.36, p < 0.01 CI95% 1.39-3.98), in indigenous vs. non-indigenous (PR 3.55 CI95% 1.34 - 9.44) and in youth (PR 3.44 CI95% 1.57 - 7.56) and adults (PR 3.39 CI95% 1.59 - 7.25) vs. old age.

Discussion and conclusions

Problematic alcohol consumption requires a multidimensional approach. The Desano, Guanano and Tuyuca ethnic groups showed a higher prevalence of problematic alcohol consumption; this could be related to the cultural context and the role of alcoholic beverages within the communities. Research is needed to investigate individual or collective factors in these populations that may have an impact on problem drinking.

Development of health literacy in Czech Republic

Nora Veselá¹

¹Institute for Postgraduate Medical Education Ruská 2412/85100 05 Praha 10

Czech Republic

Health literacy is a determinant that greatly influences individual and population health. In 2014, the first systematic study of health literacy in selected EU countries was published (HLS-EU) - Austria, Bulgaria, Germany, Greece, Spain, Ireland, Netherlands, Poland. Same method was used in Czech Republic the very same year. Results were rather alarming yet not surprising. Level of health literacy was insufficient and problematic among Czechs (13,3% insufficient and 29,2 % problematic). Ten years after the first European Health Literacy Study (HLS - EU), the results of the second European Health Literacy Study (HLS19), based on the experience of respondents from 17 countries in the WHO European Region were published. The countries included are Austria, Belgium, Bulgaria, Czech Republic, Denmark, France, Germany, Hungary, Ireland, Israel, Italy, Norway, Portugal, Russian Federation, Slovakia, Slovenia and Switzerland. These two studies will be compared and presented in the context of the level of health literacy of the Czech population. The presentation will include an introduction to existing health literacy support structures in Czech Republic (e.g. the Institute for Health Literacy, the Czech Medical Association of J.E.Purkyně, the National Institute of Public Health). In conclusion, it appears that there is a need for repeated measurement of health literacy, clarifying the evaluation methodology and thus avoiding bias.

COVID-19 infection and comorbidities: A cross-sectional study on two central Italy prisons

Francesca Galassi¹, Anna Angelone¹, Ciro Marziliano¹, Francesca Marzi¹, Marianna Mastrodomenico², Fausto Frabotta²

¹University of L'Aquila Italy, ²ASL1, Avezzano-Sulmona-L'Aquila Italy

Background and Objective: The presence of multiple chronic diseases is significantly associated with an increase in the probability of mortality when it is associated to COVID-19 infection. The aims of our study were: i) to evaluate the association between the severity of the COVID-19 disease and the presence of one or more comorbidities in the population of prisoners in 2 prisons of central Italy: LAquila and Sulmona; ii) to describe the profiles of inmates using multiple correspondence analysis.

Methods: For these purposes, a database was created including age, gender and clinical variables. The database containing anonymized data has been password protected. The Kruskal-Wallis's test was used to evaluate a possible association between diseases and the severity of covid-19 stratified by age groups. We used multiple correspondence analysis (MCA) to describe a possible characteristic profile of inmates.

Results: Our results show that age group 0-50y (covid-19 negative), of the LAquila prison, 19/62 (30.65%) were without comorbidity, 17/62 (27.42%) with 1-2 comorbidities and only 3.23% had >2 diseases. It is interesting to note that in the elderly the frequency of 1-2 or >2 pathologies were higher and only 3/51 (5.88%) inmates did not had comorbidities and were covid-19 negative (p=0.008). The MCA identified the following profiles: the prison of LAquila shows a group made up of women, aged over 60, with diabetes, with cardiovascular, orthopedic problems and hospitalized for covid-19; the Sulmona prison presents a group aged over 60, with diabetes, with cardiovascular, respiratory, urological, gastrointestinal and orthopedic problems and hospitalized or symptomatic due to covid-19.

Conclusion: Our study showed that COVID-19 infection affected inmates with more than one comorbidity and older age with create disease severity.

Sociodemographic characterization and access to health services in the gypsy community of Barcelos, Portugal

Marina Pinheiro¹, Sílvia Silva¹, Marta Lemos¹, Lucinda Barros¹, Rosa Zambrano¹, Edite Brito¹, Ana Fonseca², David Nascimento¹

¹Public Health Unit, ACES Cávado III Barcelos/Esposende, Braga, Portugal,

²Ana Fonseca Portugal

The Gypsy Community in Portugal is characterized by deficient standards of living, especially in terms of health. This work aims at a sociodemographic and access to health characterization of the Gypsy Community covered by the Grouping of Health Centers (ACES) of Cávado III - Barcelos/Esposende in Portugal so that with their greater knowledge it is possible to diagnose the situation and consequent intervention regarding their health needs. This descriptive observational study is based on clinical records (secondary data) consulted during the period January-March, 2022. The results obtained regarding the sociodemographic characterization Gypsy Community (n=237) demonstrate the existence of an extremely young population (average age=26.9 years) in a group of 56 households, a large part of which (71%) reside in the same parish, in Barqueiros. Regarding

access to primary health care, 97% of this Gypsy Community have a family doctor and 81% had at least one consultation with their doctor in the last 2 years. The main chronic diseases identified are hypertension, diabetes, dyslipidemia, and obesity. The prevalence of hypertension, diabetes, and dyslipidemia in the Gypsy Community is 11% and the prevalence of obesity and overweight is 30%. Regarding access to the emergency service in the period 2019-2022, 8 and 4% of this population used the ER at least 5 and 10 times, respectively. With regard to compliance with the National Vaccination Program (PNV), 30% of this population fails to comply with the PNV. It is essential to improve living and housing conditions and eradicate health inequalities presented by minority groups, including Gypsy Communities. This objective must be included in the priorities and agenda of the National Health Program (PNS), at the national level, and in the Diagnostics of the Situation at the local level.

Realist evaluation of effect's conditions of health mediation on healthcare utilization and participation in cancer screenings among underserved populations: The ecemso protocol study

Elodie Richard¹, Judith Martin-Fernandez², Leïla Ramiz³, Linda Cambon³, Stéphanie Vandentorren¹

¹PHARes, Centre Inserm U1219, Bordeaux Population Health, Université de Bordeaux France, ²Université de Bordeaux Searcher France, ³Centre Hospitalier de Bordeaux / PHARes, Centre Inserm U1219, Bordeaux Population Health, Université de Bordeaux France

Introduction: Despite all the existing strategies, such as organized cancer screening, healthcare utilization and participation in screening remain insufficient, particularly among underserved population. This population is more exposed to diseases, less receptive to prevention messages, and have less healthcare utilization. Interventions that promote healthcare utilization by underserved populations must therefore go beyond the question of supply. Health Mediation (HM) is one of the promising interventions that promote healthcare utilization. However, except for some pioneering studies, no study seems to have demonstrated HM's effectiveness and conditions of effect experimentally. The objective of the ECEMSo study is to identify the HM's conditions of effect on healthcare utilization and participation in cancer screening.

Methods and analysis

The ECEMSo study adheres to the theory-driven evaluation framework where the realist evaluation method and contribution analysis are used to explore the effects, mechanisms, and influence of context on the outcome. We will conduct a longitudinal study mobilizing mixed methods with a sequential explanatory multi-case and multicenter design. Knowledge mobilization workshops will be organized to promote collaboration between partners involved in HM and the health care system. The centers involved will be located in several regions of mainland France and support underserved populations who live in informal settlements. Outcomes are the evolution of healthcare utilization and cancer screenings used 6 months for those who have never been screened after the start of ECEMSo. To implement this survey we will use questionnaires, semi-structured interviews, focus groups and observations. The target number of participants are 800 beneficiaries and 33 professionals.

Discussion

The realist evaluation will allow us to identify contextual associations to the intervention, see how they work, and whether they can be adapted to implement health mediation in other settings if it proves effective. This study will allow recommendations / guidelines' production.

Evaluation of waste reduction promoted by the implementation of digital x-ray in social service of commerce dental clinic between may 2022 and november 2022 and it relation with the united nations sustainable development goals

Ellen Amaral¹, Fernanda Paiva², Marcus Bezerra³

¹Social Service of Commerce Health Management 106, Marquês de Olinda St. apt. 212, Botafogo, Rio de Janeiro, 22251-040. Brazil, ²Social Service of Commerce Claudia Coscarelli Social Service of Commerce Health Management 179, Sorocaba St. 103 apt, bl 01, Botafogo, Rio de Janeiro, Brasil, zip code 22271-110 Brazil, ³Social Service of Commerce Health Management 60, João Alfredo St, apt 504, Tijuca, Rio de Janeiro. Zip code 20511-390 Brazil

Background and objective: The United Nations has been promoting Sustainable Development Goals (SDGs) which are a call for action by all countries to promote

prosperity while protecting the planet. The Social Service of Commerce (SESC) has been committed to the SDGs since February 2022. Thus, it has been developing several actions to achieve these goals. The objective of this study is to evaluate the waste reduction promoted by the implementation of digital x-ray in dental clinic.

Method: It evaluated the amount of residual trash no longer produced at the dental clinic of Social Service of Commerce (SESC), Ramos by using the digital dental x-ray in the period comprehended from May 2022 until November 2022, totalizing 139 days of working days. Each component of the intraoral radiographic film was weighed and compared with the weight of the plastic used to protect the sensor of digital x-ray during a radiographic taken. These data allowed us to calculate the difference between the waste produced in each method. Thus, it was possible to determine the reduction of waste in this period and carry out the projection for 3, 6, 9, and 12 years.

Results: A total of 2100 intraoral exams were performed between May 2022 and November 2022; a total of 4.304g of waste was produced by conventional RX method and 123,9g with digital radiographic technique. Conclusion there was a significant reduction of waste especially plumb, converging straight to SDGs: good health and well-being; clean water and sanitation; responsible consumption and production; life below water; life on land. In 3, 6, 9 and 12 years a total of 22.104, 44.208, 66.312 and 88.416 grams, respectively, will no longer be produced, representing a 97,13% of waste reduction.

Barriers to healthcare services access among nursing students

Mohamed Kahloul¹, Imene Kacem², Rania Nakhli², Imene Mlouki³, Mohamed Ajmi¹, Walid Naija¹, Mrizak N²

¹Department of Occupational Medicine, Farhat Hached Academic hospital, Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia,

²Department of Anesthesia and Intensive Care, Sahloul Academic Hospital, Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia,

³Department of Preventive and Community Medicine, Mahdia Academic Hospital, Faculty of Medicine of Monastir, Tunisia

Background: Easy and timely access to health care services is essential for nursing students who are particularly vulnerable. National researchs on the difficulties of access to healthcare among students are rare. The aim of this study was to determine the barriers to healthcare services as reported by nursing students in order to propose solutions.

Methods: This is a cross-sectional study that took place over two month period and included all 2nd and 3rd year students enrolled in the applied license in nursing science at private nursing school during the academic year 2021/2022. The questionnaire enquired about barriers to using physical and mental healthcare services separately.

Results: A total of 150 students participated in the study, representing a participation rate of 47.3%. The health state was considered poor in 14% of cases. Psycho-affective and somatic complaints were frequently reported in 12.7% of cases for each. The social security scheme paid for in 36% of cases. The main obstacles to accessing care reported, in terms of mental health, were non-respect of confidentiality (84%), financial difficulties (82.7%), lack of time (74.7%) and fear of adverse effects (70%). Regarding physical health, they included difficulties in accessing university doctors (88%), risks related to covid-19 (79.3%) and financial difficulties (78%).

Conclusion: The difficulties of access to healthcare among students are various, requiring targeted preventive measures. Institutional programmes should use this information for improving the usage, satisfaction and effectiveness of healthcare delivery systems for nursing students.

Occupational health surveillance in Brazil: challenges in implementing the sustainable development goals in the 2030 agenda

Janine magaly arruda tavares¹, Solange laurentino dos santos¹

¹UFPE Brazil

Background and objectives: Occupational Health Surveillance (VISAT) directs health promotion and prevention actions, minimizing worker risks and vulnerabilities. The Sustainable Development Goals (SDGs) of the 2030 agenda propose a global pact, focused on human development involving motivational, political and social issues. This article aims to describe the relationship between SDG 2030 and VISAT, based on the manufacturing process. In this sense, the productive chain of clothing becomes prominent in the Agreste of Pernambuco,

they are centers of small industries, generating economic, social and territorial impacts for locals.

Methods: This is a systematic study, using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) method, with a search in PubMed, BIREME LILACS, Web of Science Scopus and extension queries. The choice was based on search selection criteria using descriptors, two articles were selected, from the perspective of sustainable development and VISAT, in the query for the introduction of materials aimed at policies on workers health.

Results: The results of the analysis show two articles extracted by PRISMA and three materials in the expanded consultation, which subsidized, changed the theme ODS, VISAT and the production process of clothing. Thus, the SDGs with the greatest reduction in the object, considering goals and indicators, involvement 3 – health and well-being, 6 – drinking water and sanitation, 9 – decent employment and economic growth, 11 – sustainable city and communities, 12 – consumption and responsible production. It is concluded that there are direct correlations between the SDGs and the manufacturing activity, however, there is a limitation in the achievement of goals and indicators, due to factors such as financial investments.

Conclusion: The research enabled a better understanding related to the activity of clothing, VISAT and sustainable development, whose happiness is indicative of establishing better living conditions for the health of workers and communities.

DOI: 10.18332/popmed/164558

Equitable accessibility to health services using timely measurements

Luis Gabriel¹, Carmen Villamizar Johns², Luis Cuervo³, Eliana Martinez³

¹Cuervo Amore Colaborative Project United States, ²Hopkins University, United States, ³Amore Colaborative Project-UNIVERSIDAD AUTONOMA DE BARCELONA United States

Introduction: The links between traffic congestion, accessibility to health services, and equity show how traffic congestion impacts accessibility among different populations. It can also be used to improve health services and land use planning. The study proposes an approach to measuring, analysing, and communicating accessibility to health services in terms of travel time, as opposed to traditional travel time analyses.

Methodology: We studied the entire city of Cali (2.258 million), assessing accessibility by car to urgent care (tertiary care emergencies) and frequent ambulatory care (haemodialysis and radiation therapy) in July and November 2020. The study is the cocreation of an interdisciplinary multisectoral group involving authorities, academia and other civil society, service providers and beneficiaries.

Results: Services are far from where most of the population lives, especially some of the most vulnerable. These people pay more to access essential health services. New analyses will indicate potential solutions and their potential impact.

Discussion: The study used a person-centred design to address the needs of different stakeholders. Studies like this can expand to other services, transportation means, and locations. They allow for integrating health equity with urban planning and enable participatory evidence-informed decision-making.

Incarceration, inclusion, and health equity: evidence, perspectives, and future directions

Stuart Kinner¹, Lisa Puglisi², Anne Bukten³, Marianne Stavseth³, Amanda Slaunwhite⁴, Mo Korchinski⁵, Amanda Butler⁶, Lindsay Pearce¹, Rohan Borschmann⁷

¹Justice Health Unit, School of Population Health, Curtin University, Australia, ²SEICHE Center for Health and Justice, Yale University, United States, ³Norwegian Centre for Addiction Research, University of Oslo, Norway, ⁴BC Centre for Disease Control, University of British Columbia, Canada, ⁵Unlocking the Gates, Canada, ⁶Department of Family Medicine, McMaster University, Canada, ⁷Department of Psychiatry, Oxford University, United Kingdom

Globally more than 11 million adults are imprisoned on any given day, and at least 410,000 children are held in criminal justice detention. Incarceration is a marker for extreme disadvantage, and exposure to incarceration may compound health inequalities. Complex health needs among people in custody are normative. Given the rapid movement of people between disadvantaged communities and carceral settings, improving the health of people exposed to incarceration is important to reducing health inequalities globally. Health outcomes after incarceration are especially poor, with high rates of preventable mortality, injury, infectious disease,

and decompensation of chronic disease documented in a growing number of (mostly high-income) countries. In this workshop we will consider prisons from a public health perspective: as settings through which marginalised and typically unwell members of the community pass, and in which health needs are managed by carceral systems that are rarely fit for purpose. We will summarise the evidence on health outcomes after incarceration, emerging from large cohort studies of adults and children released from incarceration in Australia, Norway, Canada and USA, and from an international consortium examining mortality after incarceration in 13 countries. We will identify key gaps in the evidence base, critically including research in low- and middle-income countries, and mechanisms for routinely monitoring health outcomes in and after incarceration. Informed by these brief presentations, we will facilitate a multi-disciplinary Discussion focussing on the following key questions: 1. Is incarceration a cause of poor health outcomes, a marker of pre-existing health inequalities, or both? Does it matter? 2. What opportunities exist to improve health outcomes before, during, and after incarceration, through: *3. Upstream prevention and diversion; 4. Prison healthcare quality, standards, and monitoring; 5. Transitional support and post-release care coordination. 6. What critical next steps are required to support advocacy and policy reform, specifically for public health agencies, policy makers, clinicians, researchers, advocates, and civil society? At the conclusions of the workshop we will draft a Consensus Statement on Incarceration and Health Inequalities, which will be submitted to key international agencies for potential ratification. Specific workshop Aims: 1. Sensitise a global public health audience to the health-related needs of children and adults who experience incarceration, and the role of incarceration in compounding or mitigating health inequalities at the population level 2. Identify multi-sectoral opportunities to improve the health of people exposed to incarceration through prevention, improved care, and post-release support. 3. Identify critical next steps for advocacy and policy reform. 4. Draft a Consensus Statement on Incarceration and Health Inequalities, which will be submitted to international agencies for potential ratification and published in a leading international journal.

What could go wrong? How to critically analyze the unintended effects of public health interventions on health inequities

Caroline Adam¹, Josée Lapalme²

¹Cégep du Vieux Montréal, Canada, ²McConnell-Université de Montréal, Canada

Public health Aims to improve the health of populations and reduce health inequities, notably through action on social determinants of health, including physical and social environments, public policies, access to health services, and community empowerment. Despite these intentions, growing research demonstrates that public health interventions can unintentionally contribute to increasing social inequalities in health by perpetuating social norms that can stigmatize vulnerable groups, neglecting the needs of vulnerable groups, or replicating power dynamics that disenfranchise vulnerable populations. In order to reverse these effects, researchers and professionals need to become aware of and reflect on the potential impacts of their actions on vulnerable populations. Bacchis "What is the problem represented to be?" (WPR) approach proposes a framework for analyzing policies and interventions that relies on a critical understanding of problem representation, that is, the ways in which a health problem is conceptualized by decision-makers. This useful framework has been used by many researchers to bring light to the unintentional effects of public health actions. It is through WPR's 6 analytical questions that researchers and professionals come to critically reflect on their actions. The 6 questions are: 1) What is the problem represented to be?; 2) What assumptions underlie the problem representation?; 3) How has this problem representation come about?; 4) What is left unproblematic in the problem representation?; 5) What effects are produced by the problem representation?; 6) How could the problem representation be questioned, disrupted, and replaced? Specific Aims/Objectives: Based on three public health intervention cases drawn from innovative research Findings and critical reflections, this workshop Aims to critically co-analyze these cases using Bacchi's WPR approach in order to: 1. identify the problem representation of each intervention 2. explore how the identified problem representations could produce unintended effects 3. think of alternative equity-informed interventions for the three cases Component parts: 1. A brief Introduction to present the workshop topic and learning Objectives (5 min) 2. Break-out groups to discuss each of the three cases (30 min) 3. A plenary Discussion to report the break-out groups' Discussions (10 min) 4. Comments of the three panelists on each case and collective lessons drawn (15 minutes) The cases that will be discussed are: 1. A population-level smoke-free policy adopted in Québec in 2015 where smoke-free public places

were added to the already existing policy. 2. A mandatory cultural safety training for all healthcare employees implemented by the Québec government in 2020 following an Indigenous woman's death. 3. Alternative food security interventions to traditional food security interventions, such as food banks. Key questions that the workshop will address: 1. How do the ways in which public health problems are represented influence public health interventions and their unintended effects on health inequities? 2. How might public health researchers and practitioners reflect critically about the unintended consequences of public health interventions in order to develop health equity-informed interventions?

The political determinants of health: a local perspective

Marguerite Sendall¹

¹Qatar University, Qatar

The relationship between our environment, the prevailing political context and policy landscape, and health outcomes from a planetary perspective is not linear. There is no straight forward to understand the links between these three concepts. Consequently, the political determinants of health are not well recognized in public health. This is for several reasons - they are not seen as underpinning all other determinants of health, they are too hard, and they are under researched so there is a limited body of evidence to draw. Conclusions: However, the political determinants of health within a planetary perspective are emerging as an increasingly important variable in health outcomes. This workshop will address complex contemporary public health issues within the context of policy, politics, and health outcomes from a planetary perspective to provide a deep understanding of the political determinants of health. This workshop is more important than ever to prepare the current and next generation of public health, health promotion practitioners and health policy makers for their progressively more intricate careers. Specific aims/objectives and component parts: The specific aim of this workshop is to encourage critical thinkers by challenging participants to explore complex concepts in a safe environment, to think about disciplinary ideas in different and novel ways and to kindle the inner activist to challenge the status quo, make a difference to how things are done, progress fair and equal treatment across the population, bring to the fore and highlight complexities and inequities and not accept complacency. The approach for this workshop is participant centred, interdisciplinary, multi-national and activity based. Complex concepts will be addressed in a highly interactive, engaging and thought-provoking way, the learning approach and activities will be pedagogically robust, and the structure will be logical and easy to follow. A suite of learning activities will cater to diverse learning styles and prior knowledge. The specific components of this workshop are: 1. small and interactive group activities, 2. focused and localized scenario-based activities, 3. hands-on and technology-based activities, 4. participant-led and practice relevant activities. The key questions that the workshop will address: This workshop will expose the explicit and implicit relationships between political decisions, policy and public health outcomes from a planetary perspective. The social determinants of health are well understood in public health, however the political environment which creates these conditions, is rarely given the attention required to truly understand, for example, advocacy and action strategies. The political determinants of health and the social determinants of health are intertwined and complex. This foundational understanding about the complex juxtaposition between these concepts will ensure participants meet learning objectives and feel inspired to apply this new knowledge in their local practice environment. This workshop will address two key questions: 1. How does political decision making from a planetary perspective affect our health - physical, emotional, mental, social, cultural, economic, commercial and environmental - across populations? 2. How can public health, health promotion practitioners and health policy makers engage in the political decision-making process to address health outcomes?

Sustainable Global Health Equity: acting locally, thinking globally

Marta Lomazzi¹, Rocio Saenz^{2,3}, Fernanda Lopes⁴

¹World Federation of Public Health Associations, Switzerland, ²Latin American Alliance for Global Health (ALASAG), Costa Rica, ³Network for Health Equity in the Americas (HENA / RAES), ⁴Brazilian Association of Collective Health (ABRASCO), Brazil

Achieving sustainable health equity should be a priority for all countries. Several national and international organisations support sustainable health equity as a guiding principle for economic, social and environmental policies. However, very often governments do not apply this principle and the basic needs of many population groups are not met even if the planet has sufficient resources. To

reduce inequalities and promote a more equitable distribution of resources, several determinants of health must be addressed. This is even more true in the complex reality in which we live, facing a series of crises such as climate change, COVID-19, etc. that further exacerbate the gap between higher and lower income countries and reverse progress in developing economies. The various aspects of inequality, such as income, education, gender, health, employment opportunities, are closely interrelated and mutually reinforcing. Inequality starts with unequal education. Health is a human right; sustainable health equity should be our commitment for the next generations. During the workshop, renewed public health leaders from different regions of the world will present their real-life experiences, discuss current projects and innovative ideas on how to develop and strengthen approaches to ensure sustainable health equity at the national and global level and to guarantee the dignity of every human being.

Co-building new partnerships, policies and practices for health, social wellbeing, and sustainability

Luis Souza¹, Rory Truell², Bettina Borisch³, Rosa Pavanelli⁴

¹World Federation of Public Health Associations (WFPHA), Brazil,

²International Federation of Social Workers, Switzerland, ³World Federation of Public Health Associations, Switzerland, ⁴Public Services International, France

It is largely agreed that health and wellbeing are socially determined. Yet, across the world, health and social service policies have primarily been designed separately with emphasis on each sector responding to an individual's concern only after a problem has been identified. In countries with relatively well-funded welfare systems, the focus has been on the individual rather than the wellbeing of communities and the sustainability of life on Earth. The prolonged application of such policy approaches strips communities of their organic role and partnership in co-building healthy confident environments and lifestyles. Such policy approaches are also proposed, funded and exported by the global North to countries that are in the process of developing public services. This workshop, organised by The World Federation of Public Health Associations (WFPHA), The International Federation of Social Workers (IFSW), and the Public Services International (PSI), is a part of a rapidly evolving wider discussion on the need to rethink health, social services, public services and development. With memberships across the world, these four organisations are committed to co-designing new policy and delivery paradigms, beyond the integration of sectors, to promote sustainable development, including the public and communities as permanent partners in creating and organising services with people, rather than for people. A range of case study examples from countries with differing socio-economic contexts will be presented illustrating that building partnerships between integrated public services and the people can significantly improve the health and well-being of populations in relatively short timeframes with or without additional funding requirements. Workshop participants will be invited to share their experiences and observations and to become a part of this movement that is rethinking the philosophy, relationships, values, strategies and partnerships for sustainable well-being.

Getting to the details: Understanding the commercial determinants of health by learning from local experiences and difference contexts

May van Schalkwyk¹, Nason Maani², Salma Abdalla³, Mark Petticrew¹

¹London School of Hygiene & Tropical Medicine United Kingdom, ²University of Edinburgh, United Kingdom, ³Boston University School of Public Health, Boston, United States

Aims/objectives and component parts

To map the commercial determinants of health and channels of influence through local, 'on the ground' experience from across the world. The session will start with short presentations from public health professionals working in different contexts and topic areas that will provide an introduction to the commercial determinants, the different ways in which the commercial determinants of health exert their effects, and the gaps in our understanding of these mechanisms. Different industries, settings and commercial strategies will be introduced briefly and the ways in which the activities of the private sector can be framed as a public health issue by shifting the problem definition and revisiting what we mean by "upstream" or "causes of causes". The workshop will be mainly dedicated to active participation by the attendees. Attendees of the workshop will engage in activities that aim to: Enable identifying commercial determinants in local contexts, exploring if and how this can be done or is currently being done. Map

the ways that commercial determinants interact with other influences such as the political, social, and environmental determinants of health and how this poses a challenge to, but also an opportunity to strengthen, public health practices. Explore the benefits and challenges of adopting a commercial determinants of health lens and how this may differ depending on the context, the industry, and other local factors. Discuss how to establish and adopt approaches to addressing commercial determinants that are responsive to their contextual nature while recognising the similarities in strategies and tactics across time and place, and the need for global collaboration on this agenda.

Key questions

How can we identify and characterise commercial determinants of health in our everyday practices as public health professionals? How does adopting a commercial determinants of health lens to public health issues strengthen or challenge taking action to address them?

Popul. Med. 2023;5(Supplement):A862

DOI: 10.18332/popmed/164238

Free and charitable clinics

Julie Darnell¹, Nicole Lamoureux², Cat Hulburt³, Julie Darnell¹

¹Loyola University Chicago Parkinson School of Health Sciences and Public Health Department of Public Health Sciences 1120 W. Loyola Avenue St. Joseph's Hall Room 121 Chicago, IL 60626 United States, ²National Association of Free and Charitable Clinics, Alexandria, United States, ³Americares, United States

A uniquely American response to the coverage gaps created by the American approach to healthcare. America's health care delivery system is complicated, expensive, fragmented, and inequitable. These characteristics have contributed to sizable and intractable uninsured and underinsured problems. In 2021, an estimated 8.6% of the U.S. population lacked health insurance. Though reaching a historic low, the number of uninsured exceeded 27 million. Furthermore, this overall rate masks racial and ethnic disparities: 9.6% of Black residents and 17.7% of Latino residents lacked health insurance versus 5.7% of Whites. For nonelderly adults 19-64, 13.5% of Black residents and 24.6% of Latino residents lacked health insurance, compared with 8.2% of Whites. Among adults with incomes below 100% of the federal poverty level (\$26,500 for a family of 4), 24.0% had no health insurance. In addition to the millions of U.S. residents without any health insurance, an estimated 23% of U.S. adults were underinsured, defined as having inadequate health insurance coverage that did not provide them with affordable access to health care.

This session aims to increase knowledge about free and charitable clinics, which are lesser known – yet vital – members of the U.S. health care safety net that seek to serve uninsured and underinsured persons. Free and charitable clinics are private, nonprofit organizations that utilize volunteer licensed healthcare professionals to deliver a range of services (medical, dental, mental and behavioral health) at no cost or for a small fee to patients who are uninsured and underinsured and disproportionately members of racial and ethnic minority groups. Collectively, the estimated 1,400 known free and charitable clinics in the U.S. annually reach approximately 2 million patients and provide between 4 to 5 million medical and dental visits.

Leveraging the disparate backgrounds of the three presenters who represent academia, a national membership association serving more than 800 free and charitable clinics, and a national humanitarian aid organization that is an important resource to free and charitable clinics, this session will share the latest scientific research, discuss the relevant policies affecting this unique sector, and highlight innovative programs that demonstrate free and charitable clinics' unique gap-filling role in the safety net and showcase how they provide high-quality care to the most marginalized populations in the United States.

During the session, the presenters will feature an innovative national program that they jointly co-lead, called "Roadmap to Health Equity." Launched in 2017, it has involved more than 150 free and charitable clinic stakeholders, including state-level associations serving free and charitable clinics and clinic leaders across the U.S., with the shared goal of improving the quality of care and reducing inequities. Its centerpiece is a custom national data repository of 15 validated clinical quality measures, such as blood pressure control, and patient-level characteristics, including age, race, ethnicity, and language. The repository makes available stratified performance data on the clinical quality outcomes.

Focusing attention on these little known, yet critical, members of the U.S. safety net that serve patients who might otherwise fall through the cracks offers tremendous potential for rich interactions with a diverse audience from around the globe about community-level strategies that advance equity.

DOI: 10.18332/popmed/164525

Social and environmental determinants of health inequalities

Alastair Leyland¹, Mauricio Barreto², Philip Cooper³, Natalia Romero⁴

¹University of Glasgow MRC/CSO Social and Public Health Sciences Unit University of Glasgow Berkeley Square 99 Berkeley Street Glasgow G3 7HR United Kingdom, ²Centro de Integração de Dados e Conhecimentos para Saúde (Cidacs/Fiocruz), Brazil, ³St George's University of London, United Kingdom, ⁴Universidad Internacional del Ecuador Ecuador

Outline we provoke a discussion based on our experience of working in Brazil and Ecuador, where we have a unit focused on the social and environmental determinants of health inequalities.

Health inequalities are in large part attributable to the social determinants of health – the conditions in which people are born, grow, work, live, age and die. Many environmental factors, including urbanisation and the climate emergency, are increasing priorities for individual and population health. These tend to have the most harmful impacts on the most deprived in society. The health system needs to respond to such social and environmental threats, but its organisation may mean that it is not protecting the most vulnerable in society. To try to reduce the impact of social conditions such as poverty, many governments (particularly in Latin America) have introduced policies such as conditional cash transfers or housing programmes for the very poor. Similarly, governments may introduce environmental policies to protect the environment and mitigate any harmful effects on living conditions. While such policies may not be primarily aimed at improving health, they may still have large impacts on health and health inequalities, and much of the historical improvement in life expectancy attributable to these policies. There are many axes along which we can measure health inequalities, including income, ethnicity, race, sex, geography, migration, urbanicity and deprivation. Focusing on reducing inequalities in any one dimension to the exclusion of the others runs the risk of increasing inequalities in the other axes. Aims and objectives The aim of this workshop is to encourage thinking around how non-health sector policies may be used to reduce health inequalities, particularly in low and middle income countries. Following a brief introduction to each of a series of key questions (see below), participants in the workshop will discuss ways in which social and environmental policy can reduce health inequalities and how such impacts can be evaluated.

Key questions

Why does health equity matter rather than health improvement? Why focus on policy to reduce health inequalities? What does non-health sector policy have to do with health inequalities? How can we evaluate the impact of policies on inequalities in health?

5 practical actions for national health literacy development

Richard Osborne¹, Shandell Elmer¹, Melanie Hawkins¹, Sónia Dias², Astrid Wahl³

¹Swinburne University of Technology Australia, ²Universidade NOVA de Lisboa Portugal, ³University of Oslo Norway

Brief outline of the overall workshop

This highly participatory and interactive workshop is suitable for attendees working in low to high resource settings. It will provide participants with guidance about how to undertake practical actions for health literacy development at a local and national level. The workshop activities will focus on the five action areas for health literacy development and responsiveness as described within the report 'Health literacy development for the prevention and control of noncommunicable diseases: Volume 3. Recommended actions' (World Health Organization; 2022). The workshop facilitators collaborated with the WHO to produce this report. Drawing on their practical knowledge and experience from low- to high-income countries, the workshop facilitators will lead the participants through a series of activities and case studies related to each of the five action areas. This workshop will model to the participants how they can incorporate health literacy approaches into their own organisation's strategic planning and evaluation. In this way the workshop will be both translational and build capacity.

Specific aims/objectives and component parts

This workshop has two aims:

- * Translate the framework for health literacy development and responsiveness into action.

- * Build the capacity of the participants to undertake health literacy development After a brief orientation to the report, the workshop will focus on the five action areas for the development of health literacy development and responsiveness. These action areas were designed as a framework that can be taken into different settings to be adapted and contextualized as needed. This workshop will enable participants to undertake a simulated activity in each area and begin to plan for

implementation in their own setting. The five action areas and related activities are described below:

1. Prepare for national health literacy development and responsiveness.

* Activities will focus on developing an understanding of health literacy measurement

2. Build health literacy responsive health systems

* Activities will focus on organisational assessment

3. Build community health literacy

* Activities will focus on co-design and working with community leaders

4. Target community groups

* Activities will focus on identifying who is missing out on services (e.g. digital exclusion)

5. Integrate health literacy at the national level through to local levels

* Activities will focus on developing sustainable support structures (e.g. national health literacy action plan, community of practice)

The key questions that the workshop will address

* How organisations can use health literacy development strategies for health and equity improvements at local and regional levels

* How to effectively deliver health services and health-promotion activities to people with varying health literacy profiles in different contexts

* What practical activities can be applied to develop health literacy in populations, organisations and communities

* How to identify and prioritise groups that are being left behind (people that services are failing to engage effectively)

* How to strengthen the reach and effectiveness of services and programs through the integration of health literacy at a local and national level

Popul. Med. 2023;5(Supplement):A865

DOI: 10.18332/popmed/164373

Experiences of primary care workers in the implementation of primary health care approach to address noncommunicable diseases: a qualitative case study

TJ Moncater¹

¹Department of Health Policy and Administration, College of Public Health, University of the Philippines, Manila, Philippines

Background: Information on how the execution of primary health care towards addressing noncommunicable diseases to bring about desired health outcomes have been limited. Hence, this study Aims to determine the experiences in implementing a primary health care approach to address noncommunicable diseases based from the perspectives of various concerned health workers at the primary care level.

Methods: A qualitative case study approach was employed using data from 16 focus groups Discussions 68 primary care workers. A semi-structured interview was utilized to determine perceptions and experiences in implementation of primary health care approach to address noncommunicable diseases in selected care facilities from all cities and municipalities in one province in the Philippines. All interviews were audio-recorded and transcribed verbatim. An inductive content analysis using NVivo 12 was employed to distinguish and classify relevant thematic codes.

Results: An inclusive delivery of primary health care approach through health education and promotion, assessment and monitoring of patients, patient treatment and management, and collaboration among health workers and care institutions were implemented. This Resulted to an efficacious patient health outcome such as increased health knowledge and awareness, prevention of diseases or untoward progression, and better patient satisfaction. Enablers of primary health care implementation to address noncommunicable diseases include the following: (1) supportive leadership and governance; (2) dedicated and competent healthcare workers; (3) prioritization of noncommunicable diseases; (4) functional referral mechanism; and (5) efficient utilization of limited resources. However, noncommunicable disease service delivery was overshadowed by: (1) health human resource constraints; (2) logistical inadequacies; (3) limited access and availability of services and facility; (4) patient issues and impediments; and (5) structural restrictions. Conclusions: Primary care workers argued a robust delivery of primary health care approaches to confront noncommunicable diseases positively enhancing patient health. However, its implementation is determined by concurrence of various facilitating and hindering factors.

Popul. Med. 2023;5(Supplement):A866

DOI: 10.18332/popmed/164803

Factors associated with patients defaulting HIV treatment at Helen Joseph Hospital, Gauteng Province, South Africa

Letsatsi Potsane¹

¹Democratic Nursing Organization of South Africa, Roodeport, South Africa

Background: South Africa's government has significantly improved access to antiretroviral treatment. However, antiretroviral treatment adherence remains a significant challenge in Helen Joseph Hospital. A rate of adherence of 95% to 100% is necessary to achieve the intended outcomes of antiretroviral treatment. ARV adherence is affected by numerous factors, but long waiting times are a major concern at Themba Lethu clinic. Objective: This study aimed to examine the factors associated with ARV therapy non-adherence amongst HIV-Patients at Helen Joseph Hospital. Methods: The study used a case-control design. EPINFO 7.2 was used to calculate crude odds ratios, and SPSS Version 26 was used to conduct multivariate logistic regression to compute adjusted odds ratios, 95% confidence intervals, and P-values. In total, 322 questionnaires were administered to each participant during their clinic visit.

Results: In total, there were 322 (100%) study participants, of which 51% (n=165) were non-adherent to ARV therapy. Treatment non-adherence was associated with long waiting times in Helen Joseph, Themba Lethu clinic, after adjusting for gender, age, educational level, and employment status. The adjusted odds ratio was 4.78, 95% confidence interval: (1.12 -20.42), and p value=0.04. Conclusions: The study explored factors associated with ARV treatment defaulting in Helen Joseph hospital. Long waiting times were strongly correlated with ARV treatment non-adherence in Helen Joseph hospital. If clinic waiting times are reduced, ARV treatment adherence can be improved. Contribution: To achieve an adherence rate of 95% to 100%, the Helen Joseph Hospital has to reduce patient waiting times. Managers need to formulate strategies and redesign health systems to reduce waiting times.

Popul. Med. 2023;5(Supplement):A867

DOI: 10.18332/popmed/164891

Association of antiretroviral therapy adherence and health-related quality of life among people living with HIV/AIDS currently enrolled at a Tertiary Government Hospital treatment hub in Cebu city, Philippines during the COVID19 pandemic

Maeben Ho¹

¹CEBU Philippine Obstetrical and Gynecological Society, Vicente Sotto Memorial Medical Hospital, Capitol Cebu City, Philippines

Introduction: The COVID19 pandemic has caused global stagnation. All individuals, more so for people living with chronic health conditions such as HIV/AIDS are at high risk of contracting or developing problems. Health-related quality of life (HRQoL) is becoming an important outcome measure among PLHIVs. We assessed the health related quality of life, antiretroviral therapy adherence and its association with the sociodemographic and clinical characteristics among people living with HIV/AIDS currently enrolled at a tertiary government hospital treatment hub in Cebu City, Philippines during the COVID19 Pandemic.

Methods: Descriptive cross-sectional study design was conducted from May to June of 2022. Simple random sampling was done to derive the sample population. Respondents were asked to answer a structured questionnaire. Health-related quality of life was assessed using WHOQOL-BREF and medication adherence using SMAQ. CD-4 count and clinical staging was extracted from treatment hub registry.

Results: A total of 385 respondents were included in this study. Majority were 18-35 years old (66.5%), male (74.5%), single (78.9%), college graduate (70%), employed (64.4%), were living with their family (69.6%), at immunologic stage 1 (48.1%) and are clinically at stage 1 (57.4%) of the disease. Overall HRQoL amongst respondents was 61.65± 19.39. Furthermore, highest and lowest mean scores were related to environmental domain (64.13±22.48) and social domain (60.67±25.06), respectively. 69.35% of the respondents were adherent to ART.

Conclusions: The study showed that people living with HIV/AIDS currently enrolled at a tertiary hospital treatment hub during the COVID19 Pandemic had low social health related quality of life, in relation to the other domains. Female, single, patients who were living with their family, and are at stage 2 of clinical staging have better adherence to antiretroviral therapy and is directly correlated to better health-related quality of life.

DOI: 10.18332/popmed/164899

Integrating rehabilitation services into primary health care: policy options for Iran

Saeed Shahabi¹

¹Health Policy Research Center, Institute of Health, Shiraz University of Medical Sciences, Shiraz, Iran

Background: Providing rehabilitation services in primary health care (PHC) is associated with numerous health, social, and economic benefits. Therefore, low

and middle-income countries, such as Iran, should benefit from the advantages of integrating rehabilitation services into PHC. We conducted a qualitative study to determine policy solutions that could facilitate the integration of rehabilitation services into Iran's PHC network. Methods: Semi-structured interviews were conducted with 38 participants, including health policymakers, rehabilitation managers, faculty members, and rehabilitation practitioners. Purposive and snowball sampling strategies were adopted to recruit participants. The WHO Health System building blocks framework analysis was applied to analyze the collected data.

Results: Participants perspectives and experiences outlined potential policy options including: 1) stewardship: increasing political support, strengthening the leadership of the rehabilitation sector, and promoting inter-sectoral collaborations; 2) service delivery: increasing the knowledge of healthcare professionals, using local volunteers, deploying mobile rehabilitation teams, using telerehabilitation, and improving referral pathways; 3) financing: increasing government funding, preparing a package of rehabilitation services, and using appropriate payment mechanisms; 4) human resources: expanding rehabilitation workforce, training rehabilitation assistants, and enhancing employment and social opportunities; 5) information systems: establishing a comprehensive information system and an effective surveillance system; and 6) technologies: facilitating access to a range of rehabilitation equipment and raw materials, especially for prosthetics and orthotics services.

Conclusions: Based on the WHO six building blocks framework, this study identified several policy solutions for integrating rehabilitation services into the Iranian PHC Network. Some of the policy options include increasing political support, promoting inter-sectoral collaborations, increasing the skills and knowledge of healthcare workers, establishing effective referral pathways, strengthening team-working, and increasing government funding.

DOI: 10.18332/popmed/164945

A scoping review of community health needs and assets assessment: concepts, rationale, tools and uses

Hamid Ravaghi¹, Zhaleh Abdi², Ann Guisset³

¹World Health Organization, Eastern Mediterranean Regional Office (EMRO), Egypt, ²National Institute of Health Research, Ministry of Health and Medical Education (MOHME), Iran, ³World Health Organization, Headquarters (HQ), Geneva

Objectives: Community health needs and assets assessment is a means of identifying and describing community health needs and resources, serving as a mechanism to gain the necessary information to make informed choices about community health. Thus the current scoping review was performed to shed more light on concepts, rationale, tools and uses of community health needs and assets assessment.

Methods: We conducted a scoping review of the literature published in English using PubMed, Embase, Scopus, Web of Science, NIH database, Cochrane library, CDC library, Trip, and Global Health Library databases until November 2020.

Results: A total of 166 articles including empirical papers and theoretical and conceptual work were ultimately retained for analysis. Relevant concepts were examined guided by a conceptual framework. The empirical papers were dominantly conducted in the US. Qualitative, quantitative and mixed-method approaches were used to collect data on community health needs and assets, with an increasing trend of using mixed-method approaches. Almost half of the included empirical studies used a participatory approach to incorporate community inputs at all stages of the process. Conclusions: Our Findings highlight the need for having holistic approaches to assess the community's health needs focusing on physical, mental and social well-being, along with considering the broader systems factors and structural challenges to individual and population health. Furthermore, the Findings emphasize assessing community health assets as an integral component of the process, beginning foremost with community capabilities and knowledge. There is a trend toward using mixed-methods approaches to conduct the assessment in recent years that led to the inclusion of the voices of all community members, particularly vulnerable and disadvantaged groups. A notable gap in the existing literature is the lack of long-term or longitudinal-evaluation of the community health needs assessment impacts.

Keywords: community, needs assessment, assets assessment, population health, scoping review

Popul. Med. 2023;5(Supplement):A870

DOI: 10.18332/popmed/164957

Impact of volunteering in promoting active aging

Andreia Costa^{1,2,3}, Patricia Valentim⁴, Adriana Henriques^{5,6}, Paulo Nogueira^{5,6}

¹Centro de Investigação, Inovação e Desenvolvimento em Enfermagem de Lisboa (CIDNUR), Escola Superior de Enfermagem de Lisboa (ESEL), Lisboa, Portugal, ²Laboratório de Genética e Instituto de Saúde Ambiental (ISAMB) da Faculdade de Medicina da Universidade de Lisboa, Lisboa, Portugal, ³Laboratório Associado TERRA, Faculdade de Medicina, Universidade de Lisboa, Lisboa, Portugal, ⁴Centro de Investigação, Inovação e Desenvolvimento em Enfermagem de Lisboa (CIDNUR), Escola Superior de Enfermagem de Lisboa (ESEL), Portugal, ⁵CIDNUR-Escola Superior de Enfermagem de Lisboa (ESEL), Portugal, ⁶Instituto de Saúde Ambiental (ISAMB), Faculdade de Medicina, Universidade de Lisboa, Portugal

Background and objectives: Demographic transitions in Europe emphasize the need to develop innovative solutions for active ageing. The practice of volunteering has been recognized as crucial for the promotion of active aging, as well as health literacy through the acquisition of individual resources. The aim is to identify the existing scientific evidence on the impact of volunteering in promoting active aging.

Methods: Scoping review according to the Methodology proposed by the Joanna Briggs Institute, following three steps of research: An initial search in CINAHL® and MEDLINE®; a broader search, using the same Keywords and search terms, in the CINAHL®, MEDLINE® databases and in the Google Scholar tool, and finally, a search in the bibliographical references of the selected articles. The defined time period was between 2017 and 2022.

Results: The state of retirement implies new commitments and redefinition of social roles (Kleiner, A., et al., 2022; Matthews, K. and Nazroo, J., 2020). Volunteering plays a crucial role in the social inclusion and active participation of older people in society (Papa, R., Cutuli, G., Principi, A. and Scherer, S., 2019) and in promoting active aging (Stathi, A., et al., 2021; Papa, R., Cutuli, G., Principi, A. and Scherer, S., 2019). Higher levels of health literacy promote active aging, as well as lead to the acquisition of other resources (Eronen, J., et al., 2021), such as volunteering. Discussion and Conclusions: Health literacy and volunteering proved to be strategies that can be directly related and that contribute to the promotion of active aging. Health professionals, such as nurses, have a privileged role in promoting Health Literacy, which is why it is extremely important to join forces in their training (DGS, 2019).

Health mothers' groups in Nepal: barriers, facilitators, and recommendations

Shraddha Manandhar¹, Kenda Cunningham², Ramesh Adhikari³, Pooja Rana³, Ajay Acharya⁴, Madeline Pollifrone⁵, Lok Nepali³, Padam Darji⁶, Nidhu Dangal³

¹University of Huddersfield, Nepal, ²Helen Keller International, United States, ³Helen Keller International, Nepal, ⁴FHI360, Nepal, ⁵Columbia University, United States, ⁶Cooperative for Assistance and Relief Everywhere, Inc. (CARE), Nepal

Nepal's female community health volunteers (FCHVs) each lead a monthly health mothers' group (HMG) to share health-related information and engage communities in the health system. In this study, we explored HMG functionality and variation across Nepal, including barriers and facilitators to attending HMG meetings. Cross-sectional survey data from 16 districts (n = 192 FCHVs and 1850 mothers with children <2y) were used. Qualitative data were obtained from 3 of 16 survey districts (n = 30 observations, n = 30 in-depth interviews with mothers, and n = 16 focus groups with mothers, family members, FCHVs, health workers, and SII staff). Household head sex, maternal age, maternal education, maternal self-efficacy, and engagement with an FCHV were associated with whether mothers were active participants in meetings. Qualitative findings highlighted systems-level barriers, including lack of FCHV skills, demotivation, and heavy workload. Mothers noted time as the major constraint and family support, the HMGs' savings component, and active FCHVs as facilitators to participation. Findings suggest that both supply- and demand-side solutions are needed to improve HMG performance and uptake in Nepal.

Data-driven change: assessing health promotion in the hospital/health service setting

Oliver Groene¹, Keriin Katsaros¹

¹International Network of Health Promoting Hospitals and Health Services, Germany

Background and Objective: The International Network of Health Promoting Hospitals and Health Services (HPH) was initiated by WHO following the WHO

Ottawa Charter's action area to reorient health services, it currently consists of over 600 members from 30 countries. In order to provide practical guidance to members, standards and self-assessment tools were developed. Methods: The 2020 HPH Standards were developed using a combination of literature review, standards mapping exercises, and a two-stage Delphi panel with national and regional HPH network coordinators and individual experts. Common domains, subdomains, and measurable elements across these materials were assessed in terms of clarity, scope and importance and refined following a Delphi consultation. Results: 20 experts including 11 HPH national and regional network coordinators participated in the Delphi process. Assessments of clarity, relevance, and importance and clarity and priority ranged from 5.4 to 6.6 and 4.6 to 6.9, respectively. As a result of the feedback and analysis five overarching standards, 18 substandards and 86 standard statements were identified. A .pdf and excel tool were created that allow organizations to assess and score the level of implementation and make qualitative comments. The excel tool generates graphs and visuals of the data so that those responsible for implementation can easily identify improvement areas. The standards have already been translated into 11 languages. Conclusions: Hospitals and health services who adopt a comprehensive health promotion approach guided by data can transform their organizations into health promoting settings. References: International Network of Health Promoting Hospitals and Health Services. Self-Assessment Tool for implementing the 2020 Standards for Health Promoting Hospitals and Health Services, Version 1.1. Hamburg, Germany: International HPH Network; November 2021.

Effectiveness of interventions to reduce social inequalities of overweight and obesity in adolescents: a systematic review and meta-analysis

Mohamed Dakin¹, Francis Guillemin², Abdou Omorou²

¹Institute for Collective Health, Adaptation, Measure and Assessment in Health laboratory (APEMAC, UR 4360), University of Lorraine, France, ²UR 4360 APEMAC, University of Lorraine, France

Background and Objective: Reducing social inequalities of overweight and obesity in adolescents is a public health priority. Several interventions are implemented to overcome these inequalities, but their effectiveness is challenged. This study aimed to examine the effectiveness of interventions to reduce social inequalities of overweight and obesity in adolescents through a systematic review and a meta-analysis.

Methods: A systematic search of all randomized control trials and quasi-experimental studies aiming to reduce social inequalities of weight in adolescents was conducted in five electronic databases. The primary outcome was social inequalities in Body Mass Index [BMI] z-score and the secondary outcomes were social inequalities in BMI, waist circumference, percent body fat and prevalence of overweight/obesity. Interventions were effective when they reduced social inequalities in at least one obesity-related outcome. Pooled difference means or Odds Ratios (OR) and their 95% Confidence limits (CI) were estimated for each outcome by using random effect models on Review Manager 5 software. The review is registered on PROSPERO (CRD42022362952).

Results: This review included 38 publications from 33 studies. In these studies, interventions were universal (n=3), or proportionate (n=1) or targeted disadvantaged adolescents (n=29) and mostly underpinning the social cognitive theory (n=16). Interventions were effective in half of included studies (n=19, 57.6%). A meta-analysis (27 studies) revealed that targeted interventions reduced significantly adolescent's BMI z-score (beta= -0.04; CI= [-0.08, -0.01]), BMI (beta= -0.32; CI= [-0.47, -0.18]), waist circumference (beta= -0.84; CI= [-1.48, -0.21]), unlike percent body fat and prevalence of overweight and obesity. Universal interventions did not reduce these inequalities.

Conclusions: This review shows moderate effectiveness of interventions targeting disadvantaged adolescents in the reduction of social inequalities of overweight and obesity whereas universal scarce interventions are not effective. Then, high quality research with a better implementation to reach their full potential is required to strengthen the evidence.

Background & objective: Interpretive Front-of-Pack Labels (FoPLs) are supported by the World Health Organization as a key policy tool to promote healthy diets. At present, various FoPLs formats co-exist in the European Union (EU). However, as part of the Farm to Fork strategy, the European Commission stated it would adopt a single mandatory FoPL in 2022. The aim of this study was to analyze Spanish consumers reactions to Nutri-Score and NutriInform, two FoPLs that are currently the subject of debate in EU, testing the objective understanding of the FoPLs as well as their preference among participants through subjective understanding and perception.

Methods: The experimental study was conducted in 2021 on a representative sample of 1026 Spanish adults (50% women, mean age \pm SD = 46 \pm 14 years), through an online randomized questionnaire where participants were exposed to Nutri-Score or NutriInform. Objective understanding of and preference for these two FoPLs were assessed in three food categories (Breakfast Products, Breakfast Cereals and Added Fats). Objective understanding was tested using multivariate logistic regression while preference using Principal Component Analysis (PCA) and t-tests.

Results: In terms of objective understanding, Nutri-Score was significantly associated with an increase in consumers' ability to identify healthier food products across all food categories compared to NutriInform (OR=19.1 [14.2-25.7], $p<0.0001$). On the preference dimension, Nutri-Score was perceived as significantly easier to use and was more liked than NutriInform (standardized PCA dimension resp. 0.32 \pm 1.58 vs. -0.29 \pm 1.66, $p<0.0001$ and 0.080 \pm 1.18 vs. -0.072 \pm 1.17, $p=0.039$) and participants found Nutri-Score more helpful to discriminate the nutritional quality of Breakfast Products and Breakfast Cereals (resp. 1.32 \pm 1.00 vs. 1.14 \pm 1.02, $p<0.01$ and 1.33 \pm 1.00 vs. 1.00 \pm 1.03, $p<0.0001$). **Conclusions:** Results of this study provide new evidence to support Nutri-Score in comparison with the NutriInform Battery, on both objective understanding and preference aspects.

Background and Objective: The Happy Child Program (Programa Criança Feliz - PCF, in Portuguese) reaches 1.4 million Brazilian children under three years of age with home visits aimed at promoting neuropsychomotor development. Based on a conceptual model, PCF implementation and impact were evaluated in a randomized study in 30 municipalities. Thus, we aim to present the Results of this impact evaluation of the PCF program.

Methods: A total of 3242 children were allocated to the intervention (IG) or control (CG) group, 80.0% of whom were prospectively followed up from late 2018 to late 2021. Development was assessed by the Ages and Stages Questionnaire (ASQ3). During the three-year study period, visits were replaced by virtual contacts

for an average of 12 months due to COVID-19. At the endline survey, intent-to-treat analyses showed mean scores of 203.3 in the IG and 201.3 in the CG. Additional analyses using instrumental variables and propensity scores matching also showed no effect, since the number of contacts with the program was not associated with ASQ3 scores.

Results: No impact was observed on stimulation, responsive interactions, or psychological attributes of children. The implementation study revealed low coverage in the IG, contamination of the CG, deficiencies in management and low quality of visits in many municipalities.

Conclusions: The study did not demonstrate an impact of PCF implemented under routine conditions but provides elements for its improvement. Additionally, these results show that several measures are needed to strengthen the implementation of the program, so that the stakeholders can ensure investment in early childhood as one of the priorities.

Impact of a high-resolution primary care emergency center over emergency department demand

Marcela Garrido^{1,2}, Alejandro Sepulveda¹

¹Departamento de Epidemiología y Estudios en Salud, Universidad de los Andes, Chile, ²Clínica Universidad de los Andes, Chile

Background: Emergency Departments (ED) overcrowding is a worldwide problem causing poorer inpatient outcomes and the inability of staff to adhere to protocols. EDs are, for many people the access gate to health system. In Chile, for a population around 17 million, they had over twenty million visits in 2019, compared with 17 million in primary care. The demand is growing up every year increasing crowding EDs. Since 2015, it has been implemented High Resolution Primary Care Emergency Center (HRPCEC) near to main Hospitals trying to control demand, the first one was Miraflores HRPCEC. But its impact has not been analyzed yet. Objective: To analyze the impact of implementation of Miraflores HRPCEC over Dr. Hernan Henriquez Aravena (DHHA) Hospital ED visits. Methods: We analyze visits by triage categorization, wait time and admission rate, from DHHA Hospital ED since 2012 to 2018 and visits to Miraflores HRPCEC from 2015 to 2018 with R Core Team (2022) software. We compare the period before and after 2015. To trend analysis, we used least squares regression lines, modeling the estimation error using an ARMA model. To compare the number of visits by triage, we use a Poisson model regression.

Results: Demand to DHHA Hospital ED is growing until 2014. Since 2015, there is a decrease in visit trend in 37% ($p < 0.05$). At the same time, Miraflores HRPCEC visits double. All visits by triage categorization decrease since 2015, but it is especially significant in C4 and C5 (37% and 65%). Wait times for C1, C2 and C3 fall in 90%, 71% and 55% respectively. Hospitalization rates stay stable for all triage categories. Conclusions: The implementation of HRPCEC impact directly on DHHA Hospital ED visits. Reducing demand of non-urgent triage categorization patients and improving wait time of those who need urgent care.

Street Medical Consultation: a care model for homeless people in Brazil

Tatiana Alecrim¹, Simone Protti-Zanatta², Fernanda Bugado¹, Débora Araújo¹, Sonia Zerbetto¹, Isis Katayama³, Simone Protti-Zanatta⁴

¹Federal University of São Carlos (UFSCar), São Carlos, Brazil, ²Universidade Federal de São Carlos, São Carlos, Brazil, ³Faculdade de Engenharia de Sorocaba (Facens), Sorocaba, Brazil, ⁴UFSCar, São Carlos, Brazil

Background: The homeless population presents highly vulnerable to illness, requiring health services that articulates their practices and guarantees them a full-time care through public policies and actions that responds to their real needs. Brazil has a specific health service for the homeless population care, the Street Medical Consultation. Census carried out in 2022 in São Paulo, the largest city in the country, revealed 31884 people living on streets, an increase of 31% compared to 2019, which showed 24334 people living on streets. Aim: to presents the experience of professionals from health field, who works in the teams of the Street Medical Consultation, regarding the care of homeless population in the city of São Paulo, Brazil. Methods: Qualitative study from a descriptive nature, professional experience report type, with a cross-sectional time frame.

Results: The care model used by the teams of Street Medical Consultation makes it possible to carry out "in loco" all actions provided for in primary care; therefore, accurate knowledge of the territory was highlighted; ability to build bonds, which are fundamental for adherence to treatment; performance of clinical and epidemiological diagnoses; team action planning; intersectoral

network articulation; tracking performance, procedures, treatments, and complete care. Conclusions: Street Medical Consultation teams promotes individual and collective actions in a dynamic, strategic, creative, and empathetic way, thus, contribute strongly to guarantee access to health services, complete care, expanding the possibilities of chronic and infectious diseases early detection and monitoring from homeless population, promoting healing and social reintegration.

What makes a health promotion intervention in school a perceived as a "success"? Correlates of perceived success of health-promoting interventions in elementary schools in Quebec, Canada

Erin O'Loughlin^{1,2}, Teodora Rigma³, Jodi Kalubi¹, Jennifer O'Loughlin⁴, Annie Pelekanakis⁴

¹École de Santé Publique de l'Université de Montréal, Canada, ²University of Toronto, Canada, ³École de Santé Publique de l'Université de Montréal and CRCHUM, Canada, ⁴École de santé publique de l'Université de Montréal and CRCHUM, Canada

Background and Objective: School-based health-promoting interventions (HPIs) aim to support youth development, but few interventions are formally evaluated and schools may often rely on subjective indicators to decide whether or not to maintain an intervention long-term. Identifying factors that contribute to or hinder the perceived success of HPIs could facilitate their adaptation, improve implementation. The objective of this study was to identify factors in three domains (school characteristics, characteristics of the HPI, and factors related to planning and implementation) associated with perceived success of HPIs as reported by school principals in elementary schools.

Methods: Data were drawn from PromESS, a cross-sectional study of school principals in a convenience sample of 171 public elementary schools across Quebec, Canada. School board and school recruitment spanned three academic school years (2016-2019). Data on school and participant characteristics, HPI characteristics, variables related to HPI planning and implementation and perceived success of the HPI were collected in two-part, structured telephone interviews. Descriptive statistics were used to characterize schools and study participants. Twenty-eight potential correlates of perceived HPI success were investigated separately in multivariable linear regression modelling.

Results: Participants generally perceived HPIs as highly successful. After controlling for number of students, language of instruction, school neighbourhood and school deprivation, we identified five correlates of perceived success: lower teacher turnover; higher scores for school physical environment; school/teacher commitment to student health; principal leadership; and school having developed the HPI de novo (vs. adopting it from an external source).

Conclusions: Because school principals are key players in the school environment and instrumental in HPI implementation and sustainability, we contend that their perception of HPI effectiveness is a key indicator of the potential usefulness of HPIs. If replicated, these factors should be considered by HPI developers and school personnel when planning and implementing HPIs in elementary schools.

People's health development using the PI model for persons' care in a community in One Province, Thailand

Pisit Poltana¹, Pisit Poltana², Vichai Tienthavorn¹, Sukjai Charoensuk³, Supaporn Voraroon³, Purin Srisodsakul³

¹Praboromarajchanok Institute, Ministry of Public Health, Thailand, ²Boromarajonani College of Nursing, Faculty of Nursing, Praboromarajchanok Institute, Suphanburi, Thailand, ³Boromarajonani College of Nursing, Faculty of Nursing, Praboromarajchanok Institute, Ministry of Public Health, Thailand

The research is focused on preventing and lowering diabetes and high blood pressure complications in one Thai province. PI Institute wants to integrate teaching, learning, and academic services by reducing chronic illnesses occurring in different community areas by applying simple principles of screening, grouping patients using ping pong balls in seven colors to categorize. The model is an application of community-based primary health strategies as an instrument for screening patients from normal groups to groups with complications. The researchers want to integrate teaching, learning, and academic services by reducing chronic illnesses occurring in different community areas. Hence, this research aims to explore and gain an in-depth understanding of the health conditions of people in the community and the situation of community engagement involving the health of the people in the community, as well as develop a model for improving the health of the people in the community by using the 7-colored traffic ping pong

balls for life, with the following specific Objectives: 1) To analyze community involvement in relation to the health of people in the community. 2) To develop a model for improving public health in the community by using the seven-colored traffic ping pong balls for life, and 3) To obtain policy recommendations for setting guidelines for the care of chronic patients in the community by using the seven-colored traffic ping pong balls for life, which apply the theory of innovative care for chronic conditions (ICCC) from the World Health Organization. The researchers chose villages for the study using the multistage sampling method, grouping the province and randomly selecting colleges in each district as study samples. The randomly selected colleges were selected from Area.

Health-promoting schools in Latin American countries: a systematic review on internal and external validities

Valter Filho¹, Patricia Bastos², Ana Cavalcante², Isabela Teixeira², Laécio Araujo², Janiel Felício², Antonio Júnior², Maria Silva²

¹Ceará State University, Brazil, ²Post-Graduate Program on Collective Health, Ceará State University, Brazil

Background and Objective: Elements of internal (e.g., effectiveness) and external (e.g., implementation) validities of the World Health Organization's Health-Promoting Schools (HPS-WHO) in Latin American countries are still unknown. This study aimed to synthesize information on internal and external validities (using the RE-AIM model: reach, effectiveness/efficacy, adoption, implementation, and maintenance) of interventions based on the EPS-WHO in Latin American schools. **Methods:** This systematic review follows the PRISMA guidelines (PROSPERO: CRD42020168069). Searches were performed in May 2020 in eight databases (Medline, LILACS, Web of Science, Scopus, PsycINFO, Eric, SciELO, and Cochrane), five gray literature websites, eight institutional websites, and similar reviews. Eligible studies were interventions with strategies that address the HPS-WHO model and included students aged 5-18 years of schools from Latin American countries. A validated 21-item checklist was used to calculate RE-AIM scores according to the interventions' characteristics (age groups, country, and theoretical model adopted).

Results: Initially, 2347 titles were reached; 58 studies were eligible, representing 23 interventions from seven countries: Brazil (n=12), Mexico (n=5), Peru (n=2), Chile, Costa Rica, Ecuador, and Uruguay (1 study each). "Reach" and "Effectiveness" were reported in all interventions. "Adoption", "Implementation", and "Maintenance" were reported in 91.3%, 82.6%, and 56.5% of interventions, respectively. The RE-AIM total score was low (0-7 points) in 12 interventions, moderate (8-14 points) in 10, and high (15-21 points) in one. Better RE-AIM total scores were observed in studies with the following characteristics: with adolescents, the HPS-WHO as the theoretical framework of strategies, and from Brazil.

Conclusions: We found a large number of interventions based on HPS-WHO in Latin America, but most of them had limited reporting, especially on external validity. Improving these elements is mandatory, which may guide research and practice of effective, scale-up, culturally adapted HPS-WHO strategies in countries from the region.

Major public health problems in Nigeria

Dennis Anthony^{1,2}, Augustine Onyeaghalu³

¹Department of Public Health, University of Abuja Teaching Hospital, Nigeria, ²Makwalla Health Care Services LTD, Nigeria, ³University of Ibadan, Ibadan, Nigeria

The inadequate programs designed to address the numerous health problems in Nigeria have led to the little improvement in our health status. Besides the continued neglect of the importance of addressing public health issues would make matters worse for poor Nigerians most of who are at the receiving end. The study adopted a qualitative approach so as adequately describe the study aims and objectives. The data for this study were collected through scientific database sources, web search engines and objectives, direct observation and relevant documents from the Nigerian Ministry of Health. The major Public Health challenges Nigeria faces are infectious diseases, control of vector some diseases, maternal mortality, infant mortality, poor sanitation and hygiene, disease surveillance, non-communicable diseases, and road traffic injuries etc. Nigeria is currently working towards archiving the Millennium Development Goals. Despite the collaborative efforts of both Nigerian Government Donor Agencies and NGOs to provide an efficient and effective health care delivery in Nigeria.

Keywords: public health, maternal-mortality, HIV/AIDS, Nigeria

Beyond standardized healthy food promotion interventions: understanding culinary practices as care among South Asian women in Hong Kong

Elena Nichini¹, Saba Asim¹, Aneeta Ansari¹, Dong Dong¹

¹JC School of Public Health and Primary Care, The Chinese University of Hong Kong, Hong Kong, China

Background and Objective: "Unhealthy" diet has been identified as one of the leading factors for the higher prevalence of diabetes, hypertension and obesity among South Asians in Hong Kong. Standardized health promotion interventions aim at improving knowledge of "healthy" food, assuming a lack of awareness around ideas of healthy diet and nutrition. Yet South Asian women in Hong Kong, who are the main carers of the family, do care about their children's diet and mostly recognize "unhealthy" food; despite this awareness, yet they often cook it for their children. This study aims then at exploring such contradiction and ultimately complicates our understanding of culinary practices as a form of care.

Methods: Interviews and focus groups were conducted among South Asian women in Hong Kong to explore their perceptions and attitudes towards their children's diet, "healthy" food and cooking as a form of care; this study is part of an ongoing larger research project on South Asian women's health needs.

Results: When asked about their main health concerns, South Asian women in Hong Kong often discuss about their children's diet. While they appropriate and engage with the categories of "healthy" and "unhealthy" food, yet they would rather cook anything requested by their children; culinary practices are for them a form of care. The societal context of post-colonial Hong Kong and their South Asian ethnic and migrant identity further shape these women and their children's perspectives, where "unhealthy" ingredients are more accessible, some "unhealthy" food options may be considered "modern" and some others "outdated".

Conclusions: This study suggested that standardized health promotion interventions aiming at promoting "healthy" diet fail to acknowledge cooking as an act of care embedded in the family's social life and affected by larger social forces; alternative approaches taking into account these dimensions need to be developed.

Community-based intervention for promotion healthy ageing through MAHA mobile application

Irati Redondo¹, Irati Redondo², Ane Zabala¹

¹Kronikgune Institute for Health Service Research, Spain, ²Instituto de Investigación en Servicios de Salud Kronikgune, Spain

Background and Objectives: eHealth technologies and tools can be effective instruments to address the challenge of ageing in EU, providing an opportunity to improve the health and well-being of older people by enabling access to knowledge and improving relationships with peoples environment, and ensuring the sustainability of health systems. Within Gatekeeper European project, the Basque Country region (Spain) has implemented a community-based intervention to assess the effectiveness of MAHA App for the promotion of healthy lifestyle habits among Basque elderly people.

Methods: This quasi-experimental and longitudinal study Aims to approach 10000 people aged 65+ and/or their caregivers. The community-based intervention is boosted by the community network that involves more than 39 community organizations belonging to the Basque Health Ecosystem. The MAHA App, the health asset promoted, is a self-managed tool that offers contents and materials to reinforce socialization; foster health literacy and empowerment; and promote healthy lifestyles. A mixed method approach is being carried out, using quantitative techniques, through validated questionnaires and metrics; and qualitative techniques, to collect user experience and identify the determinants, factors, and aspects of the intervention impact, and user engagement.

Results: The monitoring data shows that the actions implemented are effective, as the intervention has been widely disseminated and almost 5,000 people have accepted to participate. However, only 5% finally registered in the application. This intermediate Results shows low adherence to the intervention and a high level of dropout, as it is understood that once the user has agreed to participate, he/she has not followed the study protocol (defined as downloading the app, registering, and using it).

Conclusions: The community-based intervention implemented in the Basque Country will contribute to generating awareness and new data on research into the intention-to-treat, adherence, and attrition rate of the use of eHealth applications self-managed by the elderly. clinicaltrials.gov identifier: NCT05614479

The need for healthcare public health to be the third domainMuir Gray¹, Duncan Selbie², Walter Ricicardi³, Maggie Rae⁴¹The Oxford Value and Stewardship Programme, United Kingdom, ²Saudi Arabia Public Health Agency, Saudi Arabia, ³Università Cattolica, Italy, ⁴NHS England, United Kingdom

Value based healthcare is the new paradigm enfolding the previous paradigms of quality improvement and efficiency as health services struggle to close the gap between need and demand on the one side and resources on the other. Value based healthcare requires those who pay for or manage health services to focus on populations as well as patients and use the population as the denominator in all their decisions about the allocation and use of resources. It also requires the development of population-based systems and networks and the need to create a culture of stewardship, so that every clinician becomes committed to preserving universal healthcare by minimising waste of time, money and carbon. The skills and experience of public health professionals are of vital importance in this paradigm shift. The development of population-based screening programmes provides a very good model for the development of systems for people with asthma or people with dementia to give two examples of the systems that are needed. The public health commitment to, and understanding of, equity can support health services as they make the shift their focus from providing care to the patients who manage to access services to using their resources to help all the people with a particular need in the population. Furthermore, the public health commitment to sustainability in the broadest sense of the term makes public health professionals ideal leaders in the development of a culture of stewardship. This is a tremendous opportunity for the profession, now recognised in a number of countries including Ireland, Wales, England and Saudi Arabia. A training programme has been developed to develop the skills of population healthcare and it is proposed that healthcare public health be regarded as a public health workstream alongside health promotion and health protections.

Boost smoke-free environments: how small incentives for local policy can trigger big changesSelinde Rouwenhorst¹¹GGD GHOR Nederland Netherlands

In The Netherlands, around 20.000 people die each year from the effects of smoking and passive smoking. Every week, hundreds of children become addicted to smoking. To improve the overall public health in the Netherlands, it is important to substantially reduce the prevalence of smokers. Until recent years, municipalities played next to no role in helping to reduce smoking in the Netherlands. The start of a campaign that aims a smokefree generation by 2040 has changed that.

Part of that campaign is to create smoke-free environments. In a two-year program, 90% of the Dutch municipalities started policy and actions to ban smoking from public places, as part of the National Prevention Agreement. The participating municipalities were supported by all 25 Regional Health Services (GGDs) by providing knowledge and manpower on a regional level, together with national, regional and local organisations. The project has a number of successful elements: the GGD received a small budget to actively participate in the region; knowledge was shared between the regions and from national to local level and legal issues were dealt with by the Nat Assoc of Municipalities.

In 2021, 317 out of 352 Dutch municipalities were active in this project. There is a significant increase of smoke-free environments, mostly schoolyards, playgrounds, sports facilities, bus stops and municipal institutions. Other results are integrated plans for smoking cessation care and accessible stop smoking service, e.g. in GGD Fryslan the number of registrations for smoking cessation care increased dramatically and 80% actually quit smoking.

All parties involved agree that the strength of this project is its positive approach and the broad social support it generates. It is about persuasion, not compulsion. Working from a national focus towards a smoke-free environment, while taking into account local differences and needs, makes this project a success.

Nudging as a tool to prevent tobacco and alcohol use: findings from a scoping reviewMarcello Di Pumo^{1,2}, Marcello Di Pumo^{1,2}, Alessio Perilli¹, Mario Nurchis¹, Giuseppe Greco¹, Luca Sbrogio², Gianfranco Damiani³¹Università Cattolica del Sacro Cuore, Rome, Italy, ²Azienda ULSS6 Euganea,Regione Veneto, Padua, Italy, ³Università Cattolica del Sacro Cuore, Rome, Italy - Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy

Background and Objective: Alcohol and tobacco consumption are among the main preventable risk factors for non-communicable diseases related deaths, disabilities, and overall burden.

There are many possible mono and multicomponent prevention interventions available. One promising technique, recently applied to healthcare, is "Nudging". It aims to change behaviors by modifying the physical, psychological and social dimensions of environment in which people make choices without freedom restriction. The objective of the study was therefore to review the use of nudging techniques to prevent tobacco and alcohol use in adults.

Methods: A scoping review of the literature was performed. Participants were required to be 18-64 years of age, no gender or clinical condition restrictions were applied, mono and/or multicomponent nudge-based interventions performed in community, clinical, community and clinical or online settings were considered.

Results: 20 studies were included. 11 studies addressed tobacco use, of which 63% were set in the community and 27% online, 64% being monocomponent and 36% multicomponent, with 54% reporting successful outcomes. 7 studies addressed alcohol use, of which 29% had a community setting, 29% a clinical setting, 43% a clinical and community setting and 29% were online (29% not reported), 86% were monocomponent and 14% multicomponent with 71% reporting successful outcomes. 2 studies addressed both risk factors, of which 100% had a clinical setting, 100% were multicomponent and 50% reported success.

Conclusion: The study shows promising results in the implementation of nudging to prevent tobacco and alcohol use in adults. A set of specific measure outcomes and a comprehensive framework to inform, monitor and evaluate nudging programs and public health policy decisions are much needed. It is also important to study equity in applying nudge strategies in groups socio-economically diverse. In addition, further research is strongly required to evaluate nudge-based interventions targeting risk factors in younger people.

Healthy cities status analysis by a survey for healthy city managers in KoreaBicna Lee¹, Seungwon Shin¹, Yunhee Yang¹, Yumi Oh¹¹Korea Health Promotion Institute, Korea, Republic Of

Background and Objective: In Korea, healthy cities were implemented individually by local governments, but with the recent revision of the National Health Promotion Act, a central management system is being prepared. The purpose of this research is to provide basic data for local government support plan by analyzing current status of healthy city projects in Korea.

Methods: The research surveys for 105 cities that joined the healthy cities networks(Korea Healthy Cities Partnership, Alliance for Healthy Cities) in 2022. The contents of the survey are current status of healthy city projects promoted by local governments, such as general status, implementation system, and project status. Main status of the system such as organization, manpower, and budget among cities was compared. Difficulties and suggestions were investigated.

Results: There are differences between healthy cities due to the lack of dedicated departments, manpower, guidelines, lack of budget, and no standards of planning and evaluation. In part of organization, 88.6% of local governments were conducting projects at public health centers, and 11.4% were main office of local governments. In case of implementation system, 80.0% of cities answered that there is no dedicated manpower for the healthy city project. Each local government was promoting the healthy city project by taking advantage of the characteristics of the local government. The representative projects were targeted to people of all ages(72.4%), adults(7.6%), elderly(2.9%). Representative project area was operating health promotion activities(27.0%), spreading the health promotion culture(25.0%), creating a physical environment(27.0%), establishing the foundation of policy(15.5%).

Conclusion: Compared among healthy cities in Korea, needs as managing, supporting and reward for the healthy cities at the central government level were identified. Guideline and education for healthy city managers should be prioritized. Health promotion projects in various fields should be encouraged through active linkage and cooperation with cross-departments.

"Why will I use Family Planning? I don't want to have a family yet." Defining the Delayers, an overlooked Family Planning audienceVia Abellanos¹, Billie Puyat Murga¹, Kimiko Colardo², Cathy Church-Balin¹¹Johns Hopkins Center for Communication Programs/USAID Reac

hHealth Project, Philippines, ²RTI Philippines, USAID ReachHealth Project, Philippines

Demand generation for family planning (FP) in the Philippines has always focused on reaching Filipino couples with at least one child. This leaves out women who do not have any children yet and want to delay their first pregnancy. Among unmarried, sexually active women, only 17% used contraceptives despite 49% of the segment expressing an unmet need for FP use (NDHS 2017). FP is perceived by Filipinos to primarily be for married people. As one young woman interviewee expressed: "Why will I use family planning? I don't want to have a family yet." We dubbed this overlooked audience group "the Delayers."

USAID ReachHealth launched It's OK to Delay (IOTD), a social media platform to reach the Delayers—young, sexually active individuals aged 18-34 who may want to have a child someday, but not today. It is a refreshing take on FP, reminding the Delayers about their goals while providing information on how they can achieve these with the help of FP. IOTD uses an engaging and humorous tone to provide lifestyle and informational content about FP, emphasizing the benefits of proper and effective FP use.

Since its launch, IOTD has reached over 20 million individuals and currently has 64,000 followers. A December 2021 IOTD online survey revealed that 79% of respondents are either interested in using FP or have experience using FP, demonstrating the Delayers have FP needs distinct from that of adolescents and couples with one child or more.

Social media allows us to establish a two-way line of communication with the Delayers, linking individuals towards service provision. IOTD also highlights the importance of ensuring good service delivery, with many sharing experiences in dealing with biased providers who refuse service provision due to being unmarried, or not yet having children. A lot of work still needs to be done.

Association between health status, behaviour and communicative health literacy-Results of a Hungarian nationwide survey

Frederico Israel¹, Frederico Israel¹, Éva Biró¹, Ferenc Vincze¹

¹Doctoral School of Health Sciences, University of Debrecen, Debrecen/Hungary. Department of Public Health & Epidemiology, Faculty of Medicine, Hungary

Background and Objective: The ability of a person to obtain, interpret, and use health information is crucial for their health status. Research on health literacy has been increasing significantly, perhaps because of its impact on health care services, the health and well-being of the population. Communicative health literacy (COMM-HL) is an important aspect in healthcare services as it affects the way how a person interprets and eventually conveys a message, which could change the health behaviour and consequently the health status of an individual. Given the importance of COMM-HL, the field has become more important from the public health perspective, especially in health promotion. Our aim was to find the link between health status, behaviour and COMM-HL.

Methods: A total of 1205 Hungarian adults aged 18 years and older completed the telephone interview as part of the international Health Literacy Survey 2019. The questionnaire included items among others on sociodemographic data, health status, health behaviour and communicative health literacy. Statistical weights were applied to ensure that estimates reflect the general adult Hungarian population by gender, age group, educational level, and settlement type. The relationship between COMM-HL and the health outcome variables was investigated by binary logistic regression.

Results: The mean score of the COMM-HL scale was 86.8, nearly one-eighth of the respondents had difficulties during communication in health care services. Individuals with high level of COMM-HL had lower odds of limitation by health problems and higher odds of regular physical activity and daily fruit and vegetable consumption.

Conclusion: The study found some association between COMM-HL and the investigated variables, high level of COMM-HL contributes to a better health outcome and behaviour. Therefore, the COMM-HL of patients should be improved. Enhancing of the health care professionals' communication skills and environmental changes could support this process.

Health Promotion in Italy: structures and activities of the NHS

Roberta Bosco¹, Giovanni Guarducci¹, Nicola Nante², Gabriele Messina², Bruno Aiello³, Franco Cocchi⁴

¹University of Siena, Post Graduate School of Public Health, University of Siena, Italy, Via Aldo Moro, 2, Italy, ²University of Siena, Department of

Molecular and Developmental Medicine, University of Siena, Italy, ³Italian Society of Health Promotion - SIPS, ⁴Training and Skills Unit, Local Health Authority Rome 1, Rome, Italy

Background and Objective: The Ministry of Health is the primary health decision-making body, in Italy. It produces the National Health Plan, which is taken over by the Regions, to reference the Local Health Authorities (LHAs) responsible for health promotion (HP) activities. The objective of the study was to investigate structured HP activities at the national, regional and territorial levels.

Methods: From February 2020 to July 2021, an online search was conducted on existing HP structures, projects (divided by 17 themes) and responsibilities. The sources were the official websites of the Ministry of Health, the 21 Italian Regions, and the LHAs.

Results: Over a "prevalent period" 2014-2021, we found 41 active facilities dedicated to HP: 7 Complex Operating Units and 34 Simple Units. In another 30 facilities, we found HP activities despite the absence of dedicated units. The most treated topic seems to be a physical activity (63%), followed by addictions (53%), nutrition (48%), prevention (33%), at the tail end, dental hygiene and family/parenting (both at 7%). One of the LHAs of Turin and LHA of Salerno have the highest number of topics.

Conclusions: Despite the growing need to find complete and clear answers on the web, the results showed a great heterogeneity in the Italian context regarding HP activities published online, both in the organization of structures and in the implementation of projects. It is hypothesized that the phenomenon depends more on less attention to the digitization of information and less on actual HP-related offerings.

Acceptance of a blended physical activity intervention among German older adults - Results of a quantitative and qualitative feedback analysis

Claudia Pischke¹, Manuela Peters¹, Tiara Ratz², Saskia Muellmann³, Frauke Wichmann³, Claudia Voelcker-Rehage⁴, Sonia Lippke⁵

¹Institute of Medical Sociology, Centre for Health and Society, Heinrich-Heine-University Duesseldorf, Germany, ²Department of Reproductive Endocrinology, University Hospital Zurich (USZ), University of Zurich (UZH), Switzerland, ³Leibniz Institute for Prevention Research and Epidemiology-BIPS, ⁴Department of Neuromotor Behavior and Exercise, Institute of Sport and Exercise Sciences, University of Muenster, Germany, ⁵Department of Psychology & Methods, Jacobs University Bremen, Germany

Background/objectives Knowledge of individual preferences is central to designing interventions adaptable in terms of the different requirements of older adults regarding interventions for the promotion of physical activity (PA). This study aimed to evaluate acceptance and use of a blended PA intervention, including tailored home-based exercises and supervised on-site group sessions, and to identify requirements.

Methods: As part of a nine-month randomized trial with a cross-over design, web- and print-based intervention materials to promote PA were tested in adults aged 60 and above (n=242). Use and acceptance of program components were assessed via self-administered questionnaires three and nine months after baseline. Additionally, participant feedback was assessed in fourteen guided group interviews and via protocols of onsite group sessions. Results were analyzed descriptively and using qualitative content analysis. Data were coded based on six social-ecological requirement levels (intrapersonal, interpersonal/sociocultural, intervention content, spatial, digital, organizational).

Results: At the intrapersonal level, participants reported an increased awareness of health benefits resulting from participation. At the interpersonal level, they stated that group sessions provided companionship, encouragement from others, and opportunities for exchange with peers. At the content level, exercises and instructions for increasing strength, balance, and flexibility were appreciated. At the spatial level, participants raised small room sizes and lack of suitability of the spaces that group sessions were held in as issues. At the digital level, activity trackers were reported working well for keeping track of personal achievements and the website design was rated positively. However, some participants had difficulties handling the menus on the web interface or app. At the organizational level, regular appointments were rated positively, while the length of the program was criticized.

Conclusion: Our analysis provided information regarding acceptance and use of PA intervention components in older adults and identified requirements for future interventions at various levels.

Opportunities and challenges of integrating eye care and neglected tropical diseases services in primary health care setting in sierra leone: a mixed method study

Sapana Basnet¹, Lloyd Williams², Emma Jolley¹, Nancy Smart³, Elena Schmidt⁴, Jalikatu Mustapha⁵

¹Sightsavers "35 Perrymount Road Haywards Heath" United Kingdom, ²Ministry of Health and Sanitation, Sierra Leone, ³Sightsavers Sierra Leone "74 Wilkinson Road Nylander Drive Freetown" Sierra Leone, ⁴Sightsavers United Kingdom, ⁵Ministry of Health and Sanitation, Sierra Leone Sierra Leone

Background and Objective: The World Health Organisation (WHO) recommends reorienting health systems towards primary health care (PHC), as a foundation for achieving universal health coverage (UHC). Sierra Leone is integrating some previously vertical programmes, Neglected Tropical Diseases (NTDs) and Primary Eye Care (PEC), into its PHC services. In this study, we explored the experiences and capacities of PHC staff trained in eye care; investigated the readiness of the PHC facilities and staff to deliver NTD services; and sought to understand how PHC can deliver essential eye care and NTD services to all.

Methods: We employed a mixed-method approach, including desk review of key documents. We interviewed 57 purposively sampled health care personnel, and we conducted facility-based surveys in 32 PHC facilities. Drawing on the WHO health systems building blocks, we used a framework analysis approach to analyse all data. Ethics were obtained from the Sierra Leone Ethics and Scientific Review Committee. Empirical data was collected from 4 districts in Sierra Leone between December 2021 and February 2022.

Results: Trained staff are now able to treat basic eye diseases, provide on spot services for communities in hard-to-reach areas, and conduct outreach programmes to educate communities on eye care and NTD management. Despite the successes, multiple shortcomings and challenges across the health system continue to hinder efficacy of the training and its potential to improve eye care services. Challenges include lack of basic infrastructure including electricity and water; insufficient paid staff; shortages of basic drugs; lack of infrastructure to support digitalised data management; lack of funds for outreach programmes; and lack of accessible facilities for women and people with disabilities. Recommendations included pre- and in-service training modules for all PHC staff. **Conclusion:** Training PHC workers without the accompanying system strengthening is not enough to provide the successes that these trainings envisage.

DOI: 10.18332/popmed/164064

Human papillomavirus vaccination uptake: preliminary results of a cross-sectional study in Italy

Francesca Licata¹, Gabriella Di Giuseppe², Marika Romeo¹, Francesco Napolitano², Aida Bianco¹, Francesca Licata¹

¹University of Catanzaro "Magna Græcia", Catanzaro, Italy Department of Health Sciences, School of Medicine, University of Catanzaro "Magna Græcia", Catanzaro, Italy, ²University of Campania "Luigi Vanvitelli", Naples, Italy Department of Experimental Medicine, University of Campania "Luigi Vanvitelli", Naples, Italy

Background and Objective: Human papillomavirus (HPV) vaccination is a well-known strategy in the prevention of HPV infection and related diseases. However, HPV vaccination rates are still below the level required for community immunity. The aim of this study is to assess the uptake of HPV vaccination among young adults and its potential predictors.

Methods: This cross-sectional study was conducted among a sample of young adults (aged 18-30 years) in Southern Italy. Data was collected through an anonymous self-administered questionnaire designed to retrieve sociodemographic information, knowledge about HPV infection and vaccine, attitudes towards HPV and sexual behaviours.

Results: Among 264 respondents, 69.7% were women, 4.5% identified themselves as homosexual and 4.5% as bisexual. The majority knew that HPV vaccination is effective to prevent cervical cancer (91.7%) and believed that it is useful to prevent HPV infection (95.8%), but just 41.7% were worried to contract HPV infection. The main sources of information were school/university (76.5%) and healthcare workers (HCWs)(52.3%). Less than half (47.3%) received HPV vaccination and female gender and younger age were the strongest predictors of HPV vaccination uptake. A later sexual debut, having had multiple sexual partners, homosexual orientation, believing that HPV vaccine is useful to prevent HPV infection and having received information from HCWs and/or school/university were positively associated with HPV vaccine uptake.

Conclusion: HPV vaccination uptake was lower in the sample than the primary target of coverage in girls (>80%). Improving HPV vaccination coverage in adolescents

is a relevant public health goal that must be pursued through multicomponent intervention. Public health systems should work on the integration of several approaches, such as individual reminders, information and education activities. The finding that prevalence of male HPV vaccine uptake was lower than female highlight the need to have more male-specific HPV campaign to reduce the overall prevalence of HPV infection.

The family and community nurse as a resource to promote health: The pilot experience of an health district in the metropolitan city of rome

Rosaria Gallo¹, Luz Iaià², Francesco Mondera³, Shadi Orlandi³, Elena Megli², Giulia Cairella⁴, Fabio Boldrini⁴, Barbara Porcelli⁴, Andreina Lancia⁴

¹Local Health Unit Rome 2 - Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, ²Local Health Unit Rome 2,

³Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, ⁴Local Health Unit Rome 2 Italy

Background and Objective: National Health Systems should be oriented on a community-based approach, through proactive and proximity interventions to the detection of expressed and hidden needs. The aim of the work is to describe the launch of a pilot project in the Health District 9 Local Health Unit Rome 2, in the urban context of the metropolitan city of Rome, oriented towards the territorial activation of the specific resource of the Family and Community Nurse.

Methods: The target population is represented by 45-65 year olds recruited from the databases of General Practitioners (GPs), not in therapy for oncological pathologies. Patients receive an invitation email from their GP for an interview with the Family and Community Nurse at their practice. During the interview a 30-item questionnaire is administered to identify behavioral risk areas, which correspond to intervention areas and health objectives that are re-evaluated in subsequent appointments.

Results: Since February 2022, 3 Family and Community Nurses, 11 GPs were involved and 51 participants were enrolled. Of those recruited, 1 citizen out of 2 reported a change in lifestyle as early as the second interview. A mapping of the health services was carried out and an information brochure was drawn up in collaboration with the Prevention Department. Integrated care pathways have been created with Prevention Department, dietetics service, Addiction and Mental Healthcare Services, "Psychological well-being" desk of Rome Municipality.

Conclusion: The interaction between the services has allowed the creation of a dimension that welcomes the citizen and the Family and Community Nurse thus becomes a tool for the realization of comprehensive Primary Health Care.

Users characteristics of a park-based physical activity promotion in an urban context

Alessandro Bianconi¹, Alice Masini¹, Francesco Sanmarchi¹, Stefania Toselli², Laura Bragonzoni², Alessia Grigoletto², Sofia Marini², Zhengyang Xu², Giuseppe Barone², Erika Pinelli², Raffaele Zinno², Mario Mauro², Pietro Loro Pilone³, Sonia Arduini³, Simona Galli³, Mauro Vitiello³, Bruno Vicentini⁴, Giorgia Boldrini⁴, Muriel Musti³, Paolo Pandolfi³, Maurizio Liberti³, Gerardo Astorino³, Pasqualino Maietta Latessa², Laura Dallolio¹

¹University of Bologna Department of Biomedical and Neuromotor Sciences Italy, ²University of Bologna Department of Life Quality Studies Italy, ³AUSL di Bologna Department of Public Health Italy, ⁴Municipality of Bologna Culture and City Promotion Department Italy

Background: Physical Activity (PA) provides several benefits to human health. More than 25% of people worldwide are estimated not to comply with the World Health Organization recommendations on PA. Urban living is linked to sedentary lifestyles. Some aspects of the built environment, such as public greenness, may nudge residents' PA levels. The aim of the study was to assess the typical user profile of the "Moving Parks" project, a park-based PA promotion intervention.

Methods: The "Moving parks" project took place during summer in the public parks of Bologna (Italy). The project was created by the Local Health Authority and the Municipality of Bologna. Different types of activities were proposed, free-of-charge, twice-a-week and managed by qualified instructors. A questionnaire was proposed at the beginning of the intervention period. The variables collected involved participants' socio-demographic information, PA habits and psychological/general wellbeing, assessed through the Psychological General Well Being Index - Short version (PGWB-S).

Results: In 2022, a total of 568 participants were involved in the project, 85% were women.

The 23%(n=133) of participants were younger than 35, 55%(n=314) were 35-to-64 and 21%(n=121) were older than 64. Moreover, n=54(10%) respondents had an educational level lower than a high-school degree, n=198(35%) had a high-school degree and n=313(55%) had a university degree. PA was already a habit in the 74% of the respondents, and 41% declared to perform regular vigorous PA. The PGWB-S composite mean score was 3.49(SD 0.71).

Conclusion: This study highlights that most of citizens that participated to this intervention were females, highly educated and already physically active. Since built environment is experienced differently by genders, and green spaces are less used by women, this project suggests that group-activities may nudge a more gender-inclusive use of public parks. Further adjustments are needed to promote this type of interventions to reach more sedentary citizens.

Adapted physical activity for osteoporotic women with vertebral fractures: reading results of a qualitative study in a quantitative perspective

Fiorella Lanzillotta¹, Alice Conni¹, Sofia Marini¹, Maria De la Rosa¹, Alice Masini¹, Laura Dallolio¹

¹University of Bologna Italy

Background and Objective: In a previous trial on osteoporotic women with past vertebral fractures, we found a significant improvement of some physical performance markers after a 6 months Adapted Physical Activity (APA) program. In this study – using the Capability Opportunity Motivation behavior (COM-b) model domains - we investigated barriers and enablers to maintain APA over time in a perspective that it could aid us to monitor lasting healthy behavior changes relapses.

Methods: The McGill Illness Narrative Interview (MINI) was chosen as qualitative tool to perform interviews. Three researchers analyzed independently the interviews by an ad hoc checklist, looking for barriers and enablers to continue the APA program. A consensus was reached by checklist comparison and each factor influencing behavior was classified into one of the three COM-b model domains.

Results: Seven out of the twenty-one women originally enrolled in the study group agreed to be interviewed. Four women were continuing APA for a fee and two reported to still practice Physical Activity (PA) on their own. Our assessment showed that: the three women who did not continue the APA program referred distance from the gym as the main obstacle (Opportunity barrier); the only woman who stopped all PA showed relevant physical limitations (Capability barrier); human and professional trainer skills were very appreciated facilitators (Opportunity and Motivation enablers); almost all reported both physical and psychological great benefits (Motivation enablers).

Conclusions: Several internal and environmental determinants affected the APA maintaining. Their exploration allowed us identifying potential barriers to overcome and levers to work on in order to maintain healthy behaviors over time. In the future, to improve long-term adherence to PA programs, it is important to design Behavior Change Wheel model-based strategies, to be included in future trials, also in light of a continuous monitoring of overall potential lasting benefits.

Engaging academic institutions in public health programs: lessons from anemia control program in India

Kapil Yadav¹, Abhishek Jaiswal², Kashish Vohra³, Preetu Misra⁴, Ravneet Kaur³, Mohan Bairwa³, Sanjay Rai³

¹All India Institute of Medical Sciences, New Delhi, India Professor, Centre for Community Medicine, All India Institute of Medical Sciences, New Delhi, India Centre for Community Medicine, Old OT-Block, AIIMS, Ansari Nagar, New Delhi (Pin Code-110029), India India, ²ESIC Medical College and Hospital, Faridabad, Haryana, India, ³All India Institute of Medical Sciences, New Delhi, India India, ⁴UNICEF, India India

Background and Objectives: Public health nutrition (PHN) programs in India have seen increased focus and high political commitment recently. National Nutritional Strategy, POSHAN Abhiyaan, and Anemia Mukta Bharat (AMB) have set defined targets in line with Global Nutrition targets (2025) to strengthen nutrition services. Engaging academic institutions (medical colleges, nutrition colleges, other allied discipline academic institutions) is an important strategy to strengthen public health.

Methods: All India Institute of Medical Sciences (AIIMS), New Delhi established in 1956, is an Apex Medical Institution of India. The trinity of mission of AIIMS is teaching/training, patient service, and research with >2000 students, 300,000 patients and 600 research publications as output every year. Over last 70 years,

AIIMS contributed significantly in PHN. AIIMS was designated as National Centre for excellence (CoE) for AMB (NCEAR-A) in 2018. It has been instrumental in testing innovations in research and technology; developing guidelines incorporating scientific and community perspectives; capacity building; monitoring and supportive supervision of AMB.

Results: With its skilled workforce, AIIMS has contributed to various PHN-orientated scalable research such as iron-fortification, effectiveness of parenteral-iron formulations, and validation techniques for hemoglobin estimation. Apart from research, NCEAR-A has been actively involved in setting up Test, Treat and Talk camps in several parts of India and developing 'Training Manual' and 'Advocacy Booklet on Anemia' for medical professionals, program managers, and service providers. It works in collaboration with professional bodies to disseminate AMB strategy, support states, and institutions for developing SCOE. Establishment of an apex reference laboratory is underway.

Conclusions: Academic institutions support national public health programs through research, innovative interventions, integration of scientific knowledge and practice, and creation of a skilled younger generation. Academic institutions in return benefit from this engagement by getting platform for testing knowledge products and also can leverage greater resources for institutions.

Effect of the 'there's a people's pharmacy here' programme on hypertension and diabetes-related mortality

Samilly Miranda¹, Kionna Santos¹, Marcio Natividade², Juracy Bertoldo¹, Vinícius de Araújo Mendes¹, Luís de Souza², Erika de Aragão¹

¹UFBA Brazil, ²UFBA

Background and objective: Information about the real prevalence of non-communicable diseases (NCDs) in Brazil, and their rate of treatment and control, remains scarce. Despite the evolution of technologies for medical treatment, some sections of the population do not adhere to it. This study therefore aims to analyse the effect of the 'There's a People's Pharmacy Here' Programme (Programa Aqui Tem Farmácia Popular: ATFP) on hypertension and diabetes-related mortality.

Methods: An individualized, descriptive study involving all the dispensation of medication, from 2001 to 2017, for the treatment of diabetes and hypertension, to the users of the Primary Healthcare Network and the pharmacies accredited by the ATFP Programme. We calculated travel patterns from user households to dispensing sites, adopting 3 measures (800, 1,000 and 1,250 metres) to infer "geographically hard to access." To obtain the differences and their respective significance, we applied Pearson's Chi-Squared test. Estimates of Prevalence Ratios (PR) were used to ascertain the associations between the independent variables.

Results: Municipality-controlled multivariate models maintained a protective effect for double medication dispensing for both diabetes (9%) and hypertension (11%). Analysis per region enabled confirmation that, for both pathologies, the region with the greatest protective effect against deaths with double medication dispensing was the Southeast. We noted that large municipalities had the most widespread pattern for a reduction in deaths from diabetes, although the same behaviour was not identified for hypertension cases.

Conclusion: In general, it was possible to identify the protective effect of double medication dispensing on admissions and deaths related to diabetes and hypertension, and to determine that the ATFP programme acts as a complementary model to the primary healthcare network. The study outlines the need for a general diagnosis of access to medication and participation in the ATFP program.

DOI: 10.18332/popmed/164412

Mortality analysis for the state of Rio de Janeiro, Brazil: Observing the public health system conditions

Mônica Morangeira¹, Paulo Eduardo¹, Xavier de Mendonça¹, Rodrigo Torres Oliveira¹, Rodrigo Lages², Marcela Souza Caldas³, Alice Lima³, Paulo Almeida Rodrigues⁴, Thauanne de Souza Gonçalves⁴, Ana Matheus Peres⁵, Lucas da Silva Cabral², Paula Pungartnik¹, Édnei Santos Junior¹

¹IESC/UFRJ Brazil, ²COSEMS Brazil, ³COSEMS, ⁴UERJ/IMS Brazil, ⁵UNIFASE/COSEMS Brazil

Background, Objectives: Understanding the causes of mortality in the population is essential for the reorganization of the public health system, especially after the covid-19, that mobilized health structures in Brazil and around the world. The objective is to describe and analyze indicators of mortality to understand the regional epidemiological characteristics and support decision-making in public health planning and management in the state of Rio de Janeiro, Brazil.

Médos

Open data available in the Health Information Systems provided by the Brazilian Government were used. The General Mortality Rate of the population of the SRJ, crude and standardized, from the year of 2019, was analyzed in comparison to the indicators of Brazil and other Brazilian States. Resultados

The characteristics of persons who die in the SRJ has a slight predominance of males, a higher percentage of white people, aged over 70 years and a higher occurrence of deaths in hospitals. The Standardized Mortality Rate was 8.3% for the SRJ. The main causes of death were diseases of the circulatory system, neoplasms, diseases of the respiratory system and external causes, with a significant burden of violent deaths. The General Mortality Rate increased between 2000 and 2020 and infant and perinatal mortality maintained a downward trend.

Conclusã

This analysis allows us to outline prospects for reconstruction for the future in state and municipal public health. The mortality rate in the SRJ was higher than the Brazilian rate with disparity between the health regions of the state. Deaths from heart diseases have a homogeneous distribution in all regions of the state and deaths from ill-defined causes points to the need for investment in the qualification of information. The rates are strongly influenced by the age structure between the regions of the state, showing the need to organize care based on the characteristics of population aging.

Mental health-promoting interventions in elementary schools: School context correlates of availability and alignment with evidence-based practices

Jodi Kalubi¹, Teodora Rigma¹, Isabelle Doré¹, Louise Potvin¹, Jennifer O'Loughlin¹

¹École de santé publique, Université de Montréal Canada

Background and Objective: Schools are ideal settings to promote mental health and well-being in youth, but not all schools offer mental health-promoting interventions (MHPs). Our objectives were to identify school context correlates of MHP availability in elementary schools, and to characterize MHPs implemented in study schools according to alignment with evidence-based practices.

Methods: Data were collected in structured telephone interviews with school principals participating in PromeSS, a cross-sectional study of 171 public elementary schools in Quebec, Canada (2016-19). We examined the association between each of 17 variables related to school context and MHP availability in multivariable logistic regression models. Cross-case analysis of a convenience sample of 25 MHPs was used to classify interventions into one of 6 groupings based on a combination of high/moderate/low alignment with the Health Promoting Schools (HPS) framework (i.e., a whole-school approach in conjunction with changes to school culture and environment) and high/low adaptation to school context. Effective implementation practices (formal team, guidelines, training, process and outcome evaluation) were described for each grouping.

Results: Of 171 schools, 41% reported ≥1 MHP in the past year. Seven factors were associated with MHP availability: higher student body socioeconomic status, English language of instruction, mental health issues perceived as important in the school, higher scores for parent/community engagement with the school, and high teacher turnover. Only four (16%) MHPs were categorized as high alignment with HPS, but three of these were external interventions with low adaptation to school context. Although most other MHPs had high adaptation to school context, few used a whole-school approach or aligned with evidence-based implementation practices.

Conclusion: MHP availability is uneven across schools and is associated with social inequalities and school culture. Future research should investigate how to strengthen school capacity to identify and implement MHPs that are aligned with evidence-based practices.

Measuring the sustainability of health systems using absorptive capacity: Imbibing sustainable processes and outcomes

Shubham Gupta¹, Vikas Choudhry¹, Kultar Singh¹

¹Sambodhi Research and Communications Private Limited India

Evidence on the sustainability of outcomes has been quite minimal, limited to post-hoc evaluations. Such evidence is even scarcer in terms of sustainability of processes and the generation of evidence on what makes programs sustainable becomes crucial in resource-constraint contexts. This paper considers the case of the Technical Support Unit (TSU) in the state of Uttar Pradesh, India to showcase how absorptive capacity can be used as a mechanism to build sustainability of the processes as well as outcomes. The purpose of this Paper is to utilize the findings

of TSU evaluation to posit that building 'Absorptive Capacities' of stakeholders is an important mechanism to build sustainability of interventions. The paper also discusses how 'Absorptive Capacities' were defined and implemented in the context of health system evaluation.

The evaluation study employs a pre-post multi-method design with the district as the unit of analysis. Mixed method approach with semi-structured interview schedules were conducted with public health officials at the state, district and block level. Further, these are aided with the organizational assessment survey. The analyses are guided by the Absorptive Capacity (ACAP) framework to assess absorptive capacity at the individual and system level.

The agenda of the evaluator in most evaluations has been on demonstrating impacts throughout funding of a program based on the theory of change. The preoccupation should not be on the initial theory of change but on an emergent theory of change that includes some reflection on post-funding dynamic supports. The findings build the case for understanding the sustainability of processes and outcomes through the ACAP framework. This thinking about the sustainability of processes and outcomes will require a focus on capacities, capabilities and absorptive capacities of "permanent" actors, like the state, and actors who have the potential of mainstreaming the intervention after the funding runs out

Profile comparison of Brazilian and haitian pregnant women and their newborn babies in pato branco, Brazil, from 2015 to 2019

Debora Galvan¹, Raphaela Rodrigues²

¹Centro Universitário de Pato Branco Brazil, ²Centro Universitário de Pato Branco

Background and objective: In the last decade, there was an intense migratory flow of Haitians to Brazil. In addition, Brazil ensures the access to the Unified Health System (SUS) to all Brazilian citizens and immigrants who live in the country. Therefore, considering that SUS offers prenatal care, pregnant Haitians women can use this service as well as Brazilian pregnant women.

This study researched information about the pregnant women (Brazilians and Haitians) who live in Pato Branco, Brazil: the pregnancy itself; birth and newborn information (Brazilian and Haitian's babies) from 2015 to 2019. Concerning mothers information, this research reached color, race and marital status. Information about pregnancy itself were the average length of gestation and number of prenatal visits. Birth information was the delivery method and birthday. Regarding the newborn we were interested in color and race.

Methods: We conducted a cross-sectional study using data provided by the Paraná Secretary of Health.

Results: The results showed 6.443 live birth babies between 2015 and 2019. Those births, 88 were Haitian children. Of the 88 pregnant Haitian women, 87.5% attended seven or more doctors appointments. Of these, 11.4% women attended four to six doctors appointments. One woman did not attend any prenatal visit. When we consider all the pregnant women, information showed that 91.49% of pregnant women attended seven or more prenatal visits, while only 0.74% of the women did not attend any prenatal visit. Finally, 59.26% of the babies were delivered by cesarean section; meanwhile 40.70% were delivered by vaginal birth. About Haitian's babies, 54.5% were delivered by vaginal birth and 45.5% were delivered by cesarean section.

Conclusion: Despite the good numbers and results within what the Ministry of Health recommends for a good prenatal care, the indexes are lower for Haitian women than for Brazilian women.

of Medicine and Allied Health Sciences ReBUILD for Resilience Consortium

Sierra Leona, ³Institute for Global Health and Development, Queen Margaret

University, UK ReBUILD for Resilience Consortium United Kingdom, ⁴Institute

for Global Health and Development, Queen Margaret University, UK

Background and objectives: Community engagement (CE) with the relevant stakeholders is recognised as core to resilient health systems and is essential and instrumental in promoting accountability and trust. This is particularly important in Sierra Leone, a context often characterized by mistrust in the health system.

This study aimed to provide insights into the current CE strategies in response to issues in Sierra Leone through an inclusivity and accountability lens and test approaches to support and improve engagement, ownership and leadership and to develop resilience capacities of the health system.

Methods: The study was a prospective participatory action research (PAR) cycle, involving four research phases, in two districts in Sierra Leone: Phase 0 mapping the current situation, Phase 1 participatory power mapping with different community leaders through a gender, equity and social inclusion lens, Phase 2 identifying leverage points and co-creating an action agenda with community stakeholders; Phase 3 implementing actions, reflecting and documenting processes, adapting and learning. The results presented are based on data collected from inception to October 2022.

Results: A CE pathway to change that encompassed several context-driven PH interventions was co-created by the identified key community stakeholders and the research team, supporting an embedded approach to CE and community ownership. An intervention informed by this was piloted, designed to harmonize different CE initiatives, encompassing the One Health platform, nutritional programs, and maternal and child health interventions, among others. The study design, based on several phases and cycles, allowed to embed feedback loops for effective communication.

Conclusions: Communities should be directly involved in developing CE programs for HSS interventions. In this regard, PAR is a well-suited research method to design effective strategies to respond to local health needs. CE is a central element of comprehensive primary health care, promoting social change, increasing accountability, and building community health systems.

Erivcal cancer screening and hpv vaccination: strategies for increasing vaccination coverage in women aged 25 to 45 in asp of catania (sicily)

Enrica Esposito¹, Enrica Esposito², Cristina Mauceri³, Gabriele Giorgianni⁴, Mario Cuccia⁴, Renato Scillieri³

¹University of Catania Italy, ²University Of Catania Italy, ³U.O.C. Prevenzione malattie cronico degenerative-screening oncologici - Dipartimento di Prevenzione ASP Catania Italy, ⁴UOC Sanità Pubblica, Epidemiologia e Medicina Preventiva -Dipartimento di Prevenzione Asp Catania Italy

Background and Objective: Since 2017 HPV vaccination is free in Sicily for women up to 45 years old; screening is free for women aged between 25 and 64. HPV vaccination coverage in Sicily decreased during the COVID-19 pandemic. Consequently, the letter of screening invitation was updated inserting indications to book vaccination.

The aim of the study is to evaluate vaccination coverage in women of the Province of Catania aged 25 to 45, after sending the updated letter for screening.

Methods: Women aged between 25 and 45 tested for cervical cancer in 2021 was extracted from software used for screening. The anti HPV vaccination coverage in above mentioned age group was provided by Epidemiology Service. The screening invitation letter was updated including the HPV vaccine booking methods.

A vaccination coverage monitoring plan has been defined since the start of the involvement of target population through the updated letter.

Result: In 2021, n. 8616 screening test were performed in women aged 25 to 45. Data from Epidemiology Service ASP Catania shows a low HPV vaccination coverage in women aged 25 to 45.

During 2023, cross-reference through tax code between unvaccinated women invited for screening and vaccination registry will be provider for evaluate the effectiveness of updated invitation letter in promoting vaccination. The crossing will be carried out after 6 and 12 months from the first sending of the letter.

Conclusion: More information on free HPV vaccination program are needed in women up to the age of 45, also providing counselling on HPV vaccine with screening.

Updated letter could improve HPV vaccination and further investigations will be needed to verify changes in vaccination coverage.

Did the use of HTPs help people to stop smoking?

Marise Sabato¹, Martina Antinozzi¹, Teresa Bonarrio¹, Sara Merli¹, Francesco Mondera¹, Francesco Rosiello¹, Martina Antinozzi¹, Maria Assunta Donato¹, Maria Sofia Cattaruzza¹

¹Sapienza University of Rome Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy

Background and objectives: In the past decade there has been a surge in the

promotion of health and prevention of smoking in young people. Unitab, the tobaccology unit of sapienza university of rome (Italy), frequently organizes different awareness-raising campaigns aimed at increasing awareness on tobacco related issues, encouraging young people to stop smoking. The main objective of this qualitative study was to have a deeper understanding of young people's perception of the risks of new tobacco products and their use.

Methods: A questionnaire was administered to young women on the occasion of world women's day, the 8th of march 2022. The questionnaire was divided in 2 sections: the first contained 8 different questions addressed to everyone; the second consisted of 14 questions specifically addressed to smokers and former smokers regarding past use of tobacco products and whether they tried new products.

Results: 331 women were recruited. out of these 63.5% were non smokers (10% former smokers), 36.5% smokers. 52,9% only used traditional tobacco products, 21,5% htps and traditional products, 16,5% only smoked htps and 9,1% used electronic cigarettes or other tobacco products. 69,43% tried htps, mostly out of curiosity (34,94%), 33,73% believed htps were less harmful. interestingly, only 28% said they tried htps in order to reduce smoking/quit. 63,27% have tried to quit smoking; 27% succeeded at the first try, 21,53% the second and 11,81% needed three or more attempts.

Conclusions: There is a great need for new prevention methods as there is a wide misconception that new tobacco products are less damaging than the established products. Further studies are needed in order to understand the risks of new tobacco products to counteract misleading information.

(07061) Korea, Republic Of

Since February 2020, there has been a gradual mitigation of responses as the COVID-19 pandemic has lengthened. However, the burden of COVID-19 operation in hospital coexists according to seasonal characteristics and virus variants, and quarantine policies of each government changes. Therefore, it is becoming more important to boost the morale of medical personnel, to maintain mental and physical health, and to promote satisfaction, stability, and a sense of belonging. We had done Health Promoting Hospital (HPH) activities over a decade, developing and applying various programs to enhance physical and mental health for patients, staff, and the community. While we are still with minimum protective equipment due to COVID-19, we tried to offer our staffs to get practical and psychological rewards and to inspire employee morale through HPH activities. In particular, as a municipal hospital with intensive care unit for COVID-19, there had been times when in-hospital activities were not free. In response, the hospital executive department reorganized the structure into a field system to mobilize personnel into departments where demand and work are concentrated. Coming up with this trend, our HPH activities had also been transformed. For individual workers, initial meeting and progress report, online or non-face-to-face activity methods were used, or the risk factors of HPH activities were hedged and through small grouping of activity projects. Surprisingly, in the course of the various programs, participants responded that Simple and Fun is Beautiful. There were also experiential and training-type activities longer than a month with communication and feedback with managers. But, short experiences that arouse interest, small groups where meals and refreshments are prepared, etc., evoked a more explosive and immediate response. We would like to share and review our recent experience in the aspect of health care workers work-place well-being and enforcement of morales.

Effectiveness of invitation methods in cancer screening programmes targeting the general population: a systematic literature review

Sonia Pinto¹, Alessandro Durbano², Giulia Barbera³, Maria Grazia⁴, Ilaria Accastello⁵, Silvia Barbero⁵, Giacomo Scaioli⁵, Giuseppina Moro⁵, Fabrizio Bert⁵, Roberta Siliquini⁵

¹Università degli Studi di Torino Department of Public Health Sciences, University of Turin, Italy Via Santena, 5 bis, Torino 10126 Italy, ²Università degli Studi di Torino Italy, ³University of Turin Italy, ⁴Vari University of Turin Department of Public Health Sciences, University of Turin, Italy, ⁵University of Turin Department of Public Health Sciences, University of Turin, Italy
Background: Although cancer screenings can identify an early onset of cancer, adherence in Italy in 2019 is less than 23%. Therefore, this study aimed to test the effectiveness of invitation methods in cancer screening programmes to improve adherence to practices that could save lives and increase quality of life of potential patients.

Methods: The research consisted in an overview conducted in august 2021. All studies focused on the effectiveness of invitations methods in cancer screenings performed worldwide (e.g. leaflet, letters, doctors advice) between january 2010 and july 2021 and involving only the general population suited for the screenings available in Italy (cervical, breast and colorectal cancer). The outcome was to list and summarize the different invitation methodologies studied over the last 10 years and to highlight their effectiveness.

Results: 5513 records were screened by two authors and data extraction is ongoing. the selected papers consisted of 29 systematic reviews (37.93% colorectal, 27.59% breast, 17.24% cervical screenings): 93.1% were European, 3.45% american, and 3.35% oceanic. In particular, 20.69% of the studies compared sending an invitation letter versus letter and reminder letter, 13.79% letter versus letter and brochure, 13.79% letter versus two or more methods of contact, 10.34% letter versus letter and sms, 10.34% letter versus phone call, 2.69% letter or brochure versus medical counseling. Phone calls, medical advice and brochures increased the adherence of the screening (61.11% had a proven effectiveness); sending a second letter in close proximity to the screening test was not worthwhile (63.63% was ineffective or had no significant results).

Conclusions: The population was more inclined to adhere to screening if receiving an individual and personal contact rather than a second letter, or a text message or a brochure sent at home.

Habits and lifestyles among medical students: smoking status as a possible risk factor

Maria Assunta Donato¹, Martina Antinozzi¹, Brigid Unim², Marco Santini¹, Maria Sofia Cattaruzza¹

¹Sapienza University of Rome Department of Public Health and Infectious Diseases - Sapienza University of Rome Piazzale Aldo Moro 5, Roma Italy, ²Istituto Superiore Di Sanità, Italy Viale Regina Elena 299 - 00161 Roma Italy

Background and objective: Literature suggests that some habits (e.g., smoking and drinking) are more common among students with specific lifestyle patterns. This study aims to assess habits and lifestyles in a sample of second-year medical students at Sapienza University of Rome.

Methods: Perceived Stress Scale (PSS-10), Cigarette Dependence Scale (CDS-5), Fagerstrom Test for Nicotine Dependence and Morningness-Eveningness Questionnaire (MEQ) were administered to students online and face-to-face. Questions on sedentary lifestyle, consumption of energy drinks (tea, coffee, energy drink) and binge drinking were also included.

Results: A total of 218 students (mean age=22.4, females 61.5%) took part in the survey. Possible associations between smoking status and lifestyles were investigated; 23.4% of the students were smokers. PSS-10 did not show significant differences for smoking status, while the mean number of energy drinks used was 3.3 (SD= 1.7) for smokers and 2.4 (SD= 1.6) for non-smokers ($p<0.001$). 43.1% of the sample drank 3+ energy drinks a day, (38.3% smokers and 58.8% non-smokers; $p<0.01$). Binge drinking behaviors was observed in 50.9% of participants and significant differences emerged between smokers (72.5%) and non-smokers (44.3%) ($p<0.001$). Regarding physical activity, 60.6% of participants were sedentary, especially smokers (68.0%). In the multivariable analysis, after adjusting for age and sex, binge drinking (OR =3.15, 95%CI 1.54-6.44, $p<0.001$) and use of energy drinks (OR =3.33, 95%CI 1.02-10.95 for 2 energy drinks a day and OR = 4.19, 95%CI 1.33-13.20 for 3+ energy drinks a day; $p<0.001$) were associated with smoking.

Conclusion: The preliminary results of this study underline smoking status as a potential risk factor for unhealthy lifestyles among young medical students. Further research on unhealthy lifestyles is needed to increase health awareness and health promotion among medical students, motivating them in becoming health models for their patients.

Are avoidable hospitalizations associated with the primary healthcare governance model? a public health perspective

João Magalhães¹, Joana Pestana², António Pereira³, André Biscoia³

¹Public Health Unit, Vale do Sousa Norte, Portugal Rua Rainha D. Leonor, 107 4590-612 Paços de Ferreira Portugal, ²NOVA School of Business and Economics, ³Family Health Unit, Unidade de Saúde Familiar Prelada, ACES Porto Ocidental, Portugal PHC - Commissioning Department, Northern Regional Administration of Health, Portugal; CINTESIS@RISE - Center for Health Technology and Services Research, Faculty of Medicine, University of Porto, Porto, Portugal

Introduction: Primary healthcare (PHC) mission is to provide first level continuity of care and act as health system (HS) gatekeeper. Avoidable hospitalizations (Avh) are recognized as a sensible PHC performance measure. A governance model centred on general practitioner (GP) public or self/company delivery have found mixed results on Avh, while there is a large performance variation between HS. Therefore, the study aims to assess how PHC governance models determine Avh, as well as how interacts with the HS public model, considering GP availability and outpatient coverage.

Methods: An ecological study was conducted and countries were the observation unit. Data for GP employment type (public and self or company) and 2019 asthma and chronic obstructive pulmonary disease (COPD) and diabetes Avh was collected from Organisation for Economic Co-operation and Development health statistics. Eurostat database and Health in Transition reports were also used as sources. A three-step regression analysis was conducted based on population characteristics, PHC coverage and HS models.

Results: The study included 26 countries, 13 public-employee and 13 self/company-employed. For Asthma and COPD Avh, the first two models registered negative coefficients ($p(M0) = -4.256$ [CI 95% -75.1;66.6] and $p(M1) = -4.746$ [CI 95% -84.7;75.2]), while after interaction with HS models a positive coefficient ($p(M2) = +23.815$ [CI 95% -157.1;204.7]). In diabetes Avh, all the models registered a positive and increasing coefficient ($p(M0) = +35.551$ [CI 95% -26.7;97.8], $p(M1) = +37.128$ [CI 95% -32.4;106.7] and $p(M2) = +43.873$ [CI 95% -32.4;106.7]).

Discussion

This study creates evidence and hypotheses that GP public-employed might provide more quality of continuity care, particularly for diabetes management. The main limitations are the mix of PHC and HS models in most countries, the co-burden of disease variations and individual level demand for out-of-pocket services. In addition, these results show that PHC and HS models might influence how population access different levels of care.

Rethinking the Italian healthcare network. Community Healthcare Centers, Community Hospitals and Local Operative Centres: From the functional aspects md 77/2022 to the metaproject with the spatial features and performance requirements to be guaranteed

Maddalena Buffoli¹, Marco Gola¹, Stefano Capolongo¹, Domenico Mantoan², Alice Borghini², Federica Riano²

¹Design & Health Lab, Politecnico di milano Italy, ²AGENAS Italy

Introduction: COVID-19 highlighted the significant criticalities of the NHS and recently the Italian Government approved the NRRP to relaunch its economy and at the same time promote health, sustainability and digital innovation. Specifically, M6C1 provides for the introduction of Community Healthcare Centers (CHCs), Community Hospitals (CHs) and Local Operative Centres (LOCs) with the aim of strengthening the healthcare services. Starting from MD 77/2022, a group coordinated by AGENAS and POLIMI developed the Metaproject for the CHCs, CHs and LOCs with the aim of supporting decision makers in defining the spatial features and the performances to be guaranteed.

Methods: For the elaboration of the general strategies of the CHCs, CHs and LOCs starting from the MD 77, the study was divided into: a) a survey in which the current national and international scenario regarding the territorial healthcare; b) a survey in which all the national and regional regulations have been analysed; c) a data analysis in which the inputs from the first two phases for the development of the Metaproject have been processed.

Discussion

For the definition of the Metaproject, the functional program has been translated in a spatial one accompanied by the functional layouts. The various services have been organized by functional macro-areas and the definition for each of them in a synoptic framework which shows the performance approach and their features. Specifically, the different functions have been classified into homogeneous macro-areas by type of function to be provided with their functional layouts and the list of all the environmental units.

Conclusions: The study conducted aims at supporting the planning of these facilities in relation to the catchment area and their sizing. It will be necessary to define the location by evaluating the possibility of setting them up within existing hospitals

Optimizing the primary health care workforce to achieve timely healthcare that meets the population's needs: Romania's human resource in primary care

Diana Nemes¹, Marius-Ionuț Ungureanu¹, Monica Brînzac¹

¹Department of Public Health, Faculty of Political, Administrative and Communication Sciences, Babeș-Bolyai University, Cluj-Napoca, Romania
 Center for Health Workforce Research and Policy, Faculty of Political, Administrative and Communication Sciences, Babeș-Bolyai University, Cluj-Napoca, Romania Pandurilor 7 Street, Cluj-Napoca, Romania

Introduction: To contribute to universal health coverage and achieve the highest possible standard of health, health systems can only function with health professionals' cooperation. The importance of primary care must be reemphasized, the infrastructure must be revitalized, and the delivery of care and payment models must be redesigned. Currently, the maldistribution of health workers in Romania and the unfavorable working circumstances provide significant issues for Romania's health workforce. As a result, more and more people cannot access timely healthcare that meets their needs.

This study aims to investigate the Romanian healthcare workforce using the framework for the health labor market.

Methods: We triangulated secondary data from policy documents and other pertinent reports with data from the annual report on the Activity of Healthcare Facilities from 2009 to 2021.

Results: The overall number of physicians has grown since 2009, and there's a trend toward an aging workforce. In 2021, the number of physicians aged 65 and above increased three times compared to 2009 (from 1,386 doctors to 4,306 doctors). In contrast, the proportion of doctors aged 25 to 34 increased 1.6 times in 2021 (from 14,428 doctors in 2009 to 23,454 in 2021). Regarding family medicine, it can be observed that in an interval of 13 years, the number of family doctors not only stagnated but even decreased, varying from 12,735 family physicians in 2009 to 12,430 family physicians in 2021, showing a decrease in the attractiveness of the family medicine specialization. In 2021, the discrepancy between the number of family doctors in urban and rural areas was substantial. Out of the total of 12,430 family physicians throughout the country, 8297 practiced in urban areas, while in the rural areas, their number decreased by half.

Conclusion: Further efforts are needed to improve primary care workforce distribution and planning throughout the country.

⁵Association of Family Doctors Bucharest-Ilfov, Romania

Background and objective: Family doctors are the backbone of the Romanian health care system. As gatekeepers, they are the first point of contact for patients in need of preventive and curative health services. This research aims to provide an overview of their specific professional and personal needs and identify priority action areas.

Method: WE COLLECTED DATA FROM 305 Family Doctors based on a 20 minutes self-administered online survey in June-July 2022. The sample was balanced by region and urbanization degree.

Results: Overall, the family doctors rated their health as good and their work-life balance decent, and 83% of family doctors feel satisfied with their patient relationship. Nevertheless, these aspects tend to be eroded by the high frequency

of stressful situations and by the administrative burden, both of them correlated (negatively) with their work satisfaction. We have identified four areas of priority based on the attributes that are important but generate high dissatisfaction among Family Doctors: (1) The importance given to Family Doctors in the health system; (2) The efficiency of current rules and regulations, with direct impact on the time spent on administrative tasks and the amount of work required; (3) The payment for the services performed; and (4) The relationship with the authorities: the usefulness and frequency of required reporting, and the feedback received.

Conclusion: Family Doctors feel unheard and disrespected by the authorities, their job is pushed towards insignificance by the current laws while the existing rules and regulations generate a big deal of administrative burden. Initiating a real dialogue by the authorities would be a first step to improve existing situation.

Factors associated with the implementation of an improved community health fund in the Ubungu Municipality Area, Dar es Salaam Region, Tanzania

Goodluck Mselle¹

¹Ubungu Municipal Council, Dar es Salaam, Tanzania

Community-based health insurance schemes help households to afford healthcare services. This paper describes healthcare facilities and community factors that are associated with the Improved Community Health Fund (iCHF) scheme in the Ubungu district of Tanzania. A cross-sectional descriptive study was conducted using online questionnaires that were completed by healthcare providers and community members in public-owned healthcare facilities in the Ubungu Municipal Council district of Dar es Salaam, Tanzania, between October and November 2021. The data were analyzed using descriptive statistics and the chi-squared test of association. We found a statistically significant relationship between income level and satisfaction with the iCHF scheme. For community-related factors, income level was statistically significant in the level of involvement in iCHF implementation among local leaders. Further, income level was statistically significant in relation to community behavior/culture toward the iCHF. Occupation was statistically significant in iCHF implementation, iCHF premiums, and iCHF membership size. A statistically significant relationship was also found between income, iCHF membership size, and iCHF premiums. Moreover, people would be willing to pay the required premiums if the quality of the healthcare services under the iCHF scheme improves. Therefore, the government should allocate resources to reduce the challenges that are facing iCHF implementation, such as the preference for a user fee scheme over the iCHF, the issues that are faced by enrollment officers, and inadequate iCHF premiums and membership size.

Dynapenic abdominal obesity and sociodemographic, clinical and nutritional factors in individuals with chronic kidney disease on hemodialysis

Monica Cattafesta¹, Letícia Souza², Edson Neto³, Luciane Salaroli⁴, Cleodice Martins⁴

¹Graduate Program in Nutrition and Health, Universidade Federal do Espírito Santo, Brazil, ²Department of Health Integrated Education, Universidade Federal do Espírito Santo, Brazil, ³Collective Health, Universidade Federal do Espírito Santo, Brazil, ⁴Nutrition and Health, Universidade Federal do Espírito Santo, Brazil

Background and Objectives: Dynapenic abdominal obesity (DAO) is an important marker for assessing nutritional status. Therefore, the aim of this study was to determine the prevalence of DAO and to investigate its association with sociodemographic, clinical and nutritional factors in individuals with chronic kidney disease on hemodialysis.

Methods: Cross-sectional study with 940 individuals undergoing hemodialysis in a metropolitan region in southeastern Brazil. DAO was defined by the combination of the presence of abdominal obesity indicated by the waist-to-height ratio and the reduction in muscle strength measured by handgrip strength. Binary logistic regression was performed to calculate the odds ratio (OR) and their respective confidence intervals (95% CI).

Results: DAO was present in 45.4% of the study population. It was found that adult (OR = 3.17; 95% CI 2.35, 4.28; p < 0.001) and overweight individuals (OR = 2.58; 95% CI 1.92, 3.47; p < 0.001) have more chances to present DAO. However, those who had the habit of having their meals outside at home (OR = 0.63; CI 95% 0.47,

0.85; $p = 0.003$) and who had preserved adductor pollicis muscle thickness (OR = 0.52; 95% CI 0.38, 0.71; $p < 0.001$) have less chance to develop DAO.

Conclusions: DAO can be an important tool for assessing the nutritional status of individuals with chronic kidney disease on hemodialysis.

Facilitating policy, systems, and environment changes through community-based micro-funding in West Virginia, USA

Kathryn Burnham¹, Diana Yuh², Nancy Tompkins³

¹West Virginia University Research Corporation, United States, ²West Virginia Prevention Research Center, West Virginia University Research Corporation, United States, ³Prevention Research Center, West Virginia University Research Corporation, United States

Background: Creating policy, systems, and environment changes (PSEs) is an evidence-based health promotion strategy supported by public health research. However, issues in facilitating understanding of PSEs have caused challenges with implementation. PSEs are crucial in West Virginia (WV) where only 50% of residents have access to physical activity opportunities, 12% are food insecure, and 10.2% have limited access to health care due to cost. In this case study, the WV health agency used micro-funding to encourage community-based organizations and health care systems to implement PSEs. This study reports the number of PSEs implemented and the extent grantees accurately identified their activities as PSEs.

Methods: The study sample is 61 grantees that received micro-funding. Resources and technical assistance (TA) processes were created to increase the capacity of grantees to implement and report PSEs. In one year, grantees were provided self-guided resources, and, in another year, grantees were provided self-guided resources and tailored TA. In their end-of-year evaluation reports, grantees were asked to identify their activities as P, S, or E. Study investigators independently coded reported activities and resolved discrepancies through consensus. Comparisons between the two years were made to determine the extent to which grantees accurately described their PSEs. Additionally, responses from 11 grantees who received funding in both years were analyzed to determine capacity to identify PSEs.

Results: Eighty-two percent of the activities implemented were identified as PSEs by the study investigators; the average cost per PSE was \$941. Grantees receiving self-guided resources and tailored TA correctly classified activities as PSEs more frequently than those receiving only self-guided resources. Roughly half of the 11 repeat grantees increased the percentage of correctly identified PSEs.

Conclusions: Micro-funding can be a cost-effective way to increase the PSE implementation. To build capacity for reporting, a combination of self-guided and tailored TA provides better results.

Macrostructural processes and their impact on the interprofessional proposal in mental health: a study in a city in the state of São Paulo, Brazil

Giulia Peruzzo¹, Marina Bertagnoli¹, Ingrid Battisti¹

¹University of São Paulo, Brazil

Background and Objective: Interprofessionality has been identified as a way to achieve integrality in the Brazilian unified health system (sus), promoting specialties integration and complementarity of care in health teams, with special qualification in mental health and strengthening service's governance. However, its operationalization is threatened by macrostructural processes. Thus, the objective of this study was to analyze the influence of these processes in the implementation of practices aimed at interprofessionality's exercise, investigating its potentialities and challenges as a strategy for promoting integrality in health.

Methods: This study derives from qualitative research, with the perspective of hermeneutic-dialectic. Data was obtained by two individual interviews, with mental health and primary care coordinators, and two focus groups, one with six professionals from a psychosocial care center (caps) and the other with three professionals from the family health support center (NASF) in a municipality in the state of São Paulo. Data analysis was performed using thematic analysis.

Results: Data observed lack of financial, structural and human resources. This influences the team work process, making it difficult to carry out reflective practices and the possibility of integrated teamwork practice. The policies fragility that guarantee these practices feasibility and the management role on planning and evaluating strategies aimed at an integrated practice were also observed. Finally, the health crisis caused by the covid-19 pandemic exacerbated the difficulties previously faced, with the aggravation of population increased demand.

Conclusions: Results reinforce macrostructural aspects relevance in policies implementation in health teams routine, indicating that policies fragility, lack of resources and management planning impasses make it difficult to implement the integrality proposal. It is also concluded that the effects of the covid-19 pandemic exacerbated problems that were already present.

2022 Recovering beneficiary health follow-ups from the public welfare program Auxílio Brasil in a southern Brazilian state: strategies and results

Lauren Silva¹, Raquel Canuto¹, Maísa Pedrosa², Maria Lantmann², Deise Vetromila²

¹Universidade Federal do Rio Grande do Sul, Brazil, ²Secretaria Estadual da Saúde do Rio Grande do Sul, Brazil

Background and Objective: In 2003, the Brazilian government created the public welfare program "Bolsa Família", currently called "Auxílio Brasil", which enables impoverished families to access governmental financial aid. Nonetheless, to receive the aid, the beneficiaries must attend a primary care unit to receive vaccination, anthropometry, and prenatal care. Thereupon, a greater number of follow-ups furthers public primary health care access of lower-income Brazilians. The study aimed to analyze health conditionality follow-ups from 2011 to the first half of 2022 in the Brazilian state of Rio Grande do Sul.

Methods: The data regarding the "Auxílio Brasil" Program execution was extracted from a Brazilian open access health care database, e-Gestor. The percentage of program beneficiaries who accessed health follow-ups was analyzed, from 2011 to June, 2022. Additionally, the justifications for lack of follow-ups were summarized for analysis.

Results: The percentage of beneficiaries that accessed the health follow-ups in the state increased 8% from 2011 to June, 2022. However, there was a significant decrease in follow-ups to 47,1%, in 2020. The follow-up percentage increased in 2021 (63%) and in the first half of 2022 (70,8%), reaching a 23,7% increase since 2020. The most frequent justifications for the lack of follow-up were: incorrect information registry, difficulty to access a primary care center, and lack of capacitated health professionals in these services.

Conclusions: The "Auxílio Brasil" Program, beyond conceding financial aid to socially vulnerable Brazilians, enables a greater access to public primary health care, improving, among other things, vaccination and prenatal care rates. Considering that the access to healthcare relies on health follow-ups, it's necessary to ascertain the reasons why beneficiaries aren't being followed-up, thereby taking precise action to guarantee the access to primary health care among the most vulnerable.

Qualitative analysis of the use of the "evaluation of siderail use" instrument in a public emergency hospital

Teresa Ferreira¹, Rosimere Santana², Denise Diniz³, Noângela Nascimento¹, Teresa Vannucci¹

¹Municipal Health Department of Rio de Janeiro, Brazil, ²Federal Fluminense University, Rio de Janeiro, ³National School of Public Health, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil

Background and Objective: The study is a partial result of a masters research in which an instrument was translated and cross-culturally adapted for one of the patient safety goals – risk of falls, whose protocols guide the use of siderails as safety devices in the prevention of falls among adults and the elderly hospitalized. The pre-test stage was analyzed, by nurses of a municipal hospital of the Unified Health System/Brazil. **Methods:** In the pre-test, 30 nurses applied the version approved to 57 hospitalized patients distributed across the internal medicine, cardiology, neurology, and orthopedics wards, 29 of whom were male, aged between 41 and 69 years. Each nurse carried out a subjective assessment of the indication for the use of side rails, followed by the indication using the translated instrument.

Results: Neuropathies were the largest sample of patients to whom the questionnaire was applied (43.9%) followed by orthopedic patients (22.8%). The main subjective indication for the use of rails by nurses was "four" rails for 66.7% of cardiac/clinical patients and 48% of neuropathic patients. The highest proportion of indication for "four rails" was for women and the patients who had the lowest indication were polytrauma patients (0%), followed by general surgery patients (0%). **Conclusions:** When measuring the agreement between what the nurse judged subjectively and the patients preference for the use of rails, the highest correlations were presented in the item "no rail is indicated" and in the

patients choice of “no rail”. The study shows that independent patients with mobility and the ability to get out of bed agreed with the nurses assessment that no railing was necessary. However, patients with cognition and mobility restriction are difficult choices and require the use of an instrument for evaluation such as the one in the study. Keywords: Patient Safety, Sidedrails, Accidental Fall.

Popul. Med. 2023;5(Supplement):A919

DOI: 10.18332/popmed/165324

Quality and patient safety: experience report in the management of hospitals in the municipality of Rio De Janeiro

Noângela Nascimento¹, Teresa Ferreira², Teresa Navarro³, Marta Cortes³, Alynne Martins³, Cintia Ferreira³

¹Municipal Health Department of Rio de Janeiro, Brazil, ²Municipal Health Department, Rio de Janeiro, Brazil, ³Municipal Health Department of Rio de Janeiro, Rio de Janeiro, Brazil

Background and Objective: Risk management is the systemic and continuous application of policies and behaviors in the identification, analysis, evaluation, communication and control of risks and adverse events that affect the patient. Implementation strategies range from drafting protocols to implementing incident surveillance and monitoring systems. In this context, Ordinance 529 of the Ministry of Health (MS) regulates the Implementation of Patient Safety Centers (NSP) in the hospital environment. The NSP must promote and support the implementation of actions aimed at patient safety, guided by International Safety Goals, which serve as alerts for the prevention of major health incidents. The objective of this study is to report the experience of the Implementation of Clinical Governance, focusing on risk management in Emergency Hospitals of the municipal health network of Rio de Janeiro. **Methods:** After diagnosis, the management model to be implemented in the Emergency Hospitals of Rio de Janeiro was defined – Care Centered on the Patient and Family with Risk Management; defined and structured the specialized human resource for strengthening the NSP and risk assessments; Forums were held to support the implementation of quality tools; applied Risk Mapping in the Hospital environment; implemented management support processes, such as the Safety Huddle; carried out periodic follow-up visits for the Continuous Improvement Cycle.

Results: In 06 months of implantation, 100% of the Units with registered NSP/MS are noted; Increased number of reports of adverse events and near misses; better performance in operational and care indicators, culminating positively in the patients journey in the hospital. **Conclusions:** The implementation of this Model could guide hospitals in building a safety culture, creating an educational environment that encourages patient care with fewer incidents and damage. Care risk management must be a basic premise, regardless of the mandatory rules and regulations. **Descriptors:** risk management, patient safety, health public

Net Promoter Score (NPS) in the primary health care services in Brazil

Luiz Pinto^{1,2}, Carolina Fabricio³, Marcelo Gonçalves⁴, Otávio D’Ávila⁵, Erno Harzheim⁶

¹Primary Care Post-Graduate Program, Universidade Federal do Rio de Janeiro (UFRJ), Brazil, ²Municipal Secretary of Health of Rio de Janeiro, Brazil, ³Municipal Health Secretariat, Rio de Janeiro, Dental Surgeon in Public Health Researcher at Municipal Secretary of Health of Rio de Janeiro, Brazil, ⁴Universidade Federal do Rio Grande do Sul (UFRGS), ⁵Dentistry, Universidade Federal de Pelotas (UFPel), Brazil, ⁶Epidemiology Post-Graduate Program, Universidade Federal do Rio Grande do Sul (UFRGS), Brazil

Background and Objective: User satisfaction is an important indicator of primary health care (PHC) services. The Net Promoter Score (NPS), originally proposed by Reichheld in 2003, has been adapted for use in health services in several countries around the world. The Brazilian Institute of Geography and Statistics (IBGE) used it for the first time to evaluate primary health care services in the Unified Health System (SUS).

Methods: IBGE used the reduced version for child users of the Primary Care Assessment Tool (PCAT) created by Starfield and Shi and validated by the Brazilian Ministry of Health and included NPS. Random cluster sample (n = 4,973 children) allowed comparing the overall PCAT score with NPS. NPS is a single metric that quantifies the response to the question: How likely are you to recommend this service? Three categories are identified and classified as ‘promoters’ (those who would definitely recommend and use the service again), ‘passives’ (who are broadly happy, but would not actively promote the service) and ‘detractors’ (who actively discourage others to experience the service). The Results of calculating

this indicator ranges from -100 to +100. NPS can be classified as: (i) critical zone (-100 to 0), (ii) improvement zone, between 1 and 50; (iii) quality zone, between 51 and 75; (iv) excellence zone, between, 76 and 100.

Results: For all regions of Brazil, the NPS estimated by the IBGE is in the improvement zone, with important intra-regional differences in the Brazilian states. The higher the PCAT score, the greater the proportion of promoters in the NPS.

Conclusions: Due to its simplicity of implementation in PHC services in Brazil, NPS could be incorporated in assessing user satisfaction.

Sex education: determining factor for the intention to use the male contraceptive (Vasalgel)

Vanessa Jimenez¹, Gerardo Rivera², Josue Dominguez², Natalia Cruz³

¹School of medicine, Universidad del Valle de Mexico, Mexico, ²Universidad Veracruzana, Mexico, ³School of Medicine, Universidad del Valle de Mexico, Mexico

Background: Vasalgel is a new proposal in temporary contraceptive methods for men that shows clinical advantages in its use compared to female hormonal methods. **Objective:** To determine the factors associated with the intention to use Vasalgel. **Methods:** A cross-sectional, prospective study was carried out between August and December 2021, men residents of Veracruz aged between 20 and 34 years were included. The sexual machismo scale (Cronbach 0.91) and the Questionnaire on knowledge of responsible sexuality in young people (KR-20 = 0.57) were applied through Google Forms®. SPSS v22 software was used for data analysis, X2 test with Odds Ratio (OR) and 95% confidence interval (95%CI) and MannWhitney U test. assigning statistical significance with p<0.05.

Results: 446 men were included, 52.2% with a high level of knowledge about responsible sexuality; 41.3% knew about the “Vasalgel” method, after explaining about this method, 74.9% showed a positive intention to use it. The factors associated with the intention to use Vasalgel (OR/95%CI) were having a bachelor’s degree or higher (OR 5.9 / 95% CI 3.5-9.9), being an atheist (2.6 / 1.1-5.9), having a girlfriend (2.7 / 1.5-5.0), having had two or more sex education courses (3.6/2.0-6.3), not having children (10.0/5.7-17.3), using condoms without methods by the partner (3.0/1.8-5.1), knowledge of responsible sexuality high (5.0/2.8-9.0), medium (0.02/0.003-0.1) and low (0.1/0.01-1.9), living with your partner (0.2/0.01-0.4), and sex education courses only in high school (0.1/0.04) all with p<0.05. The participants with the intention of using vasalgel obtained lower points on the sexual machismo scale, likewise, the patients with more sexual education obtained lower scores on the sexual machismo scale (p<0.05). **Conclusions:** The level of knowledge about sexuality and machismo represent changes in the attitude of patients to favor the intention of using Vasalgel, as well as the sources where this knowledge is generated.

Reception in urgency and emergency services: ethical-political technology in the management of health care networks

Marta Côrtes¹, Noângela Nascimento², Teresa Ferreira², Teresa Vannucci³, Denise Diniz⁴

¹Municipal Health Department of Rio de Janeiro, Brazil, ²Municipal Health Department, Rio de Janeiro, Brazil, ³Municipal Health Department of Rio de Janeiro, Rio de Janeiro, Brazil, ⁴Instituto de Medicina Social Hesio Cordeiro, Universidade do Estado do Rio de Janeiro, Brazil

Background and Objective: The urgency and emergency services are submitted to heavy pressure due to the great demand and speed inherent to the care of acute conditions, generating criticism due to the difficulty of access and lack of information, where the relationships between users and workers are experienced in a scenario of precariousness of bonds and solidarity. In order to promote transformations in the quality of care, since 2009, the Municipal Health Secretary of Rio de Janeiro has bet on the “Reception” - one of the guidelines of the National Humanization Policy - as an important ethical component for the development of a network that aims to enhance life and human relationships, expressing attitude and action of inclusion towards the construction of mechanisms for access to services, ensuring care and quality of assistance. **Methods:** This work aims to report and analyze its implementation in the municipal hospitals, using the “analyzing flowchart” tool, the developed access indicators, and the results of the survey with relational technologies, sharing of care practices, and health management. **Results and Conclusions:** It is considered that the strategies and instruments used contribute significantly to guarantee the continuity of care and to qualify the health care network. **Keywords:** embracement, production of care, health management, flowchart

Workplace health promotion initiatives for Italian healthcare workers demonstrate an investment for workers, the organization and the society in the context of total worker health

Salvatore Zaffina¹, Reparata Prinzi¹, Maria Vinci¹, Vincenzo Camisa¹, Annapaola Santoro¹, Giorgia Bondanini¹, Bianca Ceresi¹, Guendalina Dalmasso², Massimiliano Raponi²

¹Occupational Medicine Unit, Bambino Gesù Children's Hospital, Rome, Italy,

²Health Directorate, Bambino Gesù Children's Hospital, Rome, Italy

The aging workforce must deal with work-related alterations such as new organizational options (e.g., agile work), psychological difficulties (e.g., COVID-19-related distress), and new technology. Individual employee happiness has an indirect impact on the company's bottom line (e.g., personnel turnover, restrictions on fitness-to-work, occupational injuries and diseases, labor law disputes). Workplace Health Promotion Initiatives (WHPIs) can successfully assist in addressing these labor-market difficulties. An Italian hospital has implemented a workplace strategy to improve the professional performance of healthcare personnel (HCWs). A multidisciplinary team directs WHPIs such as "Disability Management" (DM), which addresses developing impairments (e.g., chronic degenerative illnesses, oncological diseases), and "Help Point" (HP), which provides psychological support to overburdened HCWs. We provide Findings about the economic effect of these two WHPIs. From July 2017 to December 2019, 131 HCWs were enrolled in DM and 35 HCWs in HP (September 2016-June 2019). Sickness absence days (SADs) in the 12-month period preceding and after WHPIs. Return on Investment (ROI) was calculated as the ratio of net profit to investment cost for the WHPIs management using SAD reduction accounting for profit. SADs dropped by 67% and 60% for DM and HP respectively, resulting in ROIs of 27.66 and 2.73 (p values: 0.001, and 0.05). Given the limited sample sizes, the results must be interpreted with care. Because of their instructional value, WHPIs constitute a "win-win" strategy for employees, businesses, and society. Public health policies should raise worldwide knowledge of the economic benefits of investing in improving employee's well-being for the benefit of society as a whole, toward the global horizon of occupational salutogenesis.

Evaluation of health promoting activities by a culturally adapted "Self-Review Tool" in a Bulgarian university

Klara Dokova¹, Petya Boncheva², Klara Dokova³

¹Department of Social Medicine, Faculty of Public Health, Medical University Prof. Dr. P. Stoyanov, Varna, Bulgaria, ²Department of Social medicine, Faculty of Public Health, Medical University Prof. Dr. P. Stoyanov, Varna, Bulgaria, ³Department of Social medicine, Faculty of Public Health, Medical University "Prof. Dr. P. Stoyanov", Varna, Bulgaria

Background and Objective: The "Health Promoting University" initiative is still unknown in Bulgaria. There is no higher education institution with a strategy for health promotion with clear goals and objectives, officially embracing the principles of health promotion and implementing the initiative. The aim of the present study is to clarify the available conditions and scope of health promotion activities in a concrete Bulgarian university, applying an established tool for self-assessment of health promoting universities. Methods: The study was conducted in three phases at a medical university setting. The Self-Review Tool, a resource of the Healthy Universities network, was culturally adapted to the Bulgarian linguistic and cultural context, in the first phase. The opinion of students, academic and administrative staff on selected statements applicable to the target groups, was sought in the second phase. In the third stage representatives of the academic leadership and the students Council reached a consensus with a Delphi method on how to complete the self-review tool on behalf of the university community, after familiarization with the "voice" of the respondents from the second phase. Results In total 673 respondents took part, representing 10% of all groups: 570 students, 77 academic staff, 21 employees, three members of Student Council and two university leaders. According to the final assessment, the university performed excellent in most of the criteria, except: stakeholder engagement (73%), food (73%) and corporate engagement with the health promotion principles (67%). Conclusions: The university has demonstrated capacity and real health promotion action, without the presence of an officially accepted policy at the institutional level and without the label "Health Promoting University". Strategy, policy, leadership involvement are important factors but their absence is not an insuperable obstacle for health promotion action.

Theoretical derivation of a telephone-based health coaching intervention

Angeli Gawlik¹, Yeliz Nacak², Jens Kleinert¹, Uwe Konerding^{3,4}, Frank Vitinius²

¹Department of Health and Social Psychology, Institute of Psychology, German Sport University Cologne, Germany, ²Department of Psychosomatics and Psychotherapy, Faculty of Medicine, University Hospital Cologne, University of Cologne, Germany, ³Trimberg Research Academy, University of Bamberg, Germany, ⁴Department of Psychology and Psychotherapy, Witten/Herdecke University, Germany

Objective: Physical activity and healthy nutrition can reduce the progression of type 2 diabetes mellitus and coronary heart disease. Accordingly, copious interventions to increase such behavior have already been presented. However, such interventions are usually poorly described and there has not been much public scientific Discussion regarding their theoretical derivation. To promote such a Discussion, the theoretical derivation of a telephone-based health coaching (TBHC) intervention for patients with type 2 diabetes and coronary heart disease and the resulting intervention are presented.

Methods: The intervention is conceived as a combination of (1) the interaction between coaches and patients and (2) measures to ensure the quality of this interaction. The interaction between coaches and patients consists of (1) the style and (2) the contents of this interaction. The style of the coach-patient interaction is derived from Self-Determination-Theory and concretized using Motivational Interviewing techniques. The contents of the coach-patient interaction are derived from the Health Action Process Approach and concretized using Behavior Change Techniques.

Results: Material for guiding the coach-patient interaction has been produced. This material consists of 16 tools to be applied in the coaching sessions and guidelines for selecting the appropriate tool for each session. The quality assurance measures consist of a coach training program before and supervision sessions during the TBHC.

Conclusions: The theoretical derivation yielded an operable intervention. Both the process of derivation and the resulting intervention could prove useful for researchers designing similar interventions. The project upon which this abstract is based was funded by the Innovation Fund of the Federal Joint Committee under the funding code 01NVF18033.

Factors influencing exclusive breast feeding among children born to HIV positive mothers attending public health facilities in Western Ethiopia

Elias Roro¹, Elias Merdassa¹, Ejigayehu Bultum¹, Ilili Regasa¹

¹Wollega university Department of Public Health, Institute of Health Sciences Wollega University, Oromia region, Nekemte town, Ethiopia

Human immunodeficiency virus (HIV) positive women report confusion about the best feeding methods. Exclusive Breastfeeding (EBF) practices in HIV-positive mothers are sub-optimal in Ethiopia. This study aimed to identify the main factors influencing EBF among HIV-positive breastfeeding mothers.

A facility-based cross-sectional study was carried out from September 01, 2017, to June 30, 2018, among HIV-positive mothers with infants aged 6-23 months. Thirteen public health facilities (seven health centres and six hospitals) that provided anti-retroviral treatment (ART) and Prevention of mother-to-child transmission (PMTCT) services, found in three districts of Oromia, were randomly selected. Respondents were recruited by systematic random sampling techniques from these facilities using client registers as a sampling frame.

EBF is an outcome variable. Data were collected using face-to-face interviews with a pre-tested questionnaire and analysed using SPSS Version 20 for windows. Associations were declared at P< 0.05 by assuming Confidence Intervals did not cross 1 with corresponding 95%.

A total of 218 HIV-positive mothers were included in this study. Only 122 (56.0%) practised EBF in the first six months. The proportion of respondents who initiated EBF within the first hour of delivery was 134 (61.8%). The mean age of study participants was 28.6 years with SD + 4. Mothers' having received advice on EBF [AOR 3, 95% CI (1.2-6.7)], disclosure of HIV status to someone close to them, including their husband [AOR 6, 95% CI (1.2-29.6)] and believing HIV can be transmitted during delivery [AOR 5.2, 95% CI (1.1-24.0)] were found to increase the likelihood of EBF practices among the study participants (P-value < 0.05).

In this study, only half of the mothers practised EBF for the first six months. Care providers should continue encouraging mothers to practice EBF in the first six months. Practices should be in place to curb the risk of HIV/AIDS transmission

during delivery.

Health education in primary care in Brazil and the social production of knowledge

Ana Fittipaldi¹, Gisele O'Dwyer¹, Patrícia Henriques²

¹FIOCRUZ Brazil, ²Federal Fluminense University, Brazil

The Brazilian Unified Health System is the largest public health policy in the country, and offers every Brazilian citizen full, universal and free access to health services throughout the national territory. Its principles are universalization, integrality and equity. Primary Health Care is the first level of health care and a gateway to the health system. The goal of this research is to analyze and comprehend the experiences and expectations of primary health care users related to health education. It is a qualitative research held in two Primary Healthcare Centers in the city of Rio de Janeiro/Brazil. Participant observation of educational activities and semistructured interviews were used as research techniques. The analysis of the interviews featured Bardin's content analysis as theoretical framework, in accordance with Bourdieu's theory of social action, which encompasses concepts of habitus, symbolic capital, field and symbolic power. Twelve interviews were conducted and three analytical categories were identified: autonomy and vulnerability: the agent's social trajectory; extended health care: meanings and tensions experienced from symbolic capitals; and bonding, trust and affection: the network of social support. The collective actions opened space for dialog and appreciation of everyone's ideas to develop critical and reflective thinking. The respondents background of vulnerability was considered limiting to their capability of developing autonomy and self-care. For the respondents the collective actions represent a therapeutic practice that is complementary to the clinical care as well as a start of a social support network. The articulation of Bourdieu's theory of social action with health education contributed to the understanding of users experiences, interests and motivations. Contribution to the field of health education is expected by proposing effective and transforming actions through dialog and interaction with the dynamics of the lives of the common people.

Training of public school students in the district of Conceição de Jacareí, Mangaratiba, Rio de Janeiro/Brazil as multipliers and protagonists in the dissemination of relevant topics in oral health

Leandro Avila¹, Milene Machado¹

¹SESC/RJ, Brazil

Introduction: The OdontoSesc Mobile Units are an itinerant project of the Social Service of Commerce that offer free dental treatment and health promotion activities to the general population. Objective: it was proposed the development of training work for students of a public school in order to make them multipliers and disseminators of relevant topics related to oral health in Conceição de Jacareí, District of Mangaratiba, Rio de Janeiro/Brazil.

Methodology: A health fair model presentation was chosen. For the elaboration of the event, there was a selection of students, who were divided into groups and each one was assigned a theme: evolution of caries; periodontitis; dental trauma; dental prosthesis and oral self-examination. The training of the students was conducted by the health team with weekly meetings for the practical and theoretical development of the themes.

Result: The health fair provided the students involved with the transmission of knowledge to other students and the population in general, about the knowledge acquired by promoting the autonomy of self-care.

Conclusion: the development of health fairs is an important tool for the transmission of knowledge. A legacy is left and empowerment is generated regarding the knowledge acquired in favor of the well-being of the community.

Cadmium exposure and hypertension: a systematic review and a dose-response meta-analysis

Vincenzo Giuliano¹, Marco Vinceti², Tommaso Filippini²

¹University of Modena and Reggio Emilia, Environmental, Genetic and Nutritional Epidemiology Research Center (CREAGEN), Department of Biomedical, Metabolic and Neural Sciences, Medical School - University of Modena and Reggio Emilia, Modena, Italy, ²University of Modena and Reggio Emilia, Italy

Background and Objective: Cadmium (Cd) is a silvery white, malleable metal present in trace amounts in the Earth's crust, air and water. Its name derives from

that of the city of Cadmo, near Thebes, where it was extracted in antiquity. This heavy metal reacts easily with zinc and to a lesser extent with lead forming various compounds. The main routes of exposure for humans are diet and inhalation. Breathing low levels of Cd for many years (e.g. smokers) or consuming food and water contaminated at levels normally present in the environment (chronic exposure) can cause its accumulation in the body and lead to various pathological conditions, including hypertension. Our aim is to quantify the increase in blood pressure following chronic Cd exposure.

Methods: The protocol of the review has been submitted in PROSPERO. The literature search has been carried out on 3 different databases: PubMed, Web of Science and Embase. We used as mesh-terms: "hypertension", "cadmium" and "blood pressure". We defined the following inclusion criteria according to PICOS statement: P = healthy adult population, I = exposure to cadmium, C = subjects not exposed to cadmium, O = variation of arterial blood pressure in relation to the cadmium dose to which one is exposed, S = observational studies (cohort, cross-sectional or case-control). We also plan to perform a dose-response meta-analysis whenever possible.

Results: We found 678 articles, of which 95 duplicates. After removing these duplicates, we are scanning the abstract and full-text of the remaining 583 papers. Conclusions: The study is currently ongoing and its results will be presented at the Congress.

People's attitudes and health behavior based on their habits and experience versus scientific evidence

Aušra Beržanskaitė¹, Brigita Bikaite¹

¹Vilnius University Faculty of Medicine Institute of Health Sciences Vilnius university Čiurlionio 21, Vilnius Lithuania

Background and Objective: The pandemic years demonstrated huge overload of different information as well as misinformation about health. This enlightened people's confusion in their approaches and health behavior which is the key determinant of human health. In order to select the most optimal actions in changes of unhealthy behavior the analysis of human reasoning is particularly relevant. The objective - to reveal the importance and influence of daily habits, experiences vs scientific evidence on health behavior.

Methods: In this qualitative study the data were collected from eleven participants using semi-structured interviews lasting in average of 40 minutes. The main guidelines were prepared and informants were asked to tell in general about the daily behaviour and its impact on the health, pros and cons, the reasoning of changing unhealthy habits, awareness and application of scientific evidence, recommendations from health professionals. Data were analysed using inductive thematic analysis according to Braun and Clarke (2013).

Results: The analysis revealed several themes. The personal sensory experiences are key determinants of human health behavioral choices. They can lead to both positive and negative health behavior. Habits are very important for choosing and changing health behaviors. They encourage repeated return to both negative and positive health behaviors. Habits are difficult to change. Pleasurable health behaviors, whether positive or negative, become habitual, sometimes addictive. People may not be fully aware of the role of habits in their health behavior choices. Changing health behaviors is challenging, especially in the long term. Scientific evidence has little relevance to health behavior. It can have an impact when the individual is ready to change behavior. The recommendations from health professionals and health policy makers are accepted if they are shared in an appropriate way.

Conclusions: Peoples health choices are more influenced by their habits and experiences than by scientific evidence.

A better lifestyle favors the adoption of integrative and complementary therapies: the Brazilian national health survey

Thiago Matias¹, Thiago Matias², Leticia de Almeida¹, Marcus Lopes¹, Julianne alves¹, Gislaïne nienov¹

¹Federal university of santa catarina Brazil, ²Federal university of santa catarina rua desembargador pedro silva 2100 Brazil

Background and objective: Physical activities, diet, and sedentary behavior are essential predictors in understanding the binomial lifestyle-health outcomes. Thus, a poor lifestyle may be associated with the demand for health services such as integrative and complementary therapies. This study aimed to investigate the association between clusters of lifestyle behaviors and adherence to integrative and complementary therapies in a representative sample of Brazilians.

Methods: A cross-sectional study with secondary data analysis from the 2019 National Health Survey. 90,814 Brazilians over 15 years of age were analyzed. Independent variables were lifestyle domains; the dependent ones were the adoption of adherence to integrative and complementary therapies in primary health care. Data were obtained through questionnaires and analysis by descriptive and inferential statistics. A Two-step cluster analysis was used to identify the populations lifestyle profiles. The Rao-Scott chi-square test and logistic regression models were used for the inferential analysis.

Results: Three clusters were observed: the "Active-green diet" (26.73%; CI95%: 26.22 - 27.26), the "Inactive-health diet" (42.15; CI95%: 41.59 - 42.72), and the "At-risk" (31.11; CI95%: 30.54-31.69). Sedentary behavior was high to very high for cluster profiles. Individuals with an "Active-green diet" were more likely to adhere to integrative and complementary therapies (OR = 1.55; CI95%: 1.34 - 1.81).

Conclusion: A healthier lifestyle favor Brazilians choice for integrative and complementary therapies in the primary health care system. New studies are needed to understand whether there are inequities in access to complementary therapies in Brazil.

Analysis of medicines provided by court order in a children's hospital in Rio de Janeiro, Brazil

Nathália Alvarez¹, Miriam Ventura²

¹FIOCRUZ Brazil, ²Universidade Federal do Rio de Janeiro

Background and objective: The Brazilian Federal Constitution confers on health the status of a fundamental right of the citizen and duty to the State, marking an advance in the field of Public Health in the country and taking the first steps towards the creation of the Unified Health System (SUS). However, it's in the interpretative divergences about how SUS managers must comply with the duties established in the laws that the judicial demand against public entities arises. The phenomenon of judicialization of health can be defined as the search for the Judiciary to ensure access to medicines and other health benefits not foreseen or unavailable in SUS. The analysis of the effects of this judicial demand on the hospital environment is still understudied. The objective of this work is to analyze the medications resulting from court warrants administered by the Institute of Pediatrics Martagão Gesteira, a university hospital in Rio de Janeiro, from May 2021 to May 2022.

Methods: This is a retrospective cross-sectional descriptive study carried out in the form of documentary research using as data sources the documents available in the hospital about the drugs administered in the period studied.

Results: Five drugs provided by court order were found, where flow analysis pointed to challenges for responsible health professionals and the need for specific knowledge. The analysis of the characteristics related to the drugs pointed to failures of management of high-cost drugs available in SUS, motivating the lawsuits. All drugs found are used for treatment of rare diseases, evidencing the scarcity of medicines destined for these diseases.

Conclusion: The research allowed the discussion about judicialized drugs and the particularities of the pediatric hospital environment. Furthermore, the research showed the need for education of health professionals responsible for these drugs and the demand for health public policies.

Equally improving human, animal, plant, and environmental health through 'One Health' approaches in the LMICs

Madhumita Dobe¹, Arista Lahiri², Sweetie Jha²

¹Foundation for Actions and Innovations Towards Health Promotion, India,

²Dr. B. C. Roy Multi-Specialty Medical Research Centre, Indian Institute of Technology Kharagpur, India

The 17th World Congress on Public Health coincides with a time when the COVID-19 pandemic revealed the complex interconnectedness and interdependence of all living species in a shared environment. The pandemic was a wake-up call for the urgency to pay much more attention to the root causes of global risks and find new ways of mitigating threats, including the spread of new and re-emerging diseases. This is perhaps most important in the context of low- and middle-income countries (LMICs). Heading into an uncertain future, Public Health policy reforms and enabling actions to address societal impacts (socio-economic, political, environmental), including climate change, emerging and re-emerging infections, and other risks, are essential. The focus is now to integrate human and animal health with environmental health and climate issues into One Health. With the theme being A world in turmoil: Opportunities to Focus on the Publics Health, the Congress provides a timely and unique opportunity for the global

health community to work together, dismantling disciplinary and professional silos for interdisciplinary and transdisciplinary collaboration and capacity building to generate solutions in the Publics Health through the One Health approach. Foundation for Actions and Innovations Towards Health Promotion (FAITH), jointly with One Health for One Planet Education International (IHOPE) and the Indian Institute of Technology Kharagpur (IIT Kharagpur), would like to propose a workshop in the form of a debate on the topic: "Is One Health really about equally improving the health of humans, animals, and the environment?" The debate will be between two teams, one for and one against the motion. Each team member of each side will speak for five minutes, thus allowing 10 minutes for each group. This will be followed by a rebuttal of 5 minutes per team. A 20 minutes Discussion period, "open cross-examination" time will follow, and then a 10-minute wrap-up. The teams will consist of experts in public health, Veterinary health, and social sciences/ Anthropology with geographical representation across world regions with the majority of speakers from low-middle income countries. Gender and age balance with appropriate representation of young professional and female speakers are also ensured. Specific Aims/ Objectives: 1. To raise awareness regarding the difficulties for equally improving human, animal, plant, and environmental health through synergistic and holistic One Health approaches, particularly in the context of the LMICs. 2. To discuss the ethical dilemmas that originate from policies and One Health strategies in zoonotic disease control, antimicrobial resistance, etc., focusing on the LMICs. 3. To suggest possible roadmaps in advocacy and capacity building for moving forward and addressing the problems in implementing One health approaches, particularly in LMICs. Key questions that the workshop will address: 1. Can the One Health approach be applied synergistically and holistically to tackle existing and future health challenges in LMICs? 2. What ethical dilemmas originate from policies and One Health strategies in zoonotic disease control, antimicrobial resistance, etc., in LMICs? 3. How can we move forward and address the problems of One Health in LMICs in an equitable manner?

Developing a critical global public health agenda for traditional, complementary and integrative health care

Jon Wardle¹, Alana Gall¹, Daniel Gallego², Peter James¹, Jon Wardle¹

¹Southern Cross University Australia, ²University of North Carolina Chapel Hill, United States

Background: A wide range of practices not historically associated with biomedicine constitute traditional, complementary and integrative health care (TCIH) and are prevalent in all cultures across the globe. The 2018 Declaration of Astana on primary health care acknowledges the need to include traditional and complementary medicine knowledge and technologies in the delivery of primary health care. The World Health Assembly has also called member states to integrate TCIH into national healthcare systems, providing the base for the development of international frameworks such as the World Health Organization's Traditional Medicine Strategy, the framework on integrated, people-centred health services and self-health care, among others. The inclusion of TCIH of international agreements governing public health is significant, however member states have noted difficulties in implementation and insufficient guidance to assist appropriate integration of TCIH into their national health services, while ensuring its quality, safety and efficacy. This is compounded by the fact that to date there has been little attention on developing a public health agenda around TCIH. TCIH holds many potential challenges and opportunities for addressing current and future public health concerns at local, regional and global levels. This workshop will facilitate an inclusive debate amongst all participants regarding the necessity and benefits of advancing a critical public health agenda focused upon TCIH. Maximizing the potential of TCIH approaches, minimizing risks, and understanding how they can synergistically intersect with biomedical perspectives is required to ensure the sustainability of health systems and the achievement of the Astana Declaration's goals and SDG Goal 3. The workshop will follow an innovative mix of brief introductory presentations and town-hall style discussions/Q & A format whereby presenters will introduce brief overviews of multi-disciplinary perspectives upon this topic on issues such as recognition and regulation of traditional knowledge, medical pluralism, regional perspectives from Africa and Latin America, and Indigenous and migrant health perspectives. Participants will be able to question and discuss the various disciplinary perspectives, opportunities and next steps for the public health agenda of TCIH.

Objectives: The workshop aims to help instigate and advance critical public health thinking around TCIH, how it can contribute to our understanding of pressing global health challenges, and how issues of TCIH safety, quality, equity and effectiveness can be addressed. Workshop participants will have learned the essential features

of a critical public health approach to TCIH as well as being introduced to the fundamental issues, opportunities and challenges of investigating this topic at the local, national, regional, and global levels.

Key questions: * What are the key and emerging areas of focus for developing a critical public health agenda on TCIH for health promotion and maintenance, disease management, and rehabilitation that manifest? * What multidisciplinary approaches and multilevel collaborations are needed to achieve a critical public health agenda for TCIH? * What collaborative platforms, such as the creation of a TCIH Working Group at the WFPHA, are fundamental to advance a global critical public health agenda, facilitate dialogue, exchanges, and collaboration among stakeholders of the several world regions to ensure safety, quality and efficacy when integrating TCIH?

Plumbing poverty, plumbing violence: water security, gender based violence, and SDG 6

Susan Elliott¹, Abraham Nunbogu², Maurice Dogoli³

¹Department of Geography & Environmental Management, University of Waterloo, Canada, ²Department of Geography and Environmental Management, University of Waterloo, Canada, ³Department of Geography and Environmental Management, University of Waterloo, Waterloo, Canada

This paper asserts achieving health and wellbeing for all by 2030 (SDG 3) is not possible without first attaining universal access to safe water and adequate sanitation (SDG 6) and neither is possible without SDG 5 (empowering women). Access to water, sanitation, and hygiene (WaSH) is recognized as an important pathway to health and wellbeing. Despite progress made in Low-and Middle-Income Countries (LMICs), inequities exist across space and place. Furthermore, inequalities in WaSH access heighten women's vulnerability to violence when meeting their WaSH needs. Several methods were used to address this research problem (international document review; systematic literature review; in-depth interviews with immigrants to Canada from Ghana - one of the poorest and water stressed areas of sub-Saharan Africa - to explore perceptions of WaSH experiences over the lifecycle). The policy review revealed virtually no mentions of protection of women and girls from GBV in the context of water security. The systematic review of the literature informed a taxonomy of four types of GBV related to water security: physical, sexual, psychosocial and structural. The interview Results revealed participants' perceptions and experiences of water-related GBV are socially and context-dependent, organized around the four dimensions of water-related violence. These dimensions are not mutually exclusive and are experienced through multiple scales of gender and power relations from the household to the community level. These relationalities are important determinants of WaSH inequities and influence the extent to which women's bodies are subjected to violence or protected from it. Expressions of violence in the search for adequate WaSH represents a significant barrier to achieving the Sustainable Development Goals. The global community of WaSH practitioners, policymakers, and public health actors has yet to adequately address women's vulnerability; there is much work to be done across all spatial scales, from the local to the global.

Effectiveness of household measures for the disinfection of water for human consumption in the context of Santarém, Pará, Amazônia, Brazil

Marina Meschede¹, Francisca Jesus², Valéria Bentes², Susana Segura-Muñoz³

¹Institute for Collective Health, Western Pará Federal University, Brazil, ²Western Pará Federal University, Brazil, ³Maternal-Child and Public Health Department, Ribeirão Preto College of Nursing, University of São Paulo, Brazil

Background: In the Amazon region, cities like Santarém, state of Pará, still lack water treatment plants to serve the entire population. In these cities, the water is collected from wells and distributed to the population without treatment. There are also places where the drinking water comes from the Tapajós River on the surface. In this context, disinfection measures for domestic water are important to preserve its potability and avoid undesirable health effects.

Objective: The present study experimentally evaluated the effect of household measures on the elimination of *Escherichia coli* (E.coli) in water samples. The techniques evaluated for this work were: (i) 2.5% sodium hypochlorite; (ii) boiling; (iii) ceramic filter and (iv) sun exposure. The samples were tested, combining different concentrations of E.coli (between 03 and 100 colony forming units/100 mL).

Results: The results showed that the household disinfection measures were effective in eliminating E.coli, with the exception of the ceramic filter, where even after filtration, the water samples were positive for E.coli growth.

Conclusions: Considering that the distribution of treated water does not reach the majority of the population living in Santarém and also in peri-urban areas such as quilombos and riverside communities, the use of measures such as 2.5% sodium hypochlorite, boiling and sun exposure can favor health promotion and decrease the occurrence of outbreaks of waterborne diarrheal diseases.

What happened to the M.chimaera contamination of the heater cooler units? An underestimate risk

Benedetta Tuvo¹, Tommaso Cosci¹, Sara Bracaloni¹, Martina Ioppolo¹, Giulia Gemignani², Maurizio Petrillo³, Michele Guarino⁴, Sara Semplice⁵, Beatrice Casini¹

¹Department of Translational Research, N.T.M.S., University of Pisa, Pisa, Italy, ²Medical Direction, University Hospital of Pisa, Italy, ³Fondazione Toscana "Gabriele Monasterio", Massa, Italy, ⁴Unit of Clinical Perfusion, Fondazione Toscana "Gabriele Monasterio", Italy, ⁵Unit of Clinical Perfusion, University Hospital of Pisa, Italy

Background: A global outbreak of invasive *Mycobacterium chimaera* infections has occurred since 2015 in patients undergoing open chest cardiac surgery. Currently, 15 cases have been reported in Italy. The Ministry of Health issued in 2019, the document contain the recommendations for the prevention of M.chimaera infection, including clinical surveillance and microbiological monitoring of HCUs. In Decree 3822/2019, the Tuscany Region issued recommendations for microbiological surveillance by applying both the cultural and biomolecular methods in order to detect early contamination by M. chimaera

Aim: verify the use of a PMA-Real-Time PCR technique, to assess the efficacy of the disinfection procedure applied to the HCUs and to evaluate the presence of viable but non-culturable state of M.chimaera after water treatment.

Methods: In two Tuscan cardiac surgery centers, water samples collected from HCUs were analyzed according to the regional protocol. All samples were treated by BLU-V Viability PMA kit (Qiagen Germantown, MD, USA), according to manufacture instruction. The extraction and Real-Time was performed using QIAamp DNA Mini Kit a QuantiNova PCR kit (Qiagen), respectively, to amplify a sequence of the ITS1 region.

Results: From November 2018 to July 2019, 24 HCUs were monthly sampled (n.11 3T and n.3 1T LivaNova, n.1 TCM-Sarns Terumo and n.9 HCU40 Maquet) for a total of 82 samples. M.chimaera was detected in 12/82 (15%) (strain CP015272.1). From 2020-2022, with the replacement of all HCUs Livanova with HCUs Maquet, 100% (102/102) of the samples resulted negative by culture method, but 20.5% (21/102) of which were positive by PMA-Real Time PCR.

Conclusions: The presence of VBNC state in disinfected HCUs Results in an overestimation of the disinfection efficacy and the resuscitation/regrowth of the VBNC in the HCU water system could further increase the infection risks in patients undergoing open chest cardiac surgery.

The shape of water - preliminary data from a cluster of patients infected by Mycobacterium saskatchewanense in Haemodialysis setting in Emilia-Romagna, Northern Italy

Eleonora Ferrari¹, Elena Vecchi², Giovanna Mattei², Gian Belloli³, Giuseppe Diegoli³, Paola Monte⁴, Antonio Santoro⁵, Alessandra Palma⁴, Nicola Amadori⁶, Patrizia Falcone⁷, Melania Patuelli⁷, Lucia Palandri⁸, Marco Vinceti¹, Elena Righi¹

¹Department of Biomedical, Metabolic and Neurological Sciences, University of Modena and Reggio Emilia, Modena, Italy, ²Collective Prevention and Public Health Sector, Directorate General for Personal Care, Health and Welfare, Emilia-Romagna Region, Italy, ³Emilia-Romagna Region, Collective Prevention and Public Health Sector, Directorate General for Personal Care, Health and Welfare, "Policlinico di Sant'Orsola, Bologna University Hospital (IRCCS), Italy, ⁴University of Bologna, Italy, ⁵Directorate General for Personal Care, Health and Welfare, Collective Prevention and Public Health Sector, Emilia-Romagna Region, Italy, ⁶Directorate General for Personal Care, Health and Welfare, Emilia-Romagna Region, Italy, ⁷University of Modena and Reggio-Emilia, Italy

Background and Objective: Nontuberculous mycobacteria (NTM) are common environmental contaminants and, as opportunistic pathogens, they can colonize/infect immunocompromised patients. Our work Aims to report the

main features of a cluster of haemodialysis patients infected by *Mycobacterium saskatchewanense*, and to describe the infection prevention and control (IPC) strategies implemented accordingly.

Methods: We conducted a descriptive analysis of data coming from the infectious diseases data stream of the Emilia-Romagna Region. Spectrometric and DNA-sequencing analyses in ultrafiltered liquid were done in the regional reference laboratory, while blood cultures were performed in the local hospital laboratory.

Results: Between 04/01/2022 and 18/07/2022, a cluster of 6 patients (3 males and 3 females, median age 63.5 years) with positive blood culture for *Mycobacterium saskatchewanense* was reported in two HUB hospitals of the Region Emilia-Romagna, Northern Italy. All patients underwent online haemodiafiltration before the symptom's onset; water samples from the dialysis machines' ultrafilters also tested positive. The key clinical features reported were varied, including weight loss, asthenia, gastrointestinal symptoms, cough, night sweats, recurrent fever of unknown origin. In addition, common findings were cytopenia, increased blood levels of systemic inflammation markers, splenomegaly, osteo-medullary granulomas, and pulmonary pathologic imaging.

Conclusions: The application of the best IPC strategies (clinical and environmental surveillance, switch to traditional haemodialysis and heat disinfection...) is currently supervised by a regional interdisciplinary team, and preliminary data indicate positive outcomes. As a precaution, considering the extreme fragility of haemodialysis patients, a constant epidemiological monitoring based on clinical and diagnostic criteria is still in place, and regular environmental sampling is being performed.

The water safety plan for the control and prevention of waterborne diseases in a hospital of Southern of Italy

Valentina Spagnuolo¹, Valentina Spagnuolo¹, Osvalda Giglio², Marilena D'Ambrosio¹, Carla Leone³, Maria Caringella³, Fabrizio Fasano², Francesca Apollonio², Francesco Lisena⁴, Anna Minicucci⁴, Enrico Veschetti⁵, Lucia Bonadonna⁵, Luca Lucentini⁵, Maria Montagna²

¹Department of Precision and Regenerative Medicine and Ionian Area (DiMePre-J), University of Bari Aldo Moro, Italy, ²Interdisciplinary Department of Medicine, University of Bari Aldo Moro, Italy, ³U.O.C Hygiene - Environmental and Food Hygiene Laboratory, Bari Policlinico University Hospital, Italy, ⁴Health General Management, A.O.U. Policlinico of Bari, Italy, ⁵Department of Environment and Health, Istituto Superiore di Sanità (ISS), Rome, Italy

Background and Objective: Water Safety Plan (WSP), introduced by the WHO in 2004, represents an integrated approach and a control system based on site-specific risk analysis extended to entire water chain. It marks a fundamental step to improve the quality of water and protect human health according to the new Directive (EU) 2020/2184 on the quality of water intended for human consumption. The aim of our study was implementing a WSP in order to guarantee safety and good water quality in the internal distribution networks of the biggest University hospital in the Apulia region (Southern Italy).

Methods: From January 2020 to March 2022, a microbiological monitoring programme was carried out in the water network (hot and cold water) of two hospital pavilions (A and B). Overall, a total of 3.677 water samples was analyzed for *Legionella pneumophila* and *Pseudomonas aeruginosa* detection. The results were compared with those obtained before, during and after the WSP implementation.

Results: The verification monitoring revealed a progressive increasing of compliant samples for *Legionella pneumophila* from 76.6 up to 99.5% and from 66.4 up to 98.9% for Pavilion A and B respectively. After the water system renewal, the number of positive samples for *Pseudomonas aeruginosa* increased from 3.6% to 13.6% and from 3.1 to 48.7% for Pavilions A and B, respectively, with a load higher than the initial one. This contamination was totally removed by local treatments of the internal water distribution system.

Conclusions: In both pavilions, the WSP brought to a reduction of *Legionella pneumophila* risk, thanks to the control measures adopted, removal of dead branches and constant flushing at terminal points. The presence of *Pseudomonas aeruginosa* was probably caused by the manipulation of water network and the detachment of the biofilm, removed subsequently by hyperchlorination and flushing treatments at the water terminal outlet points.

Popul. Med. 2023;5(Supplement):A940

DOI: 10.18332/popmed/165716

India's achievement towards sustainable development goal 6 (Ensure Availability and Sustainable Management of Water and

Sanitation for All) in the 2030 agenda

Sourav Biswas¹, Sourav Biswas², Biswajit Dandapat³, Asraful Alam⁴, Lakshminarayan Satpati⁴

¹International Institute for Population Sciences India, ²International Institute for Population Sciences Govandi Station Road, Deonar, Mumbai, Maharashtra 400088 India, ³Ravenshaw University, ⁴University of Calcutta India

Background: Clean water and sanitation are global public health issues. Safe drinking water and sanitation are essential, especially for children, to prevent acute and chronic illness death and sustain a healthy life. The UN General Assembly announced the 17 Sustainable Development Goals (SDGs) and 169 targets for the 2030 Agenda on 25 September 2015. SDG 6 is very important because it affects other SDG (1, 2, 3, 5, 11, 14 and 15). The present study deals with the national and state-wise analysis of the current status and to access deficiency of India's achievement towards SDG 6 (clean water and sanitation for all) for the 2030 agenda based on targets 6.1, 6.2, 6.4, 6.6 from 2012 to 2020.

Materials and Methods: Data of different indicators of SDG 6 are collected from different secondary sources - NSS 69th (2012) and 76th (2018) round; CGWB annual report 2018-2019 and 2016-2017; NARSS (2019-20); SBM-Grameen (2020). To understand overall achievement towards SDG 6 in the 2030 agenda, the goal score (arithmetic mean of normalised value) has been calculated.

Major Findings

According to NSS data, 88.7% of Indian households had enough drinking water from primary drinking water sources throughout the year, while 79.8% of households had access to toilet facilities in 2018. As per the 2019-2021 goal score for States and UTs in rural India based on SDG 6 indicator, SDG 6 achiever States and UTs (100%) are Sikkim, Himachal Pradesh, Andaman and Nicobar Islands.

Conclusion: Drinking water and sanitation for all ensure a healthy life. It is a matter of concern for the government, policymakers, and people to improve the condition where the goal score and indicator value of SDG 6 are low.

DOI: 10.18332/popmed/163670

Healthcare associated infections in a neonatal intensive care unit before and during COVID-19

Antonio Sciurti¹, Mariateresa Ceparano¹, Antonio Sciurti¹, Claudia Isonne¹, Valentina Baccolini¹, Giuseppe Migliara¹, Maria De Blasis¹, Valentin Imeshtari¹, Vincenzo Cammalleri¹, Alessandra Romano¹, Rosa Bellomo¹, Maria Assunta Donato¹, Carolina Marzuillo¹, Fabio Natale¹, Gianluca Terrin¹, Paolo Villari¹

¹Sapienza University of Rome Department of Public Health and Infectious Diseases Piazzale Aldo Moro 5, 00185 Rome Italy

Background and Objective: Healthcare-associated infections (HAIs) are a frequent complication in neonatal intensive care units (NICUs). Hospital policies caused by COVID-19 pandemic may have played a role in HAIs development. The aim of this study was to describe and characterize over time the occurrence of HAIs in a NICU at the Policlinico Umberto I in Rome both before and during the COVID-19 pandemic.

Methods: All infants of all birth weight (BW) classes with > 2 days in the NICU, admitted from January 2018 to December 2021, were included. To assess the effect of the pandemic, we compared surveillance data from 2018-2019 with those from 2020-2021. Infections were defined using standard Centers for Disease Control and Prevention definitions.

Results: We included 513 infants, 274 admitted in 2018-2019 and 239 between 2020-2021. NICU stay in days was similar in the two periods (14.4 and 15.3 respectively) but the number of patients who died in 2018-2019 (N=13) was almost double that of 2020-2021 (N=7). Overall 27 infections were recorded in the post-pandemic period compared to 9 recorded in the previous period, mainly central line-associated bloodstream infections (7' vs 3.0', p=0.043), followed by ventilator-associated pneumonias (3.0' vs 0.4', p=0.019). The incidence density of device-associated infections was higher in patients with lower BW class in both periods analyzed. Multivariable analysis showed that the year of hospitalization, 2020 and 2021, respectively, was the main risk factor associated with the occurrence of an HAI episode in the NICU (2020, aHR: 9.21, 95' CI: 1.41-60.41; 2021, aHR: 9.30, 95' CI: 1.45-59.53).

Conclusion: Results indicate that patient management may have influenced the occurrence of HAIs during the pandemic. This reinforces the importance of the HAI surveillance protocol in the NICU, which monitors microbiologic isolates and medical device use for all BW classes of infants.

Popul. Med. 2023;5(Supplement):A942

DOI: 10.18332/popmed/163690

AgNPs-3MPS were performed under controlled conditions on a gram-negative bacterium, *Escherichia coli* (105 CFU/mL), and a gram-positive one, *Staphylococcus aureus* (104 CFU/mL), exposed for 25 minutes in the presence of visible light and in the dark.

Results: Spectroscopic and morphology characterisations demonstrated the successful silanisation of commercial TiO₂NPs and AgNPs decoration, supporting their coating on different materials. The synthesized nanohybrids stability, size, morphology, and chemical composition were also demonstrated. In vitro, studies on TiO₂NPs showed over 70% reduction in bacterial load. TiO₂NPs-AgNPs showed over 99.9% reduction ($p=0.05$) for both strains, even at a 3 logs dilution of the compounds and regardless of light.

Conclusions: Photocatalytic systems based on the combination of TiO₂NPs with noble metals represent a novel strategy to generate matrices or surfaces with an antimicrobial activity enhanced by light without the need for biocides accumulation. The preliminary results by using TiO₂NPs-AgNPs are promising and support further studies to evaluate and optimize kinetics at catalyst desirable concentrations.

DOI: 10.18332/popmed/164046

Healthcare personnel compliance with World Health Organization five moments of hand-hygiene at the university hospital of Modena in 2022

Alessandro Poggi¹, Giuseppe Brancato², Giliola Bianchini³, Michela Di Nuovo³, Enrico Ricchizzi², Patrizia Scannavini³, Patrizia Albinelli³, Stefania Paduano¹, Annalisa Bargellini¹, Loretta Casolari³, Ottavio Nicastro³

¹University of Modena and Reggio Emilia Italy, ²University Hospital of Modena, ³University Hospital of Modena Italy

Background and Objective: A higher compliance of healthcare personnel with hand-hygiene corresponds to a lower incidence of nosocomial infections. Since 2013, the Hospital Hygiene Service of the University Hospital of Modena (Modena Polyclinic and Baggiovara Hospital) has developed the "Hand-Hygiene Project": observation at time 0, room training, on-field feedback, data return. The aim of the study was to carry out a standardized observation of the healthcare personnel's compliance with WHO Five Moments of Hand-Hygiene in the University Hospital of Modena in 2022.

Methods: Adherence to hand-hygiene (4 categories per WHO-moment: "1-rub" and "2-wash": correctly rubbing hands with hydroalcoholic gel or washing with soap and water; "3-incorrect use of gloves" or "4-none", the operator does not sanitize his hands) was assessed collecting the data in the WHO survey forms and recording it on the regional MAppER platform. Observations were conducted on 219 physicians (89 trainees), 303 nurses/midwives and 110 nursing assistants in 13 wards between 24-3-2022 and 30-11-2022.

Results: Out of a total of 4097 WHO moments observed, hand-hygiene compliance was found to be 69.7%. Adherence to moments 1, 2, 3, 4, 5 was respectively 61%, 60%, 74%, 80% and 70%. Overall adherence was 66.2% for doctors (out of 1194 observations), 71.6% for nurses/obstetricians (2229), 69.7% for nursing assistants (669). Adherence was 94.9% in the Intensive Care Unit (ICU), 84.7% in pediatric wards and 74.8% in medical wards. With the project, participation has increased from 54% to 80% in the Baggiovara Hospital and from 36% to 73% at the Modena Polyclinic.

Conclusions: Adherence to hand-hygiene was good, rather uniform among healthcare professionals (doctors were slightly lower-rated) and clearly growing with the adoption of the "Hand Hygiene Project". The extraordinary adherence observed in the ICU is also related to a previous project involving a focused training of four operators per ward.

DOI: 10.18332/popmed/164108

Enhanced terminal disinfection of high touch surfaces in hospital critical settings using an automated UV-C emitting device

Alessandro Daole¹, Benedetta Tuvo¹, Michele Totaro¹, Federica Badalucco¹, Federico Vannini¹, Beatrice Casini¹, Angelo Baggiani¹

¹Department of Translational Research and the New Technologies in Medicine and Surgery, University of Pisa (Italy) Italy

Background and Objective: Healthcare-associated infection (HAI) is a major global issue for patient safety and public health. The role of environmental contamination (especially high-touch surfaces) is well established and there are strong recommendations to improve cleaning and disinfection protocols, considering the utilization of no-touch automated systems. The study evaluated the effectiveness of an automated mobile UV-C radiation device to reduce environmental contamination in addition to standard protocols in critical settings.

Methods: A 2-month prospective cross-over study was performed at the Cardiovascular and Thoracic Surgery ward of Pisa teaching hospital (Italy) from April 14th to June 16th 2021. 160 high-touch surfaces were sampled for total microbial load three times: before and after performing standard cleaning and disinfecting protocol and after UV-C treatment in 2 Surgery rooms (Sr), 1 ICU room (ICU) and 1 Patient room (Pr) occupied by 1 patient colonized by carbapenemase-producing *Klebsiella pneumoniae*.

Results: After Standard Protocol we observed a reduction of the number of contaminated surfaces (Sr: -25%, ICU: -12%; Pr: -5%) and a reduction of the mean microbial load (Sr: -45%, ICU: -63%) except for Pr (+130%).

After UV-C treatment, the number of contaminated surfaces (Sr: -66%, ICU: -75%, Pr: -100%) and the mean microbial load (Sr: -83%, ICU: -86%, Pr: -100%) decreased further in every setting.

The 95% of surfaces received a dose >200 mJ/cm², the rest received a dose >50 mJ/cm².

Globally, standard protocol in association with UV-C treatment reduced the number of contaminated surfaces (Sr: -74%, ICU: -78%; Pr: -100%) and the mean microbial load (Sr: -91%, ICU: -95%, Pr: -100%).

The pair-matched analysis data using Sign test showed a relevant reduction of microbial load after UV-C treatment ($p<0,0005$).

Conclusion: UV-C confirmed its effectiveness in reducing microbial contamination on high-touch surfaces and could represent a valid method to improve cleaning and disinfecting protocols.

Evaluation of correct hand hygiene for preventing healthcare associated infections: A study among healthcare workers at A.O.R.N. cardarelli

Flora Ascione¹, Raffaele Sarnelli², Annalisa Napoli³, Marco Livigni⁴, Filippina Onofaro⁵

¹AORN Cardarelli Italy Gaetano D'Onofrio A.O.R.N. Cardarelli Italy, ²Università degli Studi della Campania "Luigi Vanvitelli" Via S.M. Costantinopoli n. 104, Napoli Italy, ³Università degli Studi della Campania "Luigi Vanvitelli"

Via S.M. Costantinopoli 104, Napoli Italy, ⁴Università degli Studi della Campania "Luigi Vanvitelli" Dipartimento di Medicina Sperimentale Via S.M. Costantinopoli n. 104, Napoli Italy, ⁵AORN Cardarelli Italy Maria Pia Mannelli AORN Cardarelli Italy Paola Saturnino AORN Cardarelli Italy

Background and Objective: "World Hand Hygiene Day" focuses attention on the importance of correct hand washing, useful for preventing healthcare associated infections (ICA) and antibiotic resistance. This year the Healthcare Related Infections Committee of the AORN Cardarelli of Naples organized the Day Corporate hand washing, with the aim of verifying the correct procedure with the "pedagogical box" which, through the use of fluorescent gel, allows to evaluate the correct adherence to the procedure.

Methods: The study was carried out between June and October 2022 using an evaluation form self-administered by participants. The questions were asked about socio-demographic information, presence of long and/or painted nails, any jewels worn, quantity of gel taken, rubbing time, disinfected parts (fluorescent) and non (dark). The study population consisted of 463 subjects (medical doctors, nurses and social health operators) in 30 Operating Units of the AORN Cardarelli of Naples. At the end of the training event, material relating to the hands' washing procedure was distributed.

Results: The unsanitized parts were mostly back and thumb. 49% of participants were nurses, 27% has long and lacquered nails, 37% wore bracelets/rings, 90% disinfected within the proper time. Overall only 27% carried out the correct method and management of hands. The majority of participants who have applied the correct method were male, the average age was 50-65 years, most were nurses. According to the WHO the minimum standard of expected consumption is equal to 450 litres/month e at least 20 litres/1000 days of hospitalisation. In the AORN Cardarelli, gel consumption in 2021 was 571 liters per month and 25 litres/1000 days of hospitalization, indicative values for the control of infections.

Conclusion: Public health efforts and education campaigns regarding the importance of hand hygiene are needed for prevent the transmission of infections and contrast antibiotic resistance.

The impact of covid-19 pandemic on healthcare associated infections in intensive care units: findings from the spin-uti project

Martina Barchitta¹, Andrea Maugeri¹, Giuliana Favara², Roberta Magnano San

Lio², Antonella Agodi¹, SPIN-UTI network³

¹University of Catania Department GF Ingrassia; GISIO-SItI Italy, ²University of Catania Department GF Ingrassia Italy, ³GISIO-SItI Italy

Background and Objective: Although Healthcare associated infections (HAIs) pose per se extraordinary burden on Public Health, the impact of COVID-19 on healthcare is still on debate. Here, we aim to describe national trends of HAIs in Intensive Care Units (ICUs) from 2006 to 2021, and to compare clinical characteristics and outcomes of patients with or without COVID-19.

Methods: We analyzed personal and clinical data of patients participating to the "Italian Nosocomial Infections Surveillance in Intensive Care Units" (SPIN-UTI) project, who were admitted to Italian ICUs for more than 48 hours. In addition, data about diagnosis, clinical conditions, therapy, treatments and outcomes of COVID-19 patients were collected.

Results: On a total of 21523 patients from 2006 to 2021, 3485 (16.2%) presented at least one HAI. Overall, we observed an increasing trend for both the incidence of patients with HAI and the incidence density of HAIs (p-trend<0.001). Compared to the pre-pandemic period, the incidence density of HAIs increased of about 15% in 2020-21, with pneumoniae (PN) that mostly contributed to this increase (from approximately 9 to 13 infections per 1,000 patient days). Moreover, incidence of HAIs was higher in ICUs dedicated to COVID-19 patients (p<0.001), who showed a greater risk of HAIs and death than patients without COVID-19. Accordingly, the mortality in ICU increased and doubled during the pandemic (p-trend<0.001). Notably, co-infected patients had a higher mortality than in those with COVID-19 infection or HAI alone (66.2% and 39.9%, respectively) and those without any infection (23.2%).

Conclusion: Our analysis provides useful insight on whether and how the COVID-19 pandemic influenced HAI incidence and death in Italian ICUs, highlighting the need of evaluating the long-term effect of the pandemic.

Persistence of the SARS-CoV-2 virus on the surfaces of CoViD-19 departments before and after sanitization interventions with a) hydrogen peroxide and silver ions b) after nebulization with active chlorine

Cristina Genovese¹, Daniele Maisano², Rosaria Cortese², Smeralda D'Amato², Federica Denaro², Giovanna Visalli², Ioselita Giunta², Giuseppe Panto², Antonino Privitera², Roberto Venuto², Caterina Rizzo², Vincenza Fauci², Raffaele Squeri²

¹AOU G.Martino Messina University of Messina Via Consolare Valeria, 1, 98124 Italy, ²AOU G.Martino Messina Italy

Background and objective: Despite the development of effective vaccinations, the SARS-CoV-2 disease continues to have a high impact on society, due to the presence of variant of concerns of which a probable route is the indirect one. It is therefore essential to identify the possible presence of the virus on surfaces, evaluate its environmental persistence and possible ways of elimination. Our aim was to identify the presence of SARS-CoV-RNA on environmental surfaces in non-COVID and COVID wards and its elimination after sanitization with hydrogen peroxide and silver ions or with nebulization of active chlorine, both pre-sanitization and post-sanitization methods.

Materials and methods

The sampling was performed with rayon swabs pre-moistened with sterile water on a surface of 25 cm² and processed within 24 hours of sampling with the LAMP technique (ICGENE Enbiotech S.r.l.®). Statistical analysis was performed with R software.

Results: 114 surfaces were sampled (50% belonged to the healthcare area, 38% was represented by devices and 12% to the remaining area). 67.6% of the samples were carried out on surfaces belonging to CoViD-19 wards. The sampled surfaces were sanitized with a) hydrogen peroxide and silver ions in 23.5% of the cases b) with active chlorine in 76.5% of the cases. They were positive in 44% after nebulization with active chlorine and 0% after nebulization with hydrogen peroxide and silver ions with the finding of a pvalue less than 0.01.

Conclusions: SARS-CoV-2 RNA detected by RT-PCR can be found on surfaces from hours to days, depending on the environment and surface type. Despite the finding of this contamination, there aren't specific studies that have directly demonstrated indirect transmission. It remains essential to identify the most appropriate sanitization method to avoid possible transmissions through indirect contact. Nebulization with hydrogen peroxide and silver ions is a valid alternative to classic sanitization.

Resveratrol reverts tolerance and restores susceptibility to chlorhexidine and benzalkonium in gram-negative bacteria, gram-positive bacteria and yeasts

Antonella Migliaccio¹, Maria Stabile², Maria Bagattini¹, Maria Triassi¹, Rita Berisio³, Raffaele Zarrilli⁴

¹University of Naples "Federico II" Department of Public Health, University of Naples, "Federico II" Via S. Pansini 5, Naples, Italy, ²University of Naples "Federico II" 2Department of Chemical Sciences, University of Naples, "Federico II" Via Cintia 4, Naples, Italy, ³Institute of Biostructures and Bioimaging, National Research Council, CNR Naples, Italy; Italy, ⁴Eliana De Gregorio

1. Introduction: The spread of microorganisms causing health-care associated infection (HAI) is contributed by their intrinsic tolerance to a variety of biocides used as antiseptics or disinfectants. The aim of the study was to: (i) analyze the susceptibility to CHX and BZK biocides in a panel of reference strains and clinical isolates of Gram-negative bacteria, Gram-positive bacteria and yeasts; (ii) identify non-toxic compounds, which can restore susceptibility to CHX and BZK in the above pathogens.

2. Materials and Methods: MIC (mg/L) and MBC (mg/L) values of CHX and BZK were determined by a broth microdilution method. In vitro combination studies were carried out using the checkerboard method. The combined effects were determined by calculating the fractional inhibitory concentration (FIC) index.

Results: The natural monomeric stilbenoid resveratrol (RV) from 32 to 256 mg/L decreased dose-dependently CHX MIC and MBC in 33 selected strains, while not restored CHX susceptibility in *Klebsiella pneumoniae* ATCC 700603, all *Pseudomonas aeruginosa* and *Candida* spp. strains. RV up to 128 mg/L decreased dose-dependently BZK MIC and MBC, but not restored BZK susceptibility in 3 *Burkholderia* spp., *Enterococcus cloacae* ATCC 13047, *K. pneumoniae* ATCC 700603, *Stenotrophomonas maltophilia* K279 and all *P. aeruginosa* strains. Furthermore, CHX and BZK combination in the presence of RV at 64 mg/L restored CHX or BZK susceptibility in all strains and showed a synergic in 20 out 21 strains and additive effect in 1 out 21 strains.

4. Conclusions: A synergic microbicidal effect was observed when the two biocides were combined with RV in a panel of Gram-negative bacteria, Gram-positive bacteria and yeasts. RV reverts tolerance and restores susceptibility to CHX and BZK in the majority of microorganisms. The combination of RV, CHX and BZK may represent a useful strategy to maintain susceptibility to biocides in several nosocomial pathogens.

Pre-post study on the microbiome profile of a water network treated with hydrogen peroxide in an Italian hospital

Stefania Paduano¹, Isabella Marchesi¹, Federica Valeriani¹, Eugenia Carluccio², Gianluca Gianfranceschi³, Giuseppina Frezza¹, Sara Turchi¹, Carlo Leo², Vincenzo Spica³, Osvaldo Maiorano⁴, Paola Borella¹, Annalisa Bargellini¹

¹Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy, ²Medical Direction, Hospital "Vito Fazzi", Lecce, Italy, ³Department of Movement, Human and Health Sciences, Public Health Unit, University of Rome "Foro Italico", Rome, Italy, ⁴Medical Directions, ASL Lecce, Italy

Background and Objectives: A range of on-site physical and chemical treatments for secondary disinfection have been proposed with the aim of controlling microbial water contamination, differing in effectiveness, application methods (in continuous and shock), costs and management. Each method can modify the composition of the bacterial community of water systems. Nowadays, Bioinformatics and Next Generation Sequencing (NGS) technologies offer high-throughput, rapid and accurate methods of determining all cultivable and non-cultivable bacteria within a water distribution system. Our study aims to characterise the microbial community pre-post introduction of a continuous hydrogen peroxide disinfection system applied in the hot water network of an Italian hospital for Legionella control.

Methods: pre-post study is performed. The main building includes 10 blocks fed by the same water plant. Municipal cold water, cold and hot hospital water before treatment and after 1, 6 and 12 months are analysed for microbiome characterization by 16S amplicon sequencing. Here, we present the pre-treatment and post-one-month results.

Results: A total of 32 samples was collected: 14 cold water and 18 hot water samples (9 before treatment and 9 after 1 month). Cold water bacterial profiles at genus level did not vary significantly between the two sampling sessions. On the contrary, the hot water profiles differed between pre-treatment and post-one-

month treatment samples. Before treatment the two most abundant genera were *Sphingorhabdus* and *Thermus*, while after one month were *Porphyrobacter* and *Blastomonas*.

Conclusion: Determining the microbial profiles of hospital water networks through 16S amplicon sequencing is a promising approach for Public Health. Important strength of our study is the pre-post treatment approach to investigate the possible modifications of bacterial community due to hydrogen peroxide disinfection. Moreover, over time monitoring allows to evaluate microbiome stability in the treated water.

Water, sanitation, and behavioral education strategies for neglected infectious diseases in the amazonian indigenous context: a scoping review

Juan Martínez¹, Sebastian Patiño², Jovana Ocampo², Andres Sierra²

¹Universidad de los Andes Cra 50 N 127 d 19 Colombia, ²Universidad de los Andes Colombia

Background: Neglected infectious diseases (NIDs) are a group of conditions prevalent mainly in tropical areas, where they mostly affect impoverished communities and disproportionately affect women and children. The implementation of strategies for the control of these diseases is too costly for health systems such as the Colombian one. Therefore, empowering indigenous communities in the Amazon could help to improve the control of these diseases in the region.

Objective: To identify the different educational and pedagogical strategies that could be implemented in the Amazon indigenous context to achieve the best results in the teaching of the BEST framework, WASH water, and basic sanitation and diagnosis and treatment of NIDs.

Methods: Following PRISMA ScR guidelines, the search was oriented in three competencies: a) Knowledge of the WASH strategy b) Knowledge of the BEST framework c) Appropriate diagnosis and treatment for trachoma, geohelminthiasis and ectoparasites. The protocol was registered in the OSF DOI:10.17605/OSF.IO/Z2XQ9. Five databases were used. The selection criteria were 1) Component related to health education strategies; 2) Indigenous communities; 3) Amazon region; and 4) They were oriented in one of the three related competencies.

Results: 8 articles met the inclusion criteria; 2 were referred to the BEST Framework, 4 articles to WASH, and 2 to the diagnosis and treatment of NIDs.

Conclusion: There is insufficient information related to educational or pedagogical strategies in the Amazonian indigenous context for the BEST framework, WASH water and basic sanitation, and diagnosis and treatment of NIDs. The educational strategies related to the BEST framework assume the existence of theoretical bases but no practical implications. Concerning WASH, water, and basic sanitation, the most used educational strategy was the talking map and the co-creation of a community newspaper. While concerning the diagnosis and treatment of NIDs there was no related information for the Amazonian indigenous context.

Airborne microbiological contamination: are there too many people in operating rooms?

Lorenzo Dragoni¹, Gabriele Messina², Raffaele Iannaccone³, Davide Amodeo¹, Gabriele Cevenini¹, Nicola Nante³, Maria De Marco⁴

¹University of Siena Post Graduated School of Public Health, University of Siena, Italy, ²University of Siena Post Graduated School of Public Health, University of Siena, Italy; Department of Molecular and Developmental Medicine, University of Siena, Italy, ³University of Siena, ⁴Santa Maria alle Scotte Teaching Hospital, Siena, Italy Hygiene and Epidemiology Unit, "Santa Maria alle Scotte" Teaching Hospital, Siena, Italy

Background and objective: Adequate operating room ventilation and air filtration are essential measures to prevent surgical site infections and reduce hospital stays and healthcare expenditures. In addition, the number of operators present and adherence to procedures regarding door opening also have a bearing on the level of air contamination in the room. The aim of our study is to assess how much the number of operators and the opening of doors during surgery affects airborne microbiological contamination.

Methods: The data were extrapolated from reports of operational controls conducted in the operating rooms of the Santa Maria Alle Scotte Polyclinic from 2018 to 2021. The number of colonies incubated at 22°C and 36°C, collected with SAS (Surface Air System) samplers, was related by Pearson's linear correlation to the number of operators in the rooms and the number of air changes. T-test was used to assess the difference between the mean of colonies detected with doors

closed and with doors open.

Results: The number of colonies incubated at 22°C was correlated only with air changes ($R=-0.33$; $P=0.001$). In contrast, those incubated at 36°C were correlated with air changes ($R=-0.40$; $P0.05$). In contrast, the difference was statistically significant for those incubated at 36° ($P=0.040$).

Conclusion: The number of operators and the air changes have emerged to be important factors for the contamination of the hospital theatres. Further analysis, including other variables such as the type of ventilation (laminar or turbulent) and pressure gradients (between indoor and outdoor environments), are in progress to better describe the level of contaminations.

A case report of 3 saprochaete clavate disseminated infections in hematological patients at irccs ospedale policlinico san martino, genoa, liguria, north-west Italy

Rosa Amato¹, Rosa Amato², Riccardo Borghesi², Maria Sgariglia², Lucia Massolo², Oriana Ferrante², Angela Battistini³, Roberto Ziffero³, Sesilja Vyshka⁴, Lucia Arata⁵, Andrea Orsi⁶

¹Dipartimento di Scienze della Salute (DiSSal), University of Genoa, Genoa, Italy Via A. Pastore 1, 16132, Genoa (GE), Italy, ²Dipartimento di Scienze della Salute (DiSSal), University of Genoa, Genoa, Italy, ³Hygiene Unit, Ospedale Policlinico San Martino IRCCS Genoa, Genoa, Italy, ⁴Risk Management Unit, Ospedale Policlinico San Martino IRCCS Genoa, Genoa, Italy, ⁵Medical Direction, Ospedale Policlinico San Martino IRCCS, Genoa, Italy, ⁶Dipartimento di Scienze della Salute (DiSSal), University of Genoa, Genoa, Italy; Hygiene Unit, Ospedale Policlinico San Martino IRCCS Genoa, Genoa, Italy, Italy

Background: *Saprochaete clavate* is a rare emerging pathogen causing invasive fungal infections in immunocompromised patients. More than 90% of these infections have been reported in patients with hematological malignancies and are associated with high mortality rates (about 60%) in vulnerable patients. The transmission isn't defined, but the available literature describes orofecal transmission as the most common source of infection (ext. contaminated medical devices, dishes, dairy products). Here we report 3 cases of fungal infections due to *S.clavate*, observed in 3 patients admitted to hematopoietic cell transplantation and cell therapies Unit of IRCCS Ospedale Policlinico San Martino, Genoa, Liguria, north-west Italy, between July and September 2022.

Methods: We created an Excel database with positive patients for *S.clavata*: we investigated the clinical characteristics of the subjects, the details of the hospitalization, the transplant date and the date of infection.

Results: Three positive cases for *S.clavata* were observed in a 50-day period in three hematological patients (mean age 60), all undergoing allogeneic stem cell transplantation during hospitalization. Two cases tested positive for *S.clavata* in blood culture and died within an average of 9 days of detection. The discharged patient presented positivity only to nasopharyngeal swab. All patients had persistent neutropenia and two of them had been treated with cytarabine and two of them had mucositis. The patients had been treated with micafungin and levofloxacin in the period prior to testing positive. The recovery rooms were single and distant from each other.

Conclusions: Its important to investigate the emerging *S.clavata* as healthcare associated infection because of its dangerousness in vulnerable patients, to understand the mechanisms of transmission and infection and to implement interventions that limit its spread. Currently, the available literature is very small; therefore, its necessary to increase communication among international stakeholders about a pathogen which seems to be emerging as a public health problem.

Environmental factors associated with recreational water quality

Johanna Sanchez¹, Ian Young², Binyam Desta¹, Cole Heasley¹, Jordan Tustin²

¹Toronto Metropolitan University Canada, ²Toronto Metropolitan University

Poor recreational water quality poses a risk of acute gastrointestinal illness (AGI) to beach goers engaging in water activities. Internationally, concentration of *Escherichia coli* (*E. coli*) is regularly monitored to make risk management recommendations about beach water quality conditions. Laboratory processing times results in a delay in the availability of water sample results. As such, decisions about whether to post a beach as safe for swimming are based on previous day data. In Canada, these decisions are made by local public health units. Beach *E. coli* concentrations are influenced by several environmental and climatic factors, which can result in changes to water quality conditions in a short

period. A greater understanding of these factors could assist in timely decision-making processes.

We examined water quality data collected by public health authorities during the recreational bathing season from beaches across Canada, including freshwater beaches in Toronto, Niagara Region, and Manitoba, and marine beaches in Vancouver, and linked environmental data from federal and provincial weather stations. The first objective aimed to determine the environmental predictors of water quality in each region, as indicated by *E. coli* concentration. The second objective used this information to develop predictive models using a novel bayesian network approach.

Bayesian networks have potential for high predictive power, require few assumptions, can be easily updated, present results in an intuitive format, and could be more cost-effective for routine use by public health and environmental authorities.

This presentation will discuss the environmental factors associated with recreational water quality in the Canadian setting and present the bayesian network predictive models. The results of this project are relevant to recreational beaches worldwide as we provide insight on both marine and freshwater settings and may be used to inform beach monitoring programs and reduce the burden of water-borne disease.

Health carewaste management at a university hospital in Tunisia: Is there a gap between knowledge and practice?

Souha Ben Ayed¹, Imen Mlouki^{1,2,3}, Fatma Ben youssef¹, Faouzia Chebbi¹, Nejla Rezg¹, Aida khouldi¹, Sana El Mhamdi^{1,2,3}

¹Department of Preventive and Community Medicine, University Hospital Tahar Sfar Mahdia, Tunisia, ²Research laboratory "Epidemiology Applied to Maternal and Child Health" 12SP17, Tunisia, ³Department of Community Medicine, Faculty of Medicine of Monastir, Tunisia

Background and Objective: Infectious Health Care Waste (HCW) could induce nosocomial infections, putting the health of medical staff and patients at risk. Proper HCW management should therefore be strictly followed as part of a comprehensive and systematic approach to hospital hygiene and infection control. We aimed at evaluating HCW management among health workers on both sides: knowledge and practice.

Methods: We performed a cross sectional study on September 2021 at all departments of the University Hospital Mahdia (Tunisia). We used an evaluation grid to assess the accessibility of resources and the property of practices. A self-administered questionnaire, validated by the Regional Office for Nosocomial Infection Control in France was used to assess HCW management knowledge.

Results: A total of 160 health workers responded to the on-site separation questionnaire with a mean age of 32.3±7.9. Most of them were practicing at medical departments (56.9%). For ordinary waste, 94.4% of professionals knew how to manage source segregation. Professionals with less than 20 years of experience had significantly better knowledge of on-site sorting of ordinary HCW (96.6% vs 66.7%, $p=0.002$). Regarding septic waste, 84.4% of health workers had good level of knowledge. After binary logistic regression we found that doctors had lower level of knowledge about the on-site sorting comparing to paramedical staff (34.1% vs 65.9%, $OR=0.4$, 95%CI=0.171-0.966). To evaluate resources and practices, we observed 59 sites at 24 units. Over all compliance rate of resource's accessibilities was 88.1%. Sharp containers were unavailable in 39% of sites. However, compliance rate of good practice was 6.8%. In 44.1% of observations health providers placed infectious waste in general HCW containers.

Conclusions: Our study revealed a gap between knowledge and practices of HCW among health care workers. A comprehensive waste management plan is needed for safe and efficient waste management.

The importance of supervision practice in applying an operational plan to prevent Legionellosis in a hospital

Maurizio Gimigliano¹, Manuela Colosimo²

¹Azienda Ospedaliera Pugliese-Ciaccio, Catanzaro, Italy, ²Azienda Ospedaliera Pugliese Ciaccio, Italy

Background: This study aimed to demonstrate the importance of supervision practice in applying an operational plan to prevent legionellosis according to the I.S.S. 2015 guidelines. The protocol must be applied to hospital. There is the need for active surveillance corroborated by a rapid response when conditions of potential infections occur. So, monitoring contaminations with two different analytical methods (cultural and molecular biological) allowed prompt

interventions finalized to restore normal conditions quickly. Furthermore, it was possible to determine the importance of water treatment upstream of the water distribution. **Materials/methods:** Pugliese-Ciaccio is a general hospital with 450 beds plus 58 beds in the oncology unit. The hospital adopted a protocol for preventing legionellosis, but it was not being fully implemented so far. Therefore, the followed protocol was applied, water was periodically sampled at a series of specific control points along the distribution system. An Ultra Violet (UV) lamp probed with electromagnetic spectrum UVC coupled with chemicals H2O2/Ag+ ions anti-corrosive product (phosphosilicates) was supplied to the water. Those parameters, in the emergency, were varied in concentration depending on the laboratory data. In addition, an additional UV lamp was installed at the return point of the hot water before entering the boilers.

Results: During the period in which there was no complete monitoring of the procedures, the concentration of legionella had risen to very hazardous values beyond the consent upper limit. Thanks to our integrated actions, it was possible to bring them back into the safe environmental range shortly. About 1000 samples were taken during the study period at the various points at risk.

Conclusions: A combined safety action amongst consultant, analysis laboratory and safeguarding made it possible to avoid potentially lethal infections for patients or staff. Furthermore, the quarterly frequency of sampling in the departments at risk has allowed for economic, fruitful, and effective management of the plants and security.

Seroepidemiological study of Caprine Toxoplasmosis in public health

Blima Fux¹, Letícia Pedrini², Lauany Damiani³, Marcus Beltrame², Rosângela Barros¹, Rosáilda Lopes⁴, Ricardo Vitor⁴

¹Departamento de Patologia, Universidade Federal do Espírito Santo, Brazil, ²Universidade Federal do Espírito Santo, Brazil, ³Ciência Animal, Universidade Vila Velha, Brazil, ⁴Departamento de Parasitologia, Universidade Federal de Minas Gerais, Brazil

Toxoplasma gondii, the etiological agent of toxoplasmosis, is described as a potential cause of abortion in goats, causing major economic impacts. For public health, the consumption of animal foods can be a source of transmission of *T. gondii*. The objective of this work was to estimate the prevalence of goats infected by *T. gondii*, in different cities from Espírito Santo state, Brazil, and identify the infection risk factors. Immunoglobulins of the IgG Class was evaluated by the Indirect Immunofluorescence Reaction. The presence of IgG anti-*T. gondii* was 46.6% (68/146). The risk factors observed were female sex ($OR=2.81$ 95%CI 1.03 - 7.61), age group over two years old ($OR=3.5$ 95%CI 1.21 - 10.1), water from the public supply network ($OR=7.92$ 95%CI 1.77 - 35.47), storage of food and supplies in an open and unprotected place ($OR=11.13$ 95%CI 3.77 - 32.8) and presence of a domestic cat on the property ($OR=8.19$ 95%CI 2.65 - 24.71). The study found that goats domiciled in Espírito Santo, Brazil had a high prevalence of infection and there are risk factors that can trigger *T. gondii* infection in goat herds. This is the first seroepidemiology study of caprine toxoplasmosis conducted in the State of Espírito Santo, Brazil, and emphasizes the public health importance of food as a source of infection in humans. By identifying failures in animal management, it is possible to implement strategies to reduce infection rates. Control and prevention measures can reduce the sources of infection in herds and, consequently, provide safer animal products for human consumption.

Access to water, sanitation and hygiene for homeless population: experiences from São Paulo city during the COVID-19 pandemic

Geyse Santos¹, Maria Razzolini², Denise Veiga³

¹Center for Research in Environmental Risk Assessment, School of Public Health, University of São Paulo, Sao Paulo, Brazil, ²School of Public Health, University of São Paulo, Sao Paulo, Brazil, ³Center for Research in Environmental Risk Assessment, Sao Paulo, Brazil

On 31 January 2020, the WHO declared the COVID-19 outbreak a Public Health Emergency of International Concern (WHO, 2020). In Brazil, the city of São Paulo, the richest capital in the country, was the epicentre of COVID-19 cases. In the pandemic context, some measures addressed to people in street situation were intended to minimize the risk of transmission of the disease (GARCIA et al. 2020). Among these measures, the installation of community sinks and drinking water fountains were carried out, whose location was places to outreach this specific population who lives in streets. Yet these set of actions has been important to lower the impact of the COVID-19 transmission on this population, some other

aspects must be studied related to health risks prevention due to the multi-usage of these devices such as water- and foodborne diseases. Thus, for improving these actions and to promote health we must consider to verify the quality of the water distributed by these devices. Right now, our aim is to design a plan to evaluate the microbiological quality of water from these devices. Firstly, we set criteria for selecting public water distribution devices according to their location in the city, circulation of people and the number of device users and, also their level of social and health vulnerability. Further, we will carry out the assessment of drinking water quality has based on the Brazilian legislation for water potability (BRASIL, 2021). There were nine points that were selected for a one-year followed up. In addition, it has been carried out a photographic exploration of the use of the devices with the authorization of the users. The study, is still under development but we observed a variety of usages. Preliminary data indicate that these public facilities are essential for the population, but not sufficient for health promotion.

Surgical site infections: 10-year prevalence trend (2012-2021) and risk factors in a Tunisian university hospital

Sana Bhiri^{1,2}, Emna Hariz¹, Hela Ghali^{1,2}, Imene Mlouki⁴, Rania Bannour¹, Aroua Kamel³, Fatima Ezzahra Khouya³, Arwa Nafetti¹, Sofien Aidan³, Souhir Ayadi³, Salwa Khefacha¹, Mohamed Ben Rejeb^{1,2}, Asma Ben Cheikh^{1,2}, Houyem Said Latiri^{1,2}

¹Department of Prevention and Security of Care, Sahloul University Hospital, Sousse, Tunisia, ²Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia, ³Family Medicine, Faculty of Medicine of Sousse, Sousse, Tunisia, ⁴Department of Preventive and Community Medicine, Taher Sfar, Academic hospital Mahdia, Tunisia

Background and Objective: Surgical site infections (SSIs) represent a real public health burden, given their individual and economic repercussions. Several risk factors are involved in its occurrence. Our study aimed to describe the trend in the prevalence of surgical site infections in subjects operated at the Sahloul University Hospital Centre between 2012 and 2021 and to identify the associated risk factors. **Methods:** A descriptive cross-sectional prevalence study was carried out on patients operated on at Sahloul University Hospital with a single visit on a given day per department. All patients, operated on in the 30 days preceding the visit and/or for whom a prosthesis had been fitted during the year preceding the visit were collected. Socio-demographic and clinical data were collected using a synoptic form prepared from the medical records of the patients under study. **Results:** A total of 1111 operated patients were identified. The mean age was 48.9 ± 22.3 years with a male predominance and a sex ratio of 1.57. The median length of stay was 10 days [5 - 19]. In our sample, the number of SSIs was 70, giving an average prevalence rate of 6.3%. The prevalence of SSIs in this sample showed a linear significant upward trend. Analysis by site showed 49 superficial and 21 deep infections. The occurrence of a surgical site infection was significantly associated with the placement of a prosthesis ($p < 10^{-3}$), length of hospital stays of 7 days or more ($p < 10^{-3}$), and ASA score greater than or equal to two ($p = 0.023$). **Conclusions:** In the light of these results, the high rate of SSIs underlines the importance of strengthening prevention and control measures by tailoring a program targeting the suggested risk factors.

Identifying determinants to Sewer Connection uptake Lusaka Zambia

Nobutu Muttu¹, Jenala Chipungu¹, Anjali Sharma¹, Samuel Bosomprah¹, Jennifer Lamb², Ruth Kennedy-Walker³, Sophie Ayling³, Lusungu Nyirenda⁴, Nshamba Muzungu⁴, Mwansa Mukuka³, Robert Dreibeilbis²

¹Centre for Infectious Disease Research in Zambia (CIDRZ), Lusaka, Zambia, ²London School of Hygiene and Tropical Medicine (LSHTM), London, United Kingdom, ³The World Bank Group, Washington, DC, United States, ⁴Lusaka Water Supply and Sanitation Company (LWSC), Lusaka, Zambia

Background and Objective: More than half of the Zambian population living in urban areas use basic onsite sanitation facilities, most of which are deplorable, with only one-eighth of households relying on safely managed sanitation facilities. We explored the determinants of sewer connection uptake among customers in two communities where the local commercial water utility made the service available.

Methods: Between February and December 2021, we conducted surveys with landlords ($n=150$) in two peri-urban communities to understand their knowledge of sewer connection services, the multi-level determinants, and willingness to connect to a sewer line in the context of COVID-19. Interviews with landlords

($n=18$) supplemented the quantitative data by how convenience, cost, affiliation, and trust affected their choice to upgrade to a sewer connection.

Results: Of 81% of respondents that reported knowing about the available sewer connection service, 76% reported not knowing how much it costs, and 61% reported having insufficient knowledge. The individual, social and structural drivers for having a sewer connection were 1) the perceived health benefits, convenience and affordability in installation and maintenance service costs; 2) the perceived social status and belief that sewer connections work for others in their community and 3) the provision of sufficient information and reassurance of consistent water supply and maintenance services in cases of blockages from the water utility respectively. 27% of respondents said they would no longer connect to a sewer line as their income had reduced due to COVID-19. Of the four personas presented in the interviews, the perceived high service cost and distrust in the utility were the most common reasons that hindered landlords from connecting to the sewer line.

Conclusions: Insufficient knowledge of sewer connection services, the lack of trust in the water utility, community support and COVID-19 affected the willingness of landlords to connect to a sewer line.

Surveillance of the consumption of alcohol-based handrub in hospitals in Piedmont, Italy: an observational study, 2017-2021

Claudia Gastaldo¹, Antonino Russotto¹, Edoardo Rolfini², Giovanni Paladini¹, Costanza Vicentini¹, Carla Zotti¹

¹Department of Sciences of Public Health and Pediatrics, University of Turin, Turin, Italy, ²University of Turin, Turin, Italy

Background and Objective: Hand hygiene (HH) is one of the most important measures to prevent healthcare-associated infections (HAIs). During the COVID-19 pandemic, there has been increased attention to infection prevention and control (IPC) practices, particularly regarding hand hygiene. The objective of this study was to evaluate the impact of the pandemic on alcohol-based handrub consumption (AHC) in the region of Piedmont, in Northern Italy.

Methods: Data on AHC were collected as part of a wider regional IPC program, promoted annually by the Regional Health Department, which requires all public trusts to report data on indicators of IPC activities. However, in 2020-2021, data were requested directly by the Istituto Superiore di Sanità (ISS) and Ministry of Health. AHC data were collected annually from 25 hospitals/trusts for the years 2017-2021, overall and according to department type: medicine, surgery and intensive care (IC). AHC was expressed as liters per patient-day (l/pd) per year. Trends in AHC were investigated and the median for the three-year period 2017-2019 (pre-COVID) was compared with the median of the years 2020 and 2021, during the pandemic period.

Results: Median AHC doubled in 2020 compared to the pre-COVID three-year period (14 vs 29.9 l/pd). In the medicine departments, consumption tripled (10.6 vs 30.3 l/pd) while in surgery and IC it doubled (10.3 vs 22.5 l/pd and 41.8 vs 92.9 l/pd, respectively). In 2021, AHC decreased (overall 22.1 l/pd, medicine 20.6 l/pd, surgery 19.1 l/pd and IC 60.6 l/pd), however still remaining higher than in the pre-COVID three-year period.

Conclusions: There was a strong increase in 2020 in AHC in all three types of ward considered in the analysis, but this trend was not maintained in 2021 despite the persistence of the pandemic context. Further efforts must therefore be directed towards maintaining awareness of IPC practices, regardless of COVID-19.

Burden of healthcare-associated infections in Europe: a systematic literature review

Ada Maida¹, Fabio Pattavina², Roberto Ricciardi³, Floriana D¹, Anna Nistico⁴, Giovanna Calabro⁴

¹Università cattolica del sacro cuore, Section of Hygiene, University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²Fondazione Policlinico Universitario A. Gemelli IRCCS, ³Vihtali-Università cattolica del sacro cuore, Vihtali (Value In Health Technology and Academy for Leadership & Innovation), Spin-Off of Università Cattolica del Sacro Cuore, Rome, Italy, ⁴Università

Background & Objective: Healthcare Associated Infections (HAIs) are a serious public health issues that contribute substantially to the global burden of mortality and morbidity. Their trend is constantly growing in Europe, with a severe impact also in terms of additional costs for health systems. In Europe HAIs affect about 4 million patients/year, with 16 million additional hospital days and over 37.000 deaths. The study aim was to assess through a systematic literature review (SLR)

the epidemiological burden of HAIs in Europe.

Methods: A SLR was performed querying two databases (Pubmed, Web of Science) from 2012 to 2022. All studies in English language and focused on the epidemiological burden of HAIs in Europe were included.

Results: Overall, 66 studies were included. It was described a range of HAIs prevalence (4.6–49.3%) in the general population. In the adult population, the prevalence varied from 0.44% to 51.7%, most frequently with surgical site infections (1–84.3%), urinary tract infections (0.58–70.5%), bloodstream infections (0.1–46.6%) and respiratory tract infections (0.5–45.1%). Instead, in the pediatric population the HAIs prevalence varied from 2.45% to 6.9%, with a higher burden in the first year of life and a higher frequency of bloodstream infections (3.1–44.6%). The most isolated pathogens were *Pseudomonas aeruginosa*, *Escherichia coli*, *Klebsiella pneumoniae*, methicillin-resistant *Staphylococcus aureus* and *Candida* spp. The associated risk factors, in addition to advanced age and patients' clinical conditions, were the invasive devices use and prolonged hospital stays.

Conclusion: The current epidemiological situation imposes the necessity for constant HAIs control. In order to increase efficiency of prevention and control measures, there is a need for the careful design of interventional studies to figure out the most efficient single or bundle of preventive measures. In addition, it is necessary to implement the surveillance systems and to encourage greater safety training for patients, visitors and healthcare professionals.

Does protecting ourselves also protect others?

Chiara

Salini¹, Barbara Innocenti², Gabriele Messina³, Nicola Nante³

¹University of Siena, Post Graduate School of Public Health, Italy, ²Arezzo Hospital, ³University of Siena, Department of Molecular and Developmental Medicine, Italy

Background: The SARS-CoV-2 pandemic has increased the use of Personal Protective Equipment (PPE) in hospitals. Within departments with SARS-CoV-2 infected patients, staff often use the same PPE between patients since they are infected with the same microorganism. We present a case report of an *Acinetobacter baumannii* outbreak that occurred within a COVID-19 department.

Methods: The case presented is based on an experience in May 2021 in the Intensive Care Unit for COVID-19 patients of Arezzo Hospital, Italy. Within the hospital, there is an active surveillance system for rapidly spreading microorganisms or multi-resistant bacteria to prevent their transmission and reduce the risk of outbreaks. Following the case, an audit was conducted to focus on the problem and prevent it from recurring.

Results: In the department under consideration, 6 cases of *Acinetobacter baumannii* infection occurred within 9 days after the first infection. Following the event, a meeting was conducted with all department staff. It was found that due to the shortage of PPE caused by the emergency period and because all patients were admitted for the same infection, the same PPE (coveralls, visor, gloves, mask) was used during care activities; thus, the *A. baumannii* infection was spread from the first infected but asymptomatic patient to all others.

Conclusion: When we safeguard ourselves, we let our guard down because we feel "protected", but the same PPE that makes us feel protected may instead be "dangerous" to others. Hospitalized patients may carry more than one infection. During current or future pandemics, it is critical to implement common contact precautions and change or sanitize PPE even if we are caring for patients with the same ongoing infection because our PPE can act as a vehicle for further over-infection and the spread of multi-resistant bacteria.

Legionella spp contamination and infections associated with thermal waters: a systematic review

Luigi Tommasi¹, Stefania Paduano², Isabella Marchesi¹, Carmela Palazzi³, Sara Turchi², Giuseppina Frezza¹, Annalisa Bargellini¹

¹Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy,

²Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy,

³Library of Medical Faculty, University of Modena and Reggio Emilia, Modena, Italy

Background and Objectives: Thermal waters are used for therapeutic or recreational purposes as baths, inhalation, irrigation and mud therapy. Their peculiar properties, i.e. temperature, pH and concentration of salts, can create habitats suitable for survival and multiplication of opportunistic pathogens such

as *Legionella* spp. To date, there has been no systematic synthesis of literature on *Legionella* spp. contamination or legionellosis events related to thermal water. This study aims to evaluate the *Legionella* spp. presence in thermal waters and cases or outbreaks of legionellosis associated with exposure to these waters.

Methods: PubMed/EMBASE/Scopus/Web of Science/CINAHL were searched for primary studies on *Legionella* spp contamination in thermal water and on associated cases/outbreaks of legionellosis. Studies were searched up to 12 December 2022. Two PubMed search strategies have been performed: - (*legionella* OR *Legionellaceae*), first part for *Legionella* spp. contamination; - (*legionella* OR legionellosis OR "Pontiac fever" OR "Legionnaires' disease") AND (case* OR cluster* OR outbreak* OR infection* OR investigation OR surveillance), first part for legionellosis cases or outbreaks; - AND ("recreational water" OR spa OR pool OR "hot tub" OR whirlpool OR bath OR "turkish bath" OR Jacuzzi OR "natural spa" OR "hot spring" OR "thermal spring" OR "warm spring" OR spring OR thermal OR mineral waters[mesh] OR hot springs[mesh]), second part for both searches. These search strategies have been adapted for each included database.

Results: A total of 495 articles for *Legionella* spp contamination in thermal waters and 394 articles for legionellosis cases/outbreaks associated with these waters were retrieved from PubMed. The search in the other databases is still being carried out.

Conclusion: Our results will provide a synthesis of the current evidence on *Legionella* presence and infections associated with thermal waters, useful to evaluate infection risk and possible treatments to control contamination of these resources preserving their characteristics and healing properties.

Microbiological assessment of drinking water around lake atitlan, guatemala

Preet Gandhi¹, Marc Verhougstraete², Frank von Hippel², Sandra Rodriguez²

¹University of British Columbia Canada, ²University of Arizona United States

Background: Lake Atitlán is one of the most important lakes in Central America. The Atitlán watershed is home to approximately 260,000 people, the majority of whom are Mayan. The communities rely on subsistence agriculture, and use the lake for drinking water, transportation, and as a protein source through fisheries. Previous studies in the Lake Atitlán region established the presence of toxic metals and metalloids, pesticides, and indicator bacteria in drinking water and within the lake. Additionally, these communities experience a high prevalence of diarrheal diseases, childhood stunting, chronic illnesses, and various other adverse health outcomes.

Objective: This pilot project was designed to assess water quality in the Atitlán watershed. Additionally, in connection with a partnered study, breastmilk samples were collected from four towns in the watershed to correlate water contamination with maternal and infant health outcomes.

Methods: Over a 6-week period in June and July of 2022, 24 water samples were collected from drinking and freshwater sources in the towns of Panajachel, Santiago, San Juan, and San Pedro. Local hotels, restaurants, and community water taps were sampled and analyzed for the presence of *E. coli* and total coliforms via portable AquaGenX Water Testing Kits.

Results: Areas with unsafe water contamination were found in each of the four towns. The World Health Organization's standard for *E. coli* in drinking water (0 *E. coli*/100 ml) was exceeded in 83% of samples. The most pronounced water contamination was found in Panajachel, where all samples (n=12) had measurable *E. coli* and 67% of samples contained *E. coli* concentrations above 100 CFU/100ml. **Conclusion:** The data within this pilot study provide sufficient evidence of contamination to warrant further inquiry into hot-spots of contamination around Lake Atitlán, and the development of collaborative policy actions with local stakeholders.

The disinfection power of ag ions & zeolite, effectiveness of a new technology for high-touch spots

Valerio Peruzzi¹, Davide Amodeo², Nicola Nante³, Gabriele Messina³

¹University of Siena Post Graduate School of Public Health, University of Siena, Siena, Italy via Aldo Moro 2 Italy, ²University of Siena, ³University of Siena Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy

Background: Disinfection of contact surfaces has become common practice since the two-year COVID-19 pandemic. The transmission of microbial agents has long been the focus of public health and hygiene awareness campaigns. Indeed, the development of new disinfection technologies and approaches is attracting

considerable interest in the scientific community. Mixed plastic powders with antimicrobial properties and silver ions can compromise the metabolism of microorganisms. We aimed to evaluate an inorganic antimicrobial agent (IAA) based on Ag ions and zeolite mixed in a resin.

Methods: This experimental study was carried out at the University of Siena, Italy. Different objects were produced in two versions: i) with an IAA mixed in plastic resin; ii) with a standard plastic mixture. To the eye, the two versions were indistinguishable and were randomly contaminated with the hands of several operators. After the hand contamination, T0, we sampled the objects using RODAC plates at T1 (1h) and T2 (6h), incubating at 36°C for 48 hours. Comparisons of the biocidal effect were made at T1 and T2. Statistical analysis was carried out with Stata.

Results: The mean level of contamination of the objects made with standard plastic were, respectively 50 CFU (SD 36.5) at T1 and 20 CFU (SD 13.6) at T2. In comparison, the objects made with IAA resin showed a mean level of contamination of 10 CFU (SD 5.9) at T1 and 6 CFU (SD 3.6) at T2. The objects made with IAA resin have shown a mean percentage reduction of contamination of 79.5% at T1 and 78.3% at T2.

Conclusion: IAA resin reduced contamination on objects that came into contact with hands. Antimicrobial plastic blends, are a valuable aid in counteracting the spread of infection related to contact with surfaces and fomites. The public health system could support and raise awareness for using these innovative materials

Measures to reduce plastic waste in the ulss-6 euganea local health trust in padua (Italy)

Suada Tikvina¹, Davide Bonaldo², Antonella Ruffatto³, Monica Varotto⁴, Enrico Pinton⁵, Vania Zambon⁵, Maria Zaramella⁶, Emanuela Azienda⁷

¹Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua, Italy ²Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua, Italy, ³ULSS 6 Euganea, Padua, Italy ⁴Hospital Board of Directors, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy ⁵Via Casa di Ricovero 40, Cittadella (Padua) Italy, ⁶ULSS 6 Euganea, Padua, Italy ⁷Waste Manager, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy ⁸Via Casa di Ricovero 40, Cittadella (Padua) Italy, ⁹ULSS 6 Euganea Infection control and disease service, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy ¹⁰Via Casa di Ricovero 40, Cittadella (Padua) Italy, ¹¹Azienda ULSS 6 Euganea Chief Nursing Officer, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy ¹²Via Casa di Ricovero 40, Cittadella (Padua) Italy, ¹³ULSS 6 Euganea Hospital Board of Directors, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy ¹⁴Via Casa di Ricovero 40, Cittadella (Padua) Italy

Background and Objective: In the last two decades plastic consumption has grown considerably putting at risk our planets overall health. Understanding the elements of plastic production, distribution and waste management is crucial to help control this alarming health threat. Healthcare services use plastic in various ways and are responsible for a great part of single use plastic waste. In the past year, ULSS-6 Local Health Trust in Padua has taken important measures to reduce the usage of single use plastics within the hospital settings.

Methods: Various meetings were held among healthcare workers to present a code of conduct regarding plastic management. Mindful usage of plastic and adequate plastic recycling were encouraged, especially regarding single-use water bottles given that in the first 6 months of 2022 approximately 478,531 water bottles were used. Hospitals catering services were also reviewed aiming to reduce the plastic distribution in the healthcare facilities.

Results: In the second half of 2022, plastic cups were replaced with paper water cups. Given that most of the plastic water bottles are used by the hospital healthcare professionals, personal reusable water bottles are being distributed for each staff member. Over the next few months, water dispensers will be placed in each ward and in the hospitals coffee stations. Important effort has also been made to increase plastic collection points to promote adequate plastic recycling. The initial results show significant reduction in plastic bottle waste (nearly 45% in comparison with the first 6 months) but further improvement is expected in the following months.

Conclusion: Plastic waste management can be very challenging, especially in healthcare settings. Plastic cost, versatility and sanitary conditions make it difficult to completely eliminate its usage. Replacing single-use plastic containers with more sustainable materials represent small but significant steps to control plastic pollution.

DOI: 10.18332/popmed/164510

Prevention of legionella infections in medical facilities : specific indications to use of point of use filters (pou) in the preventive plans

Simone Latorre¹, Mattia Latorre¹, Federica Zedda², Antonello Campagna³

¹Italian Ministry of Health, Liguria Health Port Authority Via Ribotta 5, Roma Italy, ²Italian Ministry of Health, Liguria Health Port Authority, ³Italian Ministry of Health, Liguria Health Port Authority via ribotta 5, Roma (Italy) Italy

Results: This study also contains data of efficacy and performance specifications (field evaluation on a Legionella point-of-use filter that is 0, 2 µm (Pall Q Point®)) and is available for faucets and showers.

Microbiological challenge tests (bacterial retention of *Cyrobacter Koseri*) were performed in accordance with the ASTM standard F838-15a in March 2021 at the Hygiene Laboratory of the Department of Translational Research University of Pisa).

Further validation tests included: 1. microbiological challenging tests with *Brevundimonas diminuta*, *Legionella pneumophila* sg 1, *Pseudomonas aeruginosa*, *Escherichia coli*, *Mycobacterium gordonae* and *Cryptosporidium parvum*, and 2. microbiological challenging tests with a combination of *Legionella pneumophila* sg1 and *Aspergillus fumigatus*

Conclusions: The point-of-use filters when they are used in synergy with the others prevention methods can play an important role, cost-benefits ratio positive, to minimize the risk of growth and spread of *Legionella* and other waterborne pathogens

Healthcare-associated infections in hospital settings: New perspectives and strategies for prevention and control

Céline Paudice¹, Pietro Vernaci¹, Demetrio Cescutti², Alice Sgueglia¹, Anna Odone¹, Carlo Signorelli³, Francesco Auxilia¹, Giacomo Vigezzi¹

¹Università degli Studi di Pavia Department of Public Health, Experimental and Forensic Medicine Italy, ²School of Medicine, Università Vita-Salute San Raffaele, Italy, ³Università Vita-Salute San Raffaele School of Medicine & ASPHER Italy

Healthcare-associated infections (HAIs) are the most common and severe healthcare-associated complications and a major public health issue because of the impact on morbidity, mortality, and quality of life and of the economic burden on healthcare systems worldwide. Yet, most HAIs are preventable and can be reduced by up to 70% through effective Infection Prevention and Control (IPC) measures. New strategies and perspectives in IPC are needed to counteract antimicrobial resistance and reinforce HAIs prevention, through high-quality evidence-based care in the context of universal health coverage. This intensive workshop will explore innovative approaches through the implementation at the facility level of protocols, digital technologies and tools. It will be structured as follows.

First, data on the prevalence study on HAIs and antibiotic use, conducted at Humanitas Mater Domini Hospital Castellanza (Italy) in April 2022, will be presented. The study followed the ECDC Point Prevalence Survey protocol and involved 103 patients. 26% of included patients had an infection, and 62% were undergoing antibiotic therapy. The tool allowed the identification of non-conformities and the improvement of HAIs management, through antibiotic use awareness and stewardship.

Secondly, to explore the incidence and management of methicillin-resistant and methicillin-sensitive *S. Aureus* (MRSA and MSSA) infections, a prospective observational multicentre study conducted among patients undergoing elective arthroplasty surgery at the Clinical Institutes of Pavia and Vigevano (Italy) will be introduced. The analysis was performed between March and November 2022: out of 737 patients, 7 (0.9%) resulted positive for MRSA and 142 (19.3%) for MSSA. Early identification of MRSA/MSSA infections with active screening proved to be a reliable measure for targeted preventive antibiotic treatment in order to avoid surgical site infections.

The third presentation will open up with an outbreak of *Acinetobacter baumannii*, and Carbapenem-resistant *Klebsiella pneumoniae* that occurred in April 2022 within the intensive care unit of IRCCS Fondazione Policlinico San Matteo, Pavia (Italy), affecting 9 patients. Thanks to the swift strategy provided by the Medical Directorate, which resulted in initiatives based on the specific biological characteristics of micro-organisms survival, the outbreak ended on May 29th. This experience shows the key role of standard precautions and infection prevention and control measures in providing high-quality care.

The fourth panellist will talk about the implementation of a motivated request form for the prescription of antimicrobials through Electronic Health Records

(EHR) in 2022 at the IRCCS Policlinico San Donato, San Donato Milanese (Italy). Reviewing 55 motivated requests for meropenem, daptomycin and caspofungin, we compared the delivered doses with the administrations on the EHR. Overall, 24 requests for 97,560 milligrams of drugs were delivered but not administered; € 2,016 were subsequently lost. The introduction of EHRs allowed direct monitoring of requests' appropriateness.

The workshop, bringing together experts with topic knowledge on IPC, will provide answers on how to design a culture for HAI prevention. In the end, we will engage in a fruitful discussion with the audience on the data presented and practical public health implications, exploring how they can inform critical policy debates addressing evidence-based prevention strategies.

Multilateral collaboration between Italy-Lombardy and Sierra Leone: an effective collaboration to boost COVID-19 vaccine coverage in the country.

Thea Scognamiglio¹, Roberto Moretti²

¹Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, ²Agenzia di Tutela della Salute (ATS) Bergamo, University of Geneva, Italy

Materials and methods: The Sierra Vax team of AREU Lombardy (Regional Emergency Agency) carried out five missions in Sierra Leone: 1. Planning and starting vaccination activities, creating a series of collaborations, 2. training and motivating 31 vaccination groups for a total of 134 people. AREU modeled the project on a "settings approach" model and "Results-based" payment Methods. To improve the follow-up process, we implemented a system of rapid daily reporting of just the number of doses administered and the names of the teams to follow the process. An AREU logistician cross-checked the data reported with paper registers of the local facilities, ensuring the accuracy of the reported data. **Results:** Considering the Results of the first three months (about 7000 vaccinations per week) and the limited budget, we estimated that 100000 inoculations would be achievable by the end of May 2022. The project worked very well, reaching 153000 doses (53% more than the expected). **Conclusions:** The reporting system, combined with a system of monetary incentives via smartphone, multiplied the number of vaccinations per day for each team, going from 3 in the last weeks of December to 67 in May. The increase in vaccinations carried out by the 31 groups supervised in the presence of the AREU Sierra Vax team is a notable achievement, given the local context barriers and limitations.

Evaluation of the IDSR surveillance system in The Gambia Armed Forces, 2017 - 2021

Musa Corr¹

¹Gambia Field Epidemiology Training Program, Gambia Armed Forces, Banjul, The Gambia

Background: Integrated Diseases Surveillance and Response (IDSR) strategy was adopted in most countries in Africa since 1998. The Gambia adopted its first IDSR Technical Guidelines in 2003 but has never had it evaluated. The aim of this study is to determine whether Gambia Armed Forces (GAF) IDSR is meeting its objective and to evaluate the attributes of the system. **Methods:** A cross-sectional study was conducted among health care workers in GAF on IDSR surveillance system using a structured questionnaire. The updated CDC guidelines on surveillance system evaluation were used to access the attributes of the GAF - IDSR using the kobocollect and excel version 2010 were used to analyze. Five attributes; usefulness, acceptability, simplicity, data quality & completeness were used to achieve objectives. Attribute were summed up scores for all questions for each attribute and divided by the number of questions and multiplied by 100. Each attribute is described as good/simple/timely/complete/has quality/has good acceptability with scores >50% and vice versa if scores are <50%.

Results: The study reveals that 52.9% (9/17) of participants are between aged 21-30 years, 35.3% (6/17). 64.7% (11/17) of the study participants spent between 10-15 years in services. 64.7% (11/17) conduct only out-patient. On the level of training, 52.9% (9/17) of the participants are trained nurses. From the study usefulness score was 25.0%, simplicity was 19.2%, acceptability was 17.6%, stability was 14.9%, Data quality was 12.4%, and timeliness and completeness each were 11.8%. None of the attribute scores met the cutoff point. **Conclusions:** The IDSR surveillance system in GAF in The Gambia was not useful, not simple, not timely in submitting complete report not flexible and unstable. Training was a gap that was identified during the study as only three among the study participant and in the whole institution is trained on IDSR and disease surveillance.

Assessment of the readiness and response toward the dengue fever outbreak in Sudan: a qualitative exploration

Abdulla Bagahizel¹, Sir Elkhatim²

¹Hadramout University, Yemen, ²University of Medical Science and Technology, Sudan

Background and Objective: The mosquito-borne viruses are considered as a major public health problem in Sudan, predominantly in Kassala state during the last 10 years. The preparedness and response to the outbreak especially in the decision-making at the country or state levels need further description and consideration, due to the absence of any previous assessment studies. Therefore, this study aimed to qualitatively assess the level of readiness and response toward the 2019 dengue fever outbreak in Kassala - Sudan at the federal and state level of the ministry of health. **Methods:** This exploratory descriptive cross-sectional study involved the key informant personnel from the main four dimensions affecting the readiness and response (Surveillance, vector control, outbreak management, and health promotion). In-depth interviews were conducted to fill the open-ended questions and checklists developed by WHO and relative literatures. The interviews' contents were extensively analyzed and texted that strengthened or weakened each dimension were extracted from the key informants' interviews. **Results and Discussion:** Sudan outbreak was spotted by passive surveillance and 51 samples were tested during the outbreak period, and the private clinics and labs were not included in the surveillance system. According to the WHO checklist of outbreak readiness and response, the surveillance system and Public health laboratory in Kassala got the least score.

Conclusions: This study's outbreak readiness and response could be considered as below standard, mainly in the surveillance system and laboratory diagnostic facilities, due to absence of the intersectoral collaboration with a regulatory framework in terms of financial and operational participation.

Public health and clinical medicine need to work in partnership in the US

Sangeeta Saxena¹, Thomas Godfrey²

¹Department of Public Health, School of Health and Health Professions, Coastal Carolina University, United States, ²Department of Public Health Sciences, Pennsylvania State University, Hershey, United States

a) Introduction: The US was ranked first in terms of health security in 2019, yet it became the epicenter of the Corona virus disease pandemic in 2020, threatening its fundamental leadership in matters of world health, polarizing an already deeply divided society, rife with disparities and inequalities in access to care and medical outcomes. Even before the pandemic, the US had worse outcomes and higher healthcare costs than its contemporaries. **b) Methods:** Document analysis using READ approach, qualitative interviews and a networks framework were utilized to study the landscape of adoption of DIT. **c) Results:** The US is the only developed country without universal health coverage. The Affordable Care Act (ACA) was introduced in 2010 to make health insurance affordable and accessible to everyone. Implementation has been partial, and nearly 28 million people remain uninsured and another 18 million have inadequate health insurance. These deprived sections of society already have mortality higher than the general population, higher rates of mental and chronic illnesses, substance abuse and delayed diagnoses. They present to the health system later in the course of a disease when treatment costs are higher and outcomes less satisfactory. This is the results of a long-standing divide between clinical healthcare and public health, inadequate financing of public health, bureaucratic turf protection, partisan politics and distrust of government within the populace. Correction requires a health systems redesign by instituting changes in the structure of public health, health care delivery and medical education, increasing population health literacy, and integrating preparedness for national healthcare challenges. Details of the structure of the US health system, lapses and way forward will be elaborated. **d) Conclusions:** Public health and clinical medicine must function as a seamless continuum with public health at the forefront to ensure all Americans have access to affordable preventive and promotive healthcare.

Comparing health systems readiness for integrating services for domestic violence services: a multi-country synthesis

Manuela Colombini¹, Satya Shrestha², Stephanie Pereira³, Prabash

Siriwardhana⁴, Amira Shaneen⁵, Loraine Bacchus¹

¹London School of Hygiene and Tropical Medicine, United Kingdom,

²Kathmandu University, Nepal, ³Sao Paulo University, Brazil, ⁴University of Peradeniya, Sri Lanka, ⁵An Najah National University, Palestinian Territory, Occupied

Background: Domestic violence (DV) is a global health issue leading to adverse health consequences. Still, health systems are often unprepared to address it.

Methods: A health systems readiness assessment was conducted using multiple mixed-methods data sources including qualitative interviews, focus-group discussions, structured facility observations, and survey with providers. A cross-country synthesis and comparison across the multiple sources was conducted using a framework thematic approach.

Results: Common readiness gaps include unclear and limited guidance on DV, unsupportive leadership structure coupled with limited training and resources. Providers felt unprepared and lacked guidance on how to deal with DV cases, and felt unsupported and unprotected by managers and the organisation. Such organisational and service delivery challenges, in turn, also affected how health providers responded to DV cases leaving them less confident, less knowledgeable and unsure about their roles. Furthermore, providers' personal beliefs and values on DV and gender roles also impacted on providers' motivation and their ability to respond prompting some to become 'activists' while others reluctant to intervene and prone to blame women. Our synthesis also pointed to a disconnection between women and health services as women had low trust in providers being able to protect confidentiality, feared of being judged, or did not think health services would deal with DV (as it was not a traditional health issue).

Conclusions: Our study has shown the importance of having policy clarity on roles and responsibilities for both health managers and clinicians. It also highlighted the need to engage the leadership across every system to reframe challenges, and strengthening routine practices to encourage staff engagement in responding to DV. Future research should also determine the ways in which women, community or organisational preparations are related to later implementation success and how these interact with clients and communities.

Barriers of West African women scientists in their research and academic careers: a qualitative research

Ndeye Sougou¹, Oumy Ndiaye², Farah Nabil³, Morenike Folayan⁴, Samba Sarr⁵, Elhadji Mbaye⁶, Guillermo Perez³

¹Department of Preventive Medicine and Public Health, University of Cheikh Anta Diop, Dakar, Senegal, ²Faculty of Economics and Management, University Cheikh Anta Diop, Dakar, Senegal, ³Faculty of Health Sciences, University of Zaragoza, Zaragoza, Spain, ⁴Obafemi Awolowo University, Ile-Ife, Nigeria, ⁵Ministry of Health and Social Action, Dakar, Senegal, ⁶Institut de Recherche en Sante', de Surveillance E' pide' miologique et de Formation, Diamniadio, Senegal

Background and Objective: In 2016, the percentage of women researchers was 34% in Africa, but this figure hides great disparities according to the African Development Bank. Francophone West Africa remains one of the regions with the greatest gender disparities in the education sector. This study aims to identify barriers to the professional advancement of women researchers in West Africa.

Methods: This was a descriptive, observational, cross-sectional qualitative study conducted between June and September 2020 in five West African countries (Ghana, Senegal, Burkina Faso, Niger and Mali). Interviews were conducted with 21 female and 9 male health researchers by video call. After transcription, the data was thematically analysed using an inductive process.

Results: Four themes associated with barriers to women's careers development were identified. First was family- and environmental-related barriers. Gender norms that assign domestic tasks and responsibilities to women reduced the time they were able to dedicate to research. Second was gender insensitive organisational culture and institutional policies that deepened gender disparities and made it more difficult for women to attain leadership positions. Third was the need for women in research to undergo emancipation programs to strengthen their resilience and ability to make critical decisions as strategic approaches to address the challenges faced by women in the academia were a lot more focused on addressing their relationship with their spouse. Fourth, was the individual intermediate perception of professional and personal success which for many women, they perceive themselves as competent as their male counterparts and should not be subject to the gender discrimination they experience.

Conclusions: This work has highlighted the influence of family and social life on the professional lives of West African women researchers. The study could help contribute to the development of gender equality interventions for the career

development of women researchers in West Africa.

Adaptation and implementation of the healthcare responding to violence and abuse intervention in Nepal, Sri Lanka, Brazil and occupied Palestinian territory: a comparative analysis and lessons learned

Loraine Bacchus¹, Stephanie Pereira², Ana d'Oliveira², Beatriz Kalichman², Tharuka Ushani³, Prabash Siriwardhana³, Thilini Rajapakse³, Poonam Rishal⁴, Pusp Bhatt⁴, Smirti Luitel⁴, Samita KC⁴, Nagham Joudeh⁵, Amira Shaheen⁵, Gene Feder⁶, Claudia Moreno⁷, Manuela Colombini⁸

¹London School of Hygiene and Tropical Medicine, London, United Kingdom,

²University of Sao Paulo, Brazil, ³University of Peradeniya, Sri Lanka,

⁴Kathmandu University, Nepal, ⁵An-Najah National University, Occupied Palestinian Territory, ⁶University of Bristol, United Kingdom, ⁷World Health Organization, Switzerland, ⁸London School of Hygiene & Tropical Medicine, United Kingdom

Background: Health systems have a critical role in a multi-sectoral response to domestic violence against women, but the evidence is skewed to toward high-income countries, and lessons learned are not easily transferred to low-and-middle-income countries due to social, cultural and economic differences. The intervention strengthened the healthcare response to VAW through training for healthcare providers and managers and a care pathway for women experiencing domestic violence. The synthesis aimed to explore what factors promoted or inhibited the translation of HERA's intended goals into a 'real world' set of activities. **Methods:** Data sources include: qualitative interviews with health care providers and managers and women who disclosed violence; clinic data on cases of domestic violence and referrals; and the Provider Intervention Measure which assessed changes in attitudes and behaviour. Thematic analysis was used to analyse qualitative data and descriptive statistics were used to analyse quantitative data. **Results:** The intervention increased disclosure of violence from a negligible baseline in clinical settings, but there was little acceptance of further referral for services among women. Although obstacles varied between countries, some Findings were ubiquitous: the impact of the COVID-19 pandemic; poor inter-sectoral coordination; lack of engagement with communities; and a disconnection between what the care pathway could offer and the diverse needs of women. There was inconsistent recording of violence, compounded by multiple documentation systems; uncertainty about role of health care vis-à-vis perpetrators of violence; and poor understanding of VAW as a priority policy issue across sectors.

Conclusions: Fundamental research is needed to surface local understandings of how best to support women and children. Community engagement and community health workers have a critical role in building community trust in the health system response. Active leadership, management and institutional support is crucial to implementation.

A decade of national ambulances services in India: learnings and way forward

Kalpna Pawalia¹, Himanshu Bhushan²

¹National Health Systems Resource Centre, New Delhi, India, ²National Health System Resource Center, Munirka, India

Background and Objective: Referral transport is an indispensable part of health care delivery system of any country. A decade has passed since the launch of National ambulance services and over these years the country has witnessed a significant change in its referral mechanism. India being the second most populous country in the world fought the pandemic with its limited resources and preparedness and utilised the existing referral transport system for managing the COVID affected patients. This paper analyses the existing ambulance care delivery system in the country, highlights the steps and strategies taken by the Government in augmenting the capacity of the referral transport system in the wake of COVID 19 and the learnings thereafter. **Methods:** It is a qualitative descriptive study. Secondary data has been collated and analysed from various government portals, published guidelines and articles. Field visits reports and inputs based upon experiences have also been documented. The analysis was simply done on Microsoft excel.

Results: While the accessibility and affordability for referral services have improved over the years, a gap in the timely and assured deployment, along with the quality of services still exists which calls for further strengthening of the existing referral transport system in the country. **Conclusions:** While the pandemic is still lingering around in different forms and variants across the

world, a sustainable health system strengthening approach and preparedness is necessary to prevent any public health emergency in future. The country needs an integrated model which is responsive to the needs of the population for meeting their medical, surgical, accidental, and other emergencies along with assured transport with a trained technician. The paper highlights upon the specific areas which needs strengthening of the existing ambulances system, along with the proposed plan to experience a robust emergency and referral care delivery system in the country.

Popul. Med. 2023;5(Supplement):A981

The impact of COVID-19 pandemic on the Albanian healthcare system

Martina Giusti¹, Vieri Lastrucci², Maria Caldes³, Niccolò Persiani¹

¹Department of Experimental and Clinic Medicine, University of Florence, Florence, Italy, ²Department of Health Science, University of Florence, Italy, ³Centre of Global Health of Tuscany Region, Italy

During the COVID-19 pandemic national health emergency networks have been stressed at worldwide level. The responses of each network were different according to the models of the national healthcare system and the adopted strategies. This research aims to investigate the impact of the COVID-19 pandemic in the transitional countries. Albania was selected as representative among the transitional countries for its territorial and cultural proximity of Europe. The methodology of national case study was chosen. The analysis of the country was conducted both with interviews to the top managers of National Centre for the Health Emergencies 127 and the National Institute of Insurance, and with the desk analysis of the documents received by the same. Data showed that the number of calls to 127 increased by 47% in 2020, 56% in 2021 and 31% in 2022 (compared to 2019) for COVID-19. The requests were predominantly managed by telephone medical counselling (+243% in 2020, +89% in 2021 and +25% in 2022). This resulted in a strong containment of the growth in the number of missions (+15% in 2020, +22% in 2021 and +5% in 2022). In particular, the missions were completed more on site (+21% in 2020, +30% in 2021 and +7% in 2022) that with a transport in hospital (+12% in 2020, +17% in 2021 and +3% in 2022). This led to a reduction of access to health emergency departments of -25% in 2022 and -9% in 2021. However, hospital expenditure on emergency grows only by 22% in 2020 and 22% in 2021 in the face of higher costs for the management of patients affected by COVID-19. The strategy of the Albanian Healthcare System to manage COVID-19 positive patients at home has contained the impact the outbreak on costs of hospital emergency departments.

Private healthcare and economic commodification of health are creating equity and inclusivity issues for healthcare systems in India

Mahesh Bhatt¹

¹MMBSHS Trust, Dehradun, India

Background and Objectives: COVID-19 exposed the equity and inclusivity issues of healthcare systems globally. This study aimed to understand the commodification of healthcare and equity, inclusivity issues, and privatization of healthcare in a diverse country of 1.3 billion people, India.

Methods: We analyzed the increase in population between 2011 and 2020, data provided by government agencies, NGO reports, and media regarding expenditure on healthcare by the government, healthcare resources, health services utilization, and gaps in rural and urban healthcare.

Results: While the population of India increased by 13.25% from 2011 to 2020, health expenditure only grew by 0.39%. Three-fourths of the population relies on private healthcare and out-of-pocket spending, so the finance commission recommended increasing healthcare spending to 2.5% of GDP by 2025, which appeared difficult with current budgetary trends and political conditions. 80% of doctors work in urban areas where only 30% of the population lives, resulting in the vacant posts of doctors in rural and semi-urban areas. Unnecessary tests, procedures, unwarranted surgeries, and over-medicalization of healthcare are due to over-commercialization. The system forces doctors to decide on their employers' business interests, neglecting ethics. Market-driven healthcare inflation increases the vulnerabilities of vulnerable sections of society multiple times, pushing 50-55 million Indians below the poverty line every year.

Conclusions: The nudging of strong market-driven forces on healthcare policy frameworks of India is apparent in the PPP model implementation and insurance. Big hospitals, diagnostic facilities, and pharmacies have business interests in urban middle and upper-middle-income households. They are least interested in

Primary Health Care and less lucrative National Health Mission (NHM) activities, which are necessary for universal health coverage (UHC), equity, and inclusivity in healthcare. Privatization is increasing commercialization, creating a vicious cycle of commodification and over-medicalization of health, widening the service gaps, and losing confidence in public healthcare.

Barriers and facilitating strategies to implementing social prescribing in primary care settings in Lisbon: a qualitative study to explore key stakeholders' perceptions

Sónia Dias^{1,2}, Louise Hoffmeister^{1,2}, Ana Gama^{1,2}

¹National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal, ²Comprehensive Health Research Center (CHRC), Campo Mártires da Pátria, Lisbon, Portugal

Social prescribing (SP) is an intersectoral strategy of integrated care involving a link worker and multiple stakeholders to address users social, economic and emotional needs through the activation of community assets. SP can contribute to improve individuals' health and well-being and strengthen health systems responsiveness and efficiency. Gaps remain about challenges and influencing factors of SP implementation process. This study assessed perceived barriers and facilitating strategies of implementation of a SP project in two Family Health Units in Lisbon. Semi-structured interviews were conducted with 9 stakeholders (family doctors, social workers and community partners involved in SP), exploring barriers and facilitators to SP planning and implementation. Data were analysed through content analysis technique based on the Consolidated Framework for Implementation Research domains. The main challenges in SP implementation described by participants were the insufficient human resources, lack of time from the link workers, lack of available community responses, and reduced user awareness and adherence to the intervention. Key facilitators of the intervention included knowing the community resources available and having the professionals qualified for the role of link worker. Strong engagement of general practitioners, health authorities and technicians from community sector, frequent communication between stakeholders, and physical presence of link workers at health services were also identified as facilitators. Furthermore, having a national commitment towards SP and the support of a trustworthy research team to monitor and evaluate SP implementation were highlighted. The settings specificities are crucial for the success of the SP, but they directly depend on both organisational and individual factors that change across contexts. Priority actions for effective implementation should focus on investments in training of health professionals and community partners and promotion of user adherence. These actions may contribute to maximising the SP benefits for improved integrated care, multisectoral collaborations, and health system strengthening and sustainability.

DOI: 10.18332/popmed/165380

Prevention as a model for taking charge of the chronic and multichronic patient

Vicenzo Gaudio¹, Adele Sarcone², Arrigo Palumbo³, Rossella Zucco⁴

¹PREVENTION DEPARTMENT ASP COSENZA, ²Università degli Studi "Magna Græcia", Italy, ³Department of Medical and Surgical Sciences, Magna Græcia University, Catanzaro, Italy, ⁴APS Cosenza, Public Health Unity, Prevention Department, Cosenza, Italy

Introduction and Objectives: The project in question is part of various interventions already defined at national and regional level regarding the management of chronicity and multichronicity. Chronic pathologies are progressively growing and, requiring continuity of assistance for long periods of time as well as a strong integration with social services, they use up a large part of the resources of the SSR. Chronic-degenerative diseases weigh on the daily lives of four out of ten Italians.

Methods: The criteria for monitoring the evolution of the severity of the state of health will be defined and innovative tools will be defined that are useful for identifying the chronic population in a condition of serious frailty that requires greater social-health care. The system will have to make it possible to modify the diagnostic therapeutic assistance approach according to the seriousness of the social context in which the patient has fallen through pathology-specific integrated assistance programs - Disease management programs - based on the Chronic Care Model (CCM), developed for partially obviate the financial and organizational fragmentation of the health service and try to bridge the gap between the abundance of resources employed, services provided and the relative shortage of health outcomes.

Conclusions: 1. The project idea that we intend to present concerns the

implementation of a modern telemedicine system aimed at patients suffering from chronic diseases. The telemedicine module is of fundamental importance, as it allows remote clinical screening of all those patients with chronic and multichronic pathologies, in order to avoid hospitalization of the patients themselves. 2. This project also involves the use of an Augmented Reality Device that allows you to interact with holograms in the physical environment. With this approach, the way of thinking about telemedicine changes completely.

DOI: 10.18332/popmed/165455

Multi-sectoral approach in health sector: focusing on public-private partnership under the National Health Mission in India

Upasana Mohanty¹, Anushka Sahu²

¹Kalinga Institute of Industrial Technology (KIIT), School of Law, Odisha, India, ²School of Law, Kalinga Institute of Industrial Technology (KIIT), Odisha, India

Background: Public-private partnership (PPP) has remained an integral part of health reforms in India and is persisting to be an essential component of the National Health Mission (NHM). India being a welfare state has invariably emphasized the public delivery of services. However, due to concerns about underfunding in the public sector, the private sector stepped into the health sector and identified their roles and responsibilities for the effective implementation of health services and programmes. They have been mutually dependent and there has been a history of successful collaborations. The goal of this paper is to look at evidence on the performance of PPPs in health care services, and identify the challenges and give recommendations for a robust system.

Methods: The authors have systematically reviewed peer-reviewed literature, specifically from the SCOPUS database. Data have been retrieved from the official archives of the Government of India online portals to provide us with significant information regarding the characteristics of the PPP model and other relevant evaluative studies.

Results: The findings demonstrate that the majority of PPPs are based on contractual models. In the recent decades, the private sector has rapidly diversified its scope in the health sector and contributes > 70%. Emphasis needs to be given in the governance structure, monitoring framework, and redressal mechanism.

Conclusions: It is important to provide a conducive environment in building the capacities of the states in administering PPP that will eventually help to establish a transparent, long-term, and sustainable public health system. From the capacity building of all actors involved in the partnership to assess the functioning, it becomes important to frame policies, legal and institutional frameworks to engage the private players.

Keywords: public-private partnership, National Health Mission, health policy, healthcare sector

Working from home made possible in a health care facility - the experience of a tertiary hospital during the first COVID-19 wave

Avi Magid^{1,2}, Netanel Horowitz^{3,4}, Avi Magid^{3,5}, Ronit Almog^{1,4}, Yael Shachor-Meyouhas^{1,4}, Avi Weissman^{1,4}, Michael Halbertal^{1,4}, Michal Mekel^{3,6}

¹Rambam Health Care Campus, Haifa, Israel, ²The Max Stern Yezreel Valley College, Emek Yezreel, Israel, ³Management, Rambam Health Care Campus, Haifa, Israel, ⁴The Ruth and Bruce Rappaport Faculty of Medicine, Technion-Israel Institute of Technology, Haifa, Israel, ⁵The Max Stern Emek Yezreel Valley College, Israel, ⁶The Ruth & Bruce Rappaport Faculty of Medicine, Technion-Israel Institute of Technology, Haifa, Israel

Background and Objective: In recent years working from home (WFH) has become more common worldwide. In spite of its advantages, its prevalence worldwide before the outbreak of the COVID-19 pandemic was relatively low. The outbreak of COVID-19 pandemic enforced millions of employees to switch to WFH. Unlike other work domains, data regarding the efficiency of WFH in health systems are sparse. The objective of this study was to describe the experience of WFH in a tertiary care center during the first wave of COVID-19, and to evaluate its efficiency as perceived by employees and managers.

Methods: WFH for one day a week was permitted to selected hospital employees according to predefined criteria. A cross-sectional online survey was distributed to all employees to evaluate the experience, including the perceived efficiency and satisfaction while WFH. Descriptive analyses were used to describe the WFH characteristics.

Results: Out of 611 employees who answered the survey, 26% were managers, and 42% were permitted to WFH. Most managers were able to evaluate the employees' work efficiency (98%), had good communication with the employees while WFH

(96%), and evaluated the employees' work performance as satisfactory (100%). Most WFH employees worked in a private setting (85.7%) during fixed hours (84%). Only 43.1% combined home tasks with WFH. Almost all WFH employees reported meeting their working goals (98.7%), and perceived WFH as efficient (98.7%) with high quality (97%).

Conclusions: Our experience during the COVID-19 pandemic demonstrated that partial WFH can be successfully implemented in a large tertiary hospital with satisfaction of both employees and managers. WFH may now be gradually implemented to routine times without compromising work goals and objectives.

Which sectors should be involved in public health emergency preparedness, response and recovery?: a RAND modified consensus procedure among European union national experts

Sandra Kamga¹

¹National Institute for Public Health and the Environment (Netherlands) Netherlands

Background and objective: There is a clear need for a better understanding of optimal configurations and timing of multisectoral collaboration during public health emergencies (PHE). With this study, we aim to gather European national experts' views on which sectors should be involved in public health emergency (PHE) preparedness, response and recovery.

Methods: The study was designed based on the RAND modified consensus procedure, consisting of three consecutive steps. Firstly, a questionnaire was conducted amongst European national experts involved in the COVID-19 pandemic, to collect views on (1) sectors that should be involved in PHE preparedness, response, and recovery, and (2) recommendations on how to improve national PHE to include multisectoral collaboration. Secondly, a hybrid expert meeting took place to discuss the inclusion or exclusion of sectors and recommendations for which consensus was not met in the first questionnaire. Lastly, a second questionnaire was conducted with the aim of reaching consensus for the items discussed during the meeting.

Results: According to the 26 national experts from 12 countries that participated, the following sectors should be involved in all PHE phases: (1) Agriculture, forestry, fishery and the environment, (2) Human health industry, (3) ICT service activities, (4) (Human) Transportation and Points of entry, (5) Education and training, (6) Energy and water supply, sewerage and waste management, (7) Media and communication, (8) Governmental institutions, (9) Experts, (10) Civil Society, (11) Veterinary activities, and (12) Chemical industry. Additionally, the sector "Personal service, administrative support and security investigation activities" should also be included in the response phase. All 10 suggested recommendations on how to improve national PHE plans to include multisectoral collaboration were accepted. **Conclusion:** This study provides guidance on sectors to consider when designing and/or evaluating national PHE plans, as well as recommendations on how to integrate multisectoral collaboration in preparedness and response plans.

DOI: 10.18332/popmed/163646

One health community-based systems for prevention and preparedness to vector-borne diseases: a situation analysis of the MediLabSecure network

Maria Dente¹, Claudia Robbiati¹, Alessia Milano¹, Silvia Declich¹

¹Istituto Superiore di Sanità - Italian National Institute of Health, Italy

Background and Objectives: Vector-borne diseases (VBDs) are on the surge due to global and climate changes. The "Global Vector Control Response 2017–2030" strategy calls for community engagement and inter- and intra-sectoral action, as exemplified by the One Health (OH) approach. Evidence needs to be gathered about how countries are engaging communities for VBDs OH prevention and preparedness.

Methods: The MediLabSecure project (www.medilabsecure.com [1] - European Commission/NDICI THREATS FPI/2021/427-564) aims to prevent VBDs by promoting OH approaches to emerging arboviruses within an international network of 22 countries across the Mediterranean, Black Sea and Sahel Regions. A situation analysis, including an online survey and a workshop, were promoted within the network to explore to what extent the countries engage communities for arbovirus prevention and preparedness with a OH approach.

Results: Within the MLS network around half of the countries national VBDs plans or strategies include community engagement and 15 countries have community systems for arbovirus prevention and preparedness, mostly involving vector and disease surveillance. These systems embrace at least two sectors (human health, entomology or animal health), and most of them share data with institutional

surveillance systems. Countries not mobilising communities deem this as feasible and identified the main barriers in the lack of financial support and the difficult integration with the institutional systems. To support the implementation of VBDs OH community-based prevention and preparedness an enabling financial and policy framework, evidence about design, implementation and effectiveness of community systems are necessary.

Conclusion: The survey and the workshop identified community-based systems in place within the MLS network and areas for improvement. Decision-makers would be supported in the co-design of OH community-based systems for arbovirus and VBDs prevention and preparedness, integrated with institutional systems. This case-study could be replicated in other countries to support them in the identification of opportunities to improve community engagement. Links:-----[1] <http://www.medilabsecure.com>

DOI: 10.18332/popmed/163797

Using community-university partnerships to implement WHO's Intersectoral Global Action Plan on epilepsy and other neurological disorders (IGAP) 2022-2031: an example focusing on mental health in children with epilepsy and their parents

Kathy Speechley¹, Karen Bax², Klajdi Puka³, Mary Secco⁴, Michelle Franklin⁵, Karina Tassiopoulos³, Alyssa Mueller⁶

¹Western University, Paediatrics and Epidemiology & Biostatistics, Children's Hospital, LHSC, 800 Commissioner's Road East, London ON, N6A 5W9, Canada, ²Western University, ³Western University, Epidemiology & Biostatistics, 1465 Richmond Street, London, ON, N6G 2M1, Canada, ⁴Epilepsy SouthWestern Ontario, International Bureau for Epilepsy, 797 York St, Unit 3, London, ON, N5W 6A8, Canada, ⁵Epilepsy SouthWestern Ontario, ⁶Western University, Psychology, 1465 Richmond St, London, ON, N6G 2M1, Canada

Background/Objective: In 2022, WHO's Member States approved The Intersectoral Global Action Plan on Epilepsy and other Neurological Disorders (IGAP), endorsing a comprehensive, coordinated, intersectoral response to reduce gaps in epilepsy knowledge and treatment. Given the importance of IGAP implementation, we aim to illustrate how partnerships between community agencies and academic researchers can accelerate uptake of evidence-based programming to enhance quality of life in people with epilepsy.

Methods: Academic researchers were approached by a community epilepsy agency about the need for a new approach to reduce stress and manage emotions and behaviors among children with epilepsy and parents. Together we delivered and evaluated a mindfulness-based parent and child program designed to improve mental health. We assessed feasibility of interactive online delivery by agency staff to enable scaling up delivery across our region and beyond.

Results: We executed a randomized controlled feasibility trial with 73 child-parent dyads. Benefits and challenges were documented from the perspectives of community agency and researchers. We identified two key mutual benefits: our research directly addresses a community-identified need to foster mental health in children with epilepsy and parents, and funding is easier to secure due to our effective partnership. Challenges for the community partner include time required to learn and execute research processes. Challenges for researchers include innovation and flexibility required to design interventions for integration into agency operations given limited resources. We will present specific lessons regarding key facilitators for success.

Conclusion: This intersectoral partnership between a community epilepsy agency and an interdisciplinary team of researchers demonstrates one example of implementing the IGAP's Strategic Objective 5: Strengthen the public health approach to epilepsy. We articulate specific facilitators to overcome barriers to achieve IGAP's "148 (d) conduct implementation research, including the dissemination of lessons learned to accelerate the scale-up of successful strategies to strengthen epilepsy services".

Success of systems thinking in prevention - community perspectives

Tiana Felmingham¹, Elizabeth Hoban¹, Kathryn Backholer¹, Steven Allender¹

¹Deakin University, Australia

Background and Objective: Systems thinking is increasingly being used in communities to address some of the world's most complex public health challenges. A method within systems thinking, community-based system dynamics, helps communities visualise factors and interconnections of complex problems from the community's perspective, identifying potential action and

empowering communities to lead community change. While there are numerous descriptive examples of community-based system dynamics in the literature, there are fewer examples documenting evaluation. This study aimed to understand success of community-based system dynamics in public health practice and implementation factors that influence success, from the perspective of practitioners (health professionals) and participants of community-based system dynamics approaches.

Methods: Semi-structured, in-depth interviews were conducted with health professionals, organisational public health leadership and community members that took part in community-based system dynamics case studies in rural Victoria, Australia. Interview questions were derived from the constructs of Community Coalition Action Theory and Complexity Theory.

Results: Inductive thematic analysis was used to group and theme data from interviews. Themes related to success and implementation drew on constructs of Community Coalition Action Theory (stages of development; community context; lead agency or convening group; coalition membership; processes; leadership and staffing; structures; member engagement; and pooled member and external resources) and Complexity Theory. The outcomes of the analysis identified interactions between descriptors, feedback loops and unintended consequences. Conclusion: This study helps us to understand success of community-based system dynamics in practice, including implementation factors that influence success. More evaluation examples of community-based system dynamics are needed. These findings advance systems thinking practice in public health by informing evaluation and measurement of effectiveness in the community setting. This study helps us understand how and why existing practice influences outcomes in the community.

The Comprehensive Sexuality Education - Adolescent Reproductive Health (CSE ARH) Convergence: a multi-sectoral service delivery intervention integrating homes, schools, and communities

Jeffrey Lorenzo¹, Maria Murga², Algin Gultia³, Lucille Galicha⁴

¹Johns Hopkins Center for Communication Program, USAID ReachHealth Project, F. Ortigas Jr. Road, Ortigas Center, 1600 Pasig City, Metro Manila, Philippines, ²Johns Hopkins Center for Communication Program, ³Johns Hopkins Center for Communication Program, JHU CCP, F. Ortigas Jr. Road, Ortigas Center, 1600 Pasig City, Metro Manila, Philippines, ⁴RTI International, USAID ReachHealth Project, F. Ortigas Jr. Road, Ortigas Center, 1600 Pasig City, Metro Manila, Philippines

USAID ReachHealth project conducted a Human-Centered Design study with over 200 teens and their influencers to understand teenage pregnancy in the Philippines. Key insights led to the development of the Comprehensive Sexuality Education - Adolescent Reproductive Health (CSE-ARH) Convergence. This is an inter-sectoral and multilateral network of government agencies and organizations that seeks to harmonize strategies, share resources, and implement collaborative activities to strengthen the referral pathways of school-based interventions to increase the utilization of adolescent friendly health information and medical services.

The CSE-ARH Convergence has five components: A. Setting up - 1) Endorsement and Partnership, 2) SBC Tools and Materials Consolidation and Development, 3) Building Capacities of Schools and Communities. B. Delivery of Programs and Services - 4) Provision of Quality FP-ARH Information and Services. C. Cross-cutting - 5) Monitoring, Evaluation and Learning. Each component has its own features, level of collaboration, and designed tools. The Convergence model recognizes the social determinants of teenage pregnancy and tackles this on multiple levels - from helping teenagers themselves access accurate FP-ARH information, to building the capacities of parents, teachers, health service providers, and students; to strengthening in-schools health services and establishing functional referral links between schools and health facilities certified as adolescent friendly. The on-going implementation has already shown some results: government commitments established through policies and budget plans issued; national teen campaign launched and rolled out; students engaged as peer health navigators; psychosocial assessments being provided in pilot schools; referral links established with health facilities certified as adolescent friendly. More lessons will be shared in the next few months.

The convergence model can unlock the full power of partnership as it serves as a platform for collaboration, resource sharing, meaningful engagement of key stakeholders especially the teens, and sustaining efforts on family planning and adolescent reproductive health in the Philippines.

Multisector Collaboration Model for COVID-19 Diagnostics in the Philippines

Angeli Comia¹, Jacqueline Momville²

¹Zuellig family foundation, Philippine society of public health physicians (PSPHP), Block 3 lot la residencia virginia subdivision, majada out, calamba city, Philippines 4027, Philippines, ²Provincial health office of agusan del sur

Background and Objectives: The fragmentation and unpreparedness of the healthcare system for the management of the COVID-19 pandemic led to high local transmission and mortality. Due to the lack of testing facilities for COVID-19, the local government of Agusan del Sur depended on national and regional molecular laboratories with a turnaround time of 5 to 10 days. Hence, the late detection of COVID-19 resulted to further spread and overwhelmed the local health system capacity. This study aimed to determine the effectiveness of establishing a molecular laboratory through a multisector collaboration.

Methods: Applying the Health Change Model by the Zuellig Family Foundation, the leaders received training, coaching, mentoring, and technical assistance with an increased sense of urgency to establish and institutionalize effective and efficient testing for COVID-19 to cater to the people of the province and the nearby areas in northeastern Mindanao. The empowered leaders of the province collaborated with different public agencies, civil society organizations, and the private sector to contribute expertise and valuable resources to establish their own molecular laboratory for faster COVID-19 detection.

Results: The proactive and collaborative approach in the province of Agusan del Sur to institutionalize its own testing capacity resulted in a significant reduction in turnaround time from 5-10 days to less than 24 hours and even less than 4 hours for stat samples in emergency cases.

The expanded testing capacity made a huge contribution in identifying, isolating, and managing SARS-CoV-2 positive individuals, facilitating biosurveillance activities and research

Conclusion: The empowered leaders exemplified the Health Change Model in engaging stakeholders to share accountability and prioritize the building of reliable and sustainable diagnostic testing for COVID-19 and for other infectious diseases. Early detection of COVID-19 effectively controlled and rapidly reduced the infection and subsequent mortality in the community.

A systems approach to strengthening health service delivery in catastrophic injury related disability

Chebiwot Kipsaina¹, Angelita Martini²

¹Brightwater Care Group Brightwater Research Centre, Brightwater Care Group, Inglewood, Australia; Curtin Medical School, Curtin University, Bentley, Australia; Brightwater Research Centre Brightwater Central 2A Walter Road West Inglewood WA 6052, Australia, ²Brightwater Care Group Brightwater Research Centre, Brightwater Care Group, Inglewood, Australia; The University of Western Australia, Crawley, Australia Brightwater Research Centre, Brightwater Central, 2A Walter Road West Inglewood WA 6052, Australia Australia

Background and Objectives: Despite widespread application of the systems approach to tackle several public health problems -tobacco control, obesity, and chronic diseases, its application in injury related disability is limited. This study will describe a systems approach to disability and health service delivery derived from the World Health Organisation (WHO) Health Systems Strengthening framework for use by practitioners. The premise of the proposed health system framework is that an effective systems approach to public health issues such as disability, is a result of continuous interaction and interconnectedness of the building blocks, namely - service delivery, financing, governance, the health workforce, information systems, and supply management systems.

The study aims to develop an injury related disability service delivery model that applies systems approach for desired health outcomes and with the potential to strengthen the health systems.

Methods: Based on pilot work conducted in 2019, current study will synthesise diverse insights from injury related disability service delivery experiences and observations, review of the literature and the findings of the pilot study.

Results: Informed by the WHO framework for strengthening health systems and the nine key areas of the framework for implementation of the WHO Ouagadougou Declaration on primary health care and health systems, the study will present findings under the key elements required to underpin optimal delivery of injury rehabilitative service: (i) Leadership and governance; (ii) Service delivery; (iii) Workforce; (iv) Financing; (v) Technical equipment and supplies (Health

technologies); (vi) Health information; (viii) Community participation; (viii) Social determinants of health; (ix) Partnerships (xi) Co-designed research.

Conclusion: The Service Delivery Model is a tool which will deliver a base of evidence, quality measures and innovation to guide practitioners and policy makers in planning, developing, and implementing an integrated approach to strengthening health systems for delivery of injury and disability related rehabilitative services.

Strengthening team building and capacity development for data quality: the case of hiv program in delta state, Nigeria

Tommy Umukoro¹, Paul Marcus², Uparegh Imoter³, Oko, Okpanachi³, Olanrewaju Olayiwola²

¹Caritas Nigeria Plot 459 Cadastral Zone B2, Durumi 1, Garki, Abuja Nigeria, ²Caritas Nigeria, ³Caritas Nigeria 1 Durumi 1, Garki, Plot 459 Cadastral Zone B2, Abuja Nigeria

Background: Improving human resource management and capacity building to improve health service delivery is critical for a cohesive workforce and quality reporting in any program. Our HIV program intervention in Delta state was hampered by insufficient capacity among program and team members, which hampered the turnaround time for quality and timely reporting of program activities. The purpose of this study is to assess the efficacy of the approaches used to improve data collection, analysis, and dissemination, which resulted in improved data quality and reporting.

Method: Observational studies and questionnaires were used to assess each team members capacity gaps. The result of this studies were analyzed. Each team were mentored for 6 -12 months based on their identified training needs. Regularly virtual training were provided with personal development opportunities like individual courses to help them broaden their skills and knowledge. Each teams progress was tracked over time, and feedback was provided through spot checks and capacity reviews. Identify areas for improvement and deal with problems that are affecting team performance. Individual and team performance awards were used as incentives to promote healthy competition and team motivation.

Results: Over the course of two years, 73 team members were trained. Program reporting and report completion increased from 24% at the start of the project to 100%. In 2022, the number of team members who completed a learning resource increased from 13 to 83. In Delta state, the number of HIV patients receiving treatment increased from 14,000 in 2017 to 72,000 by 2022.

Conclusion: Encouraging the exchange of ideas, skills, competencies among team members helps in team building and is an effective method to capacity building. Gaps in data quality and reporting timeliness can be filled by increasing team members capability through online courses and improving communication between team members and their supervisors.

Management of a west Nile virus case in the province of catania: A one health approach

Milena Nardi¹, Giuseppe Mangano², Rosario Vinci³, Mirella Basile⁴, Francesco Mancusa⁵, Mario Cuccia⁶, Gabriele Giorgianni⁶, Melissa Gullotta³

¹Università degli studi di Catania via cristoforo Colombo 28 Italy, ²Università degli studi di Catania, ³Università degli studi di Catania Italy, ⁴Dipartimento di prevenzione veterinaria, asp CT Italy, ⁵Dipartimento di prevenzione veterinaria, asp CT, ⁶Dipartimento di prevenzione, SEMP, asp CT Italy

Background and Objective: Vector-borne infectious diseases (VBDs) are a major public health concern worldwide. West Nile virus (WNV) was first reported in Europe in 1958. The Minister of Health, since 2002, has activated the National Surveillance Plan for WND. In 2022, 588 confirmed cases of infection in humans were reported in Italy, including 295 neuro-invasive forms and 37 deaths. In Sicily, 3 cases have been reported, 2 in Trapani and 1 in Catania. In October, a case of WND was confirmed in a woman in Ramacca (CT), in an area already under surveillance for previous cases in equines.

Methods: After the human case, the veterinary prevention department of the ASP of Catania enforced clinical and entomological surveillance in stables within a 10-kilometer radius. The equids with nervous symptomatology were notified in SIMAN, and all animals in place were serum sampled for ELISA-IgM test and blood sampled with EDTA for RT-PCR. Anatomopathological examination was performed on the two deceased animals. An information campaign started involving mayors and breeders of Paternò and Ramacca municipalities.

Results: The clinical surveillance revealed 2 outbreaks confirmed in equids, one in Ramacca (3 cases) and the other Paternò (21 cases). Laboratory findings for the deceased horse in the outbreak in the municipality of Paternò resulted in the

isolation of WNV Lineage 1. On entomological surveillance, no mosquitos (*Culex pipiens*) were positive for WNV.

Conclusions: Climate change could determine the increase of *Culex pipiens* circulation, promoting the possible spillover of WNV, which is usually present only in 1-2% of circulating mosquitoes. Therefore, it's not surprising, despite the presence of the virus in 24 equids and the human case, the virus could not be isolated in entomological samples. In conclusion, only a multidisciplinary, one-health approach could contain WNV spread and the risk of human transmission.

Understanding Consumer Perspectives to Improve the Local Food Environment and Healthy Eating Behaviors

Rachael Dombrowski¹, Alyssa Beavers², Bree Bode¹, Winona Bynum³, Dazmonique Carr⁴

¹California State University San Marcos 333 S. Twin Oaks Valley Road ELB 507 United States, ²Wayne State University United States, ³Detroit Food Policy Council, ⁴Detroit Food Policy Council United States

Detroit residents experience an abundance of health inequities and poor health outcomes. Rates of obesity are 44 percent among youth and 70 percent among adults. Nearly 40 percent of Detroit families live in poverty and 30 percent of families do not have access to reliable transportation. The Detroit Grocery Coalition has collaborated with consumers over the past five years to create the Great Grocer Project (GGP), which assists local, independent grocers in improving their healthy food offerings, increasing access to high-quality healthy foods and promoting positive health outcomes and economic vitality for local communities. Intercept surveys among consumers (N=166) were completed within 43 stores and assessed consumer awareness of the GGP activities, healthy eating behaviors, food security and other health outcomes. Focus groups were also conducted within seven Detroit neighborhoods (n=38) to assess consumer perspectives of their local food environments. Survey and focus group participants were African American (78%) and female (53%) with half utilizing SNAP. Participants used personal vehicles for their grocery shopping (68%). Thirty percent of participants reported shopping in chain grocers within five minutes of their home. Only 12% of Detroit consumers met the Recommended Dietary Intake (RDI) for fruit, 8% reported meeting RDI for vegetables and 12% met RDI for intake of sugary drinks. Most focus group participants discussed a need to improve the quality of healthy foods sold in their local stores and wanted to assist local store owners in making those improvements. Improving quality of healthy foods would enable greater consumption of these foods according to reports from focus group participants. Community perceptions of the local food environment present ample opportunity for improving the availability of healthy options, improving healthy behaviors and reducing chronic disease. Consumers reported preference in utilizing a neighborhood store for their groceries, as long as stores are clean and welcoming.

The World Bank and Health Systems: A Policy Process Analysis

Amitabha Sarkar¹

¹Global Health Centre, Geneva Graduate Institute Indian Public Health Association Office: Bureau P2-718, Maison de la Paix, Chemin Eugène-Rigot 2, 1202 Geneva Mailing address: CP 1672, 1211 Geneva 1, Switzerland Switzerland

Background: The health systems is a domain of policy-based lending for development financing institutions (i.e. the World Bank) to improve the health of the population in the low and low-middle income countries. The aim of this research is to explore the instrumental role of the Bank's health systems policy. It is a policy process analysis to understand how the Bank's health systems policy gets formed and formulated (at the international-level of the macro system), then adopted and modified (at the national-level of the meso system) and finally implemented and operated (at the regional-level of the micro system).

Methods: This policy process analysis has been conducted by using three methods at various levels of the policy; discourse analysis (formation-formulation), situation analysis (adoption-modification), institutional and context analysis (implementation and operation).

Results: The World Bank has been active in the formulation of health systems policy for the last four decades by developing various health systems approaches (such as, basic health care, health systems development, health systems strengthening). The analysis finds that the Bank's health systems policy content at the macro level (international) has always been determined by the interactions between global economic governance and global health governance. At the meso system (India as a case study), the health systems policy with the help of policy

tools (Country Assistance Strategy) and instruments (research and lending) forge alliance with the existing national health plan to further percolate down to the state level. Finally, the health systems policy as health systems approach (in programmatic form) gets implemented and operated at the micro system by often using the decentralization structure of governance (Karnataka as a case study). Conclusion: The economic management of health care and not epidemiological reasoning is getting primacy in policy defining (macro-level), designing (meso-level) and programming (micro-level) decisions. This adversely affects the policy outcomes.

Partnership between public health and the police – needed more than ever

John Middleton¹, John Middleton¹

¹ASPHER Avenue de Tervueren 153, 1050 Brussels Belgium

Joint working between police and public health professionals is essential, for example, in emergency preparedness and response; safeguarding children and vulnerable adults; responses to acute mental health problems, problems of addiction and domestic violence; accident prevention; offender management and rehabilitation; and preventing racial violence. In the UK community safety partnerships continue to be the overarching bodies representing local authorities, the police, health services and public health, fire services, community and minority representatives and charged with planning to prevent crime and violence at local administrative level. Knowledge of the epidemiology of violence and crime, and evidence-based interventions have increased. There is growing recognition of the impact of adverse childhood experiences and the need for trauma-informed interventions by police and health services. The development of partnerships between police and public health requires enthusiasm, expertise, mutual respect and commitment by senior officers and officers working at the frontline.

Joint training is essential. Co-location is beneficial where joint decision making in real time is necessary as in children's safeguarding and mental health responses. Progress in partnerships has been undermined by austerity policies, political indifference, and disruptive service reorganisations. This paper will describe my experiences over 40 years of working with the police at local, national and international levels. In the age of pandemics and populism, it is more vital than ever that public health and police forces work together and develop effective partnerships, for the safety and health of the communities they serve.

Development of a national human rights survey using equal explanatory power - flipping the picture in the collection of national survey quantitative data honouring indigenous populations

Emma Patu¹, Kerri Kruse², Emma Patu³

¹World Federation of Public Health Associations PHANZ 81b Maraetai School Road Auckland 2018 New Zealand, ²Human Rights Commission New Zealand New Zealand, ³World Federation of Public Health Associations PHANZ New Zealand

The Human Rights Commission is the NATIONAL HUMAN RIGHTS INSTITUTION FOR NEW ZEALAND. We work across New Zealand to increase human rights standards in law, policy and practice. As a national human rights institution we work for a free, fair, safe and just New Zealand, where diversity is valued and human dignity and rights are respected. In New Zealand we work to uphold te Tiriti o Waitangi, the foundational document that upholds the rights of all New Zealanders and acknowledges the partnership relationship between Maori, the Indigenous people, and the British Crown. New Zealand is working hard to understand its contemporary responsibilities to this document and to uphold, authentically the rights of Indigenous New Zealand as it has not done since it was signed in 1840. The HRC is developing a unique quantitative national survey honouring this important document and partnership relationship. It is the first time a national survey has been developed to acknowledge an Indigenous population as a Population Group in its own right rather than as a minority. Equal Explanatory power is being used to collect a data sample that reflects this treaty partnership in action in quantitative research. This project demonstrates how to work in authentic partnership in the development of such a project from the design, leadership and decision making at all levels and includes an advisory group that also reflects that partnership by ensuring that at least half is comprised of Indigenous Academics and advisors. This is a unique opportunity to share this ground breaking methodology and approach and demonstrate to others how ideas of co-governance, shared decision making and authentic partnerships

with Indigenous peoples can be utilised to strengthen human rights practice, and ultimately the health outcomes of populations by gathering large scale quantitative data to inform Human Rights practice and mechanisms globally.

Intersectorality as an instrument to improve unified health system (sus) performance: mapping the intersectoral agendas of the ministry of health of Brazil

Jamyle Grigoletto¹, Jessica Quadros², Jessica Lopes², Iara Quirino², Priscila Carvalho², Everton Silva²

¹Ministry of Health - Brazil SQNW 311 bloco d 515a Noroeste Brasília-DF Brazil, ²Ministry of Health - Brazil Brazil

Intersectorality as an instrument of public health policy provides efficiency, effectiveness, and efficacy of actions, enabling the resolution of complex problems. This study describes the mapping of the intersectoral agendas of the MOH of Brazil between September and December 2022. It was carried out an exploratory descriptive situational diagnosis with a quali-quantitative approach to raise and characterize intersectoral action involving MOH. The research developed bibliographic surveys regarding the intersectorality, strategic concepts about health policies/programs, and main normative acts that guide the intersectoral action. The data was collected using a standard instrument together with the technical areas and document analysis. It registered the participation of 100% of the technical areas requested, namely 398 in collegiate bodies and 116 in intersectoral instances. The main findings consist of confirmation the strong relationship between the health sector and Social Assistance, and citizenship; Human rights; Science and technology; Justice and public safety; Environment; Work and income; and Education, as an expression of the social determination of the health-disease process. Despite a polysemic understanding of the concept of intersectorality, it can be inferred that this is a reality in terms of MOH actions, being presented as a guideline in the policies and programs mapped. However, it is a challenge, as the intersectoral organization demands the combination of different and complex knowledge, powers, practices, goals, resources, and joint monitoring. It is suggested the institutionalization of mapping as well as its recognition as an instrument that promote knowledge, provide transparency to the universe of intersectoral public policies, provides social collaboration and control, synergy between internal and external actions, minimizes overlaps, and enhances the performance of the MoH concerning other sectors. It attempts to pursue synergy between public policies to improve the populations health and the performance of the Unified Health System (SUS).

DOI: 10.18332/popmed/164630

An indigenous-centered methodology for health systems strengthening research and practice: Storytelling, relational accountability, and sovereignty

Christina Ore¹

¹Seven Directions, UW United States

Background: After the 2005 United Nations Millennium Development Goals report revealed limited progress, decision-makers and researchers put their attention to "health systems strengthening" to increase access, use and responsiveness of national health systems for health equity. Inequities persist and were illuminated by disparities in mortality and morbidity due to COVID-19. Indigenous systems of governance and healing represent Indigenous knowledge, strength, resilience, and resistance. These systems continue to serve their communities. Yet, they are omitted from global and national public health initiatives. This is a qualitative study of the health system that serves the Yaqui Tribe in Sonora, Mexico to inform Yaqui-centered public health. It was co-created with elders under Traditional Authority approval of the Yaqui Tribe in Sonora, AZ. Design and Methods: This participatory study using a qualitative design, took place from 2012 – 2014. Eleven community health workers and healers participated in open ended interviews. Findings: Development of a viable and ethical methodology, with emphasis on Indigenous ways of knowing and being (i.e., inherently a "culture of health" and "health in all policies"). The methodology is visualized as a spiral, where connections and relationships build over time. For each point there is 1) a translation and interpretation of the point's descriptor; 2) a description of the research process; and 3) a story that supports this aspect of the Indigenous-centered methodology. Conclusion: This approach may be used in the future collaborative studies that have meaning and use by tribal health systems within tribal nations and Indigenous communities globally. This study deconstructs existing public health concepts and supports health initiatives and public policy development. This approach is being applied at Seven Directions, we anticipate it

will contribute to an increase in access, use, and delivery of culturally relevant and effective services and programs by and for Indigenous communities in México, U.S., and abroad

DOI: 10.18332/popmed/164381

"Within whose remit it should be?": Views of multisectoral experts on the institutionalisation of blue-green prescribing in Scotland's healthcare system

Julius Alejandro¹, Katherine Irvine², Dr Chastin³, Karin Helwig³

¹Glasgow Caledonian University Glasgow Caledonian University, Glasgow, Scotland, United Kingdom United Kingdom, ²The James Hutton Institute,

³Glasgow Caledonian University Glasgow Caledonian University, Glasgow, Scotland, United Kingdom

Background and objective: Blue-Green Prescribing (BGP) is a healthcare approach that uses nature-based social prescribing and eco-directed medicines prescribing to reduce pharmaceutical pollution and promote planetary health. Due to its novelty, its institutionalisation requires consultation with practitioners and policymakers from health, environment, and water sectors. This study explored key sector experts' views on the factors that could influence the institutionalisation of BGP in Scotland.

Methods: This qualitative study is part of an exploratory mixed-methods research. Using snowball sampling and a semi-structured topic guide, we interviewed key experts from health, environment, and water sectors. Interview data underwent hybrid coding and codebook thematic analysis with audit trail. To account for the complexity, interrelationship, and behaviours of key experts, we also used systems and behaviour change lenses in data analysis.

Results: Scotland's natural resources and existing BGP-related pilot interventions offer opportunities for BGP institutionalisation. There is an increasing awareness on the health benefits of nature and the impact of pharmaceuticals on the environment translated to high interest and commitment from health, environment, and water sector experts on the institutionalisation of BGP. However, these opportunities are challenged by limited local evidence on the effectiveness of BGP-related interventions on patients; limited skills, tools, and capacities of healthcare professionals; and the need for policy changes on health human resource, environmental management, and sectoral collaboration.

Conclusion: Highlighting the need for nature-based social prescribing and reducing pharmaceutical pollution in NHS Scotland's Climate and Sustainability is an essential first step in institutionalising BGP. Despite a relatively siloed approach to sectoral interventions related to BGP, there is an existing collaboration between health, environment, and water sectors that could be strengthened. Moreover, challenges in developing an acceptable and appropriate BGP in the context of the Scottish healthcare system need to be resolved.

Intersectorality: getting our joint work straight

Evelyn Leeuw¹

¹Healthy Urban Environments Collaboratory, Australia

The proliferation of intersectoral terminology has coincided with similar developments in policy development and administrative and political science scholarship. Partly sponsored by global think tanks such as the World Bank and the international aid industry there was a call for, variously, 'Whole of Government' (WoG), 'Joined-up Government' (JUG) and horizontal, integrated or coordinated policy making. In recent years, these streams of consciousness seem to have coalesced in calls for Health in All Policies (HiAP). Several reviews and glossaries have endeavoured to transcend the evangelical approach to HiAP and its conjoint predecessor Healthy Public Policy. These reviews and glossaries purportedly show what is required to develop and maintain coherent society-wide actions, policies and governance for health. However, the terminology associated with intersectorality is not always unequivocal. The fact that multiple meanings may exist in multiple contexts does not necessarily enable a focused, and practically or scholarly sound, developmental strategy to achieving such goals. This is becoming a more acute challenge with the increased, and prominent, recognition that health is both an endpoint of a multitude of reciprocating dynamics, as well as an input for individual, social and global change. This is evident in agendas set by the Sustainable Development Goals and, for instance, planetary health paradigms. An appropriate clarification and distinction of terms and their meaning around intersectorality is sensible—it would advance coherent scholarship and practice of this essential area of health and health equity development. Based on consensus mechanisms, this presentation will offer clarity on the suite of concepts associated with intersectorality.

Reducing social inequalities in health: assessing organizational contexts for implementing integrated access for people with severe mental illness

Sofie Mejsner¹, Viola Burau², Michael Fehsenfeld²

¹Department of Public Health, Aarhus University, Aarhus, Denmark,

²Department of Public Health, Aarhus University, Denmark

Background and Objectives: Social inequalities in health are complex and vulnerable people often experience higher unmet needs and lacking coherence when seeking healthcare. They therefore require cross-sectoral initiatives. Literature argues that healthcare organization is an important but overlooked determinant of social inequalities in health, as health systems buffer or amplify structural and individual health determinants. The Flexible Assertive Community Treatment (FACT) model offers integrated healthcare access to people with severe mental illness, through interprofessional teams across health and social services. This study aimed to assess the organizational contexts that shape the implementation of this model of integrated care.

Methods: The study includes a document analysis of political and administrative documents, and semi-structured interviews of managers and healthcare professionals in three municipalities. The study applied the theory of the Organizational Fields to assess the organisational contexts in implementing the FACT model.

Results: Implementing FACT was challenged by the co-existence of different contexts across health and social care and across national and regional levels, for example by having conflicting legislation in the health and social field. These contexts make conflicting demands on intersectoral coordination, where person centered care is for instance bound by different norms and values at each level. Therefore, the successful implementation of FACT comes to depend on strong local cultures of collaboration that translate and transfer these demands into an integrated, local organisation of FACT. These collaboration cultures however differed across the municipalities, and some therefore appeared more successful in implementing FACT than others.

Conclusions: Implementing an integrated care model as FACT might become challenged by the complex and different organizational contexts vertically, at each level, and horizontally, e.g., between municipalities. The assessment of these contexts is key to identifying possibilities and limitations for a successful implementation. This knowledge may in turn reduce social inequalities in health by providing more accessible and coherent care.

Flow of regulation of elective hospital care in dentistry in the State of Ceará, Brazil: building processes based on the constitutional principles of the SUS

Oliveira Patrícia¹, Sousa Natália², Costa Guilherme², Sousa Juliana²

¹Institute for Collective Health, Secretary of Health of the State of Ceará,

Brazil, ²Secretary of Health of the State of Ceará, Brazil

Organize demand in an equitable, transparent and secure manner, with a focus on the user; developing health care protocols aligned with the access regulation process, through a computerized network and having a body of trained professionals should be objectives of the regulation centers throughout Brazil. The experience of building the work processes of the sector of regulation in hospital care in dentistry of the secretariat of health of the state of Ceará is reported. The work does not require approval by the research ethics committee, as it is a documentary research. The insertion of a professional dental surgeon in the regulatory sector of the secretary of health of the state of Ceará took place in May 2021 and remains until the present day. The first skills included bringing the levels of care closer together, mediating and facilitating communication with the oral health care unit and the network regarding flows, access and use of the regulation system, managing the supply of specialized dental consultations for specialties of oral and maxillofacial surgery and traumatology and patients with special needs. For the assessment of priorities, situations involving cases related to fractures, injuries, patients with special needs at high surgical risk, patients with microcephaly and cleft lip and palate, who only with the exception of patients with special needs, do not shows a queue. At present, the elective hospital offer has tripled, there is frank agility in scheduling specialist consultations, the maximum absenteeism of 63% with a waiting list has declined, reaching levels of 29%, in conditions of a tight waiting list. The need to register successful experiences is evident, focusing the work on the demands of the patient, user of a service committed to the resolution and completeness of his actions.

The public-private partnership in health care settings: a multiple case study analysis

Stefania Simoni¹, Salvatore Russo², Stefania Simoni³, Salvatore Russo²

¹Department of Law, University of Salento, Lecce, Italy, ²Department of

Management, University of Venice, Venezia, Italy, ³Department of Law,

University of Salento, Monteroni di Lecce, Italy

Background: The economic crisis disrupted traditional models based on market mechanisms and state funding, allowing the proliferation of alternative forms of cooperation that could respond to new social needs. Over the years, public-private partnership, in its various forms, has become strategically important in areas where, in the past, only public companies operated. In particular, management experiments aimed at introducing project financing in the management of public health authorities have been activated.

Aim: The purpose of this research was to analyze the effectiveness of public-private partnership in healthcare in order to examine strengths and weaknesses and to highlight best practices adopted.

Methodology: To pursue the research objectives the multiple case study methodology was chosen. The cases were developed through information collected by literature review; desk analysis of documentation provided by corporate managements and private partners and by conducting semi-structured interviews with actors involved in decision-making processes. Interviews were conducted with the general manager, the medical director and the project manager (RUP) of both public health companies. In the private companies, the chief operating officer was interviewed as the coordinator of the project financing.

Results: The analysis of the projects revealed very different management models. The present analysis made it possible to highlight the main critical issues of project financing: information asymmetry, inadequacy of specific skills and extreme profit orientation. Through the analysis it was also possible to identify the strategic choices that permitted to achieve better results from a social, economic and financial point of view.

Conclusions: The evidence collected will enable to make more effective and efficient choices in the design of future projects between private subjects and public authorities.

Travel medicine as an instrument of sanitary surveillance of the international health regulations: a scoping review

João Dionísio¹, Maria Ana Santos², Carina Castro Silva³, Vanessa de Melo Ferreira⁴, Márcia Cardoso⁵

¹USP Baixo Mondego Portugal, ²ACES Pinhal Litoral Portugal, ³USP Espinho/Gaia, ⁴USP Alto Tâmega Barroso Portugal, ⁵ACES Baixo Mondego Portugal

Background: In the last few decades we've seen an explosion in the number of travelers around the world, not only for tourism but also in search of a better life. With greater globalization came changes in diseases epidemiology and new and old pathogens threaten to up-end the balance of travel. Travel medicine and the International Health Regulations (IHR) are both part of this equilibrium, but there is little literature linking them both to global health. The purpose was to review both concepts and analyze its contact points and impact.

Methods: We based this scoping review on the Joanna Briggs Institute framework on scoping review methods. The Preferred Reporting Items for Systematic reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) were used as a guide in reporting. We used four major electronic databases (Medline, World of Science, SCOPUS and Google Scholar), and included studies published in English or with English versions easily accessible and grey literature.

Results: A total of 21 articles were included. In terms of data extraction and search, the inclusion was done in broad categories within IHR and travel medicine. the most common applications referenced were vaccines, of those, covid-19 and yellow fever were the most frequently cited. We decided on a narrative approach to results synthesis.

Discussion

There is sparse literature about travel medicine and its role as an integrated part of the IHR. One issue is the lack of standardization in evaluating IHR impact. Few connections are made directly from clinical practice into the legal framework creating an abstraction from practitioners and their impact on global health. Future research should focus on creating new methods to gather this evidence and to pass it along to practitioners before new threats emerge.

Primary health care vital signs profile for Malaysia

Rachel Koshy¹, Nazrila Nasir², Samsiah Awang², Kamaliah Noh²

¹Ministry Of Health Malaysia "Family Health Development Division Ministry of Health 8th Floor, Block E10, Kompleks E Precinct 1, PUTRAJAYA" Malaysia, ²Ministry Of Health Malaysia

Background and Objective: Malaysia collaborated with PHCPI (Primary Health Care Performance Initiative) to develop the Primary Health Care (PHC) Vital Signs Profile (VSP). The VSP is a measurement tool and provides an innovative picture of the primary health care system by assessing finance, capacity, performance and equity. The profile identified strength, weakness, challenges and priority areas for improvement.

Methodology: VSP was developed by global experts and is based on the PHCPI Conceptual Framework. In Malaysia, this assessment was done in two phases: first phase was to populate finance, performance and equity domains followed by the second phase on capacity using the progression model.

Results: Data was available from multiple sources including the Health Information Management System, Malaysian National Health Accounts and National Health and Morbidity Surveys. The VSP showed that PHC spending was 35% of the current health expenditure. The access index indicates that 98% of the population have access to health care and 84% of the clients received quality PHC service in public health facilities. The equity domain showed no major gap in the under five mortality occurring in the urban and rural areas. PHC capacity was strong in the drug and supplies category as well as the funds management. The strength was also identified in the information system, facility infrastructure and workforce. The PHC system was weak in the empanelment of the population.

Conclusion: Strengthening PHC depends on analysis of existing health data, accepting gaps in the system and the need for further surveys. The VSP has information and evidence on performance of the PHC and provide opportunities for policy makers and stakeholders to develop strategies to enhance the current primary health care system in Malaysia.

Engaging police in public health: critical issues and perspectives

Melissa Jardine¹

¹Nossal Institute, School of Population and Global Health, University of Melbourne, Australia

The public health community has long been aware of the central role of the law in creating healthy physical and social environments, and in responding to public health challenges. However, the critical role of the law enforcement and justice sector in achieving a multitude of public health goals has been neglected or ignored. This sector includes police, public prosecutors, magistrates, and coroners. Globally, no Master of Public Health course teaches comprehensively of the role of police in achieving public health goals, a major oversight given their ubiquitous involvement. Unfortunately, cultures of police misogyny, racism, brutality and oppression exist in many jurisdictions. There also remains a severely limited understanding of the critical nexus between law enforcement and public health both in the legal community and the public health community. The actual and potential role that engaging police in the public health enterprise can have in both police reform and in achieving public health goals is also underestimated. Although the security sector is a key partner in many public health programmes, its identity as an important part of the public health endeavour is rarely recognised. This absence of recognition has resulted in a generally inadequate approach to research and investigation of ways in which law enforcement can be effectively engaged to actively promote and protect public health as part of a broader multisectoral public health effort. This is true of police at both operational and strategic levels. There are many police officers in all jurisdictions seeking alternative ways to achieve their goals of community safety and wellbeing. They are interested to collaborate, including at the most senior level, once the issues are understood from their perspective. Many police officers are leading innovation, keen to share their initiatives, e.g. with trauma-informed approaches, domestic violence prevention and response, responses to mental health crises, suicide prevention and even harm reduction and safe sex promotion. These opportunities also contribute to the professionalization of police services – a virtuous circle. The international conference series on Law Enforcement and Public Health (LEPH) was begun in 2012 to bring together the different sectors to explore joined-up approaches to common public health issues currently criminalized or over-policed, and to find common values and goals underlying disparate cultures and languages. The Global Law Enforcement and Public Health Association (GLEPHA) grew from the conferences in 2017, to create a venue where the different sectors – often in silos or even conflict in daily life – could come together in a safe environment to build understanding and capacity for respectful partnership

approaches to complex societal issues. This workshop will: 1. Provide case studies of innovative partnership approaches to complex societal and public health issues that have been criminalized or over-policed, 2. Present learnings about effective and sustainable police and public health partnerships in achieving optimum community safety and wellbeing at all levels, in all jurisdictions, 3. Propose an agenda for future research program

Resilient health systems: Mapping of the Health Information Systems in the EU, their resilience and preparedness to join the European Health Data Space

Miriam Saso¹, Petronille Bogaert², Neville Calleja³, Michael Peolsson⁴, Elena Petelos⁵, Shona Cosgrove¹, Irène Kesiosoglou¹, Miriam Saso¹, Marika Borg³

¹Sciensano, Belgium, ²Sciensano, Brussels, Belgium, ³Ministry for Health, Malta, ⁴Swedish e-Health Agency, Sweden, ⁵University of Crete and University of Maastricht, Greece

Outline

Health Information Systems (HIS) are key pillars for generating knowledge for evidence-based decision making, and consequently, contribute to better health of the population. The COVID-19 pandemic further emphasised the importance of having robust and resilient HIS and the need for digital solutions to improve their efficiency and effectiveness.

To assess the functioning of the different HIS in Europe, mapping exercises are conducted across three different EU wide projects, namely the Population Health Information Research Infrastructure (PHIRI) project, the Joint Action Towards the European Health Data Space (TEHDAS), and the Health Emergency Preparedness Response Authority (HERA) IT project. These mapping exercises provide insights on the state-of-play, the components, strengths and weaknesses of the national health information systems and their health data management in more than 19 European countries.

During the workshop, results of the PHIRI, TEHDAS and HERA mapping exercises will be showcased, including key findings and recommendations to promote resiliency in HIS. The methodology of the mapping exercise is based on the support tool to assess health information systems, developed by the WHO regional office for Europe. PHIRI conducted assessments to map the HIS that monitor the effects of COVID-19 on population health in 9 European countries. Concurrently, the TEHDAS conducted 12 country visits to map the state-of-play of health data management systems and their preparedness to join the European Health Data Space (EHDS), one of the key components of the European Health Union. Moreover, plans to extend the experiences of the mapping exercise in the framework of the HERA IT project will be shared which will focus on digital epidemiological surveillance and health emergency preparedness.

Throughout the session, the exchange of knowledge, experiences and opinions with the audience will be fostered by the moderator and by using Slido. This will ensure key messages will be assimilated by the participants.

Aims/objectives

Sharing strengths and weaknesses of HIS functioning during the COVID-19 pandemic, showcasing best practices and promoting resiliencePresent readiness of different countries to join the EHDS, the barriers identified within their HIS to sharing and reusing health data and their needs and expectations from the EHDS.Outline key recommendations from the experience during the mapping exercises, contributing to capacity building across EuropeCreate an opportunity for engagement and knowledge exchange, offering a space for the audience to voice their views on the topics discussed

Key questions

HIS mappings serve as a catalyst and are the starting point to strengthen HIS in various perspectives. The workshop will bring together experts in the field of HIS, highlighting the key findings from different mapping exercises conducted by PHIRI and TEHDAS and give the future perspective of upcoming mapping for HERA. The workshop will also foster a discussion between the audience and the speakers on the resilience of HIS in different European countries, the preparedness of HIS to deal with future crises, as well as the challenges and capacity building needs and tools required for countries to develop their health data management systems and join the EHDS for secondary use.

Popul. Med. 2023;5(Supplement):A1011

Breaking the health silos - once and forever?

Jolanta Bilinska¹, Marta Lomazzi², Sara Perazzi³, Lwando Maki⁴, Marta Lomazzi⁵

¹ICN Switzerland, ²World Federation of Public Health Associations,

Switzerland, ³International Hospital Federation, Switzerland, ⁴Public Health Association of South Africa South Africa, ⁵World Federation of Public Health Associations Switzerland

Silos in health are detrimental to patients and society. They inhibit the effective use of the workforce, hinder collaboration, limit coordination and lead to high costs and poor outcomes for the patients and the society. Healthcare workers are very often not trained in communication and teamwork, thus amplifying the silos effect and making relations with patients, the community and the media, very complex. This silo mentality does not only apply to the care environment, but also to public health: to provide a stronger and healthier future generation, it is crucial to ensure that every individual has access to the public health and care they need and that social inequalities that contribute to ill health are addressed. This workshop, organized by the World Federation of Public Health Associations (WPHFA), the International Hospital Federation (IHF), the South African Medical Association and the World Patients Alliance (WPA), is part of a broader debate on the need to rethink health, prevention, public services and justice. With members worldwide, these four organizations will discuss how to co-design a new framework and advocate for a better use of the workforce beyond sectors to promote health, patients' outcomes and reduce health inequalities. During the workshop, panelists from the four organizations will share their experiences and vision to create a more equitable health system that meets the needs of patients and communities.

How sharp are your health security arrangements against cross-border health threats? Attend the sharp joint action workshop to find out exactly that

Anna Kratz¹, Milena Vasic², Nikolaos Bitsolas¹, Giri Shankar¹

¹Finnish Institute for Health and Welfare Finland, ²Serbian Institute of Public Health, Serbia

Strengthening International Health Regulations and Preparedness (SHARP www.sharpja.eu [1]) in the EU Joint Action (JA) was launched in 2019. This is a €10 million, four-year collaborative action of 26 countries and 61 partners that focuses on cross-border health threats. The need for this JA is based on strengthening implementation of Decision 1082/2013/EU on serious cross-border threats to health and the International Health Regulations (2005). The aims of this JA are in line with the new EU Global Health Strategy [1] [2], which recognises monitoring, early warning, preparedness, and response measures as essential elements to combat serious, cross-border threats to health.

Despite a high level of preparedness for health emergencies of biological, chemical, environmental and unknown origin across Europe, gaps do exist across member states and European countries.

This JA specifically address four key priorities:

- * Cross-sectoral capacity building, exchange of knowledge and best practices – focused on the gaps in basic IHR core capacities identified through member state reporting in relation to Article 4 of Decision 1082/2013/EU

- * Enhancing monitoring and evaluation of actions under Decision 1082/2013/EU in alignment with the WHO IHR monitoring and evaluation framework

- * Enhancing the health and security interface and preparedness and response to chemical incidents

- * Laboratory strengthening through a consolidated laboratory practice

The project is organised across 6 technical work packages (WP), supported by 4 horizontal WPs:

WP Number

Work Package Title

1 Coordination

2 Communication and dissemination

3 Evaluation of the action

4 Integration in National Policies and Sustainability

5 IHR core capacity strengthening and assessment

6 Preparedness and Response planning

7 Laboratory preparedness and responsiveness

8 Training and local exercises, exchange of working practices

9 Chemical safety and chemical threats

10 Case management and infection prevention and control preparedness

This workshop provides an opportunity for delegates to hear of the key outputs of SHARP JA and how the actions can be implemented in member countries going forward. It will also allow for a deeper exploration of specific actions of SHARP. These include:

- * IHR core capacity strengthening and assessment

- * Strengthening the capacity for IHR implementation for serious cross-border health threats through cross-sectoral, basic and advanced training

- * How project's progress monitoring by evaluation methodology and procedures can continuously improve the effectiveness and efficiency of collaborative joint action?

- * How to utilise communications tools, understanding of health policies and the challenges to dissemination to achieve effective visibility, awareness and impact for the work on multiple stakeholders?

- * Identifying the sectors that should be involved in public health emergency preparedness, response and recovery

- * Case management and infection prevention and control preparedness

The workshop will share key insights, best practices, encouraging discussion and knowledge exchange with delegates who represents a global, public health professional audience. Delegates can build on this valuable work to facilitate the improvement of their country plans for more harmonised and effective preparedness and response measures and plans.

Potentially traumatic experiences pre-migration in women of childbearing age among Somali-and Kurdish-origin women in Finland

Satu Majlander¹

¹Finnish Institute for Health and Welfare (THL), Helsinki, Finland

Background: Across Europe there are increasing numbers of migrant origin women who are of childbearing age. Especially those who have left the country as refugees, may have been victims of serious mental and physical violence. Migrant origin women are at risk of poorer pregnancy outcomes. This study examines the prevalence of potentially traumatic experiences (PTE) pre-migration and female genital mutilation/cutting (FGM/C) and their associations with adverse reproductive outcomes among migrant women of Somali- and Kurdish-origin who have been pregnant in Finland.

Methods: Survey and register data from the Finnish Migrant Health and Wellbeing Study, conducted in 2010–2012, were used. Women from 18 to 64 years of age, 185 Somali- and 230 Kurdish-origin, who had at least one pregnancy or birth in Finland were included in the analysis. Survey data were linked to the Finnish Medical Birth Register, the Register of Induced Abortions, and the Care Register for Health Care until 2018. For each outcome, logistic regression was used and adjusted for age, body mass index, time lived in Finland, and the number of births. Results: Among the women included in this study, a total 67 percent of Somali-origin and 71 percent of Kurdish-origin women had experienced PTE pre-migration and 64 percent of Somali- and 32 percent of Kurdish-origin women had undergone FGM/C. In Kurdish-origin women, complications during pregnancy (e.g. bleeding in the first trimester, known or suspected fetal abnormality, other problems) were significantly more common among women without trauma (70%) than for women with trauma (48%). No associations between trauma or FGM/C and other adverse reproductive outcomes were observed in Somali- or Kurdish-origin women.

Conclusions: Past trauma is common among Somali- and Kurdish-origin women but we found no association between previous trauma and adverse reproductive outcomes. Women who have experienced trauma need culturally-competent, trauma-informed care to address women's psychosocial needs.

Misconception and effect of menstruation (Chhaupadi) and delivery on women's health in Bajura, district Nepal

Chetraj Pandit¹

¹Nepal Public Health Association, Kathmandu, Nepal

Background: Chhaupadi is the old unscientific system in mid and far Western parts of Nepal. Reproductive age women were considered unclean during the menstrual and delivery period. Invisible cultural taboos and practices were prevailing in each and every household. The objective of the study is to assess the associated factors affecting during Chhaupadi and delivery practice with their health outcome. Methods: The cross-sectional descriptive study was conducted amongst 175 reproductive age women in Bajura districts of Nepal, by using multistage random sampling. Both qualitative and quantitative methods was used. All the data were entered in Ms excel and exported into SPSS 16.0. The necessary descriptive and inferential statistics was used for quantitative analysis and thematic analysis was done for qualitative analysis.

Results: More than one third (38.9%) of the participants were in the age group 20-29 years. Almost all the participants were from Hindu religion. The majority (91%) of participants know about the Chhaupadi system. Almost (74%) of the participants were staying in the Chhaupadi hut during menstruation. Similarly, (78.3%) of the respondents were mentioned, they did not like the Chhau system and never like to continued. There is a significant association between health effect in women and the Chhaupadi system ($p < 0.031$). Conclusions: We conclude that the larger proportion of women in Bajura district still believes in old unscientific tales and Chhaupadi practices which lead to the different health problems.

Popul. Med. 2023;5(Supplement):A1015

DOI: 10.18332/popmed/164776

Grandparents' feeding practices: Implications for child diet quality

Michelle Jongenelis¹

¹Melbourne Centre for Behaviour Change, The University of Melbourne, Australia

Background and Objective: With their increasing provision of childcare, grandparents are playing an important role in shaping the nutrition environment and eating behaviours of their grandchildren. Despite this, research assessing the feeding practices of grandparents and their association with the dietary quality of the food consumed by grandchildren is limited. Such research is needed to inform the development of interventions that provide tailored guidance to grandparents on adaptive ways of interacting with their grandchildren in the context of mealtimes. Accordingly, the present study sought to examine the feeding practices adopted by grandparents and the association between these feeding practices and grandchild consumption of healthy and unhealthy foods.

Methods: In total, 1076 grandparents (60% female; average age = 65.07 years) who reported providing regular childcare to at least one grandchild aged 3 to 14 years were recruited. They completed an online survey assessing a variety of constructs including their feeding practices and the frequency with which their grandchild consumes specific foods and beverages while in their care.

Results: Grandparents reported using positive feeding practices such as 'encouragement of balance and variety' more frequently than negative feeding practices such as 'control over eating'. Positive feeding practices were found to be more important correlates of diet quality than negative feeding practices, with the provision of a healthy food environment and limit setting emerging as the most important practices associated with healthy eating.

Conclusions: Grandparents are having a demonstrable impact on the dietary behaviours of their grandchildren and should be considered in initiatives promoting healthy lifestyle behaviours in young children. To prevent poor diet and support consumption of fruit and vegetables, grandparents should be encouraged to increase the availability of healthy foods in their home and set limits on unhealthy foods.

Popul. Med. 2023;5(Supplement):A1016

DOI: 10.18332/popmed/164794

An exploratory study on understanding the use of food labels among adolescents in India

Neha Rath¹

¹Department of Community Medicine, Banaras Hindu University, India

Background and Objective: Food labelling is identified as a key population-centric approach that can facilitate consumers to make informed food decisions by providing essential information about the food or beverage on the packaging. In the Indian context, where adolescent obesity and the resultant diet-related chronic degenerative diseases are rising, it is imperative to understand the perceptions of adolescents regarding unhealthy packaged foods and food labels. This can potentially inform the development of nutrition and health promotion interventions to facilitate healthy eating in Indian adolescents.

Methods: A convenience sample of 44 adolescents (aged 10-19 years; 29 boys, 15 girls) were recruited from rural Varanasi, India through professional networks. Face-to-face semi-structured interviews were conducted in Hindi between December 2021 and February 2022. Interviews were digitally recorded, transcribed verbatim, and translated to English. Informed by Template Analysis Technique, the narrative data were analysed thematically using the NVivo Software Program. **Results:** A number of themes emerged during data analysis. These included: (i) Frequent consumption of packaged food (e.g. potato chips, biscuits, deep-fried Indian snacks; noodles, chocolates) both at school and home; (ii) Lack of awareness about the harmful effects of consuming unhealthy packaged foods; (iii) Reasons for consuming packaged food – tasty, unadulterated; (iv) Date of expiry, price, and brand name were often read by the adolescents; (v) Lack of knowledge about other components (e.g. nutrition information) of the food label; (vi) Difficulty in understanding the food label, as it was written in English; (vii) Food

labels should be written in Hindi for easy comprehension.

Conclusions: Overall, the study sample was not well-informed about the implications of consuming unhealthy packaged foods as well as the food labels. This highlights the need to develop school-based nutrition education programs which will assist Indian adolescents in making healthy food choices.

DOI: 10.18332/popmed/164798

Women of reproductive age with intellectual disability in Bangladesh: an insight into sexual reproductive health needs

Fouzia Hoque¹

¹Bangabandhu Sheikh Mujib Medical University (BSMMU), Bangladesh

Disability is a major social and economic phenomenon in Bangladesh. Sexual and reproductive health services are yet to achieve in Bangladesh and people still attach to stigma, environmental barriers, social and cultural factors related to SRHR. It is mandatory for women of reproductive age with intellectual disabilities to get accurate, accessible, and understandable information about sexual reproductive health and services regarding contraception and reproduction in lower middle income countries like Bangladesh. The aim of the study is to understand and synthesize sexual and reproductive health needs for women of reproductive age with mild to moderate intellectual disability (ID) in Bangladesh, in order to create awareness in the community, and health care professionals as well as inform public policies and programs supporting women with ID and their families in Bangladesh. A literature review of the published literature in the last 20 years was carried out with an adjusted conceptual framework of sexual reproductive health. This study found that there is a lack of significant data in Bangladesh regarding this issue. But other neighboring countries indicated that women of reproductive age with ID have many issues and needs regarding SRH including pregnancy, contraceptions, periods, and sexual behaviors. In addition to this, health care providers do not have enough knowledge and understanding about the extent of disabilities and SRH for women with ID due to lack of training, no guidelines, and inadequate access to resources. Besides, environmental barriers, lack of awareness among women with ID, and self-stigma are also putting obstacles to get access to SRH services for women with ID. This study will play an important role to talk about sexual reproductive health needs and services for women of reproductive age with ID in Bangladesh.

DOI: 10.18332/popmed/164800

Antenatal coverage and quality in secondary-care hospitals of Punjab province, Pakistan

Faheem Anwar¹

¹Manawan Hospital, Indus Hospital and Health Network, Wagha, Pakistan

Background: Antenatal care (ANC) can avoid the majority of adverse maternal and perinatal outcomes in LMICs. A closer examination reveals that only one in every two women in Punjab has the required number of ANC 4+ visits. This study was conducted to assess the coverage and quality of ANC at secondary care hospitals in Punjab.

Methods: In this retrospective descriptive study, the data provided through the Annual Report on DHIS 2021 and the Electronic Medical Record (EMR) available at TMH were analyzed. The quality of antenatal care was assessed against the criteria of the essential package described in the Punjab Ministry of Health's Minimum Standards of Service Delivery.

Results: The monthly average ANC-1 visits per THQ were 420 and 905 at TMH. TMH recorded 114,467 follow-up visits with an average of 3.5 visits per parturient and a referral rate of 10.46%. The dropout rate at THQ Hospitals was 33.52%, while 16.41% at TMH. Normal vaginal delivery and caesarean section rate were 83% and 17% at THQ hospital whereas 49.76% and 50.23% were for TMH respectively. The EMR gives evidence on history taking, questions about stillbirths, assisted deliveries, abortions, headaches/blurred vision, swelling, and fever. Highlights include, baby movement feeling (96%) Findings of the breast examination (83), measurement of blood pressure (100%), counselling on breastfeeding and Tetanus Toxoid vaccination (78%) and prescriptions for anti-malarial, iron, and folic acid (100%).

Conclusions: The advantages of TMH over THQ hospitals include accessibility, adherence to policies and the EMR, front desk services, the availability of skilled staff, diagnostics, medication, patient education, counselling, and safety. It is proposed that data on ANC follow-up, the average number of ANC visits per parturient, the dropout rate, and referral from health facilities be included in the DHIS report to improve the study of ANC coverage and quality.

Popul. Med. 2023;5(Supplement):A1019

DOI: 10.18332/popmed/164815

Therole of the built environment in mental health in childhood: Results from a street audit tool

Eirini Flouri¹

¹University College London, Loondon, United Kingdom

Objectives: To explore the role of the built environment, measured by both Objective and subjective data for the neighbourhood, in children's trajectories of mental health and cognition from the early years until the end of primary school in the general population. **Background:** The extant research on this has produced mixed Findings. One reason may be its focus on a single aspect of the built environment. Here, it was measured in a variety of ways, using both Objective and subjective measures of the neighbourhood. We also controlled for indoor home environment and both neighbourhood and family socioeconomic disadvantage. **Methods:** We used data from the Millennium Cohort Study, a large general-population cohort study in the UK. The built environment was measured in various ways, including by direct observation of the immediate neighbourhood by interviewers. It was also measured by administrative data on socioeconomic disadvantage and urbanicity as well as Objective data on greenspace and air pollution. We also controlled for the home's physical and social environment, measured by both parent report and third-party assessments. Child outcomes (mental health and cognition) were measured across ages 3 to 11 years. Mental health was measured with the Strengths and Difficulties Questionnaire, and cognitive ability with the British Ability Scales. We fitted growth curve models and accounted for confounding.

Results: Neighbourhood disorder, as measured by third-party observation, was associated with emotional symptoms and conduct problems at age 3 years and with the trajectories of cognitive ability from ages 3 to 11 years. These effects were robust to adjustment for confounders. Greenspace, urbanicity and air pollution did not have any effect on our outcomes after adjustment.

Conclusions: Our Findings shed light on the role of the built environment in children's mental health and cognition, but also on the importance of its appropriate measurement.

DOI: 10.18332/popmed/164826

Reducing neonatal mortality in Ethiopia: a call for urgent action! An evidence brief for policy

Tesfaye Weldemariam¹, Zelalem Kebede¹, Sabit Ababor¹, FirmayeBo Bogale¹, Dagmawit Solomon¹, Yoseph Gebreyohannes¹

¹Ethiopian Public Health Institute (EPHI), Gulale, Ethiopia

Background: Neonatal mortality is a core indicator of neonatal health defined as death during the first 28 days of life. About half (47%) of global under-five death is contributed by the death that occur within the first 28 days of life (neonatal death). Though neonatal mortality has reduced by 25% between 2005 and 2016, it has shown an increment between 2016 and 2019. The Ethiopian national average of neonatal death (33 per 1,000 live births) was also higher than sub-Saharan Africa average.

Objective: To summarize the best available evidence describing the problem of the worsening neonatal mortality in Ethiopia and potential solutions for addressing the problem.

Methods: The preparation of this evidence brief for policy came to our attention for two reasons: 1) While the world has targeted to reduce neonatal mortality to at least 12 per 1,000 live births in 2030, neonatal mortality in Ethiopia is persistently high in the last decade, and 2) there is big gap observed between the current national plans and performances. Electronic databases of systematic reviews (SUPPORT Summaries, Health Systems Evidence, PDQ Evidence, Epistemonikos, the Cochrane Library) were consulted. The final selection of reviews for inclusion was based on a consensus of the authors. **Findings:** The brief identified effective and promising interventions for reduction of neonatal mortality and presented as community based intervention and continuum of care. Community-based intervention packages: 1. Intervention packages consisting of mainly building community-support groups or women's groups probably decrease neonatal mortality by 16%, 2. Intervention packages consisting of mainly building community-support groups or women's groups probably decrease neonatal mortality by 40%, 3. Community mobilization and home-based neonatal treatment probably reduce neonatal mortality. Strengthening continuum of care: Interventions linking pre-pregnancy and pregnancy care probably reduce neonatal mortality by 21%.

Factors associated with timely initiation of complementary feeding practice among children aged 6-24 months

Abdikani Jeylani¹

¹Horseed International University, Mogadishu, Somalia

Background: Complementary feeding is defined as the process starting when breast milk alone is no longer sufficient to meet the nutritional requirements of infants, and therefore other foods and liquids are needed, along with breast milk, appropriate time is 6-8 month, Malnutrition is responsible, directly or indirectly, for over half of all childhood deaths (Adhikari, Khanal, Kafle, Sah, and Kandel, 2017) [1].

Objective: To identify factors associated with timely initiation of complementary feeding among children aged 6-24 Months at Wadajir and Hodan Health Centers in Mogadishu, Somalia.

Methods: A community based cross sectional study was done among mothers have children between 6-24 months found at Wadajir and Hodan HCs from August 2021 to May 2022 The sample size of the study was 426. A pre-tested structured questionnaire and interview guide were conducted to obtain the necessary information for this study. The collected data was analyzed using SPSS Version 20.0. Descriptive statistics were calculated to see the distribution of various factors.

Results: The study revealed all most half (51%) of the respondents initiated complementary feeding early (before 6 months). Whilst (32%) and (17%) of the respondents introduced complementary feeding appropriate time (6- 8 months) and lately (after 8 months) respectively. Maternal illiteracy, child age, low average income, health seeking behavior and mother's place of delivery were significantly associated with timely initiation of complementary feeding.

Conclusions: We found most of the mothers had informal education, most common source of information related complementary foods were from person, most common reason mothers started complementary food was to get nutrition to the child while mostly they giving child potatoes as first food. The second most common reason for early initiation of complementary feeding was lack of enough breast milk having to end exclusive breast feeding early so that they could start early complementary foods. Magnitude of quality Antenatal Care Service: a systematic review and meta-analysis

Dereje Demissie¹

¹Saint Paul's Hospital, Millennium Medical College, School of Nursing, Ethiopia

Background: High quality of antenatal care (ANC) is also associated with improved opportunities to screen for and treat other chronic conditions and non-communicable diseases. **Objectives:** The aim of this study was to estimate the global quality of antenatal care services.

Methods: We conducted comprehensive literature research for published and unpublished sources from 2002 to September 08 /2022. All statistical analyses in this study were performed on stata16.0.

Results: A total 76 studies with a sample size of 940164 were included with poor quality antenatal care services utilization ranges from 2.5% to 97.47% among pregnant women. The global pooled poor quality of antenatal care services was 64.28% (95%CI: 59.58% – 68.98%) with (I²= 99.97%, p=0.001). In the subgroup analysis 70 studies done in low and middle-income countries with a weighted sample size of 861776, and 617031 pregnant women utilized poor-quality ANC services ranges from 23.5% to 97.47%. Finally, 15 studies were conducted in Ethiopia with a weighted sample size of 12031 pregnant women of antenatal care attendants revealed that 7989 pregnant women utilized poor quality ANC services ranges from 50% to 96 %. The pooled prevalence of poor Antenatal Care services in Ethiopia was 70.52% (95%CI: 64.55% – 76.48%), with significant heterogeneity between studies (I²= 98.37%, p=0.001).

Conclusions: and recommendations: The pooled estimate revealed that 64 per 100 pregnant women utilized poor quality ANC services globally. This study revealed regional and country-level disparities, where pregnant women who resided in Asia, Africa, and South American continents had the highest poor quality antenatal care services utilization. Therefore, policymakers and health planners would put a great deal of emphasis on addressing the quality of Antenatal care services.

DOI: 10.18332/popmed/164854

Advanced parental age increased the risk of implantation failure: interactive effect

Jiaqian Yin¹

¹Faculty of Education, Health and Well-being, University of Wolverhampton, United Kingdom

Background: The average childbearing age in China has been rising because of the

access to tertiary education, competitive pressure and the implementation of the three-child policy. This study aimed to explore the interaction effect of paternal and maternal age on implantation failure in couples following their first cycle of IVF/ICSI treatments. Methods: We examined the data of the Anhui Maternal-Child Health Study (AMCHS). The AMCHS recruited 2042 infertile couples who were physically fit for in vitro fertilisation (IVF) or intracytoplasmic sperm injection (ICSI) treatment at the Reproductive Centre of the First Affiliated Hospital of Anhui Medical University during the period of May 2017 to April 2021. This prospective cohort study analysed the data from 1910 cohort couples. Multivariate logistic regression models were used to identify the effects of male age, female age and their combination on implantation failure.

Results: Advanced maternal age was associated with increased implantation failure ($P < 0.001$); compared to 20-25 years, those aged in 35-40 years had adjusted OR of implantation failure of was 1.38 (1.01-1.89) and in ≥ 40 years was 3.91 (2.08-7.36) ≥ 40 years. There was evidence of an interaction between maternal age (30-35 and ≥ 35) and paternal age (≥ 35) on implantation failure ($p < 0.05$). When the male was ≥ 35 years, increased maternal age was associated with the risk of implantation failure. Conclusion: There was an additive effect on implantation failure with advanced parental age. The delay of childbearing in both men and women will be a serious public issue that may contribute to a higher risk of implantation failure in patients needing ART.

Challenges and coping mechanisms, experiences of slum women in seeking abortion services during COVID-19 lockdown in 2020 and 2021: Learning from Agra, India

Chandrima Paul¹, Siddharth Agarwal², Mayaram Sharma², Chhail Sharma², Kanupriya Kothiwala²

¹International Institute for Population Sciences, Mumbai, India, ²Urban Health Resource Center, Delhi, India

Introduction: Restricted mobility during the lockdown led to unprecedented challenges related to women's access to reproductive health services. The purpose of this research is to learn about the experiences of women in slums who needed abortion services during the COVID-19 lockdown in Agra, India in the year 2020 and 2021.

Methods: Qualitative interviews in slums were conducted with 35 married slum women in the age group of 19-35 years who underwent induced abortion during the COVID-19 lockdown. Key Informant Interviews were conducted with 7 frontline health workers (ASHAs) and 3 private nurses. Interviews were audio recorded with respondents' consent and thematically analysed.

Results: Demand-side challenges in accessing abortion services included fear of COVID-19 infection, hesitation, ignominy and social ridicule associated with abortion. Results in delayed abortions. Supply-side challenges included unavailability of government and private hospitals providing abortion services, frontline health workers being unsupportive and scared of contracting COVID-19 infection and transportation difficulties owing to lockdown/containment restrictions. Coping mechanisms practiced by women included hastily procuring abortion pills from known chemists without prescription for a secretive, economical and effortless method to abort. Women learnt about abortion pills from friends and neighbours. Women in desperation, availed services from local dais (traditional untrained birth-attendant), private trained nurses, at social franchising reproductive health clinic and services of a traditional healer too. Consequences of inability to receive timely and appropriate abortion services included severe bleeding and intense abdominal pain (both perceived as complications by women), aggravation of pre-existing anemia manifested as weakness, dizziness, headache.

Discussion: Optimal knowledge of the process of abortion will mitigate anxiety, lead more women to the appropriate abortion procedure, minimise delay in care-seeking and reduce risk of incomplete abortion. Government health system should set up emergency RCH services and co-opt private nurses by training them in safe abortion practices.

Prevalence of self-medication practice among European pregnant women: a systematic review and meta-analysis

Afaf Bouquoufi¹, Laila Lahlou², Fatima hadj³, Youssef Khabbal⁴

¹Therapeutic innovation, Translational research and epidemiology, Faculty of Medicine and Pharmacy, Ibn Zohr University, Morocco, ²Therapeutic innovation, Translational Research and Epidemiology, Faculty of Medicine and Pharmacy, Ibn Zohr University, Morocco, ³Therapeutic Innovation,

Translational Research and Epidemiology, Faculty of Medicine and Pharmacy, Ibn Zohr University, Morocco, ⁴Therapeutic Innovation, Translational Research and Epidemiology, Faculty of Medicine and Pharmacy, Ibn Zohr University, Morocco

Self-medication can be defined as "the act of the subject, to consume on his own initiative a drug without consulting a doctor, and that the drug is already in his possession or that he obtains it in a pharmacy or from another person".

The Objective of our study was to estimate the prevalence of European pregnant women towards self-medication during pregnancy a Metanalysis. We conducted a comprehensive literature search of Pubmed, Science direct, Google Scholar, and Web of Science databases to identify relevant studies available from January 2011 to December 2021. We used COVidence software to select all relevant studies. The pooled prevalence was calculated by a random-effects model. Study heterogeneity was assessed by Cochrane Q test and I2 index. A subgroup analysis was performed. R software was used for statistical analysis and publication bias analysis was performed by begg egger test. A total of 21 studies were eligible. The total sample size analyzed was 12643 pregnant women. The pooled prevalence of self-medication in Europe was 62.73% with a confidence interval of (53.45; 71.17), the I2 test revealed a high statistically significant heterogeneity of 99%. The Results of the subgroup analysis are based on income level, quality of the publication study and sample size. Heterogeneity, as assessed by the I2 statistical test, was high, statistically significant for all subgroup analyses and ranged from 96% to 99%. The funnel plot showed that there was a possibility of publication bias with a highly significant P-value. The Results obtained from this study showed that the prevalence of self-medication among pregnant women is relatively high. We recommend that health professionals consider implementing programs on the risks of self-medication, and strengthening the control and monitoring of over-the-counter sales of drugs.

Cascade approach of reaching communities for adolescents through school students and community stakeholders in rural and underserved Indian population

Rahul Bogam¹, Kalpak Sane²

¹Primary Health Care Corporation, Doha, Qatar, ²Sane Hospital and Diabetic Care Center, Pachora, India

Background and Objective: Risky substance use, infectious diseases, injuries and mental disorders are some of the identified health problems of adolescents in India. However, health inequalities persist among adolescents with widening disparities in access to quality care, predominantly in rural and underserved populations of India. The research indicates sparse knowledge levels about adolescent health (AH) among school students, grass root level health workers (GRLHWs) and general community people. The current study applied cascade approach to augment the awareness about adolescent health aspects and related health welfare programmes among school students, GRLHWs and general community people. Methods: A pilot interventional study was carried out at one of the rural clusters of one of the districts of Maharashtra State of India. The designed TIV [(Training modules preparation (T), Interactive sessions (I) and Village health meetings (V)] was implemented to educate 168 school students from 8th to 10th class, 110 grass root level health workers and 625 general community people in stepwise manner.

Results: Significant ($p < 0.001$) adolescent health knowledge improvement, active learning and positive perceptions about intervention were reported among all study participants. In addition to knowledge gain, incorporating module framing activity and interactive events were found to be effective to strengthen interpersonal communication, critical thinking, leadership, self-learning abilities and team work skills among school students. Conclusions: This study has potential to build productive and synergistic relationships between students, teachers, families, and community stakeholders to ensure commitment and engagement towards positive health. This study, emphasizing on adolescent health may be extended to address other crucial health challenges in marginalized population like maternal and child well-being, communicable diseases, life style disorders etc. The long-term impact of the current study may be appraised in the form of greater awareness of health needs of rural adolescents as well as significant decline of health problems among them.

Behavioral economics-based counseling and mobile phone text educational messages to strengthen family planning services in Jordan: a randomized control clinical trial

Yousef Khader¹

¹Eastern Mediterranean Public Health Network (EMPHNET), Amman, Jordan
Introduction: Favorable attitudes toward modern family planning methods (MFP) among Jordanian and Syrian women do not always translate into behavioral changes. This study aimed to determine the impact of behavioral economics (BE)-based counseling and personalized mobile phone text messages reminders on the use of MFP among postpartum women. Methods: A parallel-group cluster randomized controlled trial was conducted to compare two interventions "behavioral economics (BE)-based counseling" and "personalized mobile phone text messages reminders" aiming to improve the utilization of MFPs among postpartum women over status quo family planning services in comprehensive health centers in north of Jordan.

Results: In total, 1032 participated in the study (295 women in the control group, 326 women in the group 1 "BE-based counseling", and 411 women in the group 2 "BE-based counseling and monthly text messages". The rates of using MFPs in the counseling group and the counseling and message group at 3 months (54.7% and 57.1%, respectively), 6 months (50.0% and 51.7%, respectively), and 9 months (49.5% and 52.0%, respectively) were significantly higher than the rates among women in the control group (40.6% at 3 months, 37.6% at 6 months, and 34.3% at 9 months). Overall, 26.8% of women in the control group, 42.1% of women in the counseling only group, and 45.2% of women in the counseling and messages group used MFP continuously for all 9 months. Our BE-influenced revisions to the counseling guide contributed to a 6.3 percentage point reduction in pregnancy rates over the control group, while text messaging appears to have the potential to add to this decline—marginal improvements from text messaging are positive, but statistically insignificant.

Conclusions: Simple BE-inspired interventions can be effective methods for increasing the rate of MFP use and reducing pregnancy rate. We recommend scaling up the interventions in all health facilities in Jordan.

Teratological effect of Levetiracetam (antiepileptic drug) in utero on the foetus of albino mice

Nilesh Jaybhaye¹

¹North Eastern Indira Gandhi Regional Institute of Health & Medical Sciences (NEIGRIHMS), India

Aims and Objectives: Teratological effect of newly developed drugs is serious concern of practicing clinicians for pregnant women and as newly introduced antiepileptic drug Levetiracetam with limited teratological data, the respective study was undertaken with Aims of 1. to study effect of Levetiracetam on fetal growth of fetuses of albino mice 2. to study gross teratological effects of Levetiracetam on skeletal system of fetuses of albino mice and placenta. Materials and methods: 40 female mice were taken for this study and divided into 4 groups with 10 female mice each and Group I is taken as controlled group and administered with distilled water intraperitoneally. Group II, Group III, Group IV administered with escalated doses of Levetiracetam with drug concentration of 600mg/Kg, 1200mg/Kg, 1800mg/Kg respectively, intraperitoneally and then anthropometric measurements of mice fetuses and placenta were taken, skeleton of mice fetuses were studied with Alzerine Red S stain for bone malformations. Findings were analyzed using Anova variance testing and arcsine transformation followed by χ^2 analysis with a Tukey-type q test and P value was calculated. Results and observations: No significant gross external malformations of albino mice fetuses were observed in any of groups. The Results showed that Fetuses in Groups II were decreased and Group III, IV increased in weight and crown rump length, weight of placenta is increased into Group III, IV but decreased into Group II and all fetuses in all treated groups showed deficient ossification in body of vertebra (coccyx), skull bones, carpal, metacarpal, tarsal and carpal bones. Conclusions: Levetiracetam is having teratological effect and adverse outcome on overall growth of fetuses of mice and further investigations, for identification of possible teratological effects of Levetiracetam as an antiepileptic drug is needed for ensuring its safe use in pregnant women in clinical practice.

DOI: 10.18332/popmed/164881

Violence against adolescent girls in India during the covid-19 pandemic: a mixed-method investigation

Janina Isabel Steinert¹, Hannah Prince², Jessy Ezebiue³, Shruti Shukla⁴

¹TUM School of Social Sciences and Technology, Technical University of Munich, Germany, ²Hochschule für Politik, Technical University of Munich, Germany, ³World Bank, Washington DC, United States, ⁴TUM School of Social Sciences and Technology, Technical University of Munich, Germany

Background: While the "shadow pandemic" of violence against women during the COVID-19 pandemic is well documented, little is known about its impact on adolescent girls. This mixed-methods study documents effects of the pandemic on multiple forms of violence against girls in India.

Methods: 13-18-year-old girls in rural and urban communities and slum pockets in Maharashtra were surveyed between February and April 2022. Quantitative data were collected on health-related and socioeconomic impacts of the COVID-19 pandemic, domestic violence at home, and intimate partner violence (IPV) (for married/partnered girls), using audio- and computer-assisted self-interview techniques. We estimated a multivariable logistic regression to assess how the pandemic affected the risk of violence. Qualitative data were collected via eight focus group Discussions and nine in-depth interviews and transcripts were coded using thematic analysis. Findings: 3049 adolescent girls were recruited into the study, of which 277 (9.1%) were married underage. In the previous 12 months, 2003 (65.7%) girls reported at least one form of family violence and 405 (71.7%) partnered girls reported incidents of IPV. Domestic violence risk increased significantly in households who suffered greater economic harms (OR 1.19, 95% CI 1.13 to 1.26) and negative health consequences (OR=1.76, 95% CI 1.54 to 2.02) due to the pandemic. Similarly, greater detrimental health and economic impacts were associated with higher IPV risk. Interpretation: The COVID-19 pandemic has substantially increased girls' vulnerability to violence. Concerted and youth-focused policy efforts to extend support services for adolescent violence survivors, are urgently needed.

Preconception body mass index and gestational weight gain and behavioural problems children and adolescents: the UK birth cohort study

Berihun Dachew¹, Akilew Adane², Rosa Alati¹

¹School of Population Health, Curtin University, Perth, Australia, ²Ngangk Yira Institute for Change, Murdoch University, Perth, Australia

Background and Objective: Existing evidence in the association between maternal pregnancy and pre-pregnancy weight and behavioural outcomes in children is limited and inconsistent. This study aimed to examine these associations at five developmental time points between ages 3 and 16.

Methods: We used data from the Avon Longitudinal Study of Parents and Children (ALSPAC), an ongoing population-based longitudinal pregnancy cohort study in Bristol, United Kingdom (UK). Data on behavioural outcomes were measured at ages 3.5, 7, 9, 11 and 16 years using the Strengths and Difficulties Questionnaire (SDQ). Over 7960 (at 3.5 years of age) and 4400 (at 16 years of age) mother-child pairs were included in the final analysis. Generalised estimated Equation (GEE) and logistic regression analyses were used to examine the associations.

Results: Preconception underweight was associated with emotional symptoms in children (OR = 1.38, 95% CI: 1.15 – 1.66). We found an increased risk of peer relationship problems in the offspring of mothers with pre-conception overweight (OR = 1.17, 95% CI: 1.01 – 1.35) and obesity (OR = 1.41, 95% CI: 1.13 – 1.74). Preconception BMI was not associated with hyperactivity/inattention problems and conduct problems. We also found no evidence of the association between gestational weight gain and child behaviour.

Conclusions: Our Findings highlight that preconception BMI, but not gestational weight gain, may influence the emotional health of children and adolescents.

Popul. Med. 2023;5(Supplement):A1031

DOI: 10.18332/popmed/164920

Predicting low cognitive ability at age 5 - feature selection using machine learning methods and birth cohort data

Andrea Bowe¹, Gordon Lightbody¹, Anthony Staines², Mairead Kiely¹, Fergus McCarthy¹, Deirdre Murray¹

¹INFANT Research Centre, Cork, Ireland, ²School of Nursing, Psychotherapy, and Community Health, Dublin City University, Dublin, Ireland

Background and Objectives: Early life is a crucial period for shaping the developing brain. A failure to achieve early foundational cognitive skills may result in a permanent loss of opportunity to achieve full cognitive potential. Developmental screening programmes which rely on the presence of a delay may miss the opportunity for early preemptive intervention in the period of optimal neuroplasticity. The objectives of this study were to 1) apply the random forest (RF) algorithm to birth-cohort data to train a model to predict low cognitive ability at 5 years of age using maternal, infant, and sociodemographic characteristics 2) to identify the important predictive features and interactions.

Methods: Data was from 1,070 participants in the Irish population-based BASELINE cohort. A RF model was trained to predict an intelligence quotient (IQ) score £90

at age 5 years using maternal, infant, and sociodemographic features. Feature importance was examined and internal validation performed using 10-fold cross validation repeated 5 times.

Results: The five most important predictive features were the total years of maternal schooling, infant Apgar score at 1 minute, socioeconomic index, maternal BMI, and alcohol consumption in the first trimester. On internal validation a parsimonious RF model based on 11 features showed excellent predictive ability, correctly classifying 95% of participants. Examination of the model revealed important predictive interactions between many features, for example between total years of maternal schooling and maternal alcohol intake in the first trimester. This model provides a foundation suitable for external validation in an unseen cohort.

Conclusions: Machine learning approaches to large existing datasets can provide accurate feature selection to improve risk prediction. Further validation of this model is required in cohorts representative of the general population. Predicting later cognitive function has important potential risks which warrant careful attention, but it may provide an opportunity for early preemptive intervention.

Effect of Gutka consumption on the birth outcomes of women in Hub Town, Tehsil Hub, District Lasbela

Rabia Baloch¹, Naseem Zehri¹, Nighat Shah¹

¹Jinnah Sindh Medical University, Karachi, Pakistan

Introduction: Tobacco use is one of the main reason of mortality and morbidity all over the globe. Smokeless tobacco (SLT) use is increasing day by day in our country especially in uneducated women of poor socio economic families. Smokeless tobacco (SLT) is used in the form of Gutka, betel quid, chalia, naswar etc. according to a survey 4.6% smokeless users were females. Gutka is a combination of tobacco, areca nuts, and various kinds of chemicals and flavors. The adverse effects of smokeless tobacco are known as it can cause oral and gums problems like carcinoma of gums etc. Its effects on fetus are also being studied and is evidenced that it may cause adverse birth outcomes like low birth weight babies, preterm deliveries and also anemia and folate deficiency in mothers.

Objective: To evaluate the impact of Gutka consumption on maternal birth outcomes in tertiary care hospital.

Methods: An observational cross sectional study was conducted at Jam Ghulam Qadir Hospital Hub Chowki, Balochistan. When pregnant women came to hospital for delivery, self-administered questionnaire was given. We included 250 women who were using gutka and 250 women who were not using gutka. After delivery we recorded birth outcomes. Sample was divided into 2 groups A consisted pregnant woman who used Gutka and B group comprised of pregnant women who did not consumed Gutka. Then these two groups were compared.

Results: The results of this study demonstrated a very high degree of females using Gutka and leading to adverse maternal and fetal outcomes.

Conclusions: It is evident that higher usage of Gutka led to a significant decrease in infantile mean birth weight, length, head circumference of infant at birth, gestational length, physical condition of neonate, APGAR scores and any other abnormality such as cleft palate and lip in comparison to Non-Gutka users.

Maternal alcohol use disorder before and during pregnancy and the risk of stillbirth and infant mortality in Denmark

Priscilla Lee¹, Anne Laursen¹, Ellen Mikkelsen¹, Jiong Li¹

¹Aarhus University, Denmark

Background and Objectives: Previous epidemiological studies show that high maternal alcohol intake during pregnancy is related to offspring mortality, however, the association of high maternal alcohol intake before conception with stillbirth and infant mortality is less clear. This study investigated the association of maternal alcohol use disorder (AUD) before and during pregnancy with the risk of stillbirth and infant mortality.

Methods: We conducted a nationwide cohort study of 1,995,364 births in Denmark during 1980-2012. AUD diagnoses and alcoholism-related medication were retrieved from the Danish National Patient Registry and the Danish National Prescription Registry, respectively. We categorized women as having either "AUD BEFORE pregnancy only" or "any AUD DURING pregnancy". For women with AUD diagnosed only before conception, we further categorized the recency of diagnosis into 8 years. Stillbirth and infant mortality were identified from The Danish Medical Birth Register and Danish Register of Causes of Death, respectively. We used logistic regression models to analyze the association of maternal AUD with stillbirth and infant mortality.

Results: Of 1,995,364 births during 1980-2012, 8663 stillbirths and 9960 infant deaths occurred. Compared with no maternal AUD diagnosis, maternal AUD before conception was associated with 24% [95% confidence interval (CI)=1.00-1.53] and 31% (95%CI=1.10-1.57) higher odds for stillbirth and infant mortality, respectively. Recency of diagnosis before conception presented a monotonic relationship with of stillbirth and infant mortality risk. Compared with women who never had the disorder, women with AUD during pregnancy had an increased risk of having a stillbirth (OR=1.86, 95%CI=0.99-3.47) and experiencing infant mortality (OR=3.17, 95%CI=2.11-4.76).

Conclusions: Maternal AUD before and during pregnancy were associated with an increased risk of stillbirth and infant mortality. This study supported that early attention to maternal AUD is a potential way to decrease risk of stillbirth and infant mortality.

Investigating the role of friendship interventions on the mental health outcomes of adolescents: a scoping review of range and a systematic review of effectiveness

Tanya Manchanda¹, Mina Fazel¹, Alan Stein¹

¹Department of Psychiatry, University of Oxford, United Kingdom

Friendships are a crucial component of adolescence, though their role on adolescent mental health remains largely unexplored. This paper presents a scoping review, followed by a systematic review, to assess friendship interventions and their impacts on the mental health outcomes of adolescents aged 12-24. The scoping review intends to map the range of friendship interventions, while the systematic review intends to evaluate and categorise the efficacy of friendship interventions for mental health. Studies were selected using eight databases and screened for inclusion. Studies were included if they incorporated a friend or authentic social group in an intervention dedicated to improving mental health outcomes and well-being. Twenty-four studies were included in the scoping review, and 18 were eligible for the systematic review. Data from 12815 adolescents were analysed; three prominent themes emerged. The most common theme was mental health literacy, followed by supporting help-seeking and, finally, friendship-building and combating isolation. Most studies evaluated the individual who had received the intervention rather than their wider friends who would have been potential recipients of any altered interactions. Of the three included studies focusing on friendship building for mental health support, all had positive short-term outcomes but inconclusive long-term effects. Two studies brought in friends from an individual's authentic social group to, for example, learn how to support their friend better. While the opportunities for improving mental health literacy and help-seeking seem to be strong, friends' role in mental health interventions has only been developed in a few areas. It would benefit from broader domains of influence and mechanisms of action being explored, given how friends are proven to be a key point of contact for many adolescents.

DOI: 10.18332/popmed/164949

In hospital death among under five years children hospitalized with meningitis in the eastern of the Democratic Republic of Congo

Jeanniere Manegabe¹, Archippe Muhandule²

¹Faculty of Pediatrics, Evangelical University in Africa, Democratic Republic of Congo, ²Department of Pediatrics, Evangelical University in Africa, Democratic Republic of Congo

Background: Meningitis is a major public health problem needing timely diagnosis, appropriate treatment, prevention and control. Despite the advances in diagnosis and treatment of infectious diseases, meningitis is still considered as an important cause of mortality and morbidity, especially in the pediatric population of lower income countries such as the Democratic Republic of the Congo (DR Congo). In this study, we aimed to analyze the fatality aspect of suspected meningitis among children under five years.

Materials and Methods: A prospective, descriptive study carried out in the Pediatrics departments of four hospitals in the South-Kivu province in the Eastern part of the DR Congo from April 2021 to March 2022. Of the 1,386 children enrolled, 251 children were suspected of meningitis. This study captures data generated in the framework of routine medical practice, which includes medical history, clinical diagnosis and Results of locally conducted laboratory tests. **Results:** Throughout the study period, a total of 251 patients (18.1%) aged 1 month to 59 months with suspected meningitis were recruited out of 1386 children hospitalized in the Pediatrics. The fatality among hospitalized children with suspected meningitis during the study period was 27.9%, however the mortality

linked to meningitis decreases with age, ranging from 37.5% among children under 2 years to 19.4% among those over 2 years old. Children hospitalized for meningitis with malnutrition as an underlying condition, had a 3.5 times greater risk of dying. The case fatality rate was higher in transferred and not vaccinated children respectively (2.3 and 2.5 times). We observe that the death occurs early within the first 3 days.

Conclusions: Our study noted a higher fatality rate in children with suspected meningitis; that could be probably be linked to the gap in vaccination and malnutrition as underline condition.

Examining the linkages between maternity services and postpartum modern contraceptive adoption among young women in India: Insights from the 2015-16 and 2019-21 National Family Health Survey

Monirujjaman Biswas¹

¹Jawaharlal Nehru University, India

Background and Objectives: The adoption of maternity services and postpartum modern contraception are the two most crucial components help to reduce both maternal and infant mortality; still, India is consistently struggling with it. This paper, therefore, aimed to examine the linkages between use of maternity services and postpartum modern contraceptive adoption. **Methods:** The required reproductive calendar data were extracted from the 2015-16 and 2019-21 National Family Health Survey (NFHS) datasets. The assessment was made based on a sample of currently married women aged 15-24 years who had given most recent childbirth in five years preceding the survey. For the analysis, a time-to-event approach was applied using the Kaplan-Meier survival statistic, Log-Rank Chi-square test and Cox-Proportional Hazard (Cox-PH) models.

Results: The Results revealed that the proportion of postpartum modern contraceptive uptake among young users increased by only 9%, from 33% in 2015-16 to 42% in 2019-21. The Cox-PH models reported that, in both NFHS waves, the associations between various components of maternity services and postpartum modern contraceptive uptake were strongly significant, even after controlling for selected socio-economic and demographic correlates. **Conclusions:** The Findings of this study reinforced the need for implementing integrated maternal-child health and family planning programs and for boosting effective family planning counselling by health professionals to promote and motivate young women with a desire to early adoption of modern contraception in subsequent months after a recent childbirth.

Undernutrition among pregnant adolescent: a scoping systematic review

Adane Tesfaye^{1,2}, Dessalegn Tamiru², Tefera Belachew²

¹School of Public Health, College of Medicine and Health Sciences, Dilla University, Dilla, Ethiopia, ²School of Public Health, College of Medicine and Health Sciences, Jimma University, Jimma, Ethiopia

Background: In pregnant adolescents, it is hypothesized that there is 'nutrient partitioning', a competition for nutrients between the still-growing adolescent mother and her rapidly developing fetus Resulting in a compromised nutrition status of both. This scoping review examined the prevalence of undernutrition, associated factors, and outcomes of adolescent pregnancy.

Methods: We used a five stages framework of Arksey and O'Malley (2005) to carry out this scoping review. Published articles, reviews, and reports were identified through a complete search. We included articles published in the English language from 2000 to 2020. We summarized the prevalence, associated factors, and health outcomes of pregnancy during adolescence.

Results: 25 studies met the inclusion criteria. 32% of the studies are on dietary intake, 20% of them reported nutritional status and associated factors, and 48% of studies discussed the effect of poor nutrition on the outcome of Pregnancy during adolescence. Only 4 of the studies are community-based and 21 are facility based. The magnitude of undernutrition among pregnant adolescent girls ranged from 23.5% to 34%; Social determinants of health such as poor access to antenatal care visits, low educational status of partners, poor dietary intake, early marriage, rural residency, young age and having multiple pregnancies are associated with poor nutritional status. Pregnant adolescents have also more risks of poor pregnancy outcomes compared with pregnant adult women. These include fetal complications like prematurity, low or very low birth weight, and perinatal mortality, major congenital defects; hypertensive pregnancy disorders, abortion, urinary infections, and premature rupture of the fetal membranes.

Conclusions: A higher magnitude of undernutrition, less dietary intake, and more risks of poor pregnancy outcomes were observed from reviewed studies. This review demonstrated the absence of comprehensive literature which might be explored through a population-based prospective study.

Prevalence of Chlamydia trachomatis and its associated factors among sexually active women in a high HIV-burden region, Western Kenya using Point-of-Care approach

Martha Nyakambi¹, Anthony Waruru², Adesina Oladokun³

¹Pan African University of Life and Earth Sciences Including Health and Agriculture, Kenya, ²Centre for Disease Control (CDC), Kenya, ³University College Hospital, University of Ibadan, Nigeria

Background: 7.5% participants tested Chlamydia-positive and were treated. Chlamydia positivity was highest (48.3%) among inconsistent condom users and lowest (10.3%) among non-users. Women in polygamous and low education had higher prevalence (7.3%). The age group 18-25 years had the highest positivity (79%; 5.7%). Factors associated with Chlamydia were: multiple sexual partners, adjusted odds ratio (aOR) 15.7 (95% CI: 2.1, 120); being HIV-infected aOR 4.0 (95% CI: 1.3, 12.5); and having UTI aOR 4.3, (95% CI: 1.8,10.7). Nearly all participants (92%) had no explicit knowledge of the symptoms or effects of Chlamydia. Self-collection of vaginal swabs was highly acceptable (99.7%).

Conclusions: Chlamydia infections are prevalent among women with multiple sexual partners, who have other STIs, or inconsistently use condoms. Most women had poor knowledge of symptoms and Chlamydia-associated risk factors; therefore, awareness may ease the STI burden. Using Chlamydia POC diagnostic tests, provision of same-day Results and treatment is feasible.

Effectiveness of a pilot school milk scheme in increasing milk consumption among children attending Irish early years settings

Ellen Greene¹, Celine Murrin²

¹School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland., ²School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland

Background and Objectives: Milk consumption among Irish children has decreased over the past decade. As lasting food preferences can be developed in early childhood, intervening to promote a liking for milk before school age may be effective in increasing milk consumption. The EU School Milk Scheme (SMS) provides subsidised milk to schoolchildren, but in Ireland, operates predominantly in primary schools. The aim of this study is to determine whether a pilot of the SMS in Early Years Settings (EYS) is effective in increasing milk consumption and liking of milk among 2 to 5 year-old children.

Methods: The two-week SMS pilot included the provision of milk for daily distribution, with accompanying educational resources. Baseline and post-intervention data were collected via parental questionnaire in 12 intervention EYS and eight waitlist control settings, who had not yet received the intervention. McNemar's test was used to test for change in milk consumption (consuming milk daily versus less than daily) and liking of milk from baseline to follow-up among children in the intervention and waitlist control groups.

Results: Matched responses were received from 125 parents of 2-5 year-old children (intervention n=66; control n=59). There was a significant increase in daily milk consumption among children attending intervention EYS, from baseline (60.6%) to follow-up (78.8%), P= 0.023. There was not a significant difference in daily milk consumption among children attending control EYS, from baseline (67.8%) to follow-up (72.9%), P= 0.607. There were no significant differences in liking of milk from baseline to follow-up in the intervention or control group (P>0.05).

Conclusions: The SMS Early Years Pilot was effective in increasing 2 to 5 year-old children's milk consumption. Further research is necessary to explore the long-term influence of a milk provision and education intervention on preschool children's milk consumption and to determine its effectiveness on a larger scale.

Teenagers' mental health problems predict probable mental diagnosis among girls, but what about the boys?

Kristina Carlén¹, Sakari Suominen^{1,2,3}, Lilly Augustine⁴, Maiju Saarinen^{5,6}, Minna Aromaa^{7,8}, Päivi Rautava^{9,10}, Andre Sourander^{11,12}, Matti Sillanpää¹³

¹School of Health Sciences, University of Skövde, Sweden, ²Department

of Public Health, University of Turku, Finland, ³Turku University Hospital, Turku, Finland, ⁴CHILD, School of Learning and Communication, Jonkoping University, Jonkoping, Sweden, ⁵Department of Child Neurology and General Practice, University of Turku, Finland, ⁶Turku University Hospital, University of Turku, Finland, ⁷Department of Public Health, University of Turku, Turku, Finland, ⁸Turku University Hospital, University of Turku, Turku, Finland, ⁹Department of Public Health, University of Turku and Turku University Hospital, Turku, Finland, ¹⁰Clinical Research Centre, Turku University Hospital, Turku, Finland, ¹¹Department of Child Psychiatry, University of Turku, Turku, Finland, ¹²Department of Child Psychiatry, Turku University Hospital, Turku, Finland, ¹³Departments of Child Neurology and General Practice, University of Turku and Turku University Hospital, Turku, Finland

Background and Objectives: Adolescents' mental health is a public health concern. The prevalence of mental disorders is increasing, and there seems to be a gender difference, with girls reporting more mental health problems than boys, especially regarding internalizing problems. Most mental disorders debut early but often remain untreated into adulthood. Therefore, early detection of mental disorders is essential. The study aimed to estimate to what extent teenagers' self-reports of mental health problems predict probable mental diagnoses as they enter adulthood, particularly regarding gender differences.

Methods: Self-reported mental health problems, Youth Self-Report (YSR) at 15 years (n = 504) from the ongoing Finnish family competence study (FFC) using modified multivariable Poisson regression analysis for prediction of DAWBA (Development and Wellbeing Assessment) interview outcomes 3 years later.

Results: Recently published Results (Carlén et al., 2022) showed that one unit's increase in YSR was estimated to correspond to an increase in the relative risk of a probable DAWBA-based diagnosis by 3.3% [RR (95% CI) 1.03 (1.03–1.04), p < 0.001]. In gender-specific analysis, the Findings applied, particularly to girls.

Conclusions: Youth Self-Report (YSR) scores at pubertal age predicted the risk of a probable mental diagnosis at the onset of adulthood, particularly for girls. Further research is needed to explain the lower sensitivity of YSR among boys.

Social norms influence on provider provision of contraceptive services to adolescents: baseline evaluation of a vignette-based intervention in Kibra- urban informal settlement in Kenya

Paulie Njoroge¹, Elsie Sang², Abraham Afework^{3,4}

¹Save the Children-Kenya Country Office, Kenya, ²Save the Children-Kenya Country Office, Nairobi, Kenya, ³Save the Children, ⁴Nairobi, Kenya

Delaying pregnancy among girls and young women can improve maternal and child health outcomes, as well as women's educational outcomes and long-term socioeconomic trajectories. Helping adolescents and youth to delay pregnancy until they are ready starts with improving accessibility, acceptability and quality of Sexual reproductive health and family planning (SRH/FP). Social and gender norms can influence health provider attitudes and behaviors Resulting in key barriers for adolescents seeking SRH/FP services. To inform a social norm intervention addressing providers attitudes and behaviors, we carried out two surveys among health providers, and adolescents and youth seeking services in Kibra informal settlement of Nairobi, Kenya. The Results show that myths and misconceptions regarding FP methods are a key issue among providers, and concerns about FP use Resulting in promiscuity remain high, despite receiving recent SRH/FP trainings. Yet, the majority of providers believe they have a duty to provide services to their young clients. Adolescents and youth seeking services were mostly satisfied with services. However, providers treatment was the most common source of dissatisfaction. Their knowledge of FP methods varied, yet health providers were the most trusted source to seek information on SRH/FP methods. Early pregnancy impedes long-term social, educational and health outcomes of adolescent girls and young women. In Kenya, 18% of adolescent girls have already begun childbearing. Helping adolescents and youth, delay pregnancy requires quality SRH/FP services that are acceptable, accessible and address their age-specific needs and priorities. However, adolescents seeking contraception are often shamed, sent away, or harshly treated by providers. We implemented i. To inform an intervention to address social factors shaping SRH/FP provision of services in Kibra informal settlement of Nairobi, we carried out two baseline surveys among SRH/FP providers, and adolescents seeking services.

The clinical characteristics of perineal tears: a study carried out on 14 pregnant women in a tertiary center: case series

Aymar Akilimali¹

¹Medical Research Circle, Bukavu, Democratic Republic of Congo

Background: The sheer quality of the female genital tract is not always respected at the time of childbirth [1] because no protocol for the management of perineal tears exists in our services these days. The management remains dependent on a gynecologist and obstetrician. The study aimed to describe the characteristics of perineal tears. **Methods:** Our cross-sectional, retrospective, and descriptive study focused on patients admitted for childbirth and hospitalized in the obstetrics department of the Saint Luc Tertiary Clinic for a period from March 2021 to March 2022. During this period, we recorded 111 deliveries with 14 perineal tears. **Results:** A total of 111 deliveries were recorded with a 12.6% frequency of perineal tears. 64.3% of women aged between 26 and 35 and 71.4% of primiparous women [2] were affected by perineal tears. For delivery, 64.3% of births were eutocic deliveries, with 42.9% of children born with a birth weight greater than 4 kg, and the cephalic presentation [3] delivered 86% of children. For degrees of perineal tears, 64.3% of patients had first-degree perineal tears. For postpartum treatment of perineal tears, analgesics [4] help calm the pain, and antibiotic therapy has been considered. For fourth and third-degree tears, episiotomy [5] was performed as a surgical procedure. **Conclusions:** Perineal tears are the trauma often encountered in obstetrics; the first few suffer from it essentially. The high birth weight of children is often the cause. They require immediate management to prevent or avoid infections. **Links:** [1] <https://www.sciencedirect.com/topics/medicine-and-dentistry/childbirth> [2] <https://www.sciencedirect.com/topics/medicine-and-dentistry/primiparous-woman> [3] <https://www.sciencedirect.com/topics/medicine-and-dentistry/cephalic-presentation> [4] <https://www.sciencedirect.com/topics/medicine-and-dentistry/anodyne> [5] <https://www.sciencedirect.com/topics/medicine-and-dentistry/episiotomy>

Maternal and perinatal death surveillance and response in Baluchistan, Pakistan-causes & contributory factors of maternal deaths

Anaam Arif¹, Muhammad Alam¹

¹World Health Organization, Pakistan

Pakistan is the sixth most populous country in the world and is ranked 53rd in the list of countries contributing towards high maternal mortality ratios. According to a recent maternal mortality survey, the current maternal mortality ratio of Pakistan is 186 per 100,000 live births with high disparities among provinces; Balochistan is the highest contributor with MMR of 298 per 100,000 live births. This study specifically focuses on the causes and contributory factors of high maternal deaths in Balochistan based on the evidence generated by the Maternal and Perinatal Death Surveillance and Response system. MPDSR provides the decision-makers with reliable and timely data to take the required action to reduce preventable maternal deaths. Maternal mortality data was collected from the three pilot tertiary health care facilities and data was analyzed using Statistical Package for Social Sciences version (20.0). Out of 40 notified maternal deaths in the period January 2020 till July 2020 around 39 deaths were reviewed and analyzed. This study found that of these 39 maternal deaths around 32% were attributed to hemorrhage, and around 15% and 12% resulted from eclampsia and sepsis respectively. Other major causes of maternal deaths included obstructed labour (10%), embolism (10%), and anesthesia complications (2%) respectively. Non-medical causes of these maternal deaths included shortage of human resource (7.7%), lack of medical equipment (7.7%) and failure to recognize the danger signs earlier (5.1%). The major underlying factors of these maternal deaths included low antenatal visits, underutilization of family planning services, poor referral system, and delays at all levels in the three-delay model. The study concluded that almost all of these maternal deaths could be avoided by undertaking appropriate measures and timely actions.

Determinants of mortality in Postpartum Haemorrhage in Mzimba district, Malawi

Monalisa Tembo¹, Abigail Kazembe², Elizabeth Glaser³, Alice Kadango³

¹Ministry of Health, Mzuzu Central Hospital, Malawi, ²Kamuzu University of Health Sciences, Lilongwe, Malawi, ³Kamuzu University of Health Sciences, Blantyre, Malawi

Background: Severe Postpartum Haemorrhage (PPH) is one of the major complications following childbirth. Many interventions have helped to reduce its impact on maternal outcomes, nonetheless, it remains one of the major causes of maternal mortality. This study, therefore, aimed to determine the factors associated with mortality in severe PPH compared with those women who

survived after experiencing severe PPH in Mzimba District, Malawi. The findings could help to strategize appropriate interventions to manage women at higher risk of mortality from severe PPH.

Methods: A case-control approach using secondary data from women who had severe PPH was used. Stratified random sampling was used to select the cases and controls and Statistical Package for the Social Sciences was used to calculate the odds ratio and chi-squared test.

Results: The factors that were associated with mortality in severe PPH included the age range of 35 years and above (OR=5.69) rural dwelling (OR=3.83), (pre) eclampsia (OR=6.14), gravid 5 and above (OR=3.08), para 5 and above (OR=3.30), cesarean section delivery (OR=3.03) and poor neonatal outcome (OR=10.86) while the protective factors included spontaneous vaginal delivery (OR=0.30), perineal tears (OR=0.27) and uterine atony (OR=0.24).

Conclusions: The finding identifies some of the risk factors associated with mortality in PPH. It, therefore, indicates the need for comprehensive preventive measures and practices among those with risk factors to further reduce the maternal mortality associated with PPH and thereby leading to the achievement of Sustainable Development Goal 3.1.

Ethnic minority women's experiences of accessing antenatal care in high income European countries: a systematic review

Shuby Puthusseri¹, Esther Sharma², Pei-Ching Tseng², Angela Harden³, Leah Li⁴

¹Maternal and Child Health Research Centre, University of Bedfordshire, Luton, United Kingdom, ²Maternal and Child Health Research Centre, University of Bedfordshire, United Kingdom, ³School of Health Sciences, City, University of London, United Kingdom, ⁴Great Ormond Street Institute of Child Health, University College London, United Kingdom

Background and Objective: Women from ethnic minority background are at greater risk of adverse maternal outcomes. Timely antenatal care is crucial in reducing risks of poor outcomes. The aim of this study was to identify, appraise, and synthesise recent qualitative evidence on ethnic minority women's experiences of accessing antenatal care in high-income European countries, and to develop a novel conceptual access framework based on women's perspectives.

Methods: We searched eight electronic databases in addition to manual searches to identify all qualitative studies published between January 2010 and May 2021. Identified articles were screened in two stages against the inclusion criteria with titles and abstract screened first followed by full-text screening. Included studies were quality appraised using the Critical Appraisal Skills Programme checklist and extracted data were synthesised using a 'best fit' framework.

Results: Thirty studies conducted in 11 European countries were included. Participants in majority of studies were women newly arrived in the host country. Women's experiences covered two overarching themes: 'provision of antenatal care' and 'uptake of antenatal care'. The 'provision of antenatal care' theme included five sub-themes: promotion of antenatal care importance, getting to antenatal care, costs of antenatal care, interactions with care providers and models of antenatal provision. The 'uptake of antenatal care' theme included seven sub-themes: delaying initiation of antenatal care, seeking antenatal care, reaching antenatal care, engaging with antenatal care, previous experiences of interacting with maternity services, ability to communicate and immigration status.

Conclusions: Findings demonstrated multifaceted and cyclical nature of initial and ongoing access to antenatal care for ethnic minority women. Structural and organisational factors played a significant role in women's ability to access antenatal care. Need for research on experiences across different generations of ethnic minority women, taking into account duration of stay in the host country in the host country was evident.

Popul. Med. 2023;5(Supplement):A1047

DOI: 10.18332/popmed/165044

National and subnational burden of under-5 mortality in Ethiopia: evaluation of data from three decades using the Global Burden of Disease Study 2019

Gizachew Tessema¹, Awoke Misganaw², Tezera Berheto³, Gavin Pereira⁴, Yohannes Kinfu⁵

¹Curtin School of Population Health, Curtin University, Australia, ²Institute of Health Metrics and Evaluation, United States, ³Ethiopian Public Health Institute, Ethiopia, ⁴Curtin School of population Health, Curtin University, Australia, ⁵University of Canberra, Australia

Background and Objective: The under-5 mortality rate is a commonly used indicator

of population health and socioeconomic status worldwide. However, as in most resource-limited settings, deaths among children under-5 and in any age group in Ethiopia remain unreported. We aimed to systematically estimate neonatal, infant, and under-5 mortality trends, identify underlying causes, and make subnational (regional and chartered cities) between 1990 and 2019.

Methods: We used the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD 2019) to estimate three key under-5 mortality indicators –the probability of death between the date of birth and 5 years (under-5 mortality rate, U5MR). The causes of death by age groups, sex, and year were estimated using Cause of Death Ensemble modelling (CODEm). Specifically, this involved a multi-stage process that includes a non-linear mixed-effects model, source bias correction, spatiotemporal smoothing, and a Gaussian process regression to synthesise mortality estimates by age, sex, location, and year.

Results: In 2019, an estimated 190,173 (95% uncertainty interval 149,789–242,575) under-5 deaths occurred in Ethiopia, which was over two and a half times fewer 462,195 (427,639–499,980) than the deaths estimated for 1990. Nearly three-quarters (74%) of under-5 deaths in 2019 were within the first year of life, and over half (52%) in the first 28 days. The overall U5MR, IMR, and NMR in the country were estimated to be 52.4 (44.7–62.4), 41.5 (35.2–50.0), and 26.6 (22.6–31.5) deaths per 1000 livebirths, respectively, and differed substantially between regions.

Conclusions: While all regional states in Ethiopia have experienced a decline in under-5, infant, and neonatal mortality rates in the past three decades, the rate of change was not large enough to meet globally agreed-upon Sustainable Development Goals (SDGs) targets. Inter-regional disparities also remain significant, with the biggest differences being in the neonatal period.

Utilization of antenatal care services and pregnancy outcomes of women in advanced maternal age in Sri Lanka

Poojani Illangasinghe¹, Kapila Jayaratne²

¹Family Health Bureau, Ministry of Health, Sri Lanka, ²Family Health Bureau, Ministry of Health, Rajagiriya, Sri Lanka

Introduction: Childbearing in latter part of reproductive age is a challenge. Adverse pregnancy outcomes increase with advanced (>35 years) maternal age (AMA) and many are preventable. Optimum antenatal care (ANC) is beneficial in minimizing negative outcomes of AMA. **Objectives:** We aimed to describe characteristics, utilization of ANC and pregnancy outcomes of AMA women delivering at a Teaching Hospital. We also assessed association between utilization of ANC services and selected pregnancy outcomes. **Methods:** We conducted a descriptive cross-sectional study among 216 women aged >35 years delivered at Colombo North Teaching Hospital selected using a non-probability consecutive sampling method. Women were interviewed within 7 days postpartum inward using an interviewer-administered questionnaire. Selected data were extracted from clinical records. Utilization of ANC was categorized using a scoring system and the association with pregnancy outcomes was assessed by applying Chi-square test.

Results: A total of 216 AMA postpartum women (age range 35–45 years, mean 37.8 (SD=2.4)) were recruited (response rate 100%). Majority (91.7%, n=198) were multiparous. The current pregnancy was planned in 77.8% (n=168) and 52.7% (n=114) experienced antenatal morbidities. Adverse maternal (8.3%, n=18) and newborn (37%, n=80) outcomes were noted. Majority (75.9%, n=164) optimally utilized ANC. Sinhalese (OR=2.98, 95%CI 1.29–6.87, p=0.008), Buddhist (OR=2.53, 95%CI 1.33–4.80, p=0.004) women with intended pregnancies (OR=5.67, 95%CI 2.81–11.43, p<0.001) well utilized ANC. Women educated <10 years of formal education (OR=0.4, 95%CI 1.33–4.80, p=0.027), had contraceptive issues (OR=0.27, 95%CI 0.10–0.74, p=0.007) and had adverse newborn outcomes (OR=0.32, 95%CI 0.16–0.61, p=0.001) reported low tendency to utilize ANC. **Conclusions:** Many AMA women are multiparous and with planned pregnancies. Presence of adverse maternal & newborn outcomes is substantial. Majority well utilized ANC and it reduced adverse pregnancy outcomes. Effective strategies should be formulated to promote well-planned pregnancies in early reproductive ages of women.

Awareness regarding prevention and management of diarrheal disease among mothers of under five children in Central Nepal

Pramila Poudel¹

¹Gandaki Medical College, Teaching Hospital and Research Centre, Pokhara, Nepal

Introduction: Diarrhea contributes as a major burden of disease among children in

Low- and middle-income countries. Incidence of diarrhea stands as 500 per 1000 under five children in Nepal. Mothers play a vital role in its prevention and home care management. Objective of the study was to assess the level of awareness regarding prevention and management of diarrheal disease among mothers of under five children in Bara district of central Nepal. Material and Methods: A community-based household survey was conducted during November to December 2020, among 284 mothers of under five children using a semi structured interview schedule through face-to-face interview technique. Collected data was entered and analyzed using SPSS version 18. The probability value of <0.05 was considered statistically significant at 95% confidence level.

Results: Among 284 respondents, (19.6%) reported that their child had at least one episode of diarrhea within the last three weeks of data collection. Among them (9.25%) had taken their child to health center and remaining (10.35%) managed it at home. Furthermore, (69.3%) reported that their child had been in contact with female community health volunteers (FCHVs). Almost all respondent heard about ORS whereas only (43.2%) knew the correct technique to prepare and use ORS. Regarding awareness majority (61.4%) had poor level of awareness. Level of awareness was significantly associated with educational status and number of children of respondents. Conclusions and Recommendations: Majority of respondents had poor level of awareness regarding prevention and management of diarrhea. Strengthening the capacity of FCHVs and conducting various community-based health intervention in the form of teaching, health exhibition and demonstration can contribute in increasing the level of awareness among the community people.

Association between a complex community intervention and quality of health extension workers' performance to correctly classify common childhood illnesses in four regions of Ethiopia

Theodoros Zemedu¹, Solomon Abebe², Mezgebu Yitayal², Lars Persson³, Della Berhanu³

¹Institute for Collective Health, Ethiopian Public Health Institute, Ethiopia,

²College of Medicine and Health Sciences, Institute of Public Health, University of Gondar, Ethiopia, ³Department of Disease Control, London School of Hygiene and Tropical Medicine, United Kingdom

Background: Due to low care utilization, a complex intervention was done for two years to optimize the Ethiopian Health Extension Program. Improved quality of the integrated community case management services was an intermediate outcome of this intervention through community education and mobilization, capacity building of health workers, and strengthening of district ownership and accountability of sick child services. We evaluated the association between the intervention and the health extension workers' ability to correctly classify common childhood illnesses in four regions of Ethiopia.

Methods: Baseline and endline assessments were done in 2016 and 2018 in intervention and comparison areas in four regions of Ethiopia. Ill children aged 2 to 59 months were mobilized to visit health posts for an assessment that was followed by re-examination. We analyzed sensitivity, specificity, and difference-in-difference of correct classification in intervention and comparison areas at baseline and endline.

Results: Health extensions workers' consultations with ill children were observed in intervention (n = 710) and comparison areas (n = 615). At baseline, re-examination of the children showed that in intervention areas, health extension workers' sensitivity for fever or malaria was 54%, 68% for respiratory infections, 90% for diarrheal diseases, and 34% for malnutrition. At end-line, it was 40% for fever or malaria, 49% for respiratory infections, 85% for diarrheal diseases, and 48% for malnutrition. Specificity was higher (89–100%) for all childhood illnesses. Difference-in-differences was 6% for correct classification of fever or malaria [aOR = 1.45 95% CI: 0.81–2.60], 4% for respiratory tract infection [aOR = 1.49 95% CI: 0.81–2.74], and 5% for diarrheal diseases [aOR = 1.74 95% CI: 0.77–3.92].

Conclusions: This study revealed that the Optimization of Health Extension Program intervention, which included training, supportive supervision, and performance reviews of health extension workers, was not associated with an improved classification of childhood illnesses.

of Rehabilitation Therapy, Queen's University, Canada, ⁴Department of Epidemiology and Biostatistics, Institute of Public Health, University of Gondar, Ethiopia, ⁵School of Rehabilitation Therapy, Queen's University, Kingston, Canada

Background and Objective: The prevalence of severe malaria among children in African hospital-based studies is nearly 39%, and roughly 53% of children who survive severe malaria develop long-term sequelae. However, these consequences have not been studied from a disability and rehabilitation perspective. Therefore, this study aimed to assess severe malaria-related disability in Ethiopian children from the biopsychosocial perspective. Methods: Three independent but interrelated studies were conducted: (1) a systematic review of the African severe malaria literature in children that summarized the components of disability using the International Classification of Functioning, Disability, and Health (ICF), (2) an interpretive descriptive study of severe malaria-related disability from the perspectives of caregivers, and (3) a qualitative descriptive study that explored the perceptions and behaviors of healthcare providers towards severe malaria-related disability, using the Theoretical Domains Framework. The purposive sampling technique was used in both qualitative studies, and reflexive thematic analysis and directed content analysis were used to analyze data in the second and third studies.

Results: This study identified three integrated findings: (1) physical, psychological, and social functioning are notable components of disability related to severe malaria; (2) various contextual factors interacted with severe malaria and act as either barriers or facilitators of functioning, and (3) healthcare providers were focused on acute care, and they perceived that there were no rehabilitation support systems for severe malaria-related disability. Conclusions: Severe malaria-related disability is associated with impairments, activity limitations, and participation restrictions in African children. However, these children were not included in rehabilitation support and care. Implications: Future research should consider the components of disability identified in this study on a large scale. In addition, policymakers should consider funding post-severe malaria follow-up care and rehabilitation support systems, and rehabilitation professionals should include children with severe malaria-related disabilities in their care and support system.

Strengthening community-facility linkage in implementing the World Health Organization (WHO) case management guideline for Possible Serious Bacterial Infection (PSBI) among sick young infants in Western, Kenya

Ombaka Oduor¹, Meshack Kibitok²

¹Kenya Medical Research Institute, Kenya, ²Living Goods, Nairobi, Kenya

Background: Follow-up of sick young infants (SYIs) with signs of PSBI by community health workers (CHWs) can be useful in delivering simplified outpatient treatment. We describe how strengthening community-facility linkage increases fidelity, acceptability and sustainability of implementing WHO guideline on case management of PSBI when referral is not possible.

Methods: The research adopted Hybrid II implementation research strategy using a mixed-methods evaluation across 39 primary care health facilities in Migori and Busia County. We trained 395 CHWs on two digital platforms CommCare and smart health to conduct home visits on days 2, 4, and 8, assess infants receiving treatment, encourage treatment adherence, and remind the caregiver to return for follow-up treatment at the facility.

Results: Between August 2021 and May 2022, CHVs assessed 7622 newborns, 896 (11.7%) were identified with PSBI danger signs and referred to primary health care facilities (PHCF) for treatment. CHWs completed all planned household visits, assessments, and referrals for SYIs, demonstrating feasibility and acceptability. Fidelity also improved for follow-ups: the proportion of SYIs with PSBI identified in the community, treated, and re-assessed on day 2 at PHCs increased over the same period (peaked at 94%). However, the proportion of PSBI cases followed up on days 4 and 8 remained low (at 29% and 26%, respectively) mainly due to caregivers' reluctance to return to the facility for their baby's re-assessment, citing cost and improvement of baby's conditions.

Conclusions: Digital interventions can potentially improve the identification, referral and tracking of PSBI cases by CHWs and linkage with PHCFs. Combining CHWs efforts with mobile digital strategy improves the acceptability and fidelity of implementing PSBI guidelines during COVID-19 and other similar emergencies.

The price women pay: mineral extraction sites and women's safety

Kelly Parsley¹

¹Carroll College, United States

Mining areas brim with jobs and prosperity for many rural areas around the world, but they also bring a litany of crime and violence, especially violence against women. To complicate matters, the data is slim. Crisis centers and law enforcement report increased numbers of crimes, but few are tracking the impact the energy extraction industry has on women's safety and even fewer are tracking solutions to the problem. In this session we will review the academic literature on violence against women in energy extraction areas. We will address information about human trafficking, and we will include a discussion of women's safety particularly in rural areas where mineral extraction often takes place. Presenters will also share some strategies that communities have used to measure and limit the violence. In addition, presenters share policies and laws that some communities near mining sites have implemented to limit violence against women.

Young people with prior health service contacts have increased risk of repeated alcohol-related harm hospitalisations

Scott Sims¹

¹University of Western Australia, Australia

Introduction: After a first alcohol-related hospitalisation in youth, subsequent hospitalisations may demonstrate an increased risk of further alcohol-related hospitalisations, but there is no existing data on this. **Methods:** A retrospective longitudinal study between July 1992 to June 2017 using linked hospital administrative data identified 23,464 Western Australian young people (9,009 (38.4%) females and 14,455 (61.6%) males), aged 12-24 years hospitalised for at least one alcohol-related harm (ARH) episode of care. Cox regression was used to estimate hazard ratios (HRs) between risk factors and repeated alcohol-related hospitalisation after the first discharge for ARH. **Results:** Of those admitted for a (n=23,464), 21% (n=4,996) were readmitted for ARH. This high-risk sub-group comprised 46% (n=16,017) of the total alcohol-related admissions (n=34,485). After the first discharge for ARH, 16% (804) of people who experienced an alcohol-related readmission were readmitted within one month, and 51.8% (2,589) were readmitted within 12 months. At increased risk of readmission were Aboriginal people (HR=1.95; 95% CI: 1.81, 2.10) and those with prior health service contacts occurring before their first alcohol-related hospitalisation, including illicit drug hospitalisations (HR=4.40; 95%CI: 4.11, 4.72), mental health contacts (HR=2.37; 95%CI: 2.22, 2.53) and, in a sub-analysis, ED presentations (HR=1.32; 95% CI: 1.24, 1.41). **Discussion and Conclusions:** The probability of a repeated ARH hospitalisation was highest in the first month after initial discharge. There is a high-risk sub-group of young people more likely to have a repeat ARH hospitalisation. This represents an opportunity to provide interventions to those most at risk of repeated ARH.

Strengthening public health contributions in youth suicide prevention by reconceptualizing notions of resilience in youth mental health

Katrina Plamondon¹, Sana Shahram²

¹Faculty of Health and Social Development, School of Nursing, University of British Columbia, Canada, ²School of Nursing, Faculty of Health and Social Development, University of British Columbia, Kelowna, Canada

Suicide is the second-leading cause of death among youth in Canada and the world, with rates highest among Black, Indigenous, people of colour and LGBTQIA2+ youth. Evidence shows upstream, community-based factors may be more important for promoting youth mental health. Evidence also shows that not all youth present the same (or any) risk factors. Yet, youth suicide prevention efforts conceptualize resilience at the individual level, as an internally-determined response to hardship or trauma and therefore rely on biomedical, episodic interventions targeting high-risk youth. These factors limit the possibilities of primary prevention, reacting to youth in crisis rather than creating conditions for thriving. The CLARITY (Community-Led Actions for Resiliency Important to Youth) Project began in 2018 as a community-driven response to the tragic loss of young people to suicide. CLARITY uses dialogue-based research, convening people in actively co-designing upstream, inclusive, and universally accessible initiatives. This long-term research partnership intervenes on systems and structures that create barriers to resilience and put youth at risk in the first place. The CLARITY project disrupts three long-standing conceptual norms in youth suicide prevention: (1) the emphasis on episodic, downstream, and largely biomedical suicide prevention interventions; (2) the tendency in research, policy and practice to rely on constructs of resilience as an individual characteristic

borne out of surviving hardship; and, (3) the exclusion of youth as experts in their own lives. Reconceptualizing notions of resilience opens possibilities for public health to play an active role in prevention, thereby reducing the reliance on acute-care, biomedical, and individually-focused system that aims to treat, rather than prevent, illness. In this presentation, we will share results from three different CLARITY studies and knowledge mobilizations efforts, inviting participants to look upstream and toward community-building as a meaningful step toward strengthening public health contributions to youth suicide prevention.

Prevalence trends of loneliness and associations between loneliness, sociodemographic factors, and subjective health among Norwegian adolescents

Nayan Parlikar¹, Kirsti Kvaløy², Linn Strand³, Geir Espnes³, Unni Moksnes³

¹Department of Public Health and Nursing, Norwegian University of Science and Technology, Norway, ²Department of Public Health and Nursing, Norwegian University of Science and Technology, Levanger, Norway,

³Department of Public Health and Nursing, Norwegian University of Science and Technology, Trondheim, Norway

Background and Objective: Globally, loneliness is considered a public health concern. Adolescents may be particularly vulnerable to feelings of loneliness because they face unique development challenges. This study investigates the overall changes in the prevalence of loneliness among the nationally representative study populations of 13–19-year-olds in Norway over the last three decades, and whether age, gender, self-rated health (SRH), and mental distress are associated with these changes.

Methods: Data was used from the Norwegian population-based Young-HUNT survey in 1995–1997, 2006–2008 and 2017–2019 (N=25,245). Loneliness was measured by the question 'Do you feel lonely?' Mental health was assessed by Hopkins Symptom Checklist-5 for adolescents to measure anxiety and depression (cut-off ≥ 2). SRH was assessed by a single direct question 'How is your health at the moment?'. Descriptive analyses were stratified by age, gender, SRH, and mental distress over survey year. Logistic regression and interaction analyses were used to analyze the associations and predictors of loneliness.

Results: Prevalence of loneliness increased from 5.9% in 1995/97 to 10.2% in 2017/19. An increase of 8.9% in 1995/97 to 16.7% in 2017/19 was observed in girls 16-19 years old. Among mentally distressed adolescents, loneliness prevalence increased from 22.3% in 1995/97 to 32.8% in 2006/08 and lowered to 27% in 2017/19. Similar trends were seen in those with poor SRH. There was a statistically significant interaction effect between age and time point on loneliness.

Conclusions: Results indicate increasing levels of adolescent loneliness over the last three decades in Norway corresponding with findings of increasing trends of poor mental health. This highlights the importance of developing interventions for awareness, social integration, and health promotion. Schools may be an especially ideal setting for intervention with the possibility to work on the psychosocial environment, social skills, parental education and early recognition of loneliness and mental health problems.

Characteristics of menstruation and the prevalence of dysmenorrhea among Palestinian adolescents living in refugee camps in the West Bank and Jordan: a cross-sectional study

Rula Ghandour¹

¹Birzeit University, Occupied Palestinian Territory

Introduction: Menstruation is a normal biological process that girls and women experience for the duration of their reproductive years. Normal menstrual cycles during adolescence indicate good current and future reproductive health and general well-being. Dysmenorrhea is the most common menstruation disorder that can be debilitating. This study aims to assess menstruation characteristics among adolescent girls living in Palestinian Refugee Camps in the West Bank of the occupied Palestinian territory and Jordan, estimate dysmenorrhea levels, and assess its associated factors.

Methods: A household survey of 15 to 18-year-old adolescent girls was conducted between June and September 2019. Trained field workers collected data on general menstrual characteristics and dysmenorrhea level using the Working ability, Location, Intensity, Days of pain Dysmenorrhea scale (WaLIDD), in addition to demographic, socioeconomic, and health characteristics. The link between dysmenorrhea and other participant characteristics was assessed using a linear regression model.

Results: 2737 girls participated in the study. The mean age and mean age-at-menarche were 16.8±1.1 and 13.1±1.2 respectively. Mean bleeding duration was 5.3±1.5 days, and the average cycle length was 28.1±6.2 days. Around 6% reported heavy menstrual bleeding. High dysmenorrhea levels were reported (96%), with 41% reporting severe symptoms. Higher dysmenorrhea levels were associated with older age, earlier age-at-menarche, longer period durations, and heavier menstrual flow, in addition to skipping breakfast regularly and limited physical activity patterns.

Conclusions: The study reveals regular menstrual patterns in terms of length, duration, and intensity of bleeding, as well as an age-at-menarche that is slightly higher than the global average. Furthermore, it reflects on an alarmingly high prevalence of dysmenorrhea among participants that tends to vary with different population characteristics. This research calls for collaborative responsibilities and efforts to assist adolescent girls with menstrual health issues, such as dysmenorrhea and irregular periods, so that effective recommendations and actions can be achieved.

The invisible enemy: maternal smokeless tobacco use as a risk factor for low birth weight

Akanksha Mahajan¹, Bhawna Gupta²

¹Monash University, Australia, ²Torrens University, Australia

Low birth weight (<2500 g) is an important public health indicator of both maternal and child health. It increases the risk of neonatal mortality and morbidity, growth inhibition, impaired cognitive development and chronic diseases later in life. Low birth weight is more prevalent in developing countries, where smokeless tobacco use is also common and socially and culturally accepted, as compared to smoking among women. Smokeless tobacco refers to tobacco products such as khat, betel, khaini, gutka, snuff and areca nut; which are consumed by means other than smoking/burning, and can be used nasally or orally. This study systematically reviews evidence on the adverse association between maternal smokeless tobacco use and low birth weight. A systematic search of studies was conducted using electronic databases (PubMed, CINAHL, EMBASE, Scopus), along with reference list searching, with no limitation on language and date of publication. Article selection and data extraction were performed by two independent reviewers. A comprehensive quality assessment of all included studies was performed using the Newcastle Ottawa Scale. Significant associations with smokeless tobacco use were seen in 11 out of the 29 included studies for LBW. However, these results may be limited by confounding and bias. There is also a limited number of studies which evaluate the presence of a dose response relationship between smokeless tobacco use and birthweight. Further research and quality observational studies are needed to strengthen this evidence base. The adverse effects of smokeless tobacco found in this review highlights the need for policies which focus on primary prevention of smokeless tobacco use. Pregnant women should be provided with intensive education, counselling and resources regarding quitting or cutting down smokeless tobacco use to improve both maternal and child health outcomes. However, this is a challenging matter due to the addictive nature of tobacco.

A life-course approach to road safety - Findings from the DRIVE study

Rebecca Ivers¹, Holger Moller², Patricia Cullen³, Teresa Senserrick^{4,5}, Kris Rogers⁶, Soufiane Boufous⁷

¹Faculty of Medicine, School of Population Health, University of NSW, Sydney, Australia, ²School of Population Health, The University of New South Wales, Sydney, Australia, ³Faculty of Medicine, University of New South Wales, Sydney, Australia, ⁴Western Australian Centre for Road Safety Research, Australia, ⁵University of Western Australia, Australia, ⁶University of Technology Sydney, Ultimo, Australia, ⁷Faculty of Science, University of New South Wales, Sydney, Australia

Background and Objective: Despite billions of dollars being spent on road safety each year, road transport crashes remain a leading cause of injury and death worldwide. New approaches to road safety are needed.

Methods: We used data from a 2003/2004 Australian survey of young drivers (n=20 806), linked to police-reported crash, hospital and death data up to 2016. We used generalised linear models to estimate the association between protective and risk factors with car crash.

Results: After adjusting for confounding, drivers of lowest socioeconomic status had 1.90 (95% CI 1.25 to 2.88) times higher rate of crash related hospitalisation

compared with drivers of highest socioeconomic status. Drivers with the highest risky-driving scores had 1.92 times (95% CI 1.13-3.27) higher rates of hospitalised crashes compared with drivers with the lowest scores. Drivers with three or more driving offences had 3.28 (95% CI 2.28-4.72) times higher rates of single vehicle crashes compared with drivers with no driving offences. Drivers who participated in a youth resilience education program during school had 0.76 (95% CI 0.60-0.96) lower rate of any crash, compared with those who did not participate in such program.

Conclusions: We showed the sustained effect of risk and protective factors during youth and crash later in life. This implies that, in addition to creating safe-systems, injury prevention also needs to consider the intersection of the wider social determinants of health to address the underlying causes. This broader, temporal concept is embodied in a life course approach to injury prevention.

Female genital mutilation in West Africa, Senegal: a secondary analysis of the DHS 2019

Ndeye Sougou¹

¹Department of Preventive Medicine and Public Health, University Cheikh Anta Diop of Dakar, Dakar, Senegal

Background and Objectives: Female genital mutilation (FGM) continues to exist in Senegal despite the legal prohibition introduced by the government in 1999. Because of its consequences, it remains a public health problem. The aim of this study is to describe and identify the factors associated with FGM in Senegal.

Methods: The analyses in this study had been done on the DHS 2019 data of Senegal. The DHS data included 7498 women aged 15 to 49 years. A multivariate analysis was performed to control for confounding factors. The dependent variable was the existence of female genital mutilation in women. Data were analyzed with STATA 17 software.

Results: Women with FGM represented 29.09% (2181) of women. FGMs were performed in 14.24% of cases before the age of 5 years. Women who thought that FGM was justified by religion represented 13.78% (1033). However, 80.59% of women thought it was a practice that should stop. In most cases, 96.94% of the mutilations were performed by traditional excisers. The protective factors for the occurrence of female genital mutilation were the women's high level of education (secondary aOR=0.63 [0.63-0.94]), level of wealth (aOR: 0.62 [0.47-0.82]), belonging to the central region of Senegal, and Christian religion (aOR:0.029 [0.02-0.83]). Risk factors for female genital mutilation in Senegal were female age 45-49 years (aOR: 1.29 [1.06-1.56]), rural residence (aOR: 1.29 [1.06-1.56]), ethnicity, and belonging to certain regions in the northeast and southeast of Senegal.

Conclusions: To combat FGM, interventions should be targeted to certain regions and ethnic groups. Multi-sectoral interventions addressing the raising of women's empowerment.

Chagas disease in pregnant women from Amazon region, Brazil and control perspectives to potential vertical transmission

Ana Pinto¹, Lais Costa², Vera Valente³

¹Instituto Evandro Chagas, Ministério da Saúde do Brasil, Belém, Pará, Brazil, ²Instituto Evandro Chagas, Ministério da Saúde do Brasil, Brazil, ³Instituto Evandro Chagas Ministério da Saúde do Brasil, Brazil

Chagas disease is an anthroponosis of tropical areas. Brazil, specially in Amazon region concentrates several cases at endemic levels and is an active focus of transmission, increased by environmental disturbances and exposure to vectors. The most frequent transmission, through the oral route provides high parasitic loads facilitating vertical transmission in affected pregnant women and, therefore, increasing the potential to vertical transmission. We describe a series of cases of pregnant women with Chagas disease (CD) and their pregnancy outcomes. This is a descriptive, cross-sectional, case series study in a clinical cohort of follow-up with pregnant women registered as confirmed cases of CD treated in the Chagas Disease Protocol of the Medical Care Department of Instituto Evandro Chagas – IEC during January 2009 to December 2019. Twenty-two pregnant with Chagas disease were included in the study, with two approaches: 36% (8/22) of them were diagnosed in acute phase Group 1-G1) and 64% (14/22) were submitted to serological follow-up after treatment before the pregnancy and, therefore, asymptomatic actually (Group 2-G2). Among the G1 complications of mothers during pregnancy, there was one (1) threatened miscarriage, one (1) diagnosis of acute Chagas heart disease and one (1) mother's death was registered in the 40th week, which was not submitted to necropsy. At the end of the pregnancy, four (4/22; 18,2%) children were diagnosed with congenital

Chagas disease by serological criterion. Comparatively, 75% of children with Congenital infection were born from mothers diagnosed in the acute phase (G1) and one (1) child from mother with asymptomatic infection (G2) was affected. The authors discuss the need to effort new tools for the precocious diagnosis both in pregnant women and their new-borns and immediate access to the treatment with emphasis to pregnant women during acute phase of Chagas disease.

DOI: 10.18332/popmed/165374

Factors associated with dietary diversity among mothers with young children living in urban slums of Dhaka, Bangladesh

Swadesh Gurung¹, Shaila Nazneen², Sifat Yusuf², Kusum Wagle², Priyanka Gayen², Malay Mridha², Nuzhat Choudhury³

¹James P Grant School of Public Health, Kathmandu, Nepal, ²James P Grant School of Public Health, Bangladesh, ³International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b), Bangladesh

Mothers living in slums are vulnerable to malnutrition and poor dietary diversity. Dietary diversity plays a crucial role in the fulfillment of both micro and macronutrient requirements. This cross-sectional study aimed to assess the status of and factors associated with dietary diversity. The study included 332 mothers from four slums in Dhaka city. Trained enumerators collected data from 19 November till 1 December 2016. Dietary diversity (DD) was measured by asking questions about the consumption of 10 food groups in the last 24 hours. The mean age of mothers was 23.3 (± 4.7) years. The mean number of food groups consumed by mothers in the previous 24 hours was 4.54 (± 1.79) out of 10. The prevalence of poor DD (<5 food groups) was 55.1%. In the multivariable model, staying in the slum for 25-60 months [AOR= 2.3, (95% CI: 1.16, 4.67)], being in the poorest [AOR= 4.8, (95% CI: 1.84, 12.38)] and poorer [AOR= 3.8, (95% CI: 1.41, 10.09)] socio-economic status (SES) quintile and having average nutrition knowledge [AOR= 1.9, (95% CI: 1.01, 3.47)] were significantly associated with mother's poor DD. The predictive model showed differences in the probability of poor DD across SES (poorest=47% and richest=16%) reduced when good nutrition knowledge was introduced in the model. SES and nutrition knowledge is therefore associated with dietary diversity among these mothers with young children. Platforms such as electronic media and slum-based groups could be used to promote nutrition education whereas food subsidies especially for fruits and vegetables could help to enhance dietary diversity among mothers.

Increase of depression and anxiety among children and adolescents after the onset of the COVID-19 pandemic in Europe: a systematic review and meta-analysis

Helena Ludwig-Walz¹, Indra Dannheim², Lisa Pfadenhauer³, Jörg Fegert⁴, Martin Bujard⁵

¹Institute for Collective Health, Federal Institute for Population Research, Germany, ²Fulda University of Applied Sciences, Germany, ³Ludwig-Maximilians-University, Munich, Germany, ⁴University Medical Center, Ulm, Germany, ⁵Federal Institute for Population Research, Germany

Background and Objective: Depression and anxiety represented the leading causes for disease burden among children and adolescents. COVID-19 pandemic-related restrictions and school closures have influenced the life for the European youth; however, an up-to-date review how these changes affected mental health is lacking. Therefore, we aimed to determine the change in the share of children and adolescents with depression and anxiety symptoms during COVID-19 pandemic compared to pre-pandemic baselines and evaluate country-related policy impacts. **Methods:** Six databases were searched using a peer-reviewed search string with citation tracking and grey literature searches. Primary outcomes were (1) general depression or anxiety symptoms and (2) clinically relevant depression or anxiety rates. The validated Oxford Stringency Index was used as indicator for pandemic-related restrictions. Screening of title/abstract and full text level was done in duplicate. Two reviewers independently assessed risk of bias and certainty of evidence, using the Grading of Recommendations Assessment, Development and Evaluation (GRADE) approach. Data were pooled using a random-effects model. PROSPERO registration: CRD42022303714.

Results: Of 7,422 nonduplicate records, 22 studies for depression symptoms and 18 for anxiety symptoms with data from 1,621,166 participants pre-pandemic and 1,571,062 during pandemic, met inclusion criteria. Moderate certainty of evidence was observed for general depression symptoms (standardized mean difference [SMD], 0.21; 95% confidence interval [CI], 0.12-0.30) and low certainty for clinically relevant depression rates (odds ratio, 1.36; 95% CI, 1.05-1.76). For general anxiety symptoms low certainty of evidence was determined (SMD, 0.34;

95% CI, 0.17-0.51) and very low certainty for clinically relevant anxiety rates (odds ratio, 1.08; 95% CI, 0.98-1.19). Effect estimates were considerable higher, when pandemic-related restrictions were more stringent or school closure occurred.

Conclusions: Depression and anxiety symptoms increased in a pre-during-comparison in the COVID-19 pandemic in Europe, whereby pandemic-related restrictions (such as school closures) resulted in an immense effect increase.

Popul. Med. 2023;5(Supplement):A1064

DOI: 10.18332/popmed/165428

Socioeconomic determinants of congenital cataract in Kazakhstan

Aliya Kabybekova¹, Altyn Aringazina², Arda Auyezova³, Lukpan Orzabekov⁴

¹Kazakhstan Medical University "KSPH", Kazakhstan, ²Almaty Management University, Kazakhstan, ³Kazakhstan Medical University KSPH, Kazakhstan,

⁴Kazakh Eye Research Institute, Kazakhstan

Background and Objective: Congenital cataract is the one of the leading causes of reversible childhood vision impairment and blindness worldwide. If not being treated properly it negatively affects the emotional, social and economic status of the child, family and society. It was previously reported that families affected by childhood cataracts have a lower socioeconomic status and parental educational background. The objective was to determine socioeconomic status of the parents of children with congenital cataract in Kazakhstan. **Methods:** We conducted this cross-sectional study among the parents of the children with congenital cataracts from September, 2021 till March, 2022. The questionnaire including information of demographic factors, parental employment status, highest attained education, family income per person was created using Google forms. The link to the questionnaire was sent to the parents by WhatsApp messaging application. Telephone numbers were identified using the database of the Statistics Department of the Kazakh Eye Research Institute.

Results: Totally 253 parents answered the questionnaire. Median age of the parents was 33 years (IQR = 6 years). Fathers were employed mostly (133(52.6%; 95% Confidence Interval (CI), 46.2%-58.9%)), while mothers were unemployed in most cases (174(68.8%; 95% CI, 62.7%-74.4%)). The highest attained education of fathers was college education in the majority of cases (150(59.3%; 95% CI, 53.0%-65.4%)). The highest attained education of mothers was mostly university education (142(56.1%; 95% CI, 49.8%-62.3%)). Family income per person was < 100 United States dollar (USD) in 80 (31.6%; 95% CI 26.0%-37.8%), ≥ 100 USD < 200 USD – 80 (31.6%; 95% CI, 26.0%-37.8%), ≥ 200 USD – 93 (36.8%; 95% CI, 30.8%-43.0%). **Conclusions:** Despite the fact that parents mostly have higher level of education, they, especially mothers, seem to face barriers in employment. Also, the income of the family may limit their ability to provide care to child with this condition requiring intensive management.

Polymorphisms in miRNA biogenesis genes and the risk of pregnancy-induced hypertension among Jordanian women

Omar Khabour¹, Sahar Makhoul¹, Hasan Rawashdeh¹, Baraa Sakee¹

¹Jordan University of Science and Technology, Jordan

Background and Objective: Pregnancy-induced hypertension (PIH) includes gestational hypertension and pre-eclampsia. PIH might be associated with severe pregnancy outcomes. Non-genetic factors such as advanced age, high body mass index (BMI), and diabetes are significant risk factors for PIH. At the genetic level, some studies showed that single nucleotide polymorphism (SNP) in miRNA biogenesis genes such as DICER and RAN are associated with PIH. In the current study, the contribution of DICER (rs3742330) and RAN (rs14035) to PIH in Jordan was investigated. **Methods:** A total of 250 Jordanian pregnant women with (n=99) or without (n=145) PIH were recruited into the study. The rs3742330 and rs14035 were genotyped using molecular techniques. Non-genetic factors were examined using a structured questionnaire. Blood measurements were performed on all participants and were correlated with the different genotypes of studies SNPs.

Results: The frequency of rs3742330 genotypes among the study sample was 76%, 21%, 2% for AA, GA, GG respectively. The frequency of rs14035 genotypes among the study sample was 59.6%, 35.4%, 5% for CC, CT, TT respectively. An association was found between rs3742330 and PIH ($P<0.05$). The frequency of G allele and AG/GG genotypes were enriched in the PIH group compared to the control group ($P<0.05$). On the other hand, no association was found between rs14035 and PIH ($P>0.05$). With respect to environmental factors, BMI was found to be associated with a higher risk of PIH ($P<0.001$). None of the examined SNPs were associated with hematological parameters ($P>0.05$). **Conclusions:** DICER rs3742330 and BMI were associated with PIH among pregnant women in Jordan. These factors should be considered in interventions that target PIH management in the country.

Health characteristics, risk factors, and leisure activities of school-age children participating in bullying

Milena Milicevic¹, Aleksandar Stevanovic², Jovana Todorovic¹, Dejan Nikolic³, Nevena Popovac⁴, Zorica Terzic-Supic¹, Nenad Bjelica⁵, Ratko Tomasevic^{6,7}, Filip Milanovic⁸

¹Institute of Social Medicine, Faculty of Medicine, University of Belgrade, Serbia, ²Institute of Social Medicine, Faculty of Medicine, University of Belgrade, Belgrade, Serbia, ³University Children's Hospital, Faculty of Medicine, University of Belgrade, Serbia, ⁴Faculty of Medicine, University Children's Hospital, University of Belgrade, Serbia, ⁵Primary Health Care Centre Dr Simo Milosevic, Serbia, ⁶Faculty of Medicine, University of Belgrade, Serbia, ⁷Department of Gastroenterohepatology, Clinic for Internal Medicine, Clinical Hospital Center Zemun, Serbia, ⁸Pediatric Surgery Department, University Children's Hospital, Serbia

Background and Objective: School-age children bullied by their peers, about one-third of all, are at risk of developing symptoms of anxiety, depression, and stress. Professionals' role in prevention is to raise community awareness of the common health and behavioural characteristics of children involved in bullying and design effective interventions. The study aimed to examine the prevalence of participation in bullying once and multiple times and the association of school-age children's involvement in bullying with health characteristics, risk factors, and leisure activities.

Methods: A secondary analysis of the original data from the 2017 Health Behaviour in School-aged Children Study, covering 3267 children from 64 primary and high schools in Serbia, included the multivariate regression analysis.

Results: Compared to their counterparts, children participating in bullying at least once were more likely to feel everyday stomach pain, irritability or bad mood, and nervousness by 1.46, 1.58, and 1.58 times, respectively. However, those involved in multiple bullying were more likely with daily stomach pain, back pain, nervousness, and dizziness by 1.16, 1.62, 1.82, and 1.70 times, respectively. Children who reported watching TV or other media for five or more hours per day and were drunk two-three times, or four or more times in life, were 2.34, 1.53 and 1.74 times, respectively, more likely to be involved in bullying at least once. Those who had nightly meetings or reported being drunk four or more times in the last 30 days and reported playing games five or more times per day were more likely to be involved in multiple bullying by 2.54, 3.47, and 2.70 times, respectively.

Conclusions: Early identification of specific health symptoms in the pediatric population is needed. Interventions aimed at reducing alcohol abuse among school-age children should integrate training for health professionals and families of schoolchildren.

Prevalence and associated factors of unhealthy diet among adolescents: cross-sectional study among Tunisian high school students

Souhir Ayadi¹, Hela Ghali¹, Samia Abdellber², Amal Kochbati², Siwar Bkhairia², Sana Bhiri², Rania Bannour², Emna Hariz², Aroua Kamel², Fatima Khouya², Arwa Nafetti³, Sofien Aidani², Salwa Khefacha², Mohamed Rejeb², Asma Cheikh², Houyem Latiri²

¹Family Medicine, Faculty of Medicine of Sousse, Sahloul University Hospital, Tunisia, ²Sahloul University Hospital, Tunisia, ³sahloul university hospital, Tunisia

Background and Objective: According to World Health Organization (WHO), Unhealthy Diet (UD) is a major risk factor for chronic diseases, including cardiovascular disease, cancer, diabetes and other obesity-related conditions. That's why it's important to study the UD and the factors associated to it. Our study aim to describe the dietary behavior of young high school students and determine its associated factors. **Methods:** A cross-sectional study was carried out among students of seven high schools in center-eastern Tunisia during the academic year 2021/2022. The data collection was carried out in April 2022 by questionnaires distributed at the end of the course session. The questions concerned the socio-demographic characteristics, food habits and physical activity. The UD was defined by WHO as the consumption of less than five fruits and vegetables per day. Data analysis was done using SPSS software.

Results: A total of 740 adolescents were included in this study. The mean age was 17±1.16 years with extremes ranging from 14 to 19 years. A female predominance was noted (60%) with sex-ratio at 0.66. Only 37% took breakfast regularly, 19.7% had a full meal at lunch and just 31% had dinner. UD was found among 91.6% of

the study population. UD was significantly associated with not practicing physical activity ($p<10^{-3}$), not taking breakfast ($p<10^{-3}$), not having morning snacks ($p<10^{-3}$), eating cake ($p=0.001$), eating sweets ($p<10^{-3}$), eating fried-food ($p=0.001$) and not passing exams ($p<10^{-3}$). At multivariate analysis, eating cake (aOR=4.062; CI [1.685-9.795]; $p=0.002$), eating fried-food (aOR=3.239; CI [1.118-9.385]; $p=0.03$) and consuming sweets (aOR=3.263; CI [1.666-6.394]; $p=0.001$) were independent risk factors of UD. In the other hand, regular physical activity (aOR=0.524; CI [0.294-0.936]; $p=0.029$) and having breakfast regularly (aOR=0.523; CI [0.297-0.923]; $p=0.025$) were independent protective factors of UD. **Conclusions:** The prevalence of UD is alarming. That's why it is mandatory to establish effective strategies to support healthy diets and physical activity among adolescents in order to reduce non-communicable diseases related to UD.

Risk factors for stunting in children under two years old at the Tanralili health center, Maros, Indonesia

Nurleli¹, Rahayu Indriasari¹, Andi Wahyuni², Esse Pawenrusi², Andi Silwanah¹, Muhammad Zamaa², Elfita²

¹Hasanuddin University, Makassar City, Indonesia, ²Makassar College of Health Sciences, Makassar City, Indonesia

Background: Stunting is a growth disorder due to the accumulation of chronic malnutrition so that children's growth is shorter than their age, and causes permanent, long-term effects and impacts between generations. Stunting is a significant health problem in Indonesia and even in the world. The prevalence of stunting in children aged <5 years globally in 2020 is 22% (149.2 million), while the prevalence of stunting in Indonesia in 2021 is 24.4%, and in Maros Regency, it is 37.5%. This study aims to determine exclusive risk factors, family income, family food security, and the mother's knowledge of stunting in the working area of the Tanralili Maros Health Center. **Methods:** The type of research is an observational study with a case-control study design. The population in this study were infants under two years, totaling 139. The number of samples in this study was 64 respondents with a ratio of 1:1, consisting of 32 cases and 32 controls, taken by random sampling. Data collection using a questionnaire. Univariate and bivariate data analysis, with the Odds Ratio (OR) test.

Results: The results of this study indicate that children under two years of age are not exclusive breastfeeding OR = 1.623 (95% CI 0.528 – 4.991), low family income OR = 1.137 (95% CI 0.421 – 3.068), and inadequate family food security OR = 2.113 (95% CI 0.620 – 7.204) and mother's lack of knowledge OR 1.137 (95% CI 0.421 – 3.068) are risk factors for stunting. **Conclusions:** The conclusions from this study indicate that breastfeeding is not exclusive; low family income, inadequate food security, lack of maternal knowledge are risk factors for stunting. Further research is recommended to provide interventions to increase health literacy, especially regarding the use of local food. **Keywords:** stunting, breastfeeding, family income, food security, and knowledge

Early-life exposure to ambient PM2.5 and the development of hypertension in later life

Cui Guo¹

¹The University of Hong Kong, Hong Kong, China

Background: Associations between air pollution exposure and chronic diseases have been well-documented. However, the effects of early-life exposure to fine particulate matter (PM2.5) on adulthood hypertension and their dynamic associations remain unclear.

Methods: A total of 4,272 participants with 17,814 medical examinations from 2 ongoing cohorts in Taiwan and Hong were included during the study period from 2000-2018. We used a satellite-based model to assess 2-year average PM2.5 exposure at a resolution of 1 km². A linear mixed model was used to examine the associations with blood pressure. We used a Cox regression model with time-dependent covariates was used to examine the overall association with the development of hypertension in adulthood. Life-course mixed models were used to examine the health effects of PM2.5 exposure at different life stages.

Results: For each 10 g/m³ increase in PM2.5, the overall risk of adulthood hypertension increased by 40% (95% confidence interval [CI]: 8%-80%). The health effects of PM2.5 exposure at different life-stages on incident hypertension were generally independent of each other. In critical model, the risk of hypertension increased 23%, 27% and 55% for each 10 g/m³ increase in PM2.5 exposure during school age, adolescence and adulthood, respectively. Similar associations were found with blood pressure. Higher level of PM2.5 exposure at different life stages was associated with elevated blood pressure and a higher risk of developing

hypertension in adulthood.

Conclusions: Association between PM2.5 and adulthood hypertension can be traced back to childhood. Our study suggests that life-course control of air pollution exposure should be implemented to alleviate the burden of adult hypertension.

Exploring equitable access for special needs services among children in Klang Valley, Malaysia: a mixed method study

Fariza Fadzil¹, Idayu Idris², Norazlin Nor³, Juriza Ismail³, Azmi Tamil², Kamaliah Noh⁴, Noraziani Khamis⁵, Noor Ahmad⁶, Salimah Othman⁷

¹Advanced Wellbeing Research Centre, Family Health Development Division, Ministry of Health Malaysia, Putrajaya, Malaysia, ²Department of Community Health, Faculty of Medicine, University Kebangsaan Malaysia, Malaysia,

³Department of Paediatrics, Faculty of Medicine, University Kebangsaan Malaysia, Malaysia, ⁴Faculty of Medicine, University of Cyberjaya, Malaysia,

⁵Institute for Health Management, Ministry of Health Malaysia, Malaysia,

⁶Institute for Public Health, Ministry of Health Malaysia, Malaysia, ⁷Family Health Development Division, Ministry of Health Malaysia, Malaysia

Background and Objectives: Many countries still face difficulties of unequal access to health services and resource limitations. Even for high priority areas like special needs children, basic services' coverage remains low in many countries including Malaysia. This study was conducted to determine the prevalence of missed clinic appointments by income group and their sociodemographic characteristics amongst children attending Child Development Centre at the National University of Malaysia Medical Centre. **Methods:** An explanatory sequential mixed method study was performed amongst caregivers of children with developmental disabilities aged up to 17 years.

Results: Analysis showed 62 of 197 (31.5%) caregivers had missed clinic appointments, mostly attributed to forgetfulness. Bivariate analysis showed significant differences in missed appointment rates by caregiver gender and follow-up duration. Logistic regression model demonstrated that combined with male caregiver as an independent variable, follow-up duration of more than 6 years increased missed appointment's risk by 2.67 times. Bottom 40% of Malaysian household income (B40) group had missed appointments of 36.8%; not statistically significant different with other income groups, denoting equitable access to our services consistent with other studies on equitable health service access in Malaysia. Sub-analysis demonstrated statistically significant differences by ethnicity and educational level. Non-Malays and those with lower educational level in B40 group demonstrated the highest proportion of missed appointments. Distance was not a risk factor amongst income groups and amongst B40 group, 85.7% who missed appointments lived less than 40KM from the centre. Caregivers' perceived barriers were transportation, caregiver, child and healthcare services issues. **Conclusions:** While this study did not identify unequal access for the lower income group, supporting factors for accessibility were deemed important by caregivers and future plans should take cognizance of these findings to improve appointment adherence, equity and accessibility to services for special needs children.

Global school-based student health survey: country profiles and survey results in the Eastern Mediterranean region countries

Farshid Jahani¹, Elham Ahmadnezhad², Zhaleh Abdi², Elham Abdalmaleki², Sahand Riazi-Isfahani², Bahar Haghdoust², Sara Saffarpour²

¹Tonekabon University of Medical Sciences, Iran, ²National Institute of Health Research, Tehran University of Medical Sciences, Iran

Background and Objectives: The increasing prevalence of chronic non-communicable diseases (NCDs) has some major implications on the ability of many countries to achieve universal health coverage. This study aimed to investigate the status of the implementation of Global School-based Student Health Survey (GSHS), which is used to assess the risk factors of NCDs among children and adolescents, by the Eastern Mediterranean Region (EMR) countries. **Methods:** This study was a meta-analysis and systematic literature review of studies published between 2001-2018. These studies were found by searching PubMed, Google Scholar, WHO, and CDC databases. In this study, the target group was students aged between 13 and 15, and between 13 and 17 years old. GSHS implementation as well as the indicators of tobacco and alcohol use, obesity, overweight, and physical activity were compared across different countries. The random-effect model for meta-analysis was considered at 95% confidence interval.

Results: In the EMR, 19 countries have implemented GSHS at least once following

the survey manual (37 surveys). In total, 201,795 young adolescents aged between 13 and 17 years old from 19 countries covered in the GSHS were included in our analysis. Among the students (13 and 15 years old), the overall estimation of the overweight prevalence rate was 24.5% (20.6-28.8), obesity prevalence rate was 7.3% (5.4-9.5), insufficient physical activity prevalence rate was 82.4% (80.7-84.1), tobacco usage prevalence rate was 14.3% (10.53-18.67), and smoking prevalence was rate 9.6% (8.1-11.3). In those aged from 13 to 17 years old, these rates were estimated as 19.8 (13.2-27.3), 9.7 (6.2-14.0), 86.1 (84.1-87.9), 17.8 (11.8-24.7), and 11.5 (9.4-13.8), respectively.

Conclusions: GSHS has been widely implemented across EMR countries. Using nationally representative data, the results show that more efforts are needed to target the NCDs risk factors among adolescents in the region.

Obstetric violence: the perception of black women based on their experiences of pregnancy and childbirth in Portugal

Laura Brito^{1,2}, Karla Costa²

¹Center for Social Studies, University of Coimbra, Portugal, ²SaMaNe Portugal Association, Portugal

In Portugal, knowledge about the sexual and reproductive health of women of colour needs to be deepened, especially concerning the violence suffered in the context of pregnancy, childbirth and postpartum. This communication aims to present black women's perception of obstetric violence based on their experiences of pregnancy and childbirth in Portugal. Those are based on the results of an online questionnaire, conducted between March 2020 and November 2022. The information was collected from 12 questions about the socioeconomic profile of women and their perceptions of obstetric violence. 106 women participated, and the Results show that 56,6% had between 30 and 40 years; 48,11% are from Portugal and 78,3% reside in Lisbon. Regarding education, 63,2% have a degree. 49% have a monthly income between 1000€-3000€. Regarding obstetric violence, 76,4% knew the concept and of these, 54,7% knew it before their first pregnancy, mostly through social networks (55,6%). 33% claimed to have suffered obstetric violence during pregnancy, labour or/and postpartum and 50% of them claimed to have suffered obstetric violence due to their ethnic-racial identity; due to their age (20,58%); due to their weight (3%). The types of obstetric violence identified were performing procedures without consent (3%); excessive use of procedures (5,8%); lack of care by health professionals (17,6%). Although those results, 66% of women declared not to have suffered obstetric violence. The results show that, despite not considering that they had suffered obstetric violence, which may reflect the good conduct of the professional, those who suffered obstetric violence were due to ethnic-racial discrimination. This data shows the presence of racism in the obstetrics context in Portugal and highlights the urgency of approaching women's reproductive health intersectionally to understand the socio-racial dimensions of the reproductive violations suffered by black women.

Modelling environmental exposure in relationship with birth outcomes and perinatal pediatric Emergency Department admission: a casual mediation analysis of a three year survey

Valeria Bellisario¹, Giulia Squillacioti², Federica Ghelli³, Emanuele Castagno⁴, Claudia Bondone⁵, Roberto Bono³

¹Department of Public Health and Pediatrics, University of Turin, Turin,

Italy, ²Department of Public Health and Pediatrics, University of Turin,

³Department of Public Health and Pediatrics, University of Turin, Italy,

⁴Emergency Department, Regina Margherita Children's Hospital, Città della Salute e della Scienza di Torino, ⁵Emergency Department, Regina Margherita Children's Hospital, Città della Salute e della Scienza di Torino, Italy

Background and Objective: Gestational and perinatal environmental exposure has been associated with different pregnancy, birth, and early life outcomes, but the processes and timing are still unclear. Historically, applied models neglect the acute and short-term effects of environmental exposure, even more on respiratory and allergic Emergency Department (ED) admission during early life stages. We examined 3-years (2015–2017) newborns in Turin (Italy) with, at least, one respiratory/allergic pediatric ED admission during their first year of life, focusing on the relationship with air pollution (PM2.5, O3, NO2, aeroallergens) and greenness (NDVI) exposure, in the narrow window of a week before delivery and ED admission, and on the causal mediation analysis of other risk factors, elucidating causal mechanisms or effect pathways.

Methods: A tailored Logistic Regression Model, adjusted for seasonality and other possible confounding variables (mothers health and personal conditions,

gestational age of birth, meteorological/non-meteorological factors), was applied. Relative Risk (RR) associated with birth outcomes and respiratory/allergic ED admission was assessed at a time lag between 0 and 7 days prior these events. Results: We analyzed 1177 newborns (56.9% male/43.1% female), with at least one respiratory/allergic pediatric ED admission during their first year of life. We modeled air pollution and greenness exposure in relationship with some birth outcomes (i.e. Apgar score, weight) and severity of ED admissions. Preliminary analyses showed direct correlations between increased air pollutant levels and birth outcomes ($p=0.04$) and the severity of ED admissions ($p=0.002$). The spatial and causal mediation analyses are still undergoing.

Conclusions: Environmental exposure may represent adverse or protective pathophysiological connection with birth and early life outcomes, as testified by the effects reported. Further studies are needed to better elucidate such relationship, estimating casual direct/indirect effects on these crucial perinatal outcomes.

Policy analysis to assess the impact of inadequate Emergency Obstetric Care (EmOC) services on maternal mortality in Balochistan Pakistan

Tahira Kamal¹

¹Government of Balochistan, Quetta, Pakistan

All indicators of women's health and social and economic condition are abysmal in Pakistan. The Pakistan Maternal Mortality Survey (PMMS) 2019 estimates MMR at 186. MMR is a telling indicator of women's status in society and their access to and the quality of healthcare available to them. On the other hand, from family planning, perinatal, antenatal care and childbirth to caring for the newborn, there are now proven interventions available that are simple and cheap at each step. They can ensure mother and child health improvement if effectively and consistently employed. However, maternal health-related targets in Pakistan are falling short of the Sustainable Development Goals (SDGs). One of the key reasons behind this is there is neither priority nor adequate investment by the government in providing EmOC services to poor communities. I used primary and secondary data sources to investigate the impact of inadequate EmOC services on maternal mortality in Balochistan, a disadvantaged province of Pakistan. The analysis shows that one of the factors behind stark inequalities in MMR is inadequate EmOC services in Balochistan compared to other provinces. For example, MMR in Punjab is 157, and for Balochistan province, it is 298. The high mortality correlates with the state of EmOC services in the province, which is inadequate and non-functional and not on the government's agenda. The study revealed that even the availability of basic EmOC services could make a difference in women's and newborns life from safe pregnancy to delivery. The study findings recommend the government should ensure access to EmOC services for women, which is essential to saving their lives. It should be considered an essential component of the healthcare delivery system at all levels of healthcare service delivery. It requires an adequate and functional transport system and hospital equipment to deal with emergency cases.

Background: Accidents are the main cause of injury and even death in children, and more than half events happen at home. In Italy, in 2019, 12.5/1000 children/

adolescents had at least one domestic accident, but only 8% of caregivers are aware of this risk. Objective: This is an Italian, observational, retrospective cohort study which evaluate which factors influence hospitalization outcome, also by considering the effect of COVID-19 lockdown. Methods: Children aged between 3-13 years receiving a visit in emergency departments (EDs) were enrolled in the study. Data were retrieved from 16 Italian paediatric EDs, by considering the period March-June 2019 and 2020.

Results: In total, 8860 ED visits due to domestic accidents in children occurred before (4380) and during (4480) lockdown, of which 6.5% resulted in a hospitalization (4.7% in 2019, 8.4% in 2020). The risk of hospitalisation is influenced by the type of occurred accident, with 4.11-fold higher risk in case of poisoning and 1.75-fold lower risk for stab-wound incidents. In addition, differences were reported in the frequency of hospitalization between the two observed years (OR: 1.94; $p < 0.001$ for 2020 vs 2019). Males had a 1.45-fold higher risk of hospitalization compared to females ($p < 0.001$), and the risk increased with age (OR: 1.06; $p < 0.001$). Poisoning represented the major risk of hospitalization, although it caused only 1.9% of all ED admissions, and principal causes were drugs (33.5%) and cleaning products (31.1%). Conclusions: The COVID-19 lockdown had a high impact on the risk of hospitalization, although no child enrolled tested positive for SARS-CoV-2. Regarding poisoning, a public health campaign aimed at caregivers would be necessary to minimise possible risks at home. In younger children, the ingestion of drugs may be due to the imitation of adults, while for cleaning products particular attention should be paid to colourful and easy-to-open ones.

Feasibility of preconception care services in the Nigerian health system - an exploration of stakeholders' viewpoints

Doyinmola Ojifinni¹, Latifat Ibisomi^{2,3}

¹School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Parktown, South Africa, ²Division of Epidemiology and Biostatistics School of Public Health, University of the Witwatersrand, Johannesburg, South Africa, ³Monitoring and Evaluation Department, Nigerian Institute of Medical Research, Lagos, Nigeria

Background and Objective: Preconception care (PCC) services aim to improve reproductive health outcomes through the provision of biomedical, behavioral and social health interventions to women and couples before conception occurs. Policy backing is important to guide PCC provision in the health system. In Nigeria, PCC is poorly developed, often provided in an opportunistic manner with no guidelines providing direction. This study explored policymakers' and health workers' opinions about the feasibility of deploying PCC services in the country. Methods: Using a cross-sectional exploration, 39 in-depth interviews were conducted with policymakers at the federal and state tiers of government as well as health workers at the tertiary, secondary and primary levels of health care. The transcripts were analyzed thematically using a hybrid of deductive and inductive coding.

Results: The main themes identified were – issues around policy for PCC, service integration and collaboration, health system readiness and challenges to PCC service deployment. Noting that the country has no PCC policy, participants identified existing policies into which PCC can be integrated. The participants also described the importance of policy to PCC provision and provided information on existing collaborations for policy development and implementation. Although many participants believed the health system is prepared for PCC deployment, they identified challenges related to policy formulation and implementation that could hinder the process.

Conclusions: The availability of health-related policies into which PCC guidelines can be integrated makes PCC service deployment achievable in the Nigerian health system. Potential implementation challenges need to be identified and addressed as part of the planning process.

Demands for sexual health education among middle school students in China

Li Cao^{1,2,3}, Shiyu Han^{1,2,3}, Qi Zhao^{1,2,3}, Chaowei Fu^{1,2,3}

¹School of Public Health, Fudan University, Shanghai, China, ²NHC Key Laboratory of Health Technology Assessment, Fudan University, Shanghai, China, ³Key Laboratory of Public Health Safety, Fudan University, Shanghai, China

Objective: According to the World Health Organization, premarital sexuality, unplanned pregnancy, and the spread of sexually transmitted diseases are major problems in adolescent sexual health. In China, adolescents generally lack sexual

health knowledge and contraceptive ability while the sexual health education has long been backward or even stagnant. This study was aimed to understand the demand of sexual health education, and explore appropriate sexual health education strategies among middle school students in China. Methods: A self-designed questionnaire was used to conduct a self-administered anonymous survey in selected six middle schools of Shanghai and Zhejiang Province, China in October 2021. Totally, 1733 students were cluster-sampled.

Results: Among 1733 subjects, 69.4% had received sexual health education before, and it was significantly lower among boys (boys: 66.1% vs. girls: 73.7%, $P < 0.001$). More than half (51.7%) were very satisfied with their received sexual health education, and it was lower among girls (girls: 47.4% vs. boys: 55.4%, $P = 0.048$) and senior high school students (senior: 48.3% vs. junior: 59.7%, $P = 0.003$). Near 2/3 of them believed that they had easy access to sexual health knowledge. Above fifth two wished to learn more about sexual health, and sexual psychology (52.8%), sexual health care (48.1%) and sexual moral law (46.7%) were ranked top 3 in what they wanted. Schools (60.2%) and teachers (51.0%) were the most welcome facility and provider respectively for them. Conclusions: There are great demands for sexual health education among middle school students, and the role of schools and teachers should be enhanced to promote their sexual health, in China.

Socioeconomic markers of Congenital Zika Syndrome in Brazil

Enny Cruz¹, Enny Paixao¹, Qeren Fernandes², Julia Pescarini³, Mauricio Barreto⁴, Maria Teixeira⁴, Maria Costa⁴

¹London School of Hygiene and Tropical Medicine, United Kingdom, ²Fiocruz, Brazil, ³LSHTM, United Kingdom, ⁴CIDACS, Brazil

Background and Objective: Socioeconomic markers are associated with a higher risk of arbovirus infections such as dengue, Zika and Chikungunya. However, research on the relationship between socioeconomic factors and congenital Zika syndrome (CZS) remains scarce. In this study we investigated the relationship between socioeconomic markers and CZS in Brazil. Methods: We conducted a cross-sectional population-based study including all registered live births in Brazil (Live Births Information System) from 1 January 2015 to 31 December 2018. To assess CZS status, we linked the live births system with the Public Health Event Record. We used logistic regression models to estimate the OR and 95% CIs of CZS.

Results: We included 11,366,686 live births, of which 3,353 had CZS. Live births of mothers who self-identified as black or mixed race/brown were 1.72 (95% CI 1.47 to 2.01) and 1.37 (95% CI 1.24 to 1.51) more likely to have CZS. Live births from single women compared with married women and those from women with less than 12 years of education compared with those with more than 12 years of education also had higher odds of CZS. In addition, those with fewer prenatal care appointments had increased odds of CZS in the nationwide data. However, in the analyses conducted in the Northeast region (where the microcephaly epidemic started before the link with Zika virus was established and before preventive measures were known or disseminated), no statistical association was found between the number of prenatal care appointments and the odds of CZS. Conclusions: This study shows that live births of the most socially vulnerable women in Brazil had the greatest odds of CZS. This disproportionate distribution of risk places an even greater burden on already socioeconomically disadvantaged groups, and the lifelong disabilities caused by this syndrome may reinforce existing social and health inequalities.

Background: Homeless families face multiple barriers to healthcare use. Few studies have specifically examined perinatal health in homeless mothers or their use of prenatal healthcare. This study aimed to identify social determinants associated with inadequate prenatal care utilization (PCU) in homeless mothers in the Greater Paris area in France.

Methods: The cross-sectional survey ENFAMS was performed on a random representative sample of 801 homeless families living in shelters in the greater Paris area in 2013. The present study analysed data on 121 homeless mothers who had a child less than one year old. In accordance with French guidelines, PCU was deemed inadequate if one or more of the following criteria was met: attending fewer than 50% of recommended prenatal visits, PCU initiation after the first trimester of pregnancy, and fewer than three ultrasounds during the entire pregnancy. The study sample's characteristics and PCU were described. Structural equation modelling was used to identify factors associated with inadequate PCU and to estimate correlations between them.

Results: Homeless mothers in the study sample were socially disadvantaged and most were born outside France. One in five (19.3%) had inadequate PCU. Associated factors were socio-demographic characteristics (young age, primiparous), health status (dissatisfaction with self-perceived general health), and living conditions (housing instability in the second and third trimesters).

Conclusions: This study's results advocate stable housing for homeless pregnant women to ensure they can benefit from optimal PCU.

The effectiveness of an integrated community-based visiting program on early childhood development in the West Bank, Occupied Palestinian Territory

Hana Rabadi¹, Hana Rabadi², Nuha Sharif³, Salam Alkhatib⁴

¹World Vision International - AL Quds University, Bethlehem, Occupied Palestinian Territory, ²World Vision I, AL Quds University, Jerusalem, Occupied Palestinian Territory, ³Faculty of Public Health, Al Quds University, Occupied Palestinian Territory, ⁴Faculty of Health Profession, Al Quds University, Occupied Palestinian Territory

Background and Objective: Since 2010, World Vision (WV) has trained community health workers (CHWs) in vulnerable communities in Palestine to deliver timed, behavioral change communication on health and nutrition (H&N) for the First 1000 Days to mothers through scheduled home visits. This approach was later enhanced through integrating components on early learning and stimulation to align to World Health Organization framework for nurturing care for early childhood that was issued in 2018. The objective of this research is to test the effectiveness of this enhanced integrated approach on holistic child development. Methods: Twenty-six communities were randomized to control or intervention groups. 238 women were assigned to the Intervention group and received the integrated package and 231 were assigned to the Control group and received only the H&N intervention, an average of 25-30 home visits were delivered by the CHWs to all participating mothers. Data were collected from both groups at baseline and end-line using standardized questionnaires, Ages and staged questionnaires (ASQ) were used to assess child development. Intra-cluster correlation coefficients were calculated for each ASQ domain at each time point. A mixed linear model was also applied. Mean ASQ scores for the Intervention and Control arms for each developmental domain and time-point were adjusted.

Results: At 12 months of age, mean ASQ scores for 4 of the 5 developmental domains were higher in the Intervention Group than Control [Communications 59.5 vs 55.9, Personal Social 88.8 vs 79.0, Problem Solving 58.6 vs 52.8, Fine Motor 57.7 vs 53.1] ($p < 0.05$). The effect sizes of the integrated package on the developmental domains range from 0.4-0.8, whereas those for stand-alone early child development interventions tend to range from 0.2-0.5. Conclusions: The integrated approach is more effective on children's ECD during the first year of life than standalone interventions.

The effectiveness of integrated community-based nutrition interventions in improving infant and young child feeding practices in Palestine: a randomized control trial

Nuha Sharif¹, Hana Rabadi^{2,3}, Salam Khatib⁴

¹Faculty of Public, Al Quds University, Jerusalem, Occupied Palestinian Territory, ²Faculty of Public Health, Al Quds University, Occupied Palestinian Territory, ³World Vision Jerusalem-West Bank-Gaza, Occupied Palestinian Territory, ⁴Faculty of Health Profession, Al Quds University, Occupied Palestinian Territory

Background and Objective: Child nutrition remains an urgent issue in Palestine. Various sources indicate widespread inappropriate family practices, particularly regarding infant and young child feeding (IYCF). Several sources indicate that good nutritional outcomes in infants and young children require maternal support through mental health and psychosocial support (PSS). Therefore, this study aims to test the effectiveness of integrated community-based nutrition-PSS interventions in improving IYCF practices in vulnerable communities in Palestine. **Methods:** A cluster randomization trial was conducted on 26 vulnerable communities in the West Bank. The sample included 469 pregnant mothers, of which 231 were assigned randomly to the control group and 238 were assigned to the intervention group. Data were collected from both groups at the baseline and the end-line of the survey. Pregnant women in the intervention clusters were supported with the integrated package including PSS and nutrition, whereas, pregnant women in the comparison group were supported with stand-alone nutrition intervention.

Results: Exclusive breastfeeding for six months was practiced by 70% of mothers in the intervention group (a 30% increase), compared with 55% in the control group. Compared to 59% of mothers in the control group, 76% of mothers in the intervention group offered complimentary meals on time. The minimum meal diversity was introduced to 68% of children in the intervention group, compared with 60% in the control group. Also, 41% of children in the intervention group were introduced to the minimum meal frequency, compared to 10% in the control group. **Conclusions:** Providing PSS to mothers significantly improves IYCF practices more than stand-alone nutrition interventions. Therefore, the implementation of these integrated packages over a longer duration is needed to witness a significant reduction in the prevalence of malnutrition.

ADHD symptoms and educational level in adolescents: the role of the family, teachers, and peers

Heiko Schmengler¹, Margot Peeters², Gonneke Stevens², Catharina Hartman³, Albertine Oldehinkel³, Wilma Vollebbergh²

¹Department of Interdisciplinary Social Science, Faculty of Social and Behavioural Sciences, Utrecht University, Utrecht, The Netherlands,

²Department of Interdisciplinary Social Science, Faculty of Social and Behavioural Sciences, Utrecht University, The Netherlands, ³Interdisciplinary Center Psychopathology and Emotion Regulation, Department of Psychiatry, University Medical Center of Groningen, University of Groningen, The Netherlands

Background and Objective: Adolescents with ADHD symptoms tend to have a lower educational level, poorer family functioning, and less social support from teachers and classmates than their peers without such symptoms. Surprisingly, few studies have explored the contribution of these family and school factors to the association between ADHD symptoms and education. Possibly, having more ADHD symptoms contributes to poorer family functioning and less social support, and consequently a lower level of education (i.e., mediation). Moreover, the negative effects of ADHD symptoms on education may be stronger for adolescents with poorer family functioning or less social support from teachers and classmates (i.e., interaction).

Methods: Using data of the Dutch TRAILS study (N=2,229), we evaluated associations between ADHD symptoms around age 11 and educational level around age 14, as well as between ADHD symptoms around age 14 and 16 years and subsequent changes in educational level around age 16 and 19, respectively. We assessed the potential mediating role of family functioning, and social support by teachers and classmates, measured around ages 11, 14, and 16, whilst additionally evaluating interactions between ADHD symptoms and these hypothesized mediators. Direct and indirect effects were computed using interventional effects for mediation analysis.

Results: ADHD symptoms were robustly associated with poorer family functioning, less social support by teachers and classmates, and lower education throughout adolescence. Yet, no mediating effects were found, because family functioning and social support by teachers and classmates were not uniquely associated with educational level. Furthermore, we found no interactions between ADHD symptoms and family functioning and social support by teachers and classmates. **Conclusions:** Although ADHD symptoms were strongly associated with impairments in key aspects of adolescents' social context, we found no evidence

that family functioning and social support by teachers and classmates contribute to the association between ADHD symptoms and lower education.

Abortion among French students: a 2003 to 2018 follow-up

Laurent Gerbaud^{1,2,3}, Chloé Bourdet^{4,3}, Bruno Chabanas⁵

¹Institut Pascal, CHU Clermont-Ferrand, SIGMA Clermont, Université Clermont Auvergne, France, ²CNRS F-63000 Clermont-Ferrand, France, ³Service Santé Universitaire - UCA, France, ⁴Institut Pascal, CHU Clermont-Ferrand, SIGMA Clermont, Université Clermont Auvergne, Clermont-Ferrand, France, ⁵Institut Pascal, CHU Clermont-Ferrand, SIGMA Clermont, Service de Santé Universitaire - Université Clermont Auvergne, Clermont-Ferrand, France

Background and Objective: In 2003, in France, there was an alert about high levels of abortion of female students, supposedly due to a lack of information on contraception. So, we decided, in our university to create a survey system in order to check the circumstances, modalities and consequences of abortions among our students. **Methods:** Regularly, a medical investigator goes to the public and private abortion facilities. Under the respect of medical secret, we linked the medical records to the presence as student of the University Clermont-Auvergne. **Results:** Abortion rates are stable from 5 to 8,5/1000, the half of the French women rate. The main changes are the increase of medical abortion (from 23 to 43 %). Around 2/3 of abortions are for students without contraception or using only condoms. After abortion, 50% choose contraceptive pill, 23% contraceptive implant, 22% intra uterine device. Only 4% do not choose any efficient contraception. Students from China had higher relative risk (RR = 2,30) which drop down very rapidly thanks to an information strategy. This strategy does not work for students from Northern Africa and sub-Saharan Africa who still have higher relative risks (respectively 4,98 and 9,62). **Conclusions:** The information strategy failed for students from Africa, showing that we need to develop others inquiries to understand their high rates of abortion. Unfortunately, we have now to stop this survey, due to the application of the European General Data Protection Regulation.

Impact of COVID-19 on the morbidity and hospitalization of children and adolescents living in the state of Rio de Janeiro, Brazil

Cynthia Boschi-Pinto¹, João Victor Barreto Costa², José Marques da Silva Filho²

¹ISC/Universidade Federal Fluminense, ²Medical School, Universidade Federal Fluminense

Background and Objective: In September 2022, there were 34.7 million cases of COVID-19 in Brazil, corresponding to 6% of the world total and resulting in a calamity that affected the health and living conditions of millions of Brazilians. The course of the disease in children appears to be milder than in adults. However, severe forms can also occur, often requiring hospitalization and support in intensive care units (ICU). The objective of the study was to analyze morbidity due to COVID-19 and hospitalization due to Severe Acute Respiratory Syndrome (SARS) among children living in Rio de Janeiro state, between March 2020 and December 2021.

Methods: Population-based ecological study, using secondary data from the Center for Strategic Information and Response in Health Surveillance (CIEVS-RJ). Incidence rates were calculated according to age group (0-4, 5-9 and 10-19 years) and epidemiological week (Epi Week). Trends were analyzed using the Joinpoint Regression Analysis program.

Results: 117,736 cases of COVID-19 were reported; 64.1% of which among 10-19 year olds. Highest incidences occurred after the emergence of the Delta variant in the country, in June 2021. A 385% increase in the proportion of cases among children less than 19 years of age was observed between March 2020 and November 2021. There were 3,476 hospitalizations due to SARS; 39% required utilization of ICU. A 6.8% case-fatality rate was observed, reaching 10.4% among those 10-19 years. After the introduction of COVID-19 immunization in children 12 years and older, there was a significant 15.6% reduction in hospitalizations per Epi Week among children 10-19 years. Decreases in other age groups were less pronounced.

Conclusion: Our results should inform the planning for strategies and actions by public health managers as well as encourage recommendations towards the effective implementation of the immunization program among children and adolescents in Brazil.

Bullying in private schools in the United Arab Emirates: a cross-sectional studyAlfan Al-Ketbi¹, Michal Michal Grivna¹, Ismail Elkonaisi¹, Iffat Elbarazi¹, Bayan Abu-Hamada¹, Aminu Abdullahi¹¹Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates

Background: School bullying is a problematic behavior among children and adolescents because it directly impacts school achievements and the psychological well-being of both victims and perpetrators. Bullying may take many forms, including physical, verbal, cyber, and relational. The study aimed to assess students experiences with bullying victimization, perpetration, and witnessing and reviewed students attitudes toward bullying across their schools.

Methods: Three private schools were randomly selected in Al Ain city, United Arab Emirates (UAE). Students in cycle 2 (grades 6-9) filled self-reported validated questionnaire. All students present on the day of data collection participated. IBM SPSS version 28.0. was used for statistical analysis.

Results: From a total of 321 students, 41% were UAE nationals. The mean age was 12.5 years (SD 1.13); 51% were females. Total of 47% students reported being bullied in the past 12 months; 25% experienced bullying one or more times a day, 37% one or more times a week, and 38% one or more times a month. The classroom was the most common place of bullying (84%), the playground was the second (35%). Verbal bullying was the major form of bullying; "called me bad names 70%", "made fun of me" 69%, and "said mean things behind my back" 66%. Physical bullying also occurred, such as "broke my things" (29%) and "I was attacked" (23%). Most victims stated that the bullying made them feel sad (72%), and 25% did not go to school because of the bullying. 60% of the students witnessed bullying.

Conclusion: There is a high prevalence of bullying in private schools in the UAE. The study results fill a major gap in the knowledge of school bullying in the UAE. It can provide useful information to decision-makers to develop national policies against bullying to improve safety at schools.

Popul. Med. 2023;5(Supplement):A1086

DOI: 10.18332/popmed/163650

Combining health calendars and cash: building formal financial and health numeracy among poor women in Northern PakistanZohra Lassi¹, Salima Meherali², Zahra Padhani¹¹University of Adelaide, Australia, ²University of Alberta, Canada

Background: Pakistan is a country with 60% illiterate population where most of the women are living in abject household poverty, with lack of ability to afford healthcare leading to unsafe birth-practices and serious health implications.

Objective: The study implemented the "Calendars and Cash" (C&C) project to equip and empower illiterate, innumerate rural women and adolescent girls with formal numeracy and record-keeping skills to empower them to participate confidently in local economy and healthcare system.

Methods: A cross-sectional survey was conducted among a random sample of 162 community-based savings group (CBSG) women residing in Kharmang district of Gilgit Baltistan. The study used the financial numeracy survey tool to test participants' financial and health numeracy skills. Descriptive analysis was conducted and reported in ranges and frequencies, as appropriate. Bivariate analysis, chi-square and Pearson test was conducted to determine the differences between the proportions.

Results: The survey included CBSG women of 15-50 years of age. Majority of the women were married with very little/no experience in business. Numeracy and literacy capabilities broadly overlapped, revealing distinctly different profiles. Women who had spent years in school feared/avoided written calculation and acquired few numeracy skills, however women outside the school managed to run a business using mobile banking. Household financial decision-making power was observed greater among women of 25-36 years-old followed by 37-years and older women. Decisions related to child health were completely made by 9.9% of the women, while 49.4% had a major say in these decisions. The study showed no correlation between educational attainment and decision-making power among women.

Conclusion: Following the baseline survey, the authors took this project to another level where the authors trained women until they had the ability to confidently engage with formal financial and health systems. The findings of his before-after study will be made available early next year.

Effectiveness of treatment of acute malnutrition by community health volunteers: a cluster-randomized controlled trial in Northern KenyaCalistus Wilunda¹, Lydia Karimurio², Hermann Donfouet³, Teweldeberhan Daniel⁴, Elizabeth Mwaniki⁵, James Njiru⁶, Emily Keane⁷, Lily Schofield⁴, Lucy Maina⁴, Edward Kutondo⁴, Kenya Olivia Agutu⁴, Kenya Peter Okoth⁴, Judith Raburu⁴, Betty Samburu⁶, Bonventure Mwangi, Taddese Zerfu⁸, Jemimah Wekhomba², Pilar Cuellar², Daniel Kavoo², Charles Matanda², Alex Mutua⁹, Grace Gichohi⁴, Martin Chabi⁴, Patrick Codjia¹⁰, Saul Oteyza¹⁰¹African Population & Health Research Centre, Kenya P.O. Box 10787-00100, APHRC Campus, Kitisuru, Nairobi. Kenya, ²Ministry of Health Kenya, ³UNICEF Chad, ⁴UNICEF Kenya, ⁵African Population & Health Research Center Kenya, ⁶Save the Children International, ⁷Save the Children UK, ⁸Action Against Hunger United Kingdom, ⁹World Health Organization Kenya, ¹⁰UNICEF Headquarters United States

Introduction: Treatment of children with acute malnutrition has been less effective because of barriers in continuing to access health facilities after initiating treatment. We evaluated the effectiveness of integrating treatment of acute malnutrition at home by community-health volunteers (CHVs) into the integrated community case management (iCCM) program in northern Kenya.

Methods: We conducted a two-arm non-inferiority cluster-randomized controlled trial across 20 community health units (CHUs) in Loima and Isiolo sub-counties. Participants were children aged 6-59 months with uncomplicated acute malnutrition. In each sub-county, 10 CHUs were pair-matched and randomly assigned to the control or intervention group. In the intervention group, CHVs used simplified tools and protocols to identify and treat eligible children at home and provided the usual iCCM package. In the control group, CHVs provided the usual iCCM package only (screening and referral of the malnourished children to the health facilities). The primary outcome was recovery (MUAC ≥ 12.5 cm for two consecutive weeks).

Results: Children in the intervention group were more likely to recover than those in the control group [73.3% vs. 50.3%; risk difference (RD) 23.1% (95% CI 11.7 to 34.6) and risk ratio (RR) 1.38 (95% CI 1.14 to 1.67)]. The probability of defaulting was lower in the intervention group than in the control group: RD -19.8% (95% CI -31.2 to -8.3) and RR 0.41 (95% CI 0.24 to 0.69). The intervention reduced the length of stay by about 12 days, although this was not statistically significant. Weight gain was significantly higher by about 1 g/kg/day in the intervention group than in the control group.

Conclusions: Integrating the treatment of acute malnutrition by CHVs into the iCCM program led to better malnutrition treatment outcomes. There is a need to integrate acute malnutrition treatment in iCCM and review policies to allow CHVs to treat uncomplicated acute malnutrition.

DOI: 10.18332/popmed/163652

Health literacy levels among pregnant women: the mutaba'ah studyIffat Elbarazi¹, Zufishan Alam², Fatima Al-Maskari¹, Tom Loney³, Nasloon Ali², Rami Al-Rifai¹, Luai Ahmed⁴¹United Arab Emirates University Institute of Public Health, College of Medicine and Health Sciences Tawam Campus, Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, AlAin. Po B0x 15551, AlAin, UAE United Arab Emirates, ²United Arab Emirates University, ³Mohammed Bin Rashed University College of Medicine, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai College of Medicine, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai, UAE United Arab Emirates, ⁴United Arab Emirates University Institute of Public Health, College of Medicine and Health Sciences Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, AlAin, Po Box 15551, AlAin. UAE United Arab Emirates

Background: Health literacy is defined as the degree to which individuals can obtain, process, understand, and communicate health-related information required to make informed health decisions. Health literacy among pregnant women may significantly impact maternal and child health, as established through international research. In the United Arab Emirates, no previous studies have investigated the health literacy levels of pregnant women.

Method: This study reports the results from baseline cross-sectional data obtained from pregnant women participating in the Mutaba'ah Study. Mutaba'ah is the largest mother and child health prospective cohort study in the UAE, which included the recruitment of around 12,800 expectant mothers between May 2017 and September 2022 from major hospitals in Al Ain city. For the current analysis, data

from self-administered questionnaires during the antenatal visits was used, which collected sociodemographic and pregnancy-related information, including health literacy assessment, using the Brief health literacy questionnaire. Regression models were performed to investigate the associations of sociodemographic and pregnancy related-variables with health literacy.

Results: 2694 responses to the Brief health literacy tool were analyzed. Most respondents reported adequate health literacy levels (71.6%), followed by 22.8% with marginal and 5.6% with limited literacy levels. Participants were more likely to have higher literacy levels if they were more educated [adjusted odds ratio (aOR): 1.80, 95% Confidence Interval (CI): 1.45-2.24], employed [aOR: 1.45, 95% CI (1.14-1.84)], had enough people to count on for social support [aOR: 1.67, 95% CI: 1.19-2.34] and were previously vaccinated [aOR: 1.18, 95% CI: 1.0-1.39]. Participants that expressed worry about birth were less like to have high literacy levels [aOR: 0.75, 95% CI: 0.60-0.93].

Conclusion: Health literacy among Emirati pregnant women is adequate; however, policies should be directed to maintain and improve prenatal health literacy levels for better maternal and child health outcomes.

Trends in young adults' sunburn and use of sun-safe behaviours in a high UV outdoor festival environment

Sheleigh Lawler¹, Monika Janda¹, Jodie Antrobus², Caitlin Horsham¹, Stephanie Meciar¹, Elke Hacker³

¹The University of Queensland, Australia, ²Queensland Health Australia,

³Griffith University Australia

Background and Objective: Queensland, Australia has one of the highest rates of melanoma in the world. Sunburn remains highly prevalent in adolescents and young adults, who report sub-optimal sun-safe behaviours. School leaver festivals or "schoolies" celebrations are common across Australia to mark graduation from high school. In Queensland, "schoolies" occurs on the Gold Coast with numerous high UVR exposure events (outdoor music concerts, beach activities) with over 16,000 attendees each year. Data on sun-safety at "schoolies" was collected in 2019, 2021 and 2022, with the aim to better understand young people's use of sun-safe behaviours, sunburn history, and tanning behaviours.

Methods: Young people (15+) were invited to complete an online survey at the Schoolies Registration Day in 2019, 2021 and 2022. In 2022, upon completion they were offered a) 'Schoolies' bucket hat or b) Cancer Council Australia SPF50+ sunscreen. Participants who complete the baseline survey are asked to complete a follow-up survey (one week later) with questions about sunburn, tanning and sun-safe practices during "schoolies".

Results: 2019 and 2021 response rates were 663 and 826 participants, respectively. There were no observed differences between sun-safe behaviours reported in 2019 and 2021, with low to moderate adherence. Participants reported high sunburn rates in the previous 12 months across both years (89%, 79%, respectively) and two thirds of participants reported attempting to get a tan in both years. In November 2022, 5,500 young people completed the baseline survey, with follow-up data collection due to be completed December 2022 and results will be added to this series.

Conclusion: Young people, when attending an outdoor festival with high UV exposure, fail to practice optimal sun-safe behaviours increasing risk of skin cancer. The addition of 2022 data collection is building our understanding of trends in young people's use of sun safe behaviours and supports intervention efforts.

DOI: 10.18332/popmed/163677

The provision of flu vaccination in pregnant and postpartum women: the experience in Local Health Authority (ASL) Roma 1 during the 2021-2022 and 2022-2023 flu vaccination campaign

Raffaella Mosco¹, Antonietta Spadea¹, Sara Ciampini¹, Aurora Santagata¹, Marta Marino¹, Mattia Macino¹, Laura Anelli¹, Iolanda Rinaldi¹, Silvia Franceschetti¹, Fabiola Valentini¹, Paolo Maggolini¹, Valentina Ungari¹, Anna Zoppegno¹, Silvia Bracci¹, Gennaro D'Agostino¹, Antonietta Spadea¹

¹Azienda Sanitaria Locale Roma 1 Italy

Introduction: Pregnant women are a priority target in active vaccination against influenza, whooping cough and COVID-19, which provides maternal-fetal immune protection, reducing the risk of hospitalization, prematurity, cesarean delivery, fetal distress and low unborn weight. It is the responsibility of each ASL to create a dedicated pathway for pregnant women aimed at informing, taking care of and promoting health and vaccination.

Materials and Methods: In 2019, the Birth Pathway was activated in the Family

Consultatories of ASL Roma 1 to take charge of pregnant women, which starts already in the preconceptional phase with the promotion of good practices such as folic acid intake and reduction/abandonment of alcohol and tobacco intake. Obstetric ultrasound scans, testing for early detection of postpartum depression and birth coaching classes are scheduled. The birth pathway includes the promotion and administration of vaccinations, including SARS-CoV-2 vaccination. Training of all consultant professionals (gynecologists, pediatricians, obstetric nurses, social workers and psychologists) was planned to implement this activity. Results: In the 2021-2022 influenza season, 705 pregnant women and 126 in postpartum were vaccinated against influenza out of the total of 2,308 vaccinated throughout the Lazio Region, corresponding to 35.91' and 36.52' of the vaccinations carried out in Lazio and 53.33' and 51.22' of those carried out in the three metropolitan Roman ASLs. The result is particularly positive when compared with the figure of new births in ASL Roma1 compared with births in the three Roman ASLs, which corresponds to 34.5'. In the current flu season 2022-2023, 618 pregnant and 106 postpartum women were vaccinated.

Conclusions: The organization of a dedicated Pathway with a multidisciplinary approach represents a virtuous way of taking charge in the territorial care network and promotes greater adherence by the assisted and conscious and responsible choices also regarding maternal immunization, breaking down cultural and organizational barriers.

Mozambique, ³Independent Consultant, Deutsche Gesellschaft für Internationale Zusammenarbeit, Bamako, Mali, ⁴Hospital CUF Descobertas, Lisboa, Portugal, ⁵Faculdade de Ciências Médicas|NOVA Medical School, Universidade Nova de Lisboa, Lisboa, Portugal

Background and Objective: Globally, childhood anemia is a public health concern as it leads to poor health, physical and mental growth retardations, and increased risk of morbidity and mortality. This study aimed to access morphological patterns and associated factors of anemia among children aged 6 to 59 months at Maputo Central Hospital, Maputo City Province, Mozambique.

Methods: A cross-sectional health-facility study was conducted from August 2020 to January 2022 among 400 children aged 6 to 59 months attending internal and external Pediatrics consultations at the Maputo Central Hospital. Data from clinical record sheets and child's health cards on sociodemographic factors and clinical history were collected using a structured questionnaire. The cut-off values for anemia based on the mean corpuscular volume (MCV) were: microcytic (MCV 100fL). We performed descriptive analyses and chi-square tests using SPSS 28.0 software.

Results: The magnitude of microcytic, normocytic, and macrocytic anemia was 82.2% (313/381), 17.3 % (66/381), and 0.5% (2/381), respectively. Male children were more affected by microcytic (60.0%; 186/310) and macrocytic (100.0; 2/2) anemia. Children living in rural areas were more commonly affected by microcytic (57.4%, 174/303) and normocytic (59.7%, 37/62) anemia. Children whose caregivers had a secondary education level were commonly affected by microcytic (47.9%, 148/309) and normocytic (47.0%, 31/66) anemia. The child's age was associated with morphological patterns of anemia, with higher rates of microcytic (47.9%, 150/313), normocytic (69.7%, 46/66), and macrocytic (100.0%; 2/2) anemia being observed in children aged 24 to 59 months.

Conclusion: The occurrence of microcytic and normocytic was high among male children, who were living in rural areas, whose caregivers had a secondary education level, and children aged 24 to 59 months. Macrocytic anemia was more common among male children. Helpful interventions include reinforcing the promotion of healthy eating practices and improving the capacity for diagnosing.

Parental Knowledge and Perceptions on Prevention of SUID and Infant Care

Dziyana Nazaruk¹, Ana Palacios¹, Joseph Telfair¹, Tilicia Mayo-Gamble¹, Joanne Chopak-Foss¹, Nandi Marshall¹

¹Georgia Southern University, United States

Background: The U.S. infant mortality rate was 5.9 deaths per 1,000 live infant

births, which placed the U.S. at No. 33 out of 36 countries with the world's largest economy in 2018. The U.S. State of Georgia's IMR in 2018 was 7.6 deaths per 1,000 live infant births, which placed Georgia at No.45 out of 50 states. In 2017, the top ten leading causes of infant death were responsible for 67.8% of all infant deaths in the U.S. Sudden Infant Death Syndrome (SIDS) and death from unintentional injuries were in third and fourth place. The purpose of the current study was to explore the knowledge, perceptions, and confidence of mothers about infant care to reduce the risk of SUID.

Methods: Between Dec 2021 to March 2022 Via an online, targeted survey, study participants were recruited using purposeful sampling. Participants were first time mothers with infants under 1 years of age. The data was reported on 3 levels of the Socio-Ecological model, and participants' recommendations to assist in developing a holistic approach to infant care.

Results: Most mothers did not feel confident carrying for their infants upon release from the hospital, but the confidence level increased over time. They were knowledgeable about SUID prevention but felt this emotional journey and feeling of loneliness could affect their parental abilities. Participants expressed a need for emotional and physical support and perceived medical providers as the main source of reliable information.

Conclusion: Current findings demonstrated interconnectivity between all levels of the Socio-Ecological model. Results suggested that the provided medical services are compartmentalized. To reduce the risk of SUID, healthcare system and communities should provide more emotional, social, and physical support to first-time mothers; a more integrated approach to care before and after birth; and easy access to services at all stages of the process.

Maternal phthalate exposure and dietary habits during pregnancy: what do we need to look for?

Maria Scasserra¹, Domenico Maione², Lucia Palandri³, Lisa De Pasquale⁴, Marta Casalucci⁴, Francesco Uguzzoni⁴, Antonio Lorenzon⁴, Fabio Facchinetti⁵, Lorenzo Iughetti⁵, Viola Trevisani⁶, Maria Arletti⁶, Laura Lucaccioni⁶, Elena Righi¹

¹Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, ²Food Hygiene and Nutrition Service SIAN, Reggio Emilia, Italy, ³University of Modena and Reggio Emilia, Modena, Italy, ⁴University of Modena and Reggio Emilia, Italy, ⁵Unit of Obstetrics and Gynecology Mother-Infant Department, University of Modena and Reggio Emilia, Modena, Italy, ⁶Department of Medical and Surgical Science, University of Modena and Reggio Emilia, Modena, Italy

Background and Objectives: Phthalates are chemical products widely used as plasticizers, potentially harmful, especially for their antiandrogenic effects in specific populations, such as pregnant women and newborns. Ingestion is an important exposure pathway, however specific exposure sources and drivers are mainly unknown. The aim of this study was to evaluate the association between dietary and cooking habits during pregnancy and phthalates exposure at delivery. **Methods:** 197 women were recruited after delivery, in a single-center prospective cohort study at Modena's University Hospital (Italy), from January 2019 to October 2020. Exposure to 6 phthalates was assessed in urine samples and expressed as µg/g of urinary creatinine. Pregnancy, dietary and cooking habits were recorded by ad hoc questionnaire. Descriptive statistics and bivariate analyzes were performed.

Results: Overall, exposure resulted widespread in women at delivery. In women usually boiling food, urinary levels of Monobenzylphthalate (MBzP) (3.4±2 vs 4.7±3.3 µg/g) and Mono-2-ethylhexylphthalate (MEHP) (2.3±1.8 vs 5.2±15.2 µg/g) were significantly lower, whereas in women usually frying food, mono-n-butylphthalate (MnBP) appeared significantly higher (23.2±59.6 vs 9.8±11.5 µg/g). Low fruit consumption during pregnancy was associated with higher MnBP concentrations compared to daily consumption (39.3±83.1 vs 10.6±11.5 µg/g). Concentrations of monoethylphthalate (MEP) appeared higher in women who consumed cheese, eggs and fish. Daily consumption of red meat, beef and pork was associated with higher levels of di(2-ethylhexyl)phthalate (DEHP) metabolites. **Conclusion:** No strong association among exposure and dietary habits was observed, even though urinary levels of some phthalates resulted higher in women frequently consuming fat food and lower when consuming fruits or choosing healthier cooking methods. Surprisingly, no correlation appeared with packaged foods and packaging material. Further studies are needed to better elucidate ingestion exposure pathways with a greater focus on alternative sources of contamination such as food production, processing and transportation to better guide evidence-based policy making.

Interventions to improve maternity outcomes for migrant women in high-income countries: preliminary findings from a systematic review

Kerrie Stevenson¹, Kerrie Stevenson², Kemi Ogunlana², William Henderson², Samuel Edwards³, Nuria Clemente², Hannah Raymont-Jones⁴, Majel McGranahan³, Maria Castaner⁵, Gracia Fellmeth⁶, Serena Luchenski², Fiona Stevenson², Marian Knight⁶, Robert Aldridge²

¹University College London, Institute of Health Informatics, 222 Euston Rd, London, NW1 2DA, United Kingdom, ²University College London, United Kingdom, ³Warwick Medical School, United Kingdom, ⁴King's College London, United Kingdom, ⁵University of Copenhagen, United Kingdom, ⁶University of Oxford, United Kingdom

Background and Objective: Women who are migrants and who are pregnant are at high risk of poor outcomes due to experiencing numerous stressors including language barriers, social exclusion, and cultural divides in pregnancy care. High-income countries (HICs) are often the target destination for many migrants across the world. Although HIC maternity systems are often well funded, they are not routinely tailored to care for migrant women, and there are a lack of synthesised data on the most effective ways to improve care. This primary aim of this systematic review is to determine what interventions exist to improve maternity outcomes amongst migrant women in high-income countries, and the secondary aim is to assess which interventions are most effective.

Methods: PROSPERO: CRD42022380678. We will search the following databases EMBASE via Ovid, Medline via Ovid, CENTRAL, Scopus, CINAHL, PsychINFO, and Web of Science, as well as additional sources from inception up until December 2022 with no language restrictions. We will include randomised-controlled trials and quasi-experimental studies. We will exclude studies with qualitative outcome assessments. Screening, data extraction, and risk of bias will be completed by two independent reviewers. If appropriate, we will perform random effects meta-analysis.

Proposed

Results: We will present a summary of the interventions retrieved which, based on our scoping search, is likely to include peer-led initiatives, specialist care services, specialist antenatal and postnatal classes, and doula services. We will create consensus on the most effective interventions to improve maternity outcomes for migrant women in HICs.

Conclusion: We expect that there will have been a significant increase in relevant interventions published in the past decade, but that the evaluations of these interventions will be limited. Our findings will help funders and policymakers target the most effective maternity interventions for migrant women, and will inform future research.

The effects of COVID-19 disease during pregnancy and childbirth. A systematic review

Josefa Drogue Vidal¹, Francisca Farr Negrete¹, María Carroza¹

¹University of Chile, Chile

Introduction: COVID-19 pandemic has become a great public health issue, having a negative impact above the most vulnerable groups, such as childbearing people. World Health Organization (WHO) has considered this group as high-risk population in case of infection by SARS-CoV-2. Furthermore, the consequences this infection could have in fetuses and newborns are still unknown.

Objective: To describe the effects of COVID-19 during pregnancy and childbirth, during a pandemic context.

Methods: An article review was performed about SARS-CoV-2 infection during pregnancy, its effects on pregnant people, obstetrics and perinatal outcomes, that had been published between January 1st 2020 and July 5th 2022. We found 245 publications, studying 18.191 pregnant people who had been diagnosed with COVID-19 at some point during their pregnancy.

Results: Average age was 30,7 years old, 39% had some pre-existing morbidity, ¼ was obese. 53% of childbearing people were asymptomatic to the disease. Among symptomatic patients, 72% only had mild symptoms, the most frequent were cough (24%) and fever (21%). 4,3% of people from this group needed ICU hospitalization. 12,49% presented some obstetric disease, the most common been gestational diabetes (5,04%). 49,31% of deliveries were cesarean sections, and there were 158 maternal deaths. The mean gestational age at birth was 36,14 weeks, with 16,98% of preterm infants. RT-PCR positivity in newborns was 3,13%, and 0,78% of newborns died during neonatal period.

Conclusions: More than half of COVID+ pregnant people presented the infection

asymptomatically, those who had symptoms had a mild disease in more than 2/3 of the cases. Maternal mortality was 4 times higher than the global rate. The number of cesarean sections and premature births also increased, mainly in cases of severe-critical disease. It remains complex to reach conclusions about vertical transmission of the virus, therefore more studies are needed.

Sexual and reproductive health of young people in Greece: knowledge, attitudes, practices and sexual health profile of 249 individuals

Maria Papadakaki¹, Kyriaki Vagionakis¹, Joannes Chliaoutakis¹

¹LaHeRS Lab, Social Work Department, Hellenic Mediterranean University, Greece

Introduction: In Europe 25% of adolescents aged 15 are sexually active. The current study aimed at assessing knowledge, attitudes, practices and sexual and reproductive health profiles of young people in a large city of Greece.

Methods: A study was conducted in 2019 among a convenient sample of 249 individuals aged 18-30 years, living in Heraklion, Greece. The questionnaire was anonymous and was based on "Illustrative Questionnaire for interview surveys with young people" (WHO) and "Questionnaire on Gender Relations and Sexuality" (Cyprus Institute of Reproductive Medicine).

Results: The average age of participants was 22.2 years (SD=3.5) and the majority were female (69.5%) living in urban areas (85.2%). Out of a total of nine knowledge items, the maximum correct answers per individual was five (e.g. "HPVs cause warts on ovaries" (17.0%); "fungi are likely to cause infertility" (26.9%); "high likelihood of pregnancy when sexual intercourse takes place 14 days before the expected period" (n = 102, 48.4%), etc). Although participants considered "medical doctor" as the most important source of information on sexual issues (41.0%), most sought advice from "friends" (38.1%) or "the web" (21.9%). The mean age of first sexual intercourse was 16.8 years (SD3.0). Participants stated that "often" (8.3%) or "occasionally" (4.6%) have sex with people of same sex and 44.9% stated watching sexual explicit material on the web. Condom use was "very often" to "always" reported by 78.0% and "rare" to "never" by 18.3%. A total of 10.8% "had STD in the past" and 52.2% were aware of a girl under 18 years who experienced unwanted pregnancy, with the average age of abortion be at 16.7 years.

Conclusion: The study identified utilization of unreliable information sources, high misinformation and risky sexual practices among participants. There is a need to increase knowledge, skills and critical thinking through comprehensive sex education in schools.

Socioeconomic condition, mental health and quality of life in children during the COVID-19 pandemic: an intersectional analysis of a population-based study

Elsa Lorthé¹, Viviane Richard¹, Roxane Dumont¹, Andrea Loizeau¹, Javier Perez-Saez¹, Hélène Baysson¹, Maria-Eugenia Zaballa¹, Julien Lamour¹, Stephanie Schrempf¹, Rémy Barbe², Klara Posfay-Barbe², Idris Guessous², Silvia Stringhini¹

¹UEP, Switzerland, ²HUG, Switzerland

Background and Objective: Children and adolescents are highly vulnerable to the impact of sustained stressors during developmentally sensitive times. Therefore, long-term adverse effects of the pandemic warrant special consideration. However, children are not a homogeneous group: the intersection of social, economic, and demographic characteristics shapes children's daily experiences and outcomes. We investigated how demographic characteristics intersect with socioeconomic dimensions to shape the social patterning of quality of life and mental health in children and adolescents, two years into the COVID-19 pandemic.

Methods: We used data from the prospective SEROCOVID-KIDS cohort study of children and adolescents living in Geneva (Switzerland). We conducted an intersectional Multilevel Analysis of Individual Heterogeneity and Discriminatory Accuracy (MAIHDA) by nesting participants within 48 social strata defined by intersecting sex, age, migrant status, parental education and financial hardship in Bayesian multilevel logistic models for poor health-related quality of life (HRQoL, measured with PedsQL), and poor mental health (SDQ).

Results: Among participants aged 2-17 years (median 10, IQR7-13), 223/1954 (11.4%) and 100/1991 (5.0%) had poor HRQoL and poor mental health, respectively. We observed substantial between-stratum differences in the predicted proportion of poor HRQoL, ranging from 4.4% for 2-5 years old Swiss-born females with highly educated parents and no financial hardship to 33.3% for 12-17 years old Swiss-

born females with highly educated parents but financial hardship. Strata including adolescents and financial hardship had a significantly higher likelihood of poor HRQoL than their counterparts. Between-stratum variations in the predicted frequency of poor mental health were limited (range 4.2%-6.8%) and mainly explained by low parental education.

Conclusion: We found evidence of considerable differences in adverse outcomes across social strata. Interventions to address inequities in HRQoL should focus on specific population sub-groups involving adolescents and families with financial hardship, while those aiming to improve mental health should target all children and adolescents.

Why do women not utilize maternal health services at Puskesmas? an explorative qualitative study of healthcare workers in Indonesia

Herwansyah Herwansyah¹, Stavroula Kalaitzi², Katarzyna Czabanowska¹, Peter Schröder-Bäck³

¹Maastricht University, Department of International Health, Care and Public Health Research Institute (CAPHRI), Faculty of Health, Medicine, and Life Sciences, Maastricht University, Duboisdomein 30, 6229 GT, Maastricht, Netherlands, ²Indiana University, ³University of Applied Sciences for Police and Public Administration in North Rhine-Westphalia, Institute of History and Ethics of Police and Public Administration (IGE), University of Applied Sciences for Police and Public Administration in North Rhine-Westphalia, Dennewartstrasse 25-27, 52068 Aachen, Germany

Maternal health services at the Community Health Center (Puskesmas) are generally underutilized. The importance of service utilization at this healthcare facility is aimed at improving maternal health quality in response to maternal mortality reduction. Sociodemographic factors are primarily associated with low utilization of maternal healthcare services in primary care settings. Many women, including the healthcare women cohort, preferred to visit other healthcare facilities instead of the Puskesmas. The purpose of this study was to explore and describe the reasons why female healthcare workers do not use maternal health services at Puskesmas.

This descriptive explorative qualitative study was conducted in eleven Puskesmas in the Municipality of Sungai Penuh, Indonesia. Eleven Focus Group Discussions (FGDs) were carried out with female healthcare workers from those eleven Puskesmas. The Attride-Stirling's thematic network analysis approach was employed to analyse the data.

Finding suggests that although the participants considered the maternal health services at Puskesmas as one of the essential programs, they preferred seeking the services at other maternity care facilities. The underlying reasons were often conditioned by the women's motivation to obtain services from private clinics or hospitals. They believed that these facilities provide comprehensive maternity care services, which include well-equipped examination tools, the quality of services, and the availability of specialist doctors. Other related reasons include a lack of self-motivation to use the services at Puskesmas due to working conditions. The healthcare workers contended that they have to focus on their responsibilities in their stations without interrupting other staff serving other clients. Hence, they chose other healthcare facilities that open after working hours.

Individual-level factors influence female health workers not to utilize the services. The sociodemographic factors of the participants should be adequately considered in the design of the appropriate interventions to raise awareness of the importance of maternal health service utilization at Puskesmas.

How do adolescents see differences in online communication in supporting them to protect the health of their friends?

Lisa Buckley¹, Wlthanage Perera¹

¹The University of Queensland, Australia

Background and Objective: Friends can provide early adolescents with protection from harm. Positive support, comfort, or active efforts to prevent harm is evidenced in online bullying but also across other health behaviours. Research typically focuses on individual characteristics of protectors (e.g., empathy, confidence). Guided by a theory of online communication, we examine the features of online platforms as they might affect protecting of friends. Our objectives were to describe adolescents' experience of online communication and how they feel it differs from face-to-face communication and explore factors they identify as increasing the likelihood of acting to protect friends from harm.

Methods: We surveyed 216 students (Mean age = 13.72, S.D.=1.2) online during school time about helping and bystander behaviour. We provided an open-ended

text box to have students describe how they felt electronic, differed from face-to-face communication. We also had students rate (strongly disagree-strongly agree) whether key factors (in person and online) were associated with their intervening to stop a friends' risky behaviour (n=13 items).

Results: Qualitative themes of online differences included: cue absence ("can't hug"), synchronicity ("time to respond"), permanence ("people can screenshot"), relieve social anxiety ("respond without being scared"), available ("chat anytime"), and alterations ("filters"). Quantitatively (factor analysis), two factors related to likelihood of intervening: one aligning with online experience (e.g., being recorded, followers) and another more general factor (e.g., a dangerous situation, close friends, with helpful others). Items related to getting into trouble loaded across both factors.

Conclusion: A large part of adolescent communication is online, including the way they protect their friends from harm. From our study, we see that adolescents identify differences with face-to-face communication and, together with understanding the characteristics of those who actively intervene to reduce friends' harm, findings might help better provide health promotion messaging around, 'mates looking out for mates'.

DOI: 10.18332/popmed/163906

"We try to look beyond just [providing] an abortion": exploring healthcare providers' experiences of delivering abortion care at 20 weeks and over in Victoria

Alyce Wilson¹, Mary Malek², Caroline Homer², Catherine Hannon³, Clare McDonald³, Paddy Moore³

¹Gippsland Region Public Health Unit, Australia, ²Burnet Institute, Australia,

³Royal Women's Hospital, Australia

Background and Objective: Universal access to safe abortion is key to upholding sexual and reproductive health and rights. However, abortions at 20 weeks and over for psychosocial reasons are highly stigmatised and particularly difficult to access. The Abortion and Contraception Service (ACS) at the Royal Women's Hospital is the only service in Victoria, Australia that provides these abortions, and little is known about healthcare providers' experiences in providing this care. This study aimed to examine healthcare provider perspectives and experiences in providing abortion care at 20 weeks and over, and how the quality of care might be improved.

Methods: An exploratory qualitative study was conducted. Healthcare providers of abortion at 20 weeks and over for psychosocial reasons were recruited from the ACS, Royal Women's Hospital. In-depth, semi-structured interviews were conducted with participants from May to June 2022 by researchers experienced in trauma-informed care. Data were analysed by reflexive thematic analysis using NVivo software.

Results: Participants included 13 healthcare providers from medicine, nursing, midwifery, social work and Aboriginal clinical health backgrounds. Four themes were identified: 'Delivering quality care', 'Strengthening the service', 'Being an abortion provider is challenging', and 'Navigating a complex environment'. Participants perceived the care provided as patient-centred and timely, but noted barriers to care including understaffing, difficulty maintaining a sustainable workforce, and the absence of similar services state-wide. Personal challenges faced by participants included the emotional toll and ethical considerations of their work, but they felt well-supported by the wider team.

Conclusion: Further research exploring the care experiences of providers and service users of abortion at 20 weeks and over for psychosocial reasons is required to support these findings. There is an urgent need for supportive policies and frameworks to expand provision of affordable, acceptable and accessible abortions at 20 weeks and over in Victoria, and Australia more widely.

Health Institute, Ethiopia, ⁴Brigham and Women's Hospital, United States,

⁵Felege Hiwot Comprehensive Referral Hospital, Ethiopia, ⁶Johns Hopkins Bloomberg School of Public Health, United States, ⁷Beth Israel Deaconess

Medical Center, Harvard Medical School, United States, ⁸Harvard T.H. Chan School of Public Health, Harvard Medical School, United States

Background: Infections during pregnancy may increase risk of adverse birth outcomes. In many low-income settings, screening of infections in pregnancy is not routinely performed, and treatment is based on an empirical approach. We aimed to describe the prevalence and etiology of genitourinary tract and intestinal parasitic infections among pregnant women in Ethiopia.

Methods: A prospective pregnancy cohort study was conducted in 12 health centers in rural Amhara. At enrollment (≤ 24 weeks gestation), clean-catch midstream urine specimens were collected and urine culture and antibiotic susceptibility testing performed (n=618). Urinary tract infection (UTI) was defined as high-burden bacterial growth (≥ 105 colony forming units (CFU)/ml) or intermediate growth [103-105 CFU/ml] with UTI symptoms. Women provided self-administered vaginal swabs to screen for Chlamydia trachomatis and Neisseria gonorrhoeae (GenXpert, n=628). In a subset of women who reported vaginal symptoms (6.5%), point-of-care diagnostic tests (DiagnosIt® BVBLUE, OSOM® Trichomonas) were performed to test for Bacterial vaginosis (BV) and Trichomoniasis (TRICH). Stool samples were collected in participants who had received a prior presumptive mebendazole dose and examined using wet mount technique (n=319).

Results: The prevalence of UTI was 3.7%, with Escherichia coli (63%) being the predominant uropathogen, followed by Klebsiella pneumoniae and Enterococcus faecalis (8% each). Three-quarters of bacterial isolates were susceptible to nitrofurantoin, and more than one-third were resistant to ampicillin and cotrimoxazole. About 39% (n=125) of women screened had persistent parasitic infections after deworming, and the most common parasites were Entamoeba histolytica (14.4%), Giardia lamblia (13.8%), and Necator americanus (8.2%). Among symptomatic women, 9.8% were positive for BV and 2.6% for TRICH. Only a single case of chlamydia was detected.

Conclusions: In this cohort, the prevalence of intestinal parasitic infection was high despite deworming, while genitourinary tract infections were uncommon. Strengthening of the management of intestinal parasites in pregnancy is needed in this and similar populations.

We are open-minded but not liberated: Using Human-Centered Design to hear teenage voices in the Philippines

Maria Murga¹, Jeffry Lorenzo¹, Algin Gultia¹

¹Johns Hopkins Center for Communication Programs, Philippines

The Philippines declared teenage pregnancy a national social emergency in 2019. Limited accessibility to family planning (FP) commodities and services, mandatory parental consent to access contraception as a minor, and low use of health services are all key factors that contribute to this problem. USAID ReachHealth, a 5-year FP project in the Philippines, used human-centered design (HCD) to ask - How Might We Reduce Unintended Teenage Pregnancy in the Philippines?

The HCD process (Empathize, Define, Ideate, Design and Test/Implement) used participatory methods adapted for adolescents. Youth organizations recruited participants and helped in data collection and analysis. The adults close to teens were also interviewed. They worked in parallel spaces to reduce the influence of power dynamics. The team utilized projective and interactive techniques to keep adolescents engaged and open to sharing sensitive topics. They factored in adolescents' sexual identity, age and language.

The team interacted with 200+ adolescents and adults. This resulted in 12 insights, 281 potential ideas, five complementary prototypes and four implemented interventions. The insights highlight the unique perspective adolescents have compared to their parents and community. They need to be equipped to talk to teenagers about love, sex and relationships without fear that they are corrupting them. Health providers need to provide a safe space for teens so that their experience with health services is a positive one.

Teenage pregnancy is clearly a complex issue that needs to be approached at different levels with teenagers guiding the way. This serves as a comprehensive resource that program managers can use. They also need to invest in preventing the first birth and not just rapid repeat pregnancy. The HCD process highlights how important it is to involve teenagers in programs for them. They have much to say and seek genuine opportunities to weigh in on important health topics.

DOI: 10.18332/popmed/163949

Socio-demographic determinants of primary and secondary infertility in India

Aditi Prasad¹

¹International Institute for Population Sciences, Mumbai, Govandi-East,

Mumbai, India

Background and Objective: Infertility is a global public health issue that remains neglected both in the field of reproductive sciences and also on the social level, even when infertility affects a large proportion of couples worldwide. While there has been much work in the field of medicine, infertility is yet to be closely studied from the social and cultural angles. The objective of this study is to explore the socio-demographic determinants of primary and secondary infertility among currently married women (aged 20-49) in India, as well as the possible consequences of infertility.

Methods: This study used the data from the National Family Health Survey (NFHS) - 5 (2019-21) to determine the determinants of primary and secondary infertility. Bivariate and multivariate analyses were conducted to assess the factors affecting primary and secondary infertility among currently married women in India. Furthermore, chi-square tests were conducted to check the association between primary and secondary infertile women and the possible consequences of infertility.

Results and conclusion

The age of women, age at first marriage, husband/partner's age, the standard of living, working status of women, and region are some of the variables that significantly affect infertility. Women in urban areas are more likely to have primary and secondary infertility. This could be due to the delayed age of marriage or lifestyle changes. The educational and wealth status of the couple has a negative relationship with infertility, possibly due to better access to information and resources. In the present study, the association of primary and secondary infertility with marital dissolution and domestic abuse is significant. The first step in addressing infertility is to acknowledge that infertility is a problem for which no single cause is known. Thus, there needs to be a targeted approach to address infertility backed by further research and relevant policies.

DOI: 10.18332/popmed/163952

Hygienic menstrual practices among tribal adolescents in India

Chandan Hansda¹

¹International Institute for Population Sciences, India

Background: Menstruation is a natural biological process in which blood and other related materials are carried out of the uterus through the vagina. Despite being a normal process, it is seen as dirty and many taboos, misbeliefs, and misconceptions are related to it, which prevents many menstruators across the world from handling it in a healthy, hygienic, and respectful manner. Girls and women, especially in the tribal setting, have restricted access to healthcare facilities despite shifting social and cultural norms and practices. Teenagers, especially young females, are more likely to retain inaccurate beliefs and conceptions due to inadequate, incorrect, and unclear information.

Method: The present study is based on secondary data, i.e., National Family Health Survey-5 (NFHS-5), and used suitable statistical tools to explore hygienic menstrual practices among tribal adolescents in India. The total sample of scheduled tribal women aged 15-19 in NFHS-5 is 22,563.

Results: The prevalence of hygienic menstrual practices among adolescents aged 15-19 years is 77.55% overall, while among the tribal adolescents, it is approx. 67%. In most states and union territories, the prevalence of hygienic menstrual practices among tribal adolescents is less than that of overall adolescents. The usage of the hygienic method depends on the place of residence, wealth status, educational status, and toilet facility.

Conclusion: Interventions should focus on the states where the prevalence of using hygienic methods is less. Government should focus on reaching the community as lack of accessibility, and affordability is the major concern among the tribal communities. Enhancing better menstrual practices in the present helps to enhance women's reproductive health in the future.

The causal effect of parent-child interactions on children's language development at 3 and 4 years

Mary Brushe¹, Murthy Mittinty², Dandara Haag², Sheena Reilly³, Edward Melhuish⁴, Tess Gregory¹, John Lynch², Sally Brinkman⁵

¹Telethon Kids Institute & University of Adelaide, Australia, ²University of Adelaide, Australia, ³Griffith University, Australia, ⁴University of Oxford, United Kingdom, ⁵University of South Australia, Australia

Background: Inequalities in early language exposure, known as the 'word gap', have been shown to emerge as early as 18 months old. Parent-child interactions, also known as conversational turns, have been proposed as one mechanism for improving later language development. However, research to date has been

limited by small sample sizes and analytical techniques that cannot quantify a causal relationship, limiting the potential for research to inform policy and practice within early childhood.

Objective: Estimate the causal effect of parent-child interactions throughout the early years on children's later language development at 3 and 4 years old.

Methods: Language in Little Ones is an Australian prospective cohort study (n = 302) that uses speech recognition technology to quantify the number of parent-child interactions children experience over an average day. Data is collected every six months from when the child is 6 to 48 months old. Language development is measured using the standard score on the Clinical Evaluations of Language Fundamentals Preschool-2 at 36 and 48 months. Marginal structural models with inverse probability of treatment weights will be employed to account for time-varying exposures (parent-child interactions) and time-varying confounding (e.g., home activities and parent mental health).

Results: Using the counterfactual theory of causation, results of a simulation model will be presented that describes the language development standard score that could be expected had the entire population spoken a specified number of parent-child interactions at each wave of data collection.

Conclusion: These findings will advance our understanding of how increases in parent-child interactions could improve language development during the early years. Potential mechanisms influencing parents' ability to engage in high-quality interactions, such as screen time, will also be discussed. This will inform international policies and interventions to close the word gap and ensure all children start school ready to learn.

Protocol of a longitudinal population-based study evaluating the impacts of the COVID-19 pandemic on children and adolescents: the SEROCov-KIDS cohort and biobank

Andrea Loizeau¹, Elsa Lorthe¹, Roxane Dumont¹, Charlotte Verolet¹, Viviane Richard¹, Maria-Eugenia Zaballa¹, Francesco Pennacchio¹, Julien Lamour¹, Hélène Baysson¹, Klara Posfay-Barbe², Remy Barbe³, Idris Guessous⁴, Silvia Stringhini¹, on behalf of the SEROCov-KIDS, study group¹

¹Unit of Population Epidemiology, Division of Primary Care Medicine, Geneva University Hospitals, Geneva, Switzerland, ²Division of General Pediatrics, Department of Woman, Child, and Adolescent Medicine, Geneva University Hospitals, Geneva, Switzerland, ³Division of Child and Adolescent Psychiatry, Department of Woman, Child, and Adolescent Medicine, Geneva University Hospitals, Geneva, Switzerland, ⁴Division and Department of Primary Care Medicine, Geneva University Hospitals, Geneva, Switzerland; Department of Health and Community Medicine, Faculty of Medicine, University of Geneva, Geneva, Switzerland

Background and Objective: Recent observational research has revealed the impacts of the COVID-19 pandemic on the multiple dimensions of children's life coming from diverse socioeconomic backgrounds. Determining the consequences of the pandemic on this population over the longer term is a public health priority.

Methods: SEROCov-KIDS is an on-going, 3-year longitudinal and prospective cohort study to monitor and determine the direct and indirect impacts of the COVID-19 pandemic on the health and development of children (aged 6 months to 17 years) living in Geneva, Switzerland. The study integrates a paediatric biobank and a research collaborative network. Its cohort is composed of a general population-based sample (targeted N, 2000) and a sample of children with social or clinical vulnerabilities (targeted N, 500). Participants are enrolled during the first 12 months of the 30-month data collection phase. Individual consent is provided by the referent adult and adolescent, aged 14 years or older. Participation includes a baseline serological blood test, and online questionnaires at the baseline assessment and every 4 months thereafter. The outcomes are general and mental health, development trajectory, education, family socioeconomic environment, lifestyle, health behaviors, healthcare consumption, and COVID-19 exposure.

Results: The study began on September, 2021 and will be completed in August 2024. As of November 2022, 2145 children are being followed up. A total of 1829 serologies (85%) were performed and most participants (83%) agreed to the biobank. The inclusion questionnaires were completed by 1750/2145 referent adults (96%) and 423/480 adolescents (88%).

Conclusions: SEROCov-KIDS is a uniquely large cohort study monitoring the health and development of children of all ages over time, and an opportunity to build a biobank for future translational research. Its findings will provide an evidence base to guide public policies and future programs for the young population, particularly for those in vulnerable situations.

Early life exposure to phthalates and risk assessment: are we doing enough?

Lisa De Pasquale¹, Camilla Lugli², Lucia Palandri³, Riccardo Barbieri¹, Erica Passini², Fabio Facchinetti³, Lorenzo Iughetti⁴, Laura Lucaccioni⁵, Elena Righi¹

¹University of Modena and Reggio Emilia, Modena, Italy, Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, ²University of Modena and Reggio Emilia, Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, ³University of Modena and Reggio Emilia, ⁴University of Modena and Reggio Emilia, Paediatrics Unit, Maternal-Infantile Department, University Hospital, Department of Medicine and Surgery, University of Modena and Reggio Emilia, Modena, Italy, ⁵University of Modena and Reggio Emilia, Department of Medical and Surgical Science, University of Modena and Reggio Emilia, Modena, Italy

Background and Objective: Phthalates, potential endocrine disruptors with antiandrogenic effects, are widely used in several everyday products and are ubiquitous pollutants. Since 1999 European Authorities enacted several regulations to limit phthalate use and prevent exposure, mainly for more susceptible populations such as infants. This study aims to evaluate the estimated daily intake (EDI) of phthalates and to perform risk assessment evaluation in an Italian pediatric cohort.

Methods: Between 2019 and 2020, 197 mother-child couples were enrolled in a prospective cohort study at the University Hospital of Modena (Italy). Urine samples were collected at birth, 3 and 6-months. 8 phthalates metabolites were analyzed.

EDI was estimated and Risk quotients (RQ) were calculated using tolerable daily intake levels, (RQ(TDI)) as determined by the European Food Safety Authority, and the revised reference doses for anti-androgenicity RQ(RfD-AA), recently proposed. Finally, combined Hazard Indexes (HI) were calculated to assess synergic effect of different phthalates.

Results: Most EDI and RQ(TDI) were lower than the acceptable values. The highest levels were found for Diethyl-phthalate (DEP), followed by Di-2-ethylhexyl-phthalate (DEHP). Newborns showed the highest values, followed by 6-months infants. Values exceeding the risk levels were observed for DEHP or di-n-butyl-phthalate (DnBP) in 5.5% and 10% of the newborns, respectively for RQ(RfDAA) and HI. Overall, HI higher values than threshold were observed at each follow-up visit.

Conclusion: Since the European Union has a strict regulation policy regarding the most critical phthalates, these findings raise concern: exposure affecting children in Modena is still spread and includes phthalates banned in childcare products, such as DEHP and DnBP. Notably, few infants (especially newborns) exceeded the risk threshold for antiandrogenic effects. Further, exposure patterns seem to change over time during their first months of life. More extensive public health measures need to be planned to efficiently protect the most sensitive subgroups, including infants.

"Come te la passi?" project: Cross sectional survey investigating Physical Activity and well-being of children and adolescents during SARS-CoV-2 pandemic

Aurelia Salussolia¹, Marco Montalti¹, Alice Masini², Jacopo Lenzi², Flavia Rallo¹, Martina Paternò³, Marta Agosta³, Davide Resi³, Michela Stillo³, Federica Guaraldi⁴, Davide Gori², Laura Dallolio²

¹University of Bologna, School of Hygiene and Preventive Medicine, Department of Biomedical and Neuromotor Sciences, Italy, ²University of Bologna, Department of Biomedical and Neuromotor Sciences, Italy, ³Bologna Local Health Authority, Department of Public Health, Italy, ⁴IRCCS Istituto delle Scienze Neurologiche di Bologna, Italy

Background and Objective: The sars-cov-2 pandemic had a significant impact on the physical and general well-being of the youngest. In Italy, the population was forced to change habits, especially during the national lockdown that took place from march to may 2020, leading to an increase in sedentary behaviors. "Come te la passi?" project aimed to investigate changes in physical activity (pa) levels and well-being of children and adolescents in the city of bologna.

Methods: An anonymous survey was administered in july 2021 to parents of children/adolescents aged 6-18 years attending educational services in bologna. A multilevel mixed-effects generalized ordered probit regression analysis was performed to investigate the change in frequency of pa during and after the national lockdown, as compared with before the lockdown.

Results: 1134 Questionnaires were collected; 457 (40.3%) were female and the mean age was 13.0±3.4 years. Regarding perception of general well-being,

61.3% of participants reported that their child worried about the future, that 46.3% had difficulty sleeping and that 72.8% had difficulty paying attention, with a significantly higher proportion among adolescents. Regarding pa frequency during the lockdown, it was reported to be lower than before. additionally, post-lockdown pa levels do not match pre-lockdown pa levels, with a "Polarization" of pa frequency. In fact, the percentage of children/adolescents who reportedly never or rarely did pa and the percentage of those who did pa with a high frequency both increased post-lockdown, whilst the percentage of those who did pa two/three times per week halved. No gender differences were found.

Conclusion: Our results show that the current pandemic has had a strong impact on the well-being of children and adolescents. It appears to have affected mainly adolescents, and even after the end of the national lockdown, pa levels decreased significantly.

Suicidal ideation in adolescents during the COVID-19 pandemic: prevalence and risk factors from a cross-sectional study in Geneva, Switzerland

Roxane Dumont¹, Elsa Lorthe¹, Viviane Richard¹, Andrea Loizeau¹, Guillaume Fernandez², David DeRidder¹, Francesco Pennacchio¹, Julien Lamour¹, Maria-Eugenia Zaballa¹, Hélène Baysson¹, Klara Posfay-Barbe³, Remy Barbe⁴, Silvia Stringhini¹, Idris Guessous⁵, on behalf of the SEROCov-KIDS, study group¹

¹Unit of Population epidemiology - Geneva university hospital, Switzerland,

²Geneva University, ³Division of General Pediatrics, Department of Woman, Child, and Adolescent Medicine, Geneva University Hospitals, Geneva, Switzerland, ⁴Division of Child and Adolescent Psychiatry, Department of Woman, Child, and Adolescent Medicine, Geneva University Hospitals, Geneva, Switzerland, ⁵Division and Department of Primary Care Medicine, Geneva University Hospitals, Geneva, Switzerland

Background and Objectives: Pandemic-related life changes may have had a deleterious impact on suicidal behaviours. Early detection of suicidal ideation and identification of subgroups at increased risk could help prevent suicide, one of the leading causes of death among adolescents worldwide. We aimed to investigate the prevalence and risk factors for suicidal ideation in adolescents, two years into the COVID-19 pandemic.

Methods: A population-based sample of adolescents (14-17 years old) included in a prospective cohort between December 2021 and June 2022 were invited to fill in an online questionnaire and were asked about suicidal ideation ("In the past 12 months, have you thought about suicide?"). We conducted a network analysis which identifies direct and indirect risk factors using mixed graphical modelling. **Results:** Among 505 adolescents, 15% (95%CI: 11.7-18.1) declared having experienced suicidal ideation over the previous year, and 2.5% (95%CI: 1.4-4.4) declared having ever attempted suicide. Using network analysis, we identified that strong psychological distress, belonging to a sexual minority (lesbian/gay/bisexual), low self-esteem and extensive screen time were direct risk factors for suicidal ideation. In addition, female gender, addiction to social media, bullying and health compromising behaviors (smoking/drug/alcohol use) were recognized as major indirect risk factors, as connected through intermediate risk factors. Parent/adolescent relationship had the highest centrality strength in the network analysis, hence substantial influence on the network information.

Conclusion: An alarming proportion of adolescents declared having had suicidal thoughts over the previous year, especially those with strong psychological distress, low self-esteem, belonging to a sexual minority or with extensive screen time. Research suggests that these risk factors were likely exacerbated by pandemic-related societal changes. Parent/adolescent relationship was identified as a strong influential domain on which targeted preventive efforts could have a considerable impact on reducing suicidal ideation.

A systematic review of the global implementation and impact of non-invasive prenatal testing (NIPT) during prenatal screening for Down's syndrome

Elinor Sebire¹, Mairead Black¹, Sohinee Bhattacharya¹, Rachael Wood², Rute Vieira¹

¹University of Aberdeen, United Kingdom, ²Public Health Scotland, United Kingdom

Background and Objective: Non-invasive prenatal testing (NIPT) is an accurate and non-invasive screening test for Down's syndrome (DS) that has been recently implemented into antenatal screening programmes worldwide. This review provides a current understanding of the extent of NIPT use in national antenatal

screening pathways and its impact on the reproductive choices made during pregnancy, invasive prenatal diagnosis (IPD) and terminations, and on live births of babies with DS.

Methods: A systematic review of studies and guidelines describing the implementation of NIPT and its impact on reproductive choices and pregnancy outcomes. Screening and data extraction was completed independently by two researchers, along with hand-searching to identify national guidelines. Narrative synthesis, descriptive analysis and meta-analysis (where possible) were used to evaluate the implementation of NIPT, its uptake, and impact on pregnancy outcomes. Quality was assessed using the Down's and Black quality assessment tool.

Results: In total, 27 countries or states were identified offering NIPT as part of a national screening programme (n=23 studies or national guidelines). NIPT was implemented as either a first- or second-line screening test, and was patient-funded, covered by insurance or healthcare system. Most often, NIPT was a contingent test (n=16) for higher chance of DS pregnancies. In some countries, NIPT implementation resulted in a reduction of IPD procedures. Cultural and societal attitudes to prenatal testing are often cited as an influence on the uptake of NIPT. Preliminary meta-analysis results find no significant difference in the reported terminations or live births of babies with DS following NIPT implementation.

Conclusion: Implementation of NIPT into antenatal screening programmes is highly variable between countries, dependent on pre-existing prenatal testing and healthcare provisions. Further monitoring of the impact of NIPT and studies exploring the reasons behind differential uptake of screening and reduction in IPD are important to inform future public health initiatives.

Household head- an unspoken crucial dimension to improve maternal healthcare services utilization in Bangladesh: evidence from nationally representative surveys

Md Rahman¹, Mamun Bashar¹, Tasnim Ara¹, Zannatul Ferdous²

¹International Centre for Diarrhoeal Disease Research, Bangladesh

Bangladesh, ²University of Dhaka Bangladesh

Background and Objective: Bangladesh, a lower-middle income country is enormously struggling to reduce the high maternal mortality ratio (196 per 100,000 live births) which got stagnant at the level of 2010. Poor maternal healthcare (MH) services utilization could be attributed to this stagnation. MH programs mostly overlook the household head (HH)- the most influential person in household decision-making in Bangladesh. This study aims to examine the role of HH and their relationship dynamics with women in MH services utilization during pregnancy and childbirth. Additionally, this study explores the possibilities of short and long-term policy actions.

Methods: This study used data from the latest nationally representative cross-sectional Bangladesh Multiple Indicator Cluster Survey 2019, Bangladesh Maternal Mortality Survey 2016, and Bangladesh Adolescent Health and Wellbeing Survey 2019-20. Antenatal care (ANC), facility birth (FB), skilled birth attendance (SBA) for home births, and care-seeking for maternal complications were assessed as MH services. The role of HHs' education and relationship dynamics were examined through multivariate regressions and marginal effects. Spatial hotspot analyses were performed to generate policy suggestions.

Results: After controlling for pregnancy complications and all other confounders, the adjusted odds of at least four ANC visits, FB, SBA in home births, and facility-based care seeking for pregnancy complication monotonically decreased by lower levels of HH education. Marginal effects of HHs' education across different level of ANC visits indicates that less educated HHs diminish the maximum benefits of ANC in facilitating FB. Hotspot analyses revealed low-level of education among HHs and male adolescents of the eastern region, while the coverage of mobile phone ownership among HH was high there.

Conclusion: This study warrants integrating household heads into MH programs. Mobile phone-based awareness programs targeting household heads can be the immediate call for action, while averting school dropout among male adolescents can be the long-term strategy.

The use of traditional medicine practitioners for childhood illness in sub-Saharan Africa

Peter James¹, Jon Wardle², Razak Gyasi³, Ossy Kasilo⁴, Abdulai Bah⁵, George Yendewa⁶, Amos Mwaka⁷

¹National Centre for Naturopathic medicine Southern Cross University

Southern Cross University "Military Road Lismore, New South Wales, Australia 2480" Australia, ²National Centre for Naturopathic Medicine, Faculty of Health, Southern Cross University, Lismore, NSW, 2480, Australia, ³African Population and Health Research Center African Population and Health Research Center "Manga Close, Kirawa Road Nairobi, Kenya" Kenya, ⁴World Health Organisation office for Africa World Health Organisation office for Africa Brazzaville, Congo Congo, ⁵College of Medicine and Allied Sciences, University of Sierra Leone, ⁶Johns Hopkins Bloomberg School of Public Health Baltimore, MD 21205, USA United States, ⁷Department of Medicine, Faculty of Medicine, Gulu University GuLu University Pece-Laroo Division, Gulu, Uganda Uganda

Methods: We utilized extracted Demographic and Health Surveys (DHS) data collected between 2010 and 2021 among 353,463 under-fives children from 32 SSA countries. Our outcome variable was the use of TMP for childhood illnesses (diarrhea or fever/cough or both). We used STATA v14 to conduct meta-analysis and two-level multivariable modeling.

Results: Approximately [2.80% (95%CI: 1.88-3.90)] women who sought healthcare for childhood illnesses utilised the service of a TMP with the highest in Ivory coast [16.3% (95%CI: 13.87-19.06)] followed by Guinea (13.80% (95%CI: 10.74-17.57)) to the lowest in Sierra Leone [0.10%(95%CI:0.01-1.61)]. Women with no formal education [AOR=1.62;95%CI:1.23-2.12], no media access [AOR=1.19;95%CI:1.02-1.39], who lived in a household headed by a man [AOR=1.64;95%CI:1.27-2.11], without health insurance [AOR=2.37;95%CI: 1.53-3.66], who considered it a problem getting permission to visit a health facility [AOR=1.23;95%CI:1.03-1.47] and perceived the size of their children at birth to be above average[AOR=1.20;95%CI:1.03-1.41] had higher odds of using TMP for childhood illness.

Conclusion: Despite the low usage of TMP for childhood illness, our findings highlight that TMPs continue to have a role in managing childhood illness in SSA. It is essential that policymakers and service providers consider the potential role of TMPs in designing, reviewing and implementing child health policies and interventions in SSA. Also, child health policies and interventions should be focused on the characteristics of women who use TMPs for childhood diseases identified in our study.

Acceptance of influenza and Sars-CoV 2 vaccines co-administration in pregnant women according to health action process approach

Patrizia Ferro¹, Luca Mazzeo², Sefora Petta³, Antonio Maiorana⁴, Marianna Maranto⁵, Alessandra Fallucca¹, Alessandra Casuccio¹, Vincenzo Restivo¹

¹University of Palermo Department of Health Promotion, Mother-Child, Internal Medicine and Specialist of Excellence "G. D'Alessandro" (PROMISE) Via del Vespro 133, Palermo 90127 Italy, ²University of Palermo, ³University of Palermo Italy, ⁴Hospital of national importance and highly specialized ARNAS Civico-Di Cristina-Benfratelli of Palermo Italy, ⁵Hospital of national importance and highly specialized ARNAS Civico-Di Cristina-Benfratelli of Palermo

Background and objectives: Infectious diseases contracted during pregnancy, such as influenza and COVID-19, are associated with a greater probability of developing adverse events (perinatal mortality, spontaneous abortions, etc). The Center for Disease Control and other international health authorities recommend co-administration of Influenza and SARS-CoV2 vaccines in pregnant women. In Italy, there is no systematic recording of data on vaccination status for pregnant women. The aim of this study is to assess the acceptance by pregnant women of Influenza and COVID-19 vaccines co-administration.

Methods: A cross-sectional study was carried out on pregnant women at ARNAS Civico-Di Cristina-Benfratelli Hospital of Palermo, by administering a questionnaire based on the Health Action Process Approach model. It was detected difference among women who accept or not vaccine co-administration. Subsequently, it was performed a multivariable logistic analysis for women who accepted co-administration using Stata MP14.2 statistical software.

Results: Overall 120 pregnant women were enrolled in the study. Of them 33.3% (n=40) would receive co-administration during pregnancy. The women predominantly are married and graduated. The main source of information on vaccinations is the gynecologist followed by the family doctor. The multivariable analysis shows the positive expectation on co-administration (reduction of complications for mother and newborn) was associated to a greater vaccine acceptance (aOR 2,07;IC% 1,15-3,73). The higher self-efficacy of women (influence of family context) appeared to be a further factor directly associated to co-administration adherence (aOR 2,63;IC% 1,15-4,56).

Conclusion: The vaccination campaign could focus on the positive expectation of co-administration and on self-efficacy, also involving the people surrounding the pregnant woman. In places of prenatal visits, a figure is needed to improving access to vaccines for pregnant women and train healthcare workers in the mother-child area. Furthermore, a system that records specific data on vaccination coverage of pregnant women is needed to plan future interventions.

Study of the role of oral health status variables in miscarriage events

Immanuel Oktavian¹, Irene Adyatmaka², Adang Bachtiar³

¹Faculty of public health University of Indonesia "Pulo Asem Timur 8 no 5 Jakarta 13220" Indonesia, ²Faculty of dentistry Maranatha University Maranatha university "Pulo asem timur 8 no 5 Jakarta 13220" Indonesia, ³Center for health administration and policy studies

Immanuel Oktavian, Irene Adyatmaka, Adang Bachtiar The Indonesian MOH Ante Natal Care (ANC) guidelines did not included Oral Health status as a factor that plays a negative role during pregnancy and birth. This study aims to what Oral Health (OH) variables and how much it plays a role in the occurrence of Miscarriage. This research method uses secondary data from a Pilot Project of ANC Innovative at 23 locations in West-Kalimantan starting September 2021 it as 1). 254 ANC examination cards, 2). OH examination cards, 3). End of pregnancy report, which recorded 238 births (93.7%), mainly consist of 179 Normal-Births (70.5%), Miscarriages 13 (5.1%). This study focused on the Miscarriage-(M) compared to the Normal Birth-(NB). We will divide 2 groups: 1). M - all variables were compared with NB and a T-Test. Only variables that show significant differences will be assessed as factors that play a role in miscarriage. The results: Tartar in M were 12 persons (92%), NB 132 (74%) RR=1,3. Cavities M 100% compared NB 69%RR=1,5. Purple-Plaques M 100% compared NB 85%RR=1,2. Purple and Blue Plaques M 100% compared NB 89% RR=1,1. Tartar Segments M 4,08 compared NB 3,07 RR=1,3. "Severe Dysbiosis" M 100% compared NB 74% RR=1,3. It was concluded that pregnant woman, related to oral health disorder indicate that the incidence of Miscarriage were higher between 1.1 times (up 10%) to 1.5 times (up 50%). In other words, Bad Oral Health in pregnant women is estimate to have a role of 10% to 50% higher in the incidence of miscarriage.

Factors that provide protection against intimate partner physical violence among married adolescents in Bangladesh

Mizanur Rahman¹, Kanta Jamil², Quamrun Nahar³, Nitai Chakraborty¹, M Haider⁴, Shusmita Khan¹

¹Data for Impact, University of North Carolina at Chapel Hill United States, ²IAP World Services, ³International Centre for Diarrhoeal Disease Research, Bangladesh Bangladesh, ⁴icddr, Bangladesh

Background: Intimate partner physical violence (IPPV), perpetrated by husbands and within adolescence marriage are pervasive in Bangladesh. We examined factors associated with IPPV experienced by married adolescents ages 15–19 and tested four hypotheses: (1) adolescent girls married to relatively older husbands, (2) adolescents living in extended families with parents or parents-in-law, (3) adolescents who are minimally controlled by husbands, and (4) adolescents who have a child after marriage are protective of IPPV.

Methods: We analyzed IPPV data from 1,846 married girls ages 15–19 from a national adolescent survey conducted in 2019–20. IPPV is defined as the respondent having physical violence perpetrated by her husband at least once in the last 12 months. We implemented logistic regression models to test our hypotheses.

Results: Sixteen percent of married adolescent girls experienced IPPV. Girls living with parents-in-law or parents had adjusted odds ratio (AOR) of 0.56($p<0.001$) of IPPV compared to those girls who lived with husband alone. Girls with husbands ages 21–25 years and 26 years or older had AORs of 0.45($p<0.001$) and 0.33($p<0.001$) of IPPV compared to those girls with their husband ages 20 and younger. Married adolescent girls who did not own a mobile phone had an AOR of 1.39($p<0.05$) than girls who had a phone. IPPV risk increases with an increased duration of marriage for those with no living children but not for those with at least one living child; the risk was higher among those who had a child within the first year of marriage than those who had not yet had a child.

Discussion

Strictly adhering to the law that requires men waiting until the age of 21 to marry can reduce married girls' risk of IPPV. Raising girls' legal marriage age can minimize adolescents' IPPV and other health risks associated with adolescent

childbearing.

⁶Direzione Sanitaria - Area Qualità Accredimento e Risk Management

IRCCS Ospedale San Raffaele Direzione Sanitaria - Area Qualità

Accreditamento e Risk Management IRCCS Ospedale San Raffaele Italy

Background and Objective: This study aims to evaluate the use of the Modified Early Obstetric Warning Score (MEOWS) in identifying obstetric patients at risk of infection or sepsis. The study assesses the correct application of the scale and its impact on clinical decision-making a year after its integration into the obstetric unit of San Raffaele Hospital.

Methods: The study was carried out as an internal audit by the Quality and Risk Management Area in July 2022. A 16-item checklist was built to assess 51 randomly selected medical records. The scoring system used in the checklist ranged from 0 to 1 (never to always) to evaluate the records.

Results: Analysis of medical records showed that 43% included a complete evaluation of the parameters, while 33% were almost always complete. Nearly all the records (92%) were accurately completed with date, time of assessment, and reference range. Patients were assigned correctly to clinical deterioration risk classes, with 48 classified as low risk, two as intermediate risk, and one as high risk. In the case of low-risk women, MEOWS was 64% "always" and 28% "almost always" correctly performed every 12/24 hours, as indicated by the scale. Of the 14 low-risk patients who underwent a cesarean section, MEOWS monitoring was "always" performed correctly in 73% of cases and "almost always" performed correctly in 21% of cases every 12 hours until the third day. In patients with complicated cesarean sections, gestational hypertension, infection, PROM, or other pathologies, a proper assessment was performed in 63% of these cases every 4 hours.

Conclusion: Integration of the MEOWS scale resulted in a compliance rate of approximately 76% among the staff, which could be improved through further awareness-raising actions. Results also showed that its use effectively monitors obstetric patients clinical condition, optimizing the diagnostic and therapeutic plan.

Vulnerability to the impact of cyberbullying - the role of big-5 personality traits and gender
Frode Stenseng¹, Silje Skaug¹, Beate Hygen²
¹NTNU Norway, ²NTNU Social Science Norway

A considerable number of studies have focused on the prevalence of cyberbullying, and its associations to e.g. gender and mental health. However, few have investigated individual characteristics that may amplify or attenuate the subjective experience of the impact of cyberbullying, in other words, the vulnerability or resilience related to cybervictimization outcomes. A set of characteristics likely moderating this impact is personality traits, such as extraversion and neuroticism. In the present study, using data from the Early Secure in Trondheim Study, comprising 662 Norwegian 16 year old's, we analyzed data from the Cyber-Bullying and Victimization Experiences Questionnaire, and the Big Five Inventory, as well as descriptive such as gender, BMI, and parental SES. Analyses of this cross-sectional data showed a prevalence of 20% (with once in three months as cut-off), distributed almost equally among boys and girls, and that parental SES was negatively correlated with incidences of cybervictimization. Furthermore, incidences of cybervictimization was only modestly related to less agreeableness, contentiousness, and more neuroticism. However, the subjective perception of the

impact of such victimization was more strongly correlated to particularly more neuroticism. Moderation analyses showed that more neuroticism and gender (being a girl), most strongly explained the subjective experience of negative impact from cyberbullying. The present study adds knowledge beyond the descriptive level of analysis of cyberbullying and shows that the frequency of cyberbullying may diverge from the subjective experience of the negative impact from it, partly dependent upon personality traits and gender.

Background and Objective: Asthma, rhinitis, and eczema are major global health problems in childhood, with widely variable prevalence in Africa. Few studies in Cape Verde are available to inform the development of strategies for primary prevention and clinical management of allergic diseases in children. The aim of this study was to estimate the prevalence of asthma and other allergic diseases symptoms and associated factors, in 6–7 years old schoolchildren on Santiago Island, Cape Verde.

Methods: A cross-sectional study was conducted between April and September 2022, in 6-7 years old children enrolled in 43 randomly selected schools on Santiago Island and their mothers/caregivers were interviewed using International Study of Asthma and Allergies in Childhood-ISAAC questionnaire. We estimated the prevalence of asthma, rhinitis and eczema symptoms and respective 95%CI; we used multivariable logistic regression to identify factors associated with allergic diseases.

Results: The prevalence of lifetime asthma symptoms for the 1045 children was estimated at 24.1%; the current prevalence estimates were 10.5% for asthma, 20.0% for rhinitis and 7.0% for eczema. All allergic symptoms are more prevalent in boys. Among children with current asthma, 59% also had rhinitis and 13.6% eczema. In multivariable analysis, urban area residence emerged as a risk factor for rhinitis and eczema. Being exposed to antibiotics during the first year of life was a risk factor for current asthma and rhinitis, while early-life exposure to cats appeared to protect from asthma.

Conclusion: We identified asthma, rhinitis, and eczema as public health problems in Santiago Island. Higher prevalence was observed in boys and in Praia city. The estimated prevalence of asthma symptoms is consistent with other African countries data. The pinpointed determinants factors must be considered when designing strategies and health policies aimed at improving children's healthcare.

The effect of gestational weight gain on delivery and neonatal characteristics: exploring sex differences in the "MAMI-MED" cohort

Roberta San Lio¹, Martina Barchitta¹, Andrea Maugeri¹, Maria La Rosa¹, Claudia Mastra¹, Giuliana Favara¹, Giuliana Ferrante¹, Fabiola Galvani², Elisa Pappalardo², Carla Ettore², Giuseppe Ettore², Antonella Agodi¹

¹University of Catania Italy, ²Azienda ARNAS Garibaldi Nesima, Catania Italy

Background and Objective: Inadequate gestational weight gain (GWG) affects

maternal-child health. Similarly, sex differences – early evident before birth – influence the risk of adverse outcomes. The present analysis aims to evaluate the effect of GWG on delivery and neonatal characteristics, focusing on the potential role of sex in this relationship.

Methods: We used data from the ongoing "MAMI-MED" birth cohort settled in Catania (Italy). Adequate GWG was defined according to pre-gestational body mass index: 12.5–18 Kg (underweight), 11.5–16 (normal weight), 7–11.5 (overweight), and 5–9 (obese). Information about gestational age at delivery, birth length and weight, and birthweight for gestational age were collected. The latter was defined as small (SGA), adequate (AGA) or large for gestational age (LGA) according to sex-specific national reference charts.

Results: The study included 687 mother-child dyads (median maternal age = 31 years), with a median gestational age at delivery of 39 weeks. Among newborns (49.4% males), 81.1% were AGA, 7.5% SGA, and 11.3% LGA. The proportion of SGA was higher in males than in females (69.2% and 30.8% respectively; $p = 0.007$). Accordingly, the risk of SGA was almost 2.5 times greater in males (OR = 2.470; 95% CI = 1.28 – 4.75; $p = 0.007$). Regarding maternal characteristics, 65.8% mothers reported inadequate GWG (37.6% and 28.2% with reduced or excessive GWG). Birth weight was lower in infants born from mothers with reduced GWG ($p = 0.006$). After sex stratification, the relationship was confirmed in males ($p = 0.009$) and females ($p = 0.013$). There were also differences in gestational age according to GWG ($p = 0.019$), although this finding was confirmed only in the male sex ($p = 0.025$).

Conclusion: Our findings confirmed how GWG may affect delivery and neonatal characteristics, also pointing out possible differences by sex. Further research is needed to deeply understand sex differences and mechanisms underlying pregnancy complications.

Mental health matters in obesity prevention: exploring the dynamic relationships between mental well-being and obesity-related behaviours in adolescents

Anaely Aguiar¹, Anaely Aguiar¹, Eduard Romanenko², Gaironeesa Hendricks³, Anne-Siri Fismen⁴, Emmanuel Nwosu³, Natalie Savona⁵, Janetta Harbron³, Laurence Blanchard⁵, Harry Rutter⁵, Mohammad Jalali⁶, Nanna Lien², Birgit Kopainsky⁷

¹University of Bergen, Norway CO-CREATE project SV-bygget, Lauritz Meltzhus, Fosswinkel gate 6, 5007 Bergen Norway, ²University of Oslo Norway, ³University of Cape Town South Africa, ⁴Norwegian Institute of Public Health Norway, ⁵London School of Hygiene and Tropical Medicine United Kingdom, ⁶Harvard Medical School United States, ⁷University of Bergen, Norway

Background and Objective: Poor mental well-being is a complex public health problem with a high prevalence in adolescents in Europe, especially those with excess weight. For instance, previous studies have reported that adolescents with excess weight have a higher risk of developing depression and anxiety over their lifetime compared to adolescents with a normal weight. As the systemic complexity of mental well-being processes poses challenges in efforts to curb persistent obesity trends, this study seeks to understand the dynamic relationships between complex mental well-being processes, affecting energy-balance-related behaviors, and youth obesity.

Methods: Applying System Dynamics methods, we build a conceptual model which maps the key mental well-being feedback pathways leading to changes in dietary, physical activity, and sleep quality behaviors based on empirical literature synthesis and youth-generated systems maps. We then formalize the conceptual model using the Health Behaviour in School-aged Children (HBSC) data to analyze, through computer simulation, the psychological well-being dynamics resulting from feedback pathways and the impact of potential mental health-based interventions on youth obesity prevalence.

Results: The preliminary results from the simulations show that mental well-being is mainly influenced by social pressures related to an ideal body image, stressors such as school pressure and bullying, and digital device use. The core model structure is defined by three major reinforcing feedback loop structures that involve binge eating, motivation to do physical activity, and sleep quality. Identified leverage points related to coping mechanisms for psychosocial stress and increased motivation to engage in physical activity show promising results, particularly among girls.

Conclusion: These findings reveal that addressing the underlying feedback pathways between young people's weight status and mental well-being is relevant for public health professionals and others working in the field of adolescent health. More model-based studies are needed to investigate further such feedback

mechanisms in country-specific contexts.

Treatment efficacy of vitamin C or ascorbate given as co-intervention with iron for anemia - A systematic review and meta-analysis of experimental studies

Vignesh Loganathan¹, Arivarasan Bharathi², Alyssa Prince¹, Jayalakshmy Ramakrishnan¹

¹Jawaharlal Institute of Postgraduate Medical Education and Research, Puducherry, India Senior Resident, Department of Preventive and Social Medicine India, ²ESI Medical College, KK Nagar, Chennai, India Assistant Professor India

Introduction: Iron deficiency anemia (IDA) is one of the leading causes of anemia, globally. Although there is no evidence, Vitamin C is regarded to enhance iron absorption and is commonly prescribed along with iron for persons with anemia. We conducted this systematic review and meta-analysis to determine the treatment efficacy of experimental studies where vitamin C or ascorbate was given as co-intervention with iron compared to giving only iron among participants with anemia of all ages.

Methodology: A comprehensive strategy was used to search literature from PubMed, Cochrane and Google Scholar. Experimental studies conducted among participants with lab-confirmed anemia at baseline, with "ascorbic acid or vitamin C given as co-intervention with iron" as intervention and "only iron" as comparator, and reported the outcomes hemoglobin or ferritin, were selected. Random-effects model was used to estimate standardized mean differences or odds ratio of outcomes and sensitivity analyses were done. Sub-group and meta-regression analyses were conducted to evaluate the reasons for heterogeneity. (PROSPERO number: CRD42022306612)

Results: Of the total nine studies included in the review, seven studies with 905 participants were included for meta-analysis. The pooled estimate for Standardized mean difference (SMD) of hemoglobin (g/dL) and Serum Ferritin (mcg/L) for intervention type ferrous ascorbate were 0.44 (95% C.I.: -0.30, 1.26) and 0.03 (95% C.I.: -0.68, 0.73) respectively, and were not statistically significant. The pooled estimate for SMD of hemoglobin (g/dL) and Serum Ferritin (mcg/L) for intervention type 'iron and vitamin C' were 0.11 (95% C.I.: -0.05, 0.28) and -0.90 (95% C.I.: -1.09, -0.72) respectively, and were not statistically significant.

Conclusion: The SMD of hemoglobin or serum ferritin between the intervention group were not significantly favouring the intervention, when the intervention group was ferrous ascorbate or iron and vitamin C, and the quality of evidence of these effect measures were low.

Preeclampsia and eclampsia-specific maternal mortality in Bangladesh: Levels, trends, timing, and care-seeking practices

Shusmita Khan¹, Abu Siddique², Ahmed Rahman², Sabrina Jabeen², Anika Hossain², M Haider², Fatema Zohora², Md. Rahman², Shams Arifeen², Kanta Jamil³

¹Data for Impact, University of North Carolina at Chapel Hill United States, ²icddr, Bangladesh, ³IAP World Services United States

Background: Despite improvements in many health indicators, maternal mortality has plateaued in Bangladesh. In 2010, the ratio of cause-specific deaths due to preeclampsia/eclampsia decreased compared with 2001; however, in 2016, it stagnated. Achieving the global target of reductions in maternal mortality and the associated Sustainable Development Goals will not be possible without actions to prevent deaths due to preeclampsia/eclampsia. In this paper, we examined the levels, trends, specific causes, timing, place, and care-seeking behaviours of women who died due to these two causes.

Methods: We used nationally representative Bangladesh Maternal Mortality and Health Care Surveys (BMMS) conducted in 2001, 2010, and 2016 to examine levels and trends of deaths due to preeclampsia/eclampsia. The analysis of specific causes, timing, and place of preeclampsia/eclampsia deaths, and care-seeking before the deaths was based on 41 such deaths captured in the 2016 survey. We used thematic content analysis of the open history from the 2016 survey verbal autopsy (VA) questionnaire to highlight stories that put faces to the numbers.

Findings

The preeclampsia/eclampsia-specific mortality ratio decreased from 77 per 100,000 live births in the 2001 BMMS to 40 per 100,000 live births in the 2010 BMMS. The decline reached an apparent stalling in the 2016 BMMS, with preeclampsia/eclampsia-specific deaths of 46 per 100,000 live births. Although preeclampsia/eclampsia accounted for around one-fifth of all maternal deaths in

the 2010 BMMS, in the 2016 BMMS, the percentage contribution reached the 2001 BMMS level of 24%. All deceased women left their homes to care-seek; however, the majority had to visit more than one facility before they died.

Conclusions: Awareness of maternal complications, proper care seeking, and healthy reproductive practices, like family planning to space and limit pregnancy through client supportive counselling, may provide benefits. Improving regular and emergency maternal services readiness is essential.

Impact of poverty and adversity on perceived family support in adolescence: findings from the UK millennium cohort study

Nicholas Adjei¹, Kenisha Jonsson², Viviane Straatmann³, Gabriella Melis¹, Ruth McGovern⁴, Eileen Kaner⁵, Ingrid Wolfe⁶, David Taylor-Robinson¹

¹Department of Public Health, Policy and Systems, University of Liverpool, Liverpool-United Kingdom United Kingdom, ²School of Public Health and Community Medicine, Institute of Medicine, Gothenburg University, Göteborg, Sweden, ³Department of Public Health Sciences, Stockholm University, Stockholm-Sweden Sweden, ⁴Population Health Sciences Institute, Newcastle University, Newcastle-United Kingdom, ⁵Population Health Sciences Institute, Newcastle University, Newcastle-United Kingdom United Kingdom, ⁶Department of Women and Children's Health, King's College London, London-United Kingdom United Kingdom

Background: Emotional support from family members may have an important effect on adolescent health outcomes, and has been identified as a target for policy to protect against the impacts of poverty and adversity. However, few studies have assessed the extent to which poverty and adversity themselves influence the nature of emotional support that parents can provide to adolescents. We therefore aimed to investigate the impact of trajectories of income poverty and family adversities on young people's relationships with their families and perceived emotional support received.

Methods: We analysed longitudinal data on 10976 children from the nationally representative UK Millennium Cohort Study. Exposure trajectories of poverty and family adversities were characterised using group-based multi-trajectory models. The outcomes were perceived emotional support and quality of family relationships, measured by the three-item Short Social Provisions Scale (SPS-3) and levels of parent-adolescent closeness and conflict, measured at age 14. ORs and 95% CIs were estimated using multivariable logistic regressions.

Findings: At age 14 the overall prevalence of low perceived emotional support was 13%. Children of mothers with lower socioeconomic status (SES) were more likely to report low emotional support, with a clear social gradient. Compared with children exposed to low levels of poverty and adversity, children in the persistent adversity trajectory groups experienced higher odds of low emotional support and low-quality parent-adolescent relationship; those exposed to both persistent poverty and poor parental mental health were particularly at increased risk of experiencing poor family relationships and low perceived emotional support (aOR 2.2; 95% CI 1.7–2.9).

Conclusions: Low perceived emotional support and poor family relationships in adolescence are more prevalent among socially disadvantaged children and adolescents and those experiencing social adversity. Policies to improve levels of family support for UK adolescents should focus on improving modifiable determinants such as child poverty and family mental health.

Implementation of a new hadrontherapy pediatric pathway: results from CNAO (National Centre for Oncological Hadrontherapy), Italy

Riccardo Calsolaro¹, Viviana Mutti², Arianna Serra², Alexandra Ferent², Viviana Magni², Giacomo Vigezzi¹, Silvia Meneghello², Anna Odone¹, Sandro Rossi²

¹Università degli Studi di Pavia Department of Public Health, Experimental and Forensic Medicine Italy, ²CNAO Foundation Italy

Background and Objectives: The National Centre for Oncological Hadrontherapy (CNAO) in Pavia, an innovative and technologically state-of-the-art facility, is one of the 6 centres in the world treating patients with solid inoperable radioresistant tumours using protons and carbon ions (hadrons) since 2011. Following hadrontherapy inclusion within the National Health Service in 2017, patients treated progressively increased. Recently, CNAO adopted a new care pathway for pediatric patients from Italy and other countries.

Methods: We analysed administrative anonymised data of patients treated between 2017 and November 2022, considering patients' age group and treatment duration. We collected qualitative data on the implementation of the pediatric

pathway, whose team includes radiation oncologists, radiologists, anaesthetists, nurses, radiographers, biomedical engineers and psychologists. Specific patient-centred interventions have been developed to improve care humanisation and compliance by patients and their families.

Results: Out of 2,621 patients treated between 2017 and 2021, 54 (2.1%) were children, while in 2022, this share has risen to 7.8% (35 children out of 451 patients). Mean age was 12 years (range 2-17), and mean treatment course duration was 42 days (range 21-57), which was significantly higher than for adults because of disease and patient characteristics (tumour types and need for sedation). In 2022 there were no treatment interruptions among children, whose compliance was improved with a range of initiatives (dedicated pediatric recovery room, customised radiotherapy masks and children-targeted communication program, including books, cartoons and gadgets).

Conclusions: CNAO has progressively improved competencies in treating pediatric patients in terms of scientific knowledge, staff expertise and organisation, thus increasing treatments number per year and emerging as a point of reference in the pediatric network. The implementation of a targeted care pathway with a dedicated multidisciplinary team allowed for the improvement of care quality and patients' compliance in a referral centre at the national and international levels.

Pilot experience of comprehensive sexuality education among Italian adolescents: Results from the eduforist project

Alice Chinelli¹, Domenico Martinelli², Eleonora Torri¹, Rosario Galipò³, Paolo Meli⁴, Antonella Camposcragna⁵, Laura Rancilio⁶, Massimo Farinella⁷, Ludovica Colaprico⁸, Sabrina Bellini⁹, Maria Salfa¹⁰, Marco Ubbiali¹¹, Barbara Suligoi¹⁰, Anna Palamara¹², Lara Tavoschi¹

¹University of Pisa Italy, ²University of Foggia, ³ANLAIDS - National Association for the Fight against AIDS Italy, ⁴CICA - Italian Coordination of HIV/AIDS Housing Homes, ⁵CNCA - National Coordination of the Hospitality Community Italy, ⁶Caritas Ambrosiana Italy, ⁷Circolo di cultura omosessuale Mario Mieli Italy, ⁸Italian Red Cross Italy, ⁹LILA-Italian League for the fight against AIDS Italy, ¹⁰Italian National Institute of Health Italy, ¹¹University of Verona Italy, ¹²Italian National Institute of Health, La Sapienza University of Rome Italy

Background and Objective: Comprehensive sexuality education (CSE) is an integrated approach to sexual health and wellbeing promotion, internationally recognised to be highly effective in preventing HIV and sexually transmitted infections (STIs), especially when experienced in school contexts. CSE, however, is not included in Italian school curricula. This study describes the results of a pilot CSE experience among Italian adolescents attending lower secondary schools of 4 Regions within the EduForIST project, funded by the Italian Ministry of Health.

Methods: The pilot experience consists of 5 modules of 2 hours conducted per classroom. Modules have been developed by a research team of pedagogists, academics, HIV/AIDS civil-society organisations (CSOs), experts and educators from CSOs that lead the activities in the schools. The modules address the domains: A) changes in adolescence, B) emotions and relationships, C) sexual identities and diversity, D) consent, STIs/pregnancy prevention, sexual health services. The last module is dedicated to evaluation of activities, by using standardised pre/post tests and satisfaction questionnaires.

Results: The pre/post-test results referred to 35 classrooms of 11 schools (566 students). Pre/post analysis showed a significance increase of correct answers for 11/15 items investigated. Domain C and D reported the major positive increase, while a higher level of uncertainty regarded domain A and B. The students reported to be overall satisfied by the activity, especially when talking about psychological changes in adolescence and STIs' symptoms and prevention. They reported higher neutrality regarding the methods, i.e. use of innovative technological tools, and group-work.

Conclusions: Pre/post-tests analysis suggested that the pilot activity was effective in providing students with correct information, enhancing knowledge and decreasing uncertainty.

Evidence collected through this study and its advancements (increasing the geographical area of implementation and school grades) will foster awareness among policy makers on the value and urgency of introducing CSE in Italian school curricula.

Parenting stress: socio-economic determinants before and during the covid-19 pandemic. results of an Italian cross-sectional study

Marco Fasano¹, Lorenzo Iughetti², Lucia Palandri³, Lisa Pasquale¹, Eleonora

Ferrari¹, Viola Trevisani¹, Erica Passini¹, Laura Lucaccioni¹, Elena Righi¹

¹Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, ²Pediatric Unit, Maternal-Infantile Department, University Hospital, Department of Medical and Surgical Sciences for Mothers, Children and Adults, University of Modena and Reggio Emilia, Modena, Italy, ³Clinical and Experimental Medicine PhD Program, University of Modena and Reggio Emilia, Modena, Italy Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy

Background and objective: Parenting can be a stressful experience and in the context of a pandemic it can represent a challenge for many families. The aim of this study was to investigate socio-demographic factors related to parenting stress before and after the SARS-CoV-2 outbreak in Italian parents living in Modena (Italy).

Methods: From September 2019 to May 2021, 80 parents of 6 months healthy children were enrolled in a prospective cohort study at the local University Hospital and filled in the Parenting Stress Index Short Form (PSI-SF), a validated questionnaire measuring parenting stress, well-known in clinical practice for its reliability and simplicity of use. PSI scores over the 90th percentile of the Italian population distribution were considered indicative of a highly stressful condition. The role played by different socio-demographic factors in increasing PSI score was tested by chi-square test in the whole sample and by stratifying parents according to the evaluation time (PRE-COVID and COVID period).

Results: Overall, 11% of parents reported high stress scores and prevalence was higher during lockdown (15% vs 6%). In the COVID group, higher scores were observed in younger mothers (17%), higher educated parents (16% and 23% of mothers and fathers respectively), having only one child (18%) and living in the urban environment (23%), regardless of infant's gender. In the PRE-COVID group higher stress scores were reported mainly by parents with more than one child (10%), with male children (9%), and by mothers with lower education (8%). Nevertheless, differences were often not statistically significant.

Conclusion: Different socio-demographic factors appear to be related to higher parenting stress and our results suggest that they could show inverse trends in different conditions. Parenting stress in difficult circumstances must be addressed carefully and promptly and specific public health interventions for families with special needs must be planned and implemented.

Educational outcomes of children hospitalised for head injury: a population based cohort study utilising record linkage of 766,244 Scottish schoolchildren

Michael Fleming¹, Meghan Visnick¹, Jill Pell², Daniel Mackay¹, David Clark³, Albert King⁴, Michael Fleming¹

¹University of Glasgow Dr University Of Glasgow 1 Lilybank Gardens United Kingdom, ²University of Glasgow, ³Public Health Scotland United Kingdom, ⁴Scottish Government

Background: Childhood traumatic brain injury (TBI) is a leading cause of death and disability in young children and adolescents. Although there have been numerous studies to evaluate the impact of childhood head injury on educational outcomes, few large-scale studies have been conducted, and previous research has been limited by issues of attrition, methodological inconsistencies, and selection bias. We aim to investigate educational outcomes among Scottish schoolchildren previously admitted to hospital for head injury compared to peers.

Methods: A population-based retrospective cohort study was undertaken, employing secondary data analysis of routinely collected health and educational data to evaluate the relationship between hospitalisation for head injury and educational outcomes of children who attended Scottish schools between 2009 and 2013. Outcomes included special educational need, attainment in examinations, school leaver destination, absenteeism, and exclusion from school for poor behaviour. Analyses were adjusted for sociodemographic and maternity confounders.

Results: Previous hospitalisation for head injury was associated with increased odds of special educational need (OR 1.28, CI 1.18, 1.39, P<.001) and low educational attainment (OR 1.30, CI 1.11, 1.51, P<.001), as well as increased risk of absenteeism (IRR 1.09, CI 1.06, 1.12, P<.001) and exclusion (IRR 1.33, CI 1.15, 1.55, P<.001) from school. The relationship between previous head injury hospitalisation and adjusted odds of NEET (not in education, employment, or training) at 6 months after leaving school was not found to be significant (OR 1.03, CI 0.92, 1.16, P = 0.61). After narrowing the exposure definition to exclude hospitalisation attributed to concussion, the magnitude of all significant associations increased.

Conclusion: Results from this cohort study have implications for future public health measures and further research in the field of childhood traumatic brain injury. Strategies should be developed to reduce the burden associated with childhood head injury on affected children, their families, peers, educators, and communities.

Effectiveness of an exclusive breastfeeding promotion strategy adopting the trans-theoretical model: a clinical study conducted at the clinical birth unit

Vincenzo Restivo¹, Vincenzo Restivo¹, Sabina Paolizzo², Salvatore Pipitone³, Antonio Maiorana⁴, Marianna Maranto⁵, Maria Antonietta⁶, Bruna Gabriele³, Mario Giuffrè³, Alessandra Fallucca³, Francesco Vitale³, Alessandra Casuccio³, Palermo Breastfeeding Group³

¹University of Palermo Via del Vespro 133, Palermo 90127 Italy, ²University of Palermo, ³University of Palermo Italy, ⁴ARNAS Civico Italy, ⁵ARNAS Ospedali Civico-Di Cristina-Benfratelli, ⁶Coppola ARNAS Ospedali Civico-Di Cristina-Benfratelli Italy

Background and objective: Breastfeeding is the gold standard in infant nutrition. There are numerous physical and psychosocial benefits from breastfeeding for both mother and child and it is strongly recommended as an exclusive source of nutrition for the first six months of life. The low prevalence and the short duration of breastfeeding, reported in scientific literature, highlight the need for further investigations that could lead to new intervention strategies. The aim of this study is to evaluate the effectiveness of a breastfeeding promotion intervention conducted in hospital after the birth.

Methods: The study is taking place at birth clinic of two hospitals in Palermo, where mothers are recruited after giving birth. The control group is provided with basic information on breastfeeding, while the intervention group is offered the active support of an informative "desk" specifically dedicated to breastfeeding counselling. Furthermore, the factors associated with breastfeeding and the different phases of the behavioural change, linked to adoption of this practice, are investigated exploring the "Trans Theoretical Model".

Results: The study is ongoing and 114 mothers have been recruited to date. Of them, 47% (n=54) of women choose to give their child exclusively breast milk, while about 38% (n=43) are in a "contemplation" stage of adopting the practice. Statistical analyses show the factors that positively influence the decision to breastfeed were: support during pregnancy by a private gynaecologist (OR=4.4, p=0.021), adequate information on the importance of breastfeeding (OR=1.85, p=0.013), rooming-in with the new-born in hospital (OR=3.1, p=0.038).

Conclusions: The study contemplate monitoring adherence to breastfeeding in the intervention arm in the six months following recruitment. The comparison with the control arm will allow to evaluate the effectiveness of this mother-child health strategy. Furthermore, the identification of influencing factors could lead to more appropriate management of breastfeeding promotion.

Factors associated with vaccination coverage: population-based survey in Vitória-ES, Brazil

Ethel Maciel¹, João Cola², Laylla Macedo³, Mariana da Silva Araújo³, Thiago Prado¹, Tatiane Comerio¹, Adriana Ilha⁴, Jose Moraes¹, Ethel Maciel⁵

¹Universidade Federal do Espírito Santo Brazil, ²Universidade Federal Do Espírito Santo Av. João XXII 1003 Brazil, ³Universidade Federal Fluminense Brazil, ⁴Universidade Federal Do Espírito Santo Brazil, ⁵Faculdade de Ciências Médicas da Santa Casa de São Paulo Brazil

Background: One of the main disease prevention measures is immunization. In recent years, Brazil has recorded significant declines in the populations vaccination coverage. The was to estimate the prevalence of immunization coverage and analyze the factors associated with complete immunization coverage.

Methods: cross-sectional, population-based survey study with cluster sampling carried out in the city of Vitória, Espírito Santo, Brazil, between December 16, 2020 and January 4, 2021. The study population was the cohort of live births from 2017 and 2018. An interview and analysis of the child's vaccination card was carried out. The prevalence (P) of the complete vaccination schedule and for each vaccine was estimated. To verify the association of independent variables with vaccination coverage, logistic regression was used. Results were expressed as odds ratio (OR) and 95% confidence interval (95%CI).

Results: 792 vaccination cards were evaluated. Complete vaccination coverage was 51.47% (95%CI 46.05-56.85). The pentavalent and pneumococcal vaccines (P 88.80%CI95% 46.05-56.85) showed the highest prevalence of children immunized

with the first dose. The lowest prevalence was the first poliomyelitis booster (P 63.20%CI95% 55.70-70.10) of immunized individuals. Using the private service to carry out the immunization (OR 0.32 CI95% CI 0.15-0.68), and being the fourth child (OR 0.13 CI95% CI 0.02-0.71) had the lowest chance of have complete immunization coverage.

Conclusion: We identified low vaccination coverage. Using a private health service and the child's birth order was associated with a lower chance of having full vaccination coverage. The need for innovative strategies to increase childhood immunization coverage.

Effects of health education on spousal knowledge and participation in birth preparedness and institutional delivery care in Farafenni Regional Hospital, The Gambia

Haddy Bah¹, Haddy Bah¹, Florence Adeyemo²

¹University of The Gambia Department of nursing and reproductive health University of The Gambia, MDI Road Kanifing, P.O.Box 3530, Serekunda, The Gambia School of Medicine and Allied Health Sciences, University of The Gambia, P.O. Box, 1646, Gambia Gambia, ²University of Benin

Background: The purpose of this study was to design and measure the effects of antenatal health education on spousal participation in birth preparedness and institutional delivery in Farafenni and satellite villages.

Methods: The study used a quasi-experimental design, and the participants were 300 spouses of pregnant women attending their antenatal care booking at Farafenni Hospital who were equally distributed to the intervention and comparison groups. Pre-test data were collected from both groups. Thereafter, the intervention group was exposed to two health education sessions. The post-test data were collected immediately prior to the discharge of the participants' wives after institutional delivery. IBM SPSS version 21 software was used to analyze the data, and Chi-square, t-test, ANCOVA, and hierarchical linear regression were used to verify the association between the independent and dependent variables.

Findings: After controlling for the demographic variables, the health education administered to the intervention group effectively increased knowledge of birth preparedness among them (F (1, 255) = 376.108, p < .001). Furthermore, the participants in the intervention group had a higher mean score (M = 4.4; SD = 0.8) on participation in birth preparedness than those in the comparison group (M = 0.9; SD = 0.8). The spouses in the intervention group were four times more likely to be prepared for the delivery of their wives after being exposed to health education than those in the comparison group (F (1, 255) = 522.414, p < .001). The spouses in the intervention group also participated more in institutional delivery care of their wives than those in the comparison group (F (1, 255) = 49.398, p < .001).

Conclusion: The study provided evidence that educating men on maternal health care can improve their level of participation in birth preparedness and institutional delivery.

Lessons from health camp model in somalia: ensuring equity and accessibility in child immunization

Mohamed Hussein¹, Meftuh Omer¹, Salad Ahmed¹, Mohamed Hussein Omar¹, Asma Ali², Rashed Shah³

¹Save the Children International - Somalia "Save the Children International Somalia Country Office 1st August, Gen. Nuur Salaad Rd, Garowe - PL, Somalia" Somalia Somalia, ²Bill & Melinda Gates Foundation "Bill & Melinda Gates Foundation Senior Program Officer London, United Kingdom United Kingdom", ³Save the Children "899 N. Capitol Street NE Washington DC USA" United States

Somali Demographic and Health Survey (SDHS 2020) showed 60% of children received no vaccinations at all and just 11% of children were fully immunized. This sufficiently depicted Somalia as one of the most difficult places having inequitable health service delivery, following decades of conflict and political instability, coupled with limited capacity and infrastructure. Population living in inaccessible areas controlled by non-state actors with minimal or no humanitarian agencies in operation, have greater needs compared to those in fairly accessible or government-controlled areas.

Save the Children in Somalia, together with other partners, co-designed health camps to offer integrated essential health and nutrition services, including immunization for population living in selected districts within these extremely underserved areas. At least 28,573 zero dose/missed children aged 0-23 months were identified within targeted communities, with dire need to receive life-saving primary health care services.

Initially, this 'Health Camp' model was piloted in 11 inaccessible villages in Kismayo and Afmadow districts between Sept and Oct 2022, and served as week-long 'integrated mobile outreach services' every month. Local NGO staff and community volunteers were trained to effectively deliver primary health care services and engaged to identify existing health facilities in their locations for revival. A total of 3,166 under 5 children (1,532 boys; 1,634 girls) received lifesaving health services and 608 under 23-months children received Penta-1 of which 55% of them were identified as zero dose children (above 6 months age but never received Penta 1 before). This health camp model appears as an effective and preferred (by community) approach to reach more zero-dose children and to interrupt the cycle of transmission of vaccine preventable diseases.

Adolescents, sexuality and pornographic content in digital environments

Marcia Stengel¹, Simone Peres², Pablo Gómez³

¹Pontifícia Universidade Católica de Minas Gerais "Rua Donato da Fonseca 658 apto. 202" Brazil, ²Universidade Federal do Rio de Janeiro, ³Universidad de la República Uruguay

This paper discusses the access to pornographic content by adolescents in virtual environments and its repercussions for their affective-sexual lives. It explores contemporary configurations of sexuality, such as affective and sexual initiation, sexual experimentation and consolidation of the construction of the self and sexual identities during this process. The theme of pornography is thought from the crossing that access to virtual environments has today in the lives of adolescents. The study of the access to virtual environments related to sexuality brings relevant contributions to the field of knowledge about adolescents and to the health field, pointing out new elements for the analysis of the constitution of these subjects. The analysis of this access is fundamental to the understanding of the changes linked to the modes of interaction of adolescents among themselves and of the changes related to sexuality, affective life and sexual life. This work is based on a systematic review that advocates primary studies on sexuality and adolescence available in various databases; retrospective interviews conducted with young people between 18 and 24 years, both sexes, from two Brazilian cities, about the retrospective trajectory of amorous and sexual initiation, which occurred during adolescence until the current moment of trajectories, which includes affective and sexual life with a focus on the theme of pornography; and analysis of data from a representative survey of Uruguayan high school students, which correlates pornography use with indicators of sexual risk and socialization. The data point to the common use of online pornography among adolescents and the impact on their affective and sexual lives. These impacts range from the search for certain sexual practices; the discourse of pornography addiction and the harm it brings; recognition of violence in online pornography. It is necessary to think about these effects of online pornography, promoting affective-sexual education for adolescents.

Emergency department admissions for non-suicidal self-injurious behaviors in adolescents in Italy: Eleven-year retrospective cross-sectional study and geographical risk evaluation

Giovanni Paladini¹, Carlo Mamo², Gianmarco Giacomini¹, Roberta Onorati², Alberto Borraccino¹

¹University of Turin Department of Public Health and Pediatrics, University of Turin Italy, ²Local Health Board T03 Piedmont Regional Public Health Observatory, Epidemiology Unit Italy

Background and Objectives: Self-injurious thoughts and behaviors (sibt) can be divided in suicidal and non-suicidal self-injuries (nssis). In Italy, there is a lack of longitudinal epidemiological data on trends in admissions of adolescents to eds for nssis. This study aims to describe the frequency and reason of access to ed among the population between the ages of 10 and 19 years in piedmont, and to identify risk groups by age and geographical areas.

Methods: A retrospective cross-sectional study was conducted on medical records (gathered from the ministerial database of health information) of patients aged between 10 and 19 years, accessing eds in the piedmont region. All eds' accesses from january 2011-september 2021 were included, all potential nssis (at triage and through icd9 codes) were selected. Gender and age proportion of eds' hospitalization due to nssi was calculated for 100 thousand accesses each year, and overall methods, severity and geographical risk were described.

Results: A total of 1,414,096 ed visits were analyzed, with an nssi ratio of 46.8 cases per 100.000 ed admissions. The overall ratio from 2011 to 2021 increased

from 42.6 to 66.9 with a 57% increase. Nssi were more frequent in girls, with a significantly higher risk of admission (or=1.18; 95%ci 1.01-1.38), except in 2013 and 2015. The 15-19 years old compared with 10-14 years old, showed a greater odds ratio of 1.44 (1.15-1.80). The analysis carried out on urban vs peri-urban vs suburban areas showed gradually increasing adjusted risk: 1 vs 1.26 (0.97-1.64) vs 2.19 (1.62-2.97).

Conclusion: Nssis represent a public health issue and deserves specific attention due to the dramatic increase registered in the last seven years. The nssis cases which require ed access are the most severe cases, the remaining mild or moderate portion of this phenomenon is likely to be underestimated by 10-20 times.

Dyslipidemia risks and severity of obesity among adolescents in united arab emirates

Syed Shah¹, Nauman Javaid¹

¹Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, UAE Institute of Public Health, College of Medicine and Health Sciences, UAE University 90 Zayn St, Falaj Hazza, Al Ain, Abu Dhabi United Arab Emirates

Background and Objectives: The prevalence of obesity among children and adolescent has increased in UAE. Few data were available about the burden of dyslipidemia and its association with the severity of obesity.

Methods Emirates

We performed a cross-sectional analysis of data in a random sample (1186) of 111 public and private schools in Al Ain, UAE. Body mass index ≥ 95 percentile for age and gender by the 2000 Centers for diseases control and prevention indicated obesity among the study participants. Fasting serum total cholesterol (TC), high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C) and triglycerides (TG) were measured. We used standard cutoff values of ≥ 200 mg/dL for TC, ≥ 130 mg/dL for LDL-C, ≥ 130 mg/dL for TG to indicate elevated levels, and < 40 mg/dL for low HDL-C. We used multivariable logistic regression analysis to identify correlation between obesity and dyslipidemia after controlling for age and gender.

Results: Overall, 7.7% of participants (95% CI 6.3-9.3) had elevated TC, 10.4% (95% CI 8.7-12.2) LDL-C, 5.8% (95% CI 4.6-7.3) TG and 49.9% (95% CI 47.1-52.8) had low HDL-C dyslipidemia. After controlling for age and gender, Increase in obesity was significantly associated with increased prevalence of TC, LDL-C, TG, and low HDL dyslipidemia.

Conclusion: A significant proportion of Emirati adolescents had dyslipidemia. These findings suggest the critical need for comprehensive intervention strategies to control obesity to decrease dyslipidemia and premature mortality.

Qualitative evaluation of the national strategy for obstetric fistulas in mozambique 2012 to 2020

Maria Cambe¹

¹National Insitute of Health National Insitute of Health Vila de Marracuene, parcela 342 Mozambique

Objective: To explore the perception and knowledge related to FO by community and health providers in Maputo, Zambezia, and Nampula provinces.

Method: The qualitative approach consisted of in-depth interviews with 28 women survivors of FO; 21 health care providers; and 12 Community Leaders. All interviews were annotated, transcribed and analyzed using the content analysis technique.

Results: The problem of FO is associated with early marriages, and deliveries outside the US. Almost all FO survivors live far from US (minimum of 15 KM), people talk little about FO and look at the disease as taboo. There is little awareness, little dissemination, there is a need to improve access routes to peripheral US, as well as increase the quantity and quality of Human Resources (HR).

Conclusion: Discrimination directly affects women with FO and their full participation in society; Create an FO management committee to improve follow-up and monitoring of survivors; Strengthen psychosocial support, since most survivors feel depressed

Influence of the socioeconomic position (sep) of men on child health outcomes in Nigerian households

Abraham Idokoko¹, Salim Adib²

¹American University of Beirut (AUB) Epidemiology and Population Health Department, Faculty of Health Sciences, AUB Van Dyck Building, Bliss Street,

Riad El Sohl, Beirut Lebanon, ²American University of Beirut (AUB)

Background and Objective: Maternal factors that influence child health outcomes have been extensively studied worldwide and within the Nigerian context. However, there is seemingly little research about the role of paternal factors, knowing that men are culturally situated to influence health-related decision-making in a typical Nigerian household. Therefore, we conjectured that the inequality and stagnated improvement in the child health indices of Nigeria may be partially attributable to unexplored male-specific factors. Hence, this study examined child mortality variations across socio-cultural contexts in Nigeria and explored the determining effect of the socioeconomic position (SEP) of men.

Methods: Randomly sampled, nationally representative data from 14,000 households, collected between August and December 2018 in the context of the periodic Demographic and Health Survey (DHS) were analysed. A normalized SEP variable suited to the context and research question was generated as a composite index of the weighted measures of the respondent's age, education, occupation, employment status and household wealth-index quintile. Bivariate analyses and multiple regression models of the hazard of child mortality associated with the dichotomized SEP status were conducted.

Results: Of the 13,311 eligible men aged 15-59 years, preliminary findings showed a child under 5-years old was 43 times more likely to die when a man heads the household compared to when a woman did. The crude propensity of an under-five child death was 1.67 times higher in households with men of high SEP compared with those with low SEP.

Conclusion: Findings reveal a significant predictive power of men's SEP on child mortality in Nigeria and underscore the need to explore socio-cultural factors associated with men in household health outcomes analysis, as this will improve the overall understanding of the influence of men on the well-being of their families in culturally diverse settings.

Evaluation of the implementation fidelity of a project introducing a health innovation in West Africa

Sarah Louart¹, Habibata Balde², Abdourahmane Coulibaly³, Elhadji Dagobi⁴, Kadidiatou Kadio⁵, Gildas Hedible⁶, Valérie Leroy⁶, Valéry Ridde⁷

¹ALIMA; University of Lille Senegal, ²University of Conakry; African Center of Excellence for Prevention and Control of Communicable Diseases, ³Faculté de médecine et d'odontostomatologie (Mali), IRL3981 Environnement, santé, société Ucad Dakar, Usttb Bamako, Cnst Ouagadougou, CNRS France Mali, ⁴Université Abdou Moumouni de Niamey Niger, ⁵Institut de Recherche en Sciences de la Santé du Centre National de la Recherche Scientifique et Technologique (IRSS/CNRST) de Ouagadougou (Burkina Faso), ⁶CERPOP UMR1295 Inserm - University of Toulouse 3 France, ⁷Institut de Santé et Développement, Université Cheikh Anta Diop Senegal

Background and objective: The AIRE project aims to improve the detection of respiratory distress in children under five years of age by introducing the routine use of pulse oximeters (POs) during consultations in primary health centers (PHCs) in four countries (Burkina Faso, Guinea, Mali, Niger). A wide range of activities (training of health workers, distribution of essential drugs, supervision visits, etc.) were also carried out. Assessing whether the activities planned by the project were actually implemented and for as long and as often as planned is very important in order to link intervention activities to results; and to analyze implementation challenges in the field.

Methods: Our research used the Carroll et al. (2007) and Perez et al. (2016) framework for analysing fidelity and adaptation to implementation. We identified the core activities planned for this project both through a review of the AIRE project documentation and by interviewing the operational teams. We then interviewed the actors involved in the project in 16 PHCs (health workers, heads of centers, etc.) to learn about the actual implementation of the activities.

Results: In all countries, essential activities such as the training of agents and the distribution of POs have been carried out, but have sometimes been modified compared to what was planned. We note that the implementation of some activities varies between countries. For example, in Guinea and Burkina Faso, visits to supervise the use of the PO were made more often than planned, while in Mali visits were less frequent in some centers due to safety issues. In one country, technical support to the PHCs on drug management could not be carried out due to difficulties in recruiting a logistician.

Conclusion: Differences in implementation fidelity between countries and between health centers may help explain variations in project outcomes.

Let's move europe: school based promotion of healthy lifestyles to prevent obesity - EUMOVE project

Giulia Longo¹, Andrea Cecilian², Giorgia Zanutto³, Giulia Longo⁴, Alice Masini³, Sofia Marini², Giorgia Soldà³, Aurelia Salussolia³, Alessandra Anastasia³, David Oliva⁵, Laura Dallolio³

¹Alma Mater Studiorum Università di Bologna Italy, ²Alma Mater Studiorum Università di Bologna Department for Life Quality Studies, University of Bologna, Rimini, Italy, ³Alma Mater Studiorum Università di Bologna Department of Biomedical and Neuromotor Sciences, University of Bologna, Bologna Italy, ⁴Alma Mater Studiorum Università di Bologna 1. Department of Biomedical and Neuromotor Sciences, University of Bologna, Bologna Italy, ⁵Universidad de Extremadura Departamento de Didáctica de la Expresión Musical, Plástica y Corporal, Grupo Análisis Comportamental de la Actividad Física y el Deporte (ACAFYDE), Facultad de Formación del Profesorado, Universidad de Extremadura, Cáceres (Spain) Spain

Background and objective: The prevalence of overweight and obesity in childhood and adolescence is one of the most significant health issues of the 21st century. To prevent associated diseases, healthy habits should be promoted. EUMOVE is an Erasmus+ Project aimed at implementing a comprehensive set of strategies and evidence-based resources to enable the educational community to promote healthy lifestyles among children and adolescents from 8 to 16 years old.

Methods: The current project is based on two theoretical frameworks: the Behaviour Change Wheel (BCW; Michie, van Stralen, and West, 2011) and the Creating Active Schools Framework (Daly-smith et al., 2020). EUMOVE Project is focused on seven functions to enable those interventions to occur: education, persuasion, enablement, training, modelling, restrictions, and environmental restructuring.

Results: All the countries involved in the project are responsible for comprehensive evidence-based educational resources consisting of: EUMOVE smartphone APP, Physically Active Lessons toolkit, Real-Time active breaks platform, Learning Units about healthy lifestyle, Active School Commuting toolkit, Parent Toolkit about promoting healthy lifestyles and School Leader toolkit. In December 2022 EUMOVE website and EUMOVE APP were launched on the internet. The University of Bologna created several Learning Units (LUs) about healthy lifestyles. The LUs are divided into three main categories: 12 LUs related to healthy nutrition, 10 to physical activity and 5 to healthy sleep. The LUs can be used by all the teachers at school regardless of the subject they teach and obviously can be integrated, adapted and extended based on the teacher's experience, creating potential academic connections.

Conclusion: EUMOVE project can be a new strategy to integrate healthy lifestyles into the school curriculum and among teachers, students and their families in order to prevent obesity. EUMOVE will organize 4 blocks of events throughout Europe to promote practical strategies for promoting healthy habits.

Adolescent health indicators in humanitarian settings: A cross-country comparison

Aisha Shalash¹, Dervla Kelly², Khalifa Elmusharaf³, Niveen Abu-Rmeileh⁴

¹Birzeit University Palestinian Territory, Occupied, ²School of Medicine, University of Limerick Ireland, ³University of Birmingham Dubai United Arab Emirates, ⁴Birzeit University

Background: Adolescents (aged 10-19) face many barriers to health services, especially in humanitarian crises. Developing a response to adolescent health needs requires age and sex-disaggregated data. We aim to collect available adolescent health indicators and their sources in humanitarian crises to identify gaps in the data to inform policy and practice.

Methods: Adolescent health indicators of five countries currently facing humanitarian crises: Myanmar, Nigeria, Ukraine, Yemen, and occupied Palestinian territories, were collected. An extensive search on the available adolescent health indicators was done using surveys in each country, reports, assessments by humanitarian organizations, and peer-reviewed journals. Data were extracted on the source of information, indicator name, domain, categorization, level, numerator and denominator, age groups, and sex on each indicator.

Results: The Multiple Indicator Cluster and Demographic Health Survey were done in all five countries selected, but surveys were adjusted according to the appropriateness of each country and done infrequently. Yemen and occupied Palestinian territories only included women in their sample sizes, and no one younger than 15 was interviewed. Many times countries' indicators used by humanitarian organizations were out-of-date. Yemen's latest survey was done in 2015. The most frequent indicators found were in the categorization of reproductive health. Limited data was found on adolescents aged 10-14, boys,

and WASH and nutrition indicators. Out of 52 proposed priority indicators, the most any country fully collected was seven indicators

Conclusion: Adolescent health information in humanitarian crises requires frequent surveys and unique data collection methodologies, including all adolescent age groups. Unfortunately, the current surveys used to measure adolescent health indicators cannot be inclusive to all adolescents. Establishing a list of priority indicators in humanitarian settings will help agencies provide appropriate health services and programs based on the adolescent needs of the country.

Community's perceptions of the factors related to acute malnutrition in samburu county

Hazel Odhiambo¹, Calistus Wilunda², Esther Anono¹, Ruth Muendo¹, Hazel Odhiambo¹, Chessa Lutter³, Valerie Flax⁴, Faith Thuita⁵, Estelle Sidze⁶, Elizabeth Murage⁷, Albert Webale⁸, Brad Sagara⁷, Teresia Macharia⁹, Monica Ngángá^{1,11}

¹African Population and Health Research Center Kenya, ²African Population and Health Research Center, Kenya, ³RTI International, ⁴RTI International United States, ⁵RTI International Kenya, ⁶African Population and Health Research Center, ⁷Mercy Corps United States

Background: The causal pathways of acute malnutrition in Africa's drylands are complex, interlinked, and require in-depth assessment and analysis to clarify them. We aimed to understand community perceptions of factors related to acute malnutrition across livelihoods in Samburu County.

Methods: This qualitative study was conducted in 2021 in selected villages representing three livelihoods: urban/peri-urban, pastoral, and agropastoral. Data were collected through community dialogues, focus group discussions, in-depth interviews, and key informant interviews from 331 participants including mothers and fathers with children younger than three years, and selected key informants. Question guides focused on three areas related to acute malnutrition: factors that influence maternal, infant, and young child nutrition (MIYCN) practices; use and barriers to use of health care services; and gender dynamics in household decision-making. Data were analyzed thematically.

Results: Factors that influence MIYCN practices: Poverty appeared to be the main barrier to affording nutritious foods, and seasonality was a key factor for food access and utilization in all livelihoods. Other barriers included maternal alcohol use in urban/peri-urban and agropastoral zones; poor water, sanitation, and hygiene practices; and cultural beliefs prohibiting the consumption of certain foods during pregnancy and lactation. Adolescent mothers faced additional challenges with breastfeeding and complementary feeding because of inadequate knowledge.

Factors associated with utilization of healthcare services: Communities trusted healthcare services and the staff, which was attributed to health education and sensitization across livelihoods. Enrollment in the national health insurance scheme and availability of ambulances facilitated health care access. Long distances to health facilities, facility-level barriers, frequent migration, and use of traditional medicine.

Gender dynamics in household decision-making: Women were involved in low-paying manual labor and petty trade, while men controlled assets and capital across livelihoods.

CONCLUSION: Poverty and seasonality interlinked with other factors such as nutrition, healthcare utilization, household decision-making, childcare, and sanitation practices.

Background: There is an urgent need to understand how Primary Health Care (PHC) strategies in Latin American countries (LACs) can be developed, strengthened, and made more comprehensive, effective, and sustainable – especially given the need for cross-sectoral collaborative platforms to achieve the Sustainable Development Goals (SDGs). This study aimed to evaluate the long-term effect of PHC strategies on child mortality in Brazil, Ecuador, Mexico, and Colombia (BEMC).

Methods: A multi-country study with a mixed ecological design was carried out. We created a longitudinal dataset (2000-2019) using secondary sources and the analysis included 5,647 municipalities with good quality of vital information. The PHC coverage was calculated and municipalities were classified into four groups: low, intermediate, high, and consolidated coverage. Dependent variables were neonatal, post-neonatal, infant, and child (under-5 and 1 to 4 years of age) mortality rates and under-5 mortality rate (U5MR) due to Primary Care Sensitive Conditions. A set of socioeconomic and health services covariables were used to adjust the models. The effect of PHC was evaluated using conditional negative binomial regression models for panel data with fixed-effects specification and the effect measure was the Rate Ratio (95% Confidence Interval).

Results: In multivariate analysis, the consolidated PHC municipalities showed significant risk reductions of post-neonatal (27.2%), infant (13.4%), and child mortality (under-5: 18.7% and 1-4 years: 24.3%). A consolidated coverage of PHC was significantly related to lower U5MR by vaccine-preventable and sensitive conditions (RR 0.548; 95% CI 0.528-0.568), diarrhea (RR 0.442; 95% CI 0.421-0.465), anemia (RR 0.631; 95% CI 0.563-0.708), nutritional deficiencies (RR 0.556; 95% CI 0.525-0.588), and pulmonary diseases (RR 0.534; 95% CI 0.294-0.969).

Conclusion: Despite the limitations of LACs health systems, promoting a PHC strategy has successfully contributed to improving child health. It is necessary to ensure this strategy expansion, sustainability, and equitable distribution.

Marketing of food to children through food packaging is associated with unhealthy foods in Brazil

Camila Borges¹, Ana Duran¹

¹Center for Epidemiological Research in Nutrition and Health Brazil

Background and objective: The exposure to the marketing of unhealthy foods is linked to growing overweight and obese in childhood. Persuasive marketing strategies influence children's food intake, preferences, attitudes, and eating behavior. The present study aims to assess the relationship between presence of marketing to children through food packaging and the nutritional profile of the products.

Methods: The analysis was conducted with 7,726 products found in Brazilian retail from 2018 to 2021. Marketing strategies on packaging were collected by trained researchers. Elements such as: mascots, animated characters, fun activities, school, sports, athletes, gifts, energy, growth were used as indicators of marketing to children. The Pan American Health Organization (PAHO) nutrient profile model (free sugar, sodium, total fat, saturated fat, trans fat and non-nutritive sweeteners) with information from the nutritional composition table and ingredient list were used. The association between the presence of marketing to children and the nutritional profile was verified by logistic regression. Values of p<0.05 were considered significant. The analyses were performed in Stata 16.1.

Results: A total of 2,613 (33.8%) products with marketing to children on the packaging were observed. Foods with marketing to children were 2.1 times more likely to have high free sugar than those without this type of marketing (p<0.001) and 1.4 times more likely to have high total fat and saturated fat (p<0.001). No statistically significant associations were observed between the presence of marketing to children and sodium, saturated fat, and non-nutritive sweeteners.

Conclusion: Foods with marketing to children found in Brazilian retailers in 2018 to 2021 are significantly more likely to have higher amounts of free sugar, total fat, and saturated fat than those not targeted to children.

The effect of an adapted physical activity intervention for pregnant women during childbirth preparation classes: preliminary results from the well-done! study

Anna Zannoner¹, Sofia Marini², Alice Masini¹, Francesca Scognamiglio¹,

Angela Coa¹, Gaia Sicari¹, Gisele Castagna¹, Ida Rescigno¹, Vincenza Leccese¹, Isotta Caravita¹, Dila Parma¹, Virginia Bertini¹, Laura Dallolio¹

¹Department of Biomedical and Neuromotor Sciences, University of Bologna Italy, ²Department for Life Quality Studies, University of Bologna Italy

Background and objectives: Regular physical activity (pa) during pregnancy is beneficial for mothers and fetuses. The world health organization recommends that healthy pregnant and post-partum women should perform at least 150 minutes/week of moderate-intensity pa. Unfortunately, less than 15% of pregnant women reach these recommendations. The aim of this study is to co-design an adapted physical activity intervention (apai) for pregnant women to include in childbirth preparation classes (cpcs) and evaluate its feasibility and efficacy in terms of pa levels and other outcomes.

Methods: This was a quasi-experimental study designed in collaboration with pregnant women and midwives using focus groups. kinesiologists and midwives conducted the intervention at the st. Orsola-malpighi hospital, bologna, (Italy). During cpcs, the experimental group (eg) performed 1 h of pa administered by midwives and co-supervised by kinesiologists for 6 weeks, while the control group (cg) received a one hour lesson about pa recommendation in pregnancy. Pa levels were assessed using the pregnancy physical activity questionnaire (ppaq) at the baseline and at the end of the intervention. Statistical analysis was performed using spss.18.

Results: We enrolled 77 women (mean age 34.8±4.3) from november 2021 to may 2022. Preliminary results from 60 participants showed that the ppaq for total activity significantly improved in the eg after 6 weeks (Δ total-activity=13.74±29.65, p value=0.04), slightly raising in the cg but not significantly (Δ total-activity=3.47±40.76, p value=0.59). Notably, moderate activity significantly improved in eg (Δ moderate-activity=7.96±16.97 p value=0.04), while worsened in cg (Δ moderate- activity=-4.13±24.53, p value=0.29). However, there was no statistically significant difference between groups.

Conclusion: Preliminary findings suggest that introducing apai in cpcs improves pa levels in pregnant women. A multidisciplinary cooperation between health professionals is crucial in health promotion interventions.

Screening of visual disorders in primary schools: a cross-sectional study from devrek, türkiye

Eray Öntaş¹, Onur Özalp²

¹Zonguldak Devrek District Health Directorate Turkey, ²Zonguldak Devrek State Hospital Turkey

Background: Considering neuronal plasticity in early childhood, screening and interventions for visual impairment are cost-effective, because of their impact on DALY. It was aimed to detect and evaluate the most prevalent vision disorders that may lead to the development of amblyopia (lazy eye).

Method: Media opacity, anisocoria, strabismus, anisometropia, astigmatism, myopia and hyperopia diseases were screened by mobile binocular infrared photo retinoscopy (Plusoptix A12R, Germany) in 467 children in 8 primary schools in Zonguldak Devrek district. 55 (63.2%) of the 87 children who were found to have visual disorders on screening, were evaluated in the referred district hospitals ophthalmology clinic in terms of demographic data, medical history, refraction values with cycloplegia, best corrected visual acuity (BCVA, logMAR), strabismus and amblyopia.

Results: In primary school vision screening, 18.3% of children (n=87) were referred to the hospital. Among the children (n=55) examined by the ophthalmologist, the mean age was 7.1 years, and 50.9% were girls. The median spherical equivalent values of the students were -0.25 (min:-2.38-max:7.13) and -0.25 (min:-2.63-max:8.25) in the right and left eye, respectively. The mean BCVA were 0.05 (min:0-max:1) and 0.1 (min:0-max:1.51) in the right and left eye, respectively. After the examination, 81.8% of the patients (n=45) were prescribed eyeglasses, and occlusion treatment was recommended for 3 new-diagnosed amblyopia. Occlusion treatment was also recommended for 15 students who didn't meet the definition of amblyopia but whose visual acuity was not complete. Strabismus was not detected in any of the 55 students.

Conclusion: When the age-specific treatment costs were evaluated according to the literature, it was determined that only 3 new amblyopia early diagnoses in primary school 1st grades cover the cost of the screening device. Therefore, visual disorder screening in primary schools should be implemented as a standard, as it offers an effective intervention at a low cost.

Background: The Integrated Management of Childhood Illness (IMCI) guidelines for children under 5 is a symptom-based algorithm guiding health care workers in resource-limited countries at the primary health center (PHC) level. Hypoxaemia (SpO₂< 90%) is a life-threatening condition underdiagnosed in West Africa. To improve the diagnosis and care-management of hypoxaemia, the AIRE project, UNITAID-funded, has implemented the routine Pulse Oximeter use into IMCI consultations at PHCs level in Burkina Faso, Guinea, Mali and Niger. This study aimed to measure the added value of PO integrated into IMCI.

Methods: In 16 AIRE research PHCs (4/country), all children aged 0-59 months attending IMCI consultations, except those aged 2-59 months classified as green non-respiratory cases were eligible for PO use, and enrolled in a cross-sectional study with parent's consent. Those classified as severe cases were followed for 14 days. Socio-demographic and clinical data including data about PO use, pathways, patterns of care and health outcomes at D14 were collected.

Results: From June 2021 to June 2022, 39,496 children attended IMCI consultations; 31,721 were eligible for PO use of whom 80.3% had an SpO₂ measurement. The prevalence of severe case using IMCI+PO was at 10% (n=3,179; 95% confidence interval [95%CI]: 9.7-10.4). Hypoxemia prevalence was 0.7% (95%CI: 0.58-0.76) among eligible children for PO use and 6.6% (95%CI: 5.8- 7.5) among all severe cases. Of all severe cases identified with IMCI+PO, 1,981 were enrolled and followed-up, their D-14 mortality rate was 4.8% (95%CI: 3.5-5.3). The PO allowed to identify +1.9% (95% CI: 1.5-2.5) severe cases.

Conclusion: Based on this large sample study, the uptake of PO integrated into IMCI consultations was high and the identification of severe cases have been increased for +1.9% using PO. However, hospital referral and timely oxygen therapy to manage them remain challenges for governments in the West African settings.

Assessing unmet Sexual and Reproductive Health needs of adolescents living with disabilities in Zambia: A cross-sectional study.

Tikulirekuti Banda¹, Edward Sibeene¹, Innocent Chansa¹, Steven Miti¹, Joseph Zulu¹, Owaka Isaac Ogwen², Edna Nyanchama Nyang'echi², Dennis Muya², Justus Osano².

¹The University of Zambia

²Kenyatta University

Background: Sexual and reproductive health rights (SRHR) thus are fundamental human rights, which should be enshrined in national, regional, and international laws as they are critical for gender equality and sustainable development. Yet young people living with disability continue to face gaps in meeting their SRHR needs. In Zambia, current national data estimates that 7.2% of Zambia's population are living with a disability, who, among other socio-economic challenges, face limitations in access to equitable and quality health care.

Methods: The research adopted a concurrent parallel design which used both qualitative and quantitative data collection.

The study was conducted in 3 provinces of Zambia (Lusaka, Southern and Western provinces) among adolescents and young people aged 15-24 years. A total of 149 adolescents and young people were recruited in the study and administered with surveys. 4 Focus Group discussions were also conducted with these adolescents to gain deeper understanding on their challenges accessing SRHR services in

Zambia. 16 Key Informant interviews were conducted with health facility staff and non-governmental organizations with persons with disability. Results: Generally, there was a low inclination of the availability of SRHR services across all study locations with Lusaka (50.2%), Southern (30.5%) and Western (19.2%). The study also established various harmful practices directed towards adolescents and young people living with disability with stigma and discrimination being the leading harmful vice. The study also found that the main perpetrators of these harmful practices were relatives, while guardians and parents came 3rd respectively.

Conclusion: There is need to provide disability sexual and reproductive health services to bridge existing gaps in the provision and access of sexual reproductive health services for adolescents and young people living with disability in Zambia and the region at large.

Analysis of factors associated with nicotine initiation - a 3-year follow-up study among adolescents in the sopkard-junior study

Marta Miller¹, Klaudia Suligowska², Tomasz Zdrojewski³, Łukasz Balwicki³

¹Medical University of Gdańsk Poland, ²Departament of Preventive Medicine, Medical University of Gdańsk; ³Departament of Dental Techniques and Masticatory System Dysfunctions, Medical University of Gdańsk,

³Departament of Preventive Medicine and Education, Medical University of Gdańsk Poland

Background and objective: The earlier a person reaches for nicotine, the longer they remain addicted to it. Use of tobacco products negatively affects the cardiorespiratory system. The study aimed to analyze factors associated with nicotine initiation among children and adolescents over a 3-year period.

Methods: Data for analysis came from a questionnaire-based cross-sectional survey performed as part of the interdisciplinary SOPKARD-Junior program among the same cohort of students at elementary schools based in Sopot, Poland. Students and their parents participated in a prospective 3-year follow-up study. Responses were collected from children in 2018 at age of 10-11yo and again in 2021 at age 14-15yo. Each time, responses were also collected from the parent of the student research participant. The survey instrument was a set of forty-nine questions, based on the GYTS (The Global Youth Tobacco Survey) questionnaire. Results: During the 3 year period, almost 4.5 times more children had already undergone nicotine initiation. An upward trend was observed in terms of teens noticing smoking people in mass-media - from 53% in 2018 to 68% in 2021. In 2018, children who underwent nicotine initiation declared using only one type of tobacco product. In 2021, already 53.8% of children after nicotine initiation had tried both traditional cigarettes and e-cigarettes. Teenagers were also two times more likely to declare using e-cigarettes than traditional cigarettes. There was a statistically significant correlation in both years indicating that non-smoking children who were frequently exposed to cigarette adverts in stores were more likely to initiate smoking after peer's offer to smoke.

Conclusions: In comparison to earlier elementary school grades, final grade students have a higher exposure to the concurrent use of electronic and traditional cigarettes and are more likely to initiate smoking. It is crucial to limit mass-media promotion of smoking and adolescents exposure to tobacco advertising.

Early childhood education quality and child development in lao pdr

Alanna Sincovich¹, Benjamin Lam², Tess Gregory³, Nathalie Rodilosso⁴, Sally Brinkman²

¹Telethon Kids Institute Australia, ²University of South Australia Australia,

³Telethon Kids Institute, ⁴Princeton University United States

Background: Globally, as scale up of early childhood education (ECE) continues, monitoring ECE quality is imperative to promote service aspects that drive positive outcomes for children. Monitoring of ECE quality in low- and middle-income countries (LMICs) is scarce, limited by challenges in varied conceptualisations of quality, lack of measurement tools that reflect local culture and context, and implementation difficulties in low resource settings.

Objectives: This research sought to describe quality of ECE across Northern Lao PDR and explore the association between ECE quality and children's development. Advancing understanding of the quality of ECE provision in Lao PDR, how quality may be captured, and how it relates to children's development, are all necessary steps toward informing interventions and policy aimed at improving ECE quality.

Methods: Using data from the World Bank Early Childhood Education Project we conducted a cross-sectional investigation on ECE quality and children's development. Participants were children aged 2-6 years (n=1,168) attending ECE

across 131 villages. Linear regressions explored the association between ECE quality, captured using the Measure of Early Learning Environments (MELE), and adult reported and directly assessed child development. Models were adjusted for child, household, and village level confounding variables.

Results: Mean scores on quality domains indicated classrooms scored highest on Interactions and Approaches and lowest on Learning Activities. Results from linear models estimating the association between ECE quality and child development demonstrated Overall Quality had the strongest association with child development, followed by Interactions and Approaches.

Conclusion: Although associations between ECE quality and children's development were small, findings reiterate the need for investment not only in expansion of ECE access, but also high-quality service provision. Emphasis on quality must extend beyond facilities and materials, to adequately equipping schools and teachers with the training and resources to facilitate learning through high quality interactions within any given context.

Proposal to improve access to the maternal and perinatal care route (ramp) through supply chain quality management and digital health interventions for dispersed rural territories

Helena Carretero¹, Lina Tafurth¹

¹Universidad Icesi Colombia

The Ministry of Health of Colombia has been developing care routes to improve perinatal maternal care. However, the reported figures show gaps in access to health services and quality problems, especially for populations in dispersed rural territories. Given the importance of maternal and perinatal health declared in the sustainable development goals (SDG) and the results of the World Health Organization (WHO) and the United Nations Fund (UNFPA) that in the year 2021, they estimated that 810 women die every day from complications of pregnancy and childbirth, mostly from preventable or treatable causes, the need to investigate which variables affect this type of preventable causes was identified. When reviewing the improvement strategies in health organizations, advantages in the use of Supply Chain Quality Management were evident. (SCQM), since it helps to break barriers, improve connectivity and quality in the provision of health services. The objective of this work was to propose an integration alternative between the SCQM and digital solutions to improve access and the Maternal Perinatal Care Route (RAMP) in rural municipalities of Santander de Quilichao and Caloto in Colombia. Descriptive research with the collection of information in databases to interpret the data on the provision of services through the RAMP, through analysis with Process Mining. With this research it was possible to know the variables that influence preventable causes, simulate the reality of the processes in two (2) levels of care and find the variables that affect bottlenecks and the patterns that impact the results. It was confirmed that the integration of SCQM and digital interventions drives the performance of RAMP activities and allows the improvement of processes with scalability and overcoming barriers. The two aforementioned strategies translate into a commitment to improve access and service provision at RAMP.

System fragmentation and service silos: Leveraging provider perspectives to support families living in poverty

Brittany Schuler¹

¹Temple University College of Public Health 28 Wilson Ave Chalfont PA 18914 USA United States

Background and significance

Intersections of high poverty and trauma increase risks for toxic stress, which can have major consequences for health and mental health. These consequences are particularly salient during childhood, when physical growth and brain development undergo rapid change. Service providers are often the first and only point of contact for many families and have invaluable perspectives on child health and wellbeing and community-driven factors that contribute to health equity or health disparities. Understanding perspectives of professionals involved in community support services could provide insight on system-level changes needed to promote child health equity and provide up-to-date information on the social, economic, and political circumstances promoting or impairing equitable and health and wellbeing among families with limited economic resources living in economically marginalized communities.

Purpose: The aims of this qualitative study were to draw on the perspectives of multidisciplinary social service community professionals who work with populations exposed to high levels of systemic trauma and poverty. We apply

a social justice and ecocultural lens to assess service provider perceptions of major barriers and facilitators to health and mental health in at-risk communities. Method: We conducted semi-structured in-depth interviews with $n = 21$ social service staff, stakeholders, and volunteers. Service providers were asked a series of open-ended questions related to their perspectives on: (1) health disparities and their repercussions on family's high risk for health disparities; and (2) protectors of and approaches to advance health equity. Analysis was conducted using MAX QDA analytic software, using an ongoing, iterative process following a systematic approach recommended for health research and capturing multi-layered, ecocultural perspectives.

Results: Major qualitative themes contributing to health disparities included burnout and high turnover rates, complex family needs beyond organizational capacity, funding limitations, limited professional development, disconnects between family needs and services, and system fragmentation. Protectors of health equity included prioritizing community engagement, partnerships with other providers, holistic and wrap-around physical and mental health supports, honoring choice and autonomy of families served, capacity building, and providing supports to address effects of vicarious trauma.

Conclusion: Implications are provided for organizational-level targets to promote child health equity in economically underserved populations.

Consumption and food habits of children and adolescents with autism spectrum disorder - ASD

Raissa Matos Ferreira¹, Joana Gonçalves²

¹Graduate student Federal University of Ouro Preto, Ouro Preto, Minas Gerais, Brazil, ²Nutritionist layane layane vilela marques nutritionist Brazil daiane santos postgraduate student rua ja 16 qd 34 lote 02 mauricio arantes de lisboa Brazil

Children and adolescents with ASD have a differentiated diet with a tendency to dysfunctional and significant eating habits, compromising sensory activities that make it difficult to obtain and establish a healthy diet. This study aimed to understand the consumption and eating habits of children and adolescents with Autism Spectrum Disorder (ASD). This is an exploratory and descriptive qualitative and quantitative research, carried out with 51 parents and guardians of children aged between 5 and 12 years old diagnosed with ASD. The research was carried out in three institutions located in the city of Rio Verde, Goiás, Brazil, through a structured questionnaire in Google Forms. Indicating 6 categories: Food consumption; Eating habits; Food selectivity; Professional follow-up; Aspects and characteristics of children and adolescents; Food allergy and intolerance. The individuals with ASD surveyed have a considerable consumption of ultra-processed foods, greater acceptance of liquid and soft-textured foods, dysfunctional habits such as eating at the same times, in the same quantities and in front of screens (cell phones, tablets and televisions), they also have some alterations gastrointestinal; in addition to not having nutritional follow-up, thus leaving those responsible insecure about feeding their children. It is concluded that children and adolescents with ASD have a different diet with a tendency to dysfunctional and significant eating habits, in which each individual manifests their own eating patterns, and may also compromise sensory activities that make it difficult to obtain and establish a healthy diet.

Benchmarking of population-based childhood cancer survival by toronto stage: From epidemiological data to proper health planning

Rosalia Ragusa¹, Laura Botta², Fabio Didonè³, Antonina Torrisi⁴, Gemma Gatta⁵

¹Azienda Ospedaliero Universitaria Policlinico "G.Rodolico - San Marco Integrated Cancer Registry Ct-Me-En via S.Sofia, 78 Italy, ²IRCCS National Cancer Institute Foundation, Milan, Italy Evaluative Epidemiology Unit, IRCCS National Cancer Institute Foundation, Milan Via Giacomo Venezian, 1, 20133 Milano Italy, ³University of Milano Bicocca, Milan, Italy Unit of Biostatistics, Epidemiology and Public Health, Department of Statistics and Quantitative Methods, University of Milano Bicocca, Milan, Piazza dell'Ateneo Nuovo, 1 - 20126, Milano Italy, ⁴A.O.U. Policlinico, Catania Cancer Registry Catania-Messina-Enna, via S.Sofia, 78, Catania Italy, ⁵IRCCS National Cancer Institute Foundation, Milan, Italy Evaluative Epidemiology Unit Via Giacomo Venezian, 1, 20133 Milano Italy BENCHISTA Italy Working group

Introduction: Paediatric cancers are rare tumours, heterogeneous in location and biologically very different from adult cancers. Documented survival variation across European countries and Italian regions show that there is still room for

further improvement by reducing inequalities. We aim to understand why there are differences in survival. The stage of the tumor is a determining factor in the likelihood of recovery and the intensity of treatment required by the cancer patient. The BENCHISTA-ITA project (National BENCHMARKING of CHILDhood Cancer Survival by STAGE at diagnosis), that is the Italian twin project of the International BENCHISTA, collect stage at diagnosis of solid paediatric tumours, according to the Toronto Guidelines.

We will compare how far the cancer has spread at diagnosis and test if differences in tumour stage explain any survival differences between Italian regions.

Materials and Methods: The project study stage distribution and survival for 9 paediatric solid tumours diagnosed between 2014 and 2017 with 3 years of follow-up for life-stage definition.

The study involves:

- The identification of all new diagnoses.
- Evaluation of the clinical documentation of cases eligible for research, extraction, ICC-3 classification, coding (ICD0-3.2), clinical and pathological information useful for staging
- Linkage of identified cases with clinical records
- Stage assignment at tumour diagnosis using the Toronto staging guidelines using a two-tier system
- Production of a database containing clinical information, stage, recurrence and other prognostic factors

The registries will centralise the data at the National Cancer Institute in Milan. An initial comparative analysis will show stage distribution and 3-year survival by stage by area/country.

Results: Data from 28 population-based cancer registries were collected covering about 84% of the Italian child population. In particular, data on: imaging/examination performed before any treatment; source used for staging; primary treatment defined as given within 1 year from diagnosis; relapse/ recurrence/ progression; follow up and status of life.

The study tested the applicability of Toronto Guidelines as a tool to obtain population-level comparable stage information for childhood cancers. Difference in stage distribution and survival differences between regional grouping were presented.

Conclusions: The Italian BENCHISTA project, improving the connection between pediatric cancer registries, aims to improve care of children with cancer in the national territory, reducing possible disparities.

The wide adoption of Toronto Guidelines will facilitate international comparative incidence studies, strengthen the interpretation of survival data, and contribute to more appropriate solutions to improve childhood cancer outcomes.

Dietary habits and physical activity among a sample of Kuwaiti pregnant women: a sociocultural study

Maha Alsejari¹

¹Kuwait University, Kuwait

Pregnancy is an important stage in mother and the fetus life. Several physiological and psychological changes occur for both. One of the most prominent factors that affect their health is women's food habits, physical activity, and basic information about pregnancy. The current study aims to measure the pattern of lifestyle behaviors of pregnant women. A sample of 214 Kuwaiti pregnant women were selected. Questionnaire was the major tool of the study. Questionnaire consists five sections: (1) socio-cultural factors; (2) Information about the main sources of pregnancy and the health condition of the pregnant women; (3) A general healthy lifestyle behaviors; (4) pregnant women's lifestyle; and (5) awareness of basic information of pregnancy. Also, interview with 12 informant women were conducted. Descriptive and inferential statistics were used. T-test and chi-square were the major statistical procedures. Results indicate that there are many respondents have changed their eating habits and lifestyle behavior during pregnancy. There is a high degree of awareness about health issues related to pregnancy were noticed. It is found also that there are some cultural differences between certain social groups in Kuwait.

DOI: 10.18332/popmed/164885

"In fact, that's when I stopped using contraception": a qualitative study exploring why sexually active women discontinued contraceptive use in KwaZulu-Natal, South Africa

Mbuzeleni Hlongwa¹

¹SA Medical Research Council, University of KwaZulu-Natal, South Africa

Background and Objective: Contraception is one of the most important public

health interventions which respond to reproductive health needs of women, thereby enabling them to plan their pregnancies and decide on the number of children they desire. However, there remain a high proportion of women who experience unplanned pregnancies every year in South Africa. High rates of contraceptive users discontinue their use within a year of starting to use contraception. Therefore, this study explored the reasons why sexually active women discontinued contraceptive use in KwaZulu-Natal, South Africa.

Methods: In October 2021, we conducted a qualitative study at Umlazi Township in KwaZulu-Natal province, South Africa, through face-to-face interviews. Eligible women from four primary health care facilities were recruited through a criterion-based sampling strategy. Using NVivo version 11, two skilled researchers independently conducted thematic data analysis, as a mechanism for quality assurance, before the Results were collated and reconciled.

Results: The study included 15 female participants, aged between 18 and 35 years, of whom two-thirds were aged 18-24 years. We found that women were concerned about unpleasant contraceptive side effects, including prolonged or irregular menstrual periods, bleeding, weight gain, and/or severe pains, Resulting in discontinuation of their use. In addition to contraceptive stock outs, women also reported that health care providers did not appropriately counsel or inform them about the available contraceptive Methods, including how to use them.

Conclusions: Interventions aimed at reducing contraceptive stock outs are immediately required to ensure that women are empowered to choose contraception based on their own preference, convenience, and/or experience. It is imperative that counselling on contraceptive method side effects be improved, to ensure that women have freedom to make decisions about their preferred method, proper management of side effects, and to assist them with method switching as needed, instead of discontinuation.

Beyond incarceration: improving outcomes for women and families affected by substance use disorder

Chetana Musapeta¹

¹National Center for Wellness and Recovery, Tulsa, United States

Substance use during pregnancy and motherhood is both a public health and criminal justice concern. Negative health consequences associated with substance use impact both the mother and the developing fetus, and there are ongoing attempts to criminalize substance use during pregnancy that put women who are pregnant and substance-using at risk of detection, arrest, and punishment. Additionally, The COVID-19 pandemic changed the landscape of health care delivery overnight. As communities and businesses shut down, behavioral health practitioners were forced to expand in innovative ways to serve their most at-risk community members. The purpose of the Neonatal Abstinence Syndrome (NAS) grant program is to reduce morbidity and mortality rates and reduce incidence of NAS among pregnant women and women of childbearing age who are at high risk for Substance Use disorders and Opioid Use Disorders in six rural counties. This was achieved in three ways: (1) Increasing access to prenatal and postnatal care for both incarcerated pregnant women and women of childbearing age through telehealth services via iPad carts. (2) Increasing awareness and treatment options among medical providers by delivering medication for the treatment of opioid use disorder (MOUD) for physicians to safely treat women. (3) Hosting caregiver support and resources for family members and loved ones impacted by addiction. The poster will show an overview of successful case studies, where rural consortia leveraged telehealth to improve access to care among people who are incarcerated and people at risk of delivering a child with substance use. We will address the effectiveness, challenges, and successes of deploying telehealth services within in rural jails, virtual care coordination using evidence-based practices, and continuum of care for women and families once they exit the justice system.

DOI: 10.18332/popmed/164896

Associations between parental psychological factors and overweight / obesity status in children with Autism or Autism Spectrum disorder

Akemi Nishide¹

¹College of Life Science, Ibaraki Christian University, Tokyo, Japan

Background and Objectives: There is a higher frequency of obesity in children with autism spectrum disorders (ASD). Their environment, such as their parents' attitude towards health matters may affect this issue, however, this link has not yet been well established. Thus, the aim of study is to examine how parental psychological factors, such as self-efficacy and outcome expectancy, affect the

children's overweight/obesity status (ob).

Methods: A cross sectional study involving sixteen schools for special needs education in Ibaraki prefecture and two schools in other areas in Japan was conducted. At the beginning of September 2022, a questionnaire on the parents' self-efficacy, outcome expectancy as well as a brief self-administered diet history questionnaire was distributed to parents of all first grade to sixth grade elementary school children. Fully completed questionnaires of children whose parents reported them as having ASD or autism, were then analysed. The exposure variable was ob or non-overweight/obesity (non-ob), assessed using self-reported height and weight measurements. The parents' self-efficacy and outcome expectancy were assessed using a five-ordinal scale. A logistic regression analysis was employed to estimate the odds ratio with 95% confidence interval for the analysis of effects of parental factors on ob in children with ASD.

Results: There were a total of 147 participants (Autism; n=52, Asperger; n=0, ASD; n=95). It was observed that the parents of ob children have a lower outcome expectancy regarding the healthy diet and having breakfast than the parents of non-ob children, although no significant associations were observed in personal factors, such as school area and sex. Fifth grade children were more likely to be classed as ob than those in younger grades.

Conclusions: Support, such as a school-based nutrition education program, particularly before fifth grade, may be required to improve parental attitude which influences the eating behaviour of children with ASD.

A scoping review of the factors that influence the uptake of IPTp among pregnant women informed by the socio-ecological model

Alaa Suliman¹

¹University of Limerick, Ireland

Malaria in pregnancy (MiP) is a major health problem, according to World Health Organization in 2020 there were an estimated 33.8 million pregnancies, 34% (11.6 million) of which were exposed to malaria infection. (World Health Organization 2021). Moreover, it contributes to devastating health outcomes that may end up in a medical emergency ('Management of malaria in pregnancy : Indian Journal of Medical Research' 2022). The progression towards scaling up intermittent preventive treatment in pregnancy (IPTp) uptake remains slow relative to other MiP interventions. Preventive strategies and good quality case management are the starting point for controlling the malaria burden. The objective of this study is to review the available knowledge on the main contextual factors of a direct impact on the uptake of IPTp among pregnant women globally, as well as to address the gaps in the existing literature. **Methods:** A comprehensive literature search was carried out from May to June 2022 on the following online electronic databases; PUBMED, Scopus, Web of Science, EBSCO, and Medline. Sixty-six out of 4210 screened studies addressing the factors that influence the uptake were included. Two independent reviewers investigated the studies for eligibility. Factors that affect the uptake were conceptually analyzed using the socioecological model. **Results:** It was observed from the literature that there are still low levels of awareness and knowledge among pregnant women regarding IPTp importance, this emphasizes the importance of women's empowerment for health-seeking behavior. The availability, accessibility, and affordability of IPTp pose a persistent challenge that impedes governments from achieving the recommended coverage target. Additionally, Health care workers showed inconsistency while delivering IPTp to women and faced difficulties regarding their working conditions. **Conclusions:** From a public health perspective policymakers must address health system obstacles that hinder IPTp implementation from being delivered and utilized by pregnant women.

National abortion survey in Peru

Elisa Juarez¹, Roberto Carrasco¹, Rossina Guerrero²

¹Universidad Continental, Peru, ²Non-Governmental Organization (NGO) Centro de Promoción y Defensa de Derechos Sexuales y Reproductivos (PROMSEX), Peru

Background: In 2019, the Institute of Public Opinion of "Pontificia Universidad Católica del Perú", by request of the NGO PROMSEX carried out a nationwide survey to calculate the frequency of abortion among women in Perú. Their objective was to have solid information that could support advocacy for abortion in a setting with high legal restrictions to this procedure. Our team at Continental University has secondarily analyzed this data. **Methods and Sampling:** A probabilistic, multistage, and stratified sampling by socioeconomic level was carried out. A total of 2400 women between 18 and 49 years old were included in the sample. The

survey was carried out using the Ballot Box method, which has been previously used in other settings to explore stigmatizing topics reducing social desirability bias. Findings: We estimate that approximately 19.25% of surveyed women had at least one abortion in their lifetimes. About 11.99% of women were under-aged (under 18 years old) when they had the first or only abortion reported; 43.37% were between 18 and 24 years old; 28.32% were between 25 and 30 years old, and 16.33% were 31 years or older. Moreover, 42.34% of women who have had an abortion did not attend a health provider to undergo the procedure.

Discussion: Despite the legal restrictions that Perú has for abortion, this is not an uncommon practice among women in the country. Women who were under 25 years old when they had their first abortion accounted for the largest group and more than three-quarters of the first abortion occurred when women were under 25. Most women did not visit a health provider to undergo the abortion, which suggests that they looked for alternatives to access this procedure.

The evaluation of the impact of early sexual activities in young people aged 10-17 years on their mental health: a systematic review study

Oluwatoyin Adesope¹

¹University of Chester, United Kingdom

Background: Adolescence is an important stage of building psychological and social skills necessary for mental health. However, these could be altered by factors such as peer pressure, cruel parenting, media, stress, low socioeconomic status, and adverse-environmental exposure. In adolescents, mental disorder contributes to a 13% global disease burden- with depression, and anxiety problems recognised as the leading disorder among the ages 15-19. Similarly, suicide is among the top five leading causes of death in this age group of 15-19 years. While most adolescents' mental health disorder risk factors have been extensively investigated, the association between sexual activities in adolescents and their mental health or mental disorder requires further attention. Furthermore, few primary studies like cross-sectional, case-control, longitudinal/cohort, correlation, and comparative studies have been conducted to find out the association between sexual activities in adolescents and their mental health. Still, no research has been conducted to synthesise these studies into a single document to better inform policy decisions on promoting mental wellness in young people. Aims and Objectives: The aim of this study is to evaluate the impact of early sexual activities in young people aged 10-17 years on their mental health and to use pooled estimates to establish precision of Results. The study seeks to synthesize all available primary studies into a single study.

Methods: PsycINFO, Web of Science, CINAHL, Cochrane and PubMed electronic databases were searched for available literature that will answer the study's research question.

Results: Out of 32 studies selected for full screening, only 9 met the inclusion criteria for the study. These 9 studies make up the included studies for the review. Conclusions: Seven of the nine studies showed statistically significant association between early sexual activities in adolescents' and their mental health outcome of interest, with more consequence on the girls when compared to the boys.

Assessment of vulnerability factors leading to psychoactive substances use among school children

Chaimaa Moubchiri¹

¹University Hassan the first, Morocco

The use or consumption of psychoactive products is a dynamic subject of scientific interest for all nations. The correlation between the use of Psychoactive substances use and adolescence is a real challenge that requires a multidisciplinary participation in the planning and implementation of prevention actions. At the national level, there is already a slight increase in prevalence figures between the MedSPAD 2013 and MedSPAD 2017 surveys for tobacco, alcohol, cannabis and sleeping pills among Moroccan schoolchildren aged between 15 and 17 years. We opted for a systematic bibliographic search using PRISMA STATEMENT; in order to answer our problem; which is interested in the evaluation of vulnerability factors related to the use of psychoactive substances in young school children. The school environment is an effective field to prevent the use and positively impact this transition. On the socio-economic level, this scourge escapes no one, it is contextual, the disparity exists and coexists in the same context being well off or coming from a low social level, the risk of use is always present. The integration of the family is paramount to protect young adolescents against the influence of peers, which ranks as an underlying factor that follows a neurobiological process

. The assessment of vulnerability factors is one of the first pillars to reduce the use of Psychoactive substances use in young school children

Keywords: vulnerability, psychoactive substances(PAS), adolescents, assessment

Fathers' experiences of child care and feeding: a photo-elicitation study in urban low resource setting, Addis Ababa, Ethiopia

Hanna Berhane¹, Dagmawit Haimanot²

¹Department of Women's and Children Health, International Maternal and Child Health, Uppsala University, Uppsala, Sweden, ²Addis Continental Institute of Public Health, Ethiopian Public Health Association, Ethiopia

Background and Objectives: Children's health and wellbeing studies focus mainly on mothers roles, and very little is known about the experiences and challenges that fathers face to fulfill their responsibilities. This study Aims to explore the fathers' lived experiences of child care and feeding in urban low-income settings. Methods: A qualitative study was conducted in Addis Ababa, Ethiopia. Photo-elicitation was used to facilitate the in-depth interviews with fathers who had children below the age of five years. Participants were asked to take pictures depicting their roles as fathers, capturing aspects of the setting they deemed noteworthy. A thematic analysis approach was used to analyze transcribed and cleaned data.

Results: The overarching theme of this study was fatherhood as an enduring identity, comprising three subthemes: 1) Blessings of fatherhood, 2) Adjusting to fathering roles, and 3) Struggles/demands of fatherhood in low-resource settings. The analysis indicated that having children and becoming a father was a blessing. Fathers conveyed their love, devotion, and attachment to their children, and some used the term "my second chance in life". Nonetheless, while striving to spend time and care for children relentlessly, parallel challenges, such as the internal struggle to adjust to a new 'fatherhood' role while maintaining their old selves, were highlighted. The pressure of providing for a family amidst existing pressures from the external environment, such as poor housing conditions, a lack of employment opportunities, and the current COVID-19 pandemic disrupts their context further adding to their stress. Conclusions: Most fathers were engaged in child care and feeding suggesting that like mothers, fathers should be viewed as a potential agent for implementing nutrition interventions. However, if such interventions are to be successful, they need to incorporate components that boost fathers livelihoods and general well-being.

Parent adolescent communication on sexual and reproductive health issues in Pokhara, Nepal

Narayani Tripathi¹, Bibek Rimal²

¹Family Planning Association of Nepal (IPPF), Nepal, ²Family Planning Association of Nepal, Nepal

The aim of this study was to assess the prevalence of communication, and factors affecting communication between high school adolescents with their parents on reproductive health issues in Pokhara Metropolitan city, Nepal. A school-based cross-sectional study for quantitative and focus group discussion for qualitative study was done where data from adolescents were taken through self-administered questionnaire and information and data were collected from parents through focus group discussions. A multistage sampling technique was used to sample the study participants. Data were collected by using a self-administrated structured questionnaire, which was developed based on previous literature incorporating all variables to be assessed. Data were entered and analyzed through Epi data and SPSS version 20.0, respectively. This study revealed that 18.1% of students discussed RH issues with their parents. Factors such as being a male student (adjusted odds ratio [AOR] =3.36; 95% CI 1.57-7.17); being in the 11-12th grade (P value 0.001;95% CI 0.183-0.77), knowledge on RH issues (AOR =3.94; 95% CI 1.91-8.104); significantly affect the communication between parents and students on RH issues. This study showed that only a low proportion of students communicated on RH issues with their parents. Parents should focus on both male and female child equally, in discussing RH matters and in improving their communication skills, and should be transparent in the community to encourage open discussion among family members particularly with their adolescent children.

Trauma informed approach: an innovative tool for assisting a victims of sexual violence

Kelly Parsley¹¹Carroll College, United States

W.H.O. estimates that "1 in 3 (35%) of women worldwide have experienced either physical and/or sexual intimate partner violence or non-partners sexual violence in their lifetime" and Amnesty International concurs: "at least one out of every three women worldwide has been beaten, coerced into sex, or otherwise abused in her lifetime." While these numbers are deplorable, few medical professionals have learned skills to support these victims. This poster presentation will train medical personnel on trauma-informed ways of supporting rape survivors that include. Creating care based on respect and physical/emotional safety. Understanding of how brains function when confronted with trauma. Avoiding re-traumatization by providing services that meet survivor's needs. Methods: This poster presentation will rely on academic research on sexual violence which includes Discussions of Safety: the ability to seek help knowing that those helping will keep information confidential, will work to keep them safe, and will not respond to them by victim blaming. Empowerment: the ability to determine when to seek medical, legal, and social service assistance. Control: the ability to make choices for themselves. Voice: the ability to tell their stories to medical personnel who won't blame them for the assault but instead will actively listen. Justice: the ability to define justice. It may include court hearings, or something as simple as safe housing, alternate routes to work, and/or the ability to work at a different branch of the same business. Impact By implementing a trauma-informed response to sexual violence, agencies can better serve survivors, speed their recovery, and avoid inadvertently re-traumatizing victims. Implications Research suggest that trauma-informed approaches can reduce stress, speed healing, reduce substance abuse, reduce depression and Post Traumatic Stress Disorder (PTSD), promote psychological well-being, and help victims become functioning members of society again.

Prevalence of sexual violence in school children in Brazil: National School Health Survey 2019

Deborah Malta¹, Nádia Vasconcelos², Fabiana Andrade², Isabella Pinto², Crizian Gomes², Gisele Andrade², Juliana Bottoni², Marli Montenegro³¹Departamento de Enfermagem Materno-Infantil e Saúde Pública, Escola de Enfermagem, Universidade Federal de Minas Gerais, Brasil, ²Universidade Federal de Minas Gerais (UFMG), Brazil, ³Ministerio da Saude Brasil, Brazil

Adolescents are considered one of society's vulnerable groups, and are exposed to different types of social and health problems, among which violence stands out. Sexual violence (SV) stands out as one of the main forms of aggression against teenager. SV is defined as "any action in which a person, taking advantage of his position of power and making use of physical force, coercion, intimidation or psychological influence, with or without the use of weapons or drugs, compels another person - any sex - to have, witness, or otherwise participate in sexual interactions." The study analyzes data on sexual violence against adolescents using the 2019 National School Health Survey. Objectives To analyze the prevalence of sexual violence among students between 13 and 17 years old in Brazil. methods Cross-sectional study with data from National Survey of School Health 2019. It was analyzed the prevalence and respective 95% confidence intervals (95%CI) of sexual abuse and rape involving students from 13 to 17 years old of Brazil, according to sex, age groups, school type, aggressor, administrative region of residence and federative units.

Results: The prevalence of sexual abuse among students was 14.6% (95%CI: 14.2;15.1) and of rape was 6.3% (95%CI: 6.0;6.6). The prevalence was higher among the female students and of the age group of 16 and 17 years old. The most common aggressor was a intimate partner. Among schoolchildren who were raped, more than half reported to have experienced this violence before the age 13 years old (53.2%; 95%CI: 51.0;55.4). Conclusions: The sexual violence has a elevated prevalence among the Brazilian students between 13 and 17 years old. Besides, the aggressions were perpetrated, overall, by people in the family nucleus and intimate and affectionate relationships. There must be intersectoral articulation to develop public policies that act to face this problem.

Monitoring and evaluation of perinatal healthcare in Italy: data from the National Outcomes Evaluation Programme (years 2015-2021)

Alice Maraschini¹¹Istituto Superiore di Sanità, Italy

Background and Objective: The National Outcomes Evaluation Programme (Programma Nazionale Esiti, PNE) monitors several aspects of perinatal health

care, with particular attention to the quality and appropriateness of health care in Italian maternities.

Methods: Perinatal health care was assessed by calculating seven indicators: two volume indicators (total number of deliveries; number of deliveries by caesarean section, CS); three process indicators (proportion of deliveries with primary CS; proportion of vaginal births after caesarean, VBAC; proportion of episiotomies in vaginal deliveries); and two outcome indicators (hospital readmissions within 42 days from hospitalization in case of vaginal delivery and CS). The information source was the National Hospital Discharge Records. Risk adjustment models were implemented to compare hospital performance and the impact of women's area of residence, eliminating confounding due to women's age, and comorbidities both before and at the time of hospitalization for delivery, as well as for potential clinical determinants of the mode of delivery.

Results: In Italy, the number of hospitalizations for birth has progressively decreased over time, from 484743 in 2015 to 398,506 in 2021. At the same time, the primary CS rate decreased from 25.1% in 2015 to 22.4% in 2021, and the proportion of episiotomies dropped from 24.4% to 12.3%. Both procedures demonstrated significant regional and hospital variability and a strong North-South gradient. Within the same period, the proportion of VBAC increased slightly from 8.4% to 10.7%.

Conclusions: The analysis based on perinatal indicators of the PNE shows high proportion of CS and episiotomy compared to the WHO recommended rates. In addition, the low proportion of VBAC and the persistence of a wide inter- and intra-regional variability suggest ample room for improvement in perinatal care in Italy.

DOI: 10.18332/popmed/165123

Child development in the context of the COVID-19 pandemic: repercussions for health promotion

Debora Mello¹¹University of Sao Paulo, Brazil

Introduction: The COVID-19 pandemic has made the health situation worldwide serious, with possible effects on children related to behavioral, dietary and emotional changes. Objective: To analyze care circumstances and concerns about child development in the context of the COVID-19 pandemic from the maternal perspective. Methodology: Longitudinal study, through telephone interviews with 86 mothers of Brazilian children between two and three years old, with the same participants in 2020, 2021 and 2022.

Results: Maternal reports express changes in the child's sleep routine, diet and behavior. Dialogues about the pandemic were not carried out with children, mainly in 2020 (48%), with an improvement in 2021 and 2022. From the maternal perspective, the pandemic situation can harm child development, reported in 2020 (40%), increased in 2021 (63%) and returned to the same level in 2022 (40%). Reading children's books was a practice carried out by the majority in 2020 (65%), 2021 (71%) and 2022 (63%). Use of electronic devices in children's routine was frequent in 2020 (78%), 2021 (80%) and 2022 (94%). More than 90% of children's vaccination status was up-to-date, and around 30% of families failed to take their children to health appointments during the analyzed period. Conclusions: There are gaps in activities to promote development, to establish limits and understand children's needs. The situation of the COVID-19 pandemic presents itself as a circumstance that can generate difficulties in the process of caring and providing development at home. Implications for health: Health care in the context of early childhood requires advances to increase the decision-making process and choices of everyday parenting practices. Primary health care for children with quality and proximity to families has the potential to promote development, reduce vulnerabilities and contribute to meeting the essential needs of children.

The associations of early formal childcare with problem behaviour trajectories from 5 to 14 years of age

Kathrin Burdenski¹¹Loughborough University, United Kingdom

Background and Objective: Childcare provides the first opportunity to stimulate children's cognitive, social, and emotional development outside the home. We know little about how childcare is associated with mental health in childhood and adolescence. The Millennium Cohort Study, a large UK longitudinal study, was used to examine the relationship between age of starting childcare and weekly hours in formal childcare between birth and 5 years and externalizing and internalizing behavior trajectories from ages 5 to 14 years.

Methods: The sample comprised 6194 children. Parents reported externalizing and internalizing behaviors with the strengths and difficulties questionnaire at 5,

7, 11 and 14 years. Associations were analyzed using a multilevel general linear regression model, with adjustment for socio-economic position, maternal mental health, demographics, and child temperament.

Results: Later entry into childcare was associated with more internalizing but not externalizing behaviors, with the effect strengthening from 5 years to 14 years. In the fully adjusted model, starting childcare between 1-2 and 4-5 years compared to starting between 0-1 year was associated with 0.39 (-0.01, -0.79) and 0.98 (0.24, -1.71) higher internalizing behavior scores at 14 years. Children who spent more than 40 hours per week in childcare between birth and 3 years had 1.23 (0.58, 1.87) higher externalizing behavior scores at 5 years than children who spent no time in childcare. The association disappeared by 14 years. Weekly hours were not associated with internalizing behavior.

Conclusions: Results show that childcare is associated with subsequent mental health and that the timing matters. Childcare could play an important role in a population's mental health promotion, however so far this is only the case for internalizing behaviors, and high intensities might even be associated to more problem behaviors.

New perspectives for the school medical service in Italy

Eva Massari¹, Luisa Brgonzoli¹, Chiara Crepaldi¹, Maria Iardino¹, Damiano Fuschi²

¹Fondazione The Bridge, Milano, Italy, ²Università degli Studi di Milano, Italy
Background and Objective: The School Medical Service was introduced in Italy in 1978 with the aim of developing health prevention and promotion targeted to school pupils. For many years it played a key role, but then it lost its relevance. Despite this, the National Prevention Plan 2020-25 considers it as a fundamental setting for health promotion and protection of the overall national community. Fondazione The Bridge launched an in-depth study aimed to develop an implementation strategy useful to create a new model of school medical service focused on health promotion.

Methods: The first step was building a multi-stakeholder working group that worked on the analysis of the literature review to collect examples of best practices at national and international level. The second step concerned the identification of strength and weakness of different regulatory aspects gathered from existing local practices. Three surveys addressed to mayors, teachers and headmasters have been carried out to collect their wishes and views, generating new ideas that have been proposed as suggestions to policy makers.

Results: The multistakeholders team identified key issues to be considered when developing a new school medical service able to support health promotion and prevention, including the possibility to consider the school as a vaccination setting. The position paper proposed a working model and concrete operative options for the development of policy initiatives.

Conclusions: An innovative strategy able to redesign the relationship between Primary Care, Social Health Services and School, within an integrated strategy able to gather relevant stakeholders (school, health services, municipality), has the potential to generate benefits and positive effects for students, their families and the overall community. Bringing social and health services closer to schools and raising awareness among students can positively influence the determinants of health and ensure greater equity in the provision of social and health services.

DOI: 10.18332/popmed/165179

Adolescents' knowledge, self-efficacy, and the use of implant contraceptives in west point community, Liberia

Mildred Silikpoh¹, Eementary Kpoh²

¹Institute for Collective Health, Cuttington University Graduate School, Liberia, ²Cuttington University Graduate School, Congo Town, Liberia

Background: Implant contraceptives are available for free in public health facilities and selected private clinics in most communities in Liberia for the purpose of controlling and preventing unplanned and unwanted pregnancies. Despite the freely available contraceptives, adolescents between the ages of 10 to 19 years still conceive. As a result, nearly 26% of adolescents unintentionally become pregnant, and 30% of pregnancies end in unsafe abortions.

Objective: The aim of this study was realized through the following objectives: 1. What is the extent of knowledge of adolescents on implant contraceptive use? 2. What is the extent of self-efficacy of adolescents on implant contraceptive use? 3. What is the extent of implant contraceptive use among adolescents?

Methods: A self-administered questionnaire survey was distributed to 294 female adolescents using stratified and simple random sampling. Descriptive analysis was conducted on the data using the Statistical Package for Social Sciences (SPSS)

software. Means and Standard deviations were used to determine the extent of knowledge, self-efficacy, and implant contraceptive use among adolescents.

Results: Nearly over half (52.2%) of the 294 surveyed female adolescents demonstrated having fair knowledge of the use of implant contraceptives. An estimated 41% of these respondents believed that implant contraceptive causes infection. Adolescents' motivation (self-efficacy) towards implant contraceptives use was low (overall mean of 2.29). The extent of adolescents' use of implant contraceptives was also low. Respondents that have used implant contraceptives recorded the least mean (2.38) which is interpreted as low for implant contraceptives.

Conclusions: These findings point out a huge gap in knowledge and self-efficacy levels of adolescents as well as their use of implant contraceptives. Hence, there is an urgent need for Sexual Reproductive Health (SRH) education programming, with a focus on the importance of implant contraceptives in the West Point Community in Liberia.

DOI: 10.18332/popmed/165250

Evaluation of indicators of physical development in children and adolescent as a standard for health

Vanya Nedkova-Milanova¹, Mariyana Stoyanova², Daniel Monov³, Milena Karcheva⁴

¹Department of General Medicine, Medical University, Pleven, Bulgaria,

²Department of Hygiene, Medical Ecology, Occupational Diseases and Disaster Medicine, Medical University, Pleven, Bulgaria, ³Medical College, Sector Public Health Inspector, Medical University of Varna, Varna, Bulgaria,

⁴Department of Infectious Diseases, Epidemiology, Parasitology and Tropical Medicine, Medical University of Pleven, Pleven, Bulgaria

Background and Objective: The assessment of the level of physical development is an element of the control over the health of the children and adolescent and occupies an important place in the practical activity of the health specialists. The aim of the study was analysis from the preventive examinations of the main indicators for the physical development of children and adolescent from 1 to 18 years in organized units in Rousse for 5-years period.

Methods: Data from reports of the Regional Health Inspectorate-Ruse, Ruse were used. We analysed, evaluate and monitor the health status of children and adolescent in organized groups in Rousse district for 5 years (2016-2020). Anthropometric indicators of height, weight and physical capacity were a marker of health. When performing an individual assessment of height and weight, according to anthropometric indicators, they are divided into three groups: Group I "norm", Group II "extended norm", Group III "outside the norm".

Results: The scope of the conducted research has better indicators for children 98% and 99% (2016,2017,2018,2019), than adolescents 97.16% (2016) to 95.93% (2020). For children and adolescents, the indicators in the "norm" are leading in the three indicators of height, weight and physical capacity. 2.38% of those exempted from physical education classes were found to be obese.

Conclusions: A good organization has been established to monitor the physical development of children and adolescent in Rousse district by Regional Health Inspectorate, physicians and staff in health offices for anthropometric research for 2016-2020. It is extremely important to carry out an annual preventive screening of children and adolescents in order to promptly detect deviations from their physical development.

DOI: 10.18332/popmed/165273

Mortality profile of pregnant women with severe acute respiratory syndrome due to COVID-19 in Brazil: Pre- and post-vaccination

Danielle Kassada¹, Maria Vilela¹, Paula Costa², Dalvani Marques², Débora Santos², Eliete Silva², João Oliveira², Luisa Silva², Giulia Rios², Amanda Camargo², Victoria Santos²

¹Public Health, University of Campinas, Brazil, ²University of Campinas, Sao Paulo, Brazil

Background and Objective: Pregnant women are more susceptible to more severe Sars-CoV-2 infections, therefore the Brazilian ministry of health recommends immunization since July 2021 to reduce maternal morbimortality. This study aims to describe the mortality profile of Brazilian pregnant women due to COVID-19, in the pre- and post-vaccination period. Methods: A descriptive, cross-sectional, and comparative study of notifications for severe acute respiratory syndrome to COVID-19 in pregnant women in Brazil, based on extracted data from the influenza epidemiological surveillance information system from epidemiological week 1 to 26 of 2021 and 2022. To perform the analyses, the statistical software SAS in 9.4 version was used, and a significance level of 5% was considered.

Results: There were 883 deaths of pregnant women with Sars to COVID-19 in 2021 and 10 in 2022. In 2021, those who were 35 years or older, lived in the northern region, had fever, cough, dyspnea, respiratory distress, saturation lower than 95%, comorbidities, obesity, admission to the Intensive Care Unit (ICU), need for ventilatory support, were not vaccinated, and had an incomplete vaccination schedule were the ones with the highest proportion of cases that died. In 2022, pregnant women were 35 years old or older (50%), from the northeast region (40%), and brown (66.7%). Regarding clinical manifestations, fever (83.3%) and cough (62.5%) were the most identified symptoms. With regard to risk factors, 80% of pregnant women had at least one comorbidity and heart disease was the most prevalent (66.7%). Between these pregnant women, 66.7% needed ICU and 77.8% needed ventilatory support. As for vaccination, 70% were not vaccinated. Conclusions: The study allowed the characterization of the epidemiological profile of pregnant women with Sars to COVID-19 who died in Brazil. This profile may be related to the social determinants of health and the difficult access to health care services.

DOI: 10.18332/popmed/165412

A systems thinking approach to better understand the causal relationships driving child stunting in the Lao PDR

Tari Bowling¹

¹Deakin University, Australia

Background and Objectives: The Lao PDR (Laos) has the highest rate of child-stunting (low height-for-age) in South-East Asia despite a higher gross national income compared to other countries. Stunting has significant implications for a country's future economic prosperity and productivity and remains a priority global health issue. A paradigm shift is needed if the burden of childhood stunting is to be reduced both in Laos and globally. This requires a better understanding of the underlying drivers of childhood undernutrition within context, and how these drivers interact to produce the symptomatic outcome of child stunting. Using community-based system dynamics (CBSD), a participatory approach that builds stakeholder capacity to learn and address complex problems, this research sought to better understand the fundamental dynamics of child-stunting in Laos and build stakeholder capacity in systems thinking.

Methods: The CBSD approach was adapted to the context of Laos incorporating literature reviews, exploratory system models, and two stakeholder group model building workshops in Laos. Current research and mental models of stakeholders were mapped, and a combination of synthesis and triangulation employed for data aggregation.

Results: Stakeholders developed five causal-maps of the child-stunting system, along with narratives articulating their understanding of child-stunting determinants in Laos. A thematic analysis of the data identified three key gaps between stakeholder knowledge, published literature, and socioeconomic data. Traditional practices and post-partum dietary restrictions, antenatal care and treatment by health care practitioners, and the education system were identified as core underlying drivers of child-stunting in Laos.

Conclusions: This research provides insights into the complexity of childhood stunting in Laos and delivers an adapted CBSD approach that can be applied to other complex public health problems in low-resource settings. Scaling up this research provides the opportunity to bridge the knowledge-policy gap and inform evidence-based, high-impact policies with improved health outcomes.

Cardiometabolic profile of Brazilian children and adolescents during the COVID-19 pandemic

George Machado-Coelho¹

¹Medicine School, Federal University of Ouro Preto, Minas Gerais, Brazil

Background: Cardiovascular Diseases (CVD) are the major cause of death in the world and, although predominate in adulthood, exposure to risk factors (RF) begins in childhood. Objective: To evaluate the associations between RF for CVD and overweight in children and adolescents during the COVID-19 pandemic. Methods: Population-based cross-sectional study with 948 students from Ouro Preto city, Minas Gerais, with the application of a sociodemographic and behavioral questionnaire, measurement of anthropometry, blood pressure and serum lipid profile in the year 2021. The association between overweight/obesity and sociodemographic, clinical and behavioral factors was determined by binary logistic regression adjusted for confounding variables, using a significance level of 0.05.

Results: The sample consisted of 51.2% boys, 56.6% adolescents, 68.6% black or brown, 86.6% public school students and 54.8% with family income < 2 minimum

wages. In the clinical evaluation, 25.3% had a waist circumference > percentile 90th, 23.2% were overweight, 8.5% were obese, 3.3% were hypertensive, 68.9% were hypercholesterolemic and 56.0% were hypertriglyceridemic. Compared to adolescents, children were more likely to have hypercholesterolemia (OR 1.75 [1.31-2.33], p=0.001) and hypertriglyceridemia (OR 1.74 [1.34-2.27], p<0.001). Overweight students are more likely to have a birth weight > 4,000g (OR 2.13 [1.05-4.32], p=0.037), family history of obesity (OR 2.65 [2.00-3.51], p<0.001) and diabetes mellitus (OR 1.83 [1.18-2.84], p=0.007), being hypertensive (OR 8.26 [3.52-19.40], p<0.001) and hypertriglyceridemic (OR 1.89 [1.42-2.53], p<0.001). Discussion: A previous study carried out with students from Ouro Preto detected a lower prevalence of waist circumference > percentile 90th (8.0%), overweight (8.2%), obesity (6.7%), hypertension (2.7%), hypercholesterolemia (36.9%) and hypertriglyceridemia (17.0%). The worsening of the data may be a reflection of social isolation in the face of the COVID-19 pandemic. Conclusions: Therefore, in this post-pandemic era, it's essential to invest in strategies that effectively prevent RF in early stages of life.

Dietary intake with food taboos among pregnant women attending antenatal checkups at a hospital in Narayanganj city, Bangladesh

Arifur Rahaman¹, Mahabuba Afrin², Sipra Mondal³

¹Department of Nursing Science, Rufaida College of Nursing, Dhaka, Bangladesh, ²Department of Health Science, Graduate School of Biomedical and Health Sciences, Hiroshima University, Hiroshima, Japan, ³Department of Urology Operation Theater, Dhaka Medical College Hospital, Dhaka, Bangladesh

Background and Objective: Food habits during pregnancy should be directed toward promoting the health and well-being of the mothers as well as their growing fetuses. But in Bangladesh, there are some misconceptions, beliefs, and practices regarding food intake during pregnancy, which put deleterious effects on the health of mothers as well as on that of their growing fetuses. The aim of this study is to find out the existing dietary intake and food taboos during pregnancy among Bangladeshis.

Methods: A descriptive cross-sectional study was conducted among pregnant women who attended antenatal checkups from Narayanganj Hospital, Bangladesh. A total of 129 participants were enrolled in the study according to the inclusion criteria. After taken consent from the respondents, a face-to-face interview was conducted with each respondent using a semi-structured questionnaire. Socioeconomic, food habits, and taboos data were collected after that data were analyzed by SPSS-25 version software.

Results: The mean age of the participants was 24.89 years, within them, 40.5% of age was 20-25 years. Among the participant 93.5% said some foods are harm full to the baby, as well they don't eat twin bananas (due to threat of twin fetuses), pineapple, coconuts, duck eggs, local mirka fish, local puti fish 83.7%, 82.5%, 25.2%, 29.3%, 79.7%, 13.0% respectively. Food taboos were significant among those with primary education level (P < 0.001), housewife occupation (P < 0.001), and family income BDT 21000-30000 (P < 0.001).

Conclusions: The overall findings revealed that most of the women thought some foods are harmful during pregnancy which is the misconception of that types of foods. The protective factors for food taboos were educational level, occupational status, and family income. Community-based nutritional health education and campaign can be effective to the intake of nutritional food during the pregnancy period.

Teachers' perceptions of school dropout among adolescents: a descriptive study conducted in five middle schools in Sousse Tunisia

Arwa Neffati¹, Houyem Said¹, Hela Ghali¹, Soumaya Mhamdi², Soumaya Bouali³, Nouha Abbassi³, Sana Bhiri¹, Rania Bannour¹, Aroua Kamel¹, Fatimaezzahra Khouya¹, Emna Hariz¹, Soufiene Aidani¹, Souhir Ayadi¹, Salwa Khfacha¹, Mohamed Rejeb¹, Asma Cheikh¹

¹Department of Prevention and Safety of Care, Sahloul University Hospital, Sousse, Tunisia, ²School of Sciences and Health Techniques of Sousse, Tunisia, ³Higher School of Sciences and Techniques of Health of Sousse, Tunisia

Introduction: Dropping out of school is a problem that weighs heavily on the school system in Tunisia. Thus, Prevention programs are being implemented to improve the quality of education in Tunisia. The objective of our study is to describe the perceptions of middle-school teachers in the region of Sousse about school

dropout.

Methodology: A descriptive study was conducted among five middle-schools chosen randomly based on the lists of schools provided by the regional direction of souse through a self-administered questionnaire from April 26th to June 1st 2022.

Results: A sample of 329 teachers was collected. The response rate was calculated at 86.02% with a predominance of females (62.6%). Most of the teachers interviewed mentioned 'student-related' factors such as lack of effort from the student (86.14%), low educational level (75.63%), and excessive drug and alcohol use (73.95%). They mentioned family-related factors: parental neglect and abandonment (83.2%), poor relationship between parents (81.24%) and divorce (80.25%). On the 'social level', the most mentioned factors were the influence of bad companions (80.25%) and violence (73.53%). In addition, 'the educational' system and its changes can intervene in the dropout as the lack of positive role models in education (75.21%), the large number of students per class (73.11%), the lack of resource persons specialists (68.9%), the lack of financial, human and material resources granted (67.68%).

Conclusions: It is important to emphasize the importance of dropout prevention in collaboration with the various stakeholders, in the detection of any deviant behavior and in the early management of students at risk.

Factors associated with electronic cigarette consumption in the covid-19 pandemic in young people

Eduardo Murillo¹, Josue Dominguez¹, Felix Celedonio¹, Meghan Uriza¹, Rocio Mendoza¹

¹Universidad del Valle de Mexico, Mexico

Background: In Mexico, the commercialization of vapers is considered illegal due to the damage it produces in its users, however, the use of electronic cigarettes has spread among young people worldwide, recognizing as users a total of 1.1% of the national population. **Objective:** To determine the factors associated with vape consumption in young people during the covid-19 pandemic. **Methods:** A cross-sectional, prospective study was carried out between December 2021 and April 2022, men and women residents of Veracruz aged between 12 and 25 years were included, excluding participants with a clinical diagnosis of anxiety, with treatment for addictions or anxiety, evaluating the reasons why which vape consumption is made, as well as the changes in consumption since the start of the pandemic. SPSS v22 software was used for data analysis, Chi2 test with Odds Ratio (OR) and 95% confidence interval (95%CI) and MannWhitney U test.

Results: 617 participants were included, identifying 15.5% of current vape users, 0.8% of the population stopped consuming during the pandemic, while 5.5% of the population started using it, 4.7% increased it, 1.1% decreased it, and 6.1% maintained their frequency of consumption. Age, sex, and perceived anxiety had values of $p > 0.05$, while having less than secondary education (OR/95%CI) (3.1/0.14-0.69), being a student (0.3/0.12-0.8), having high socioeconomic level (1.59-1.0-2.5), having a job (2.19/1.3-3.6), perceiving that vape increases work performance (7.4/3.2-16.2), that it increases academic performance (6.7/3.12-14.4) or perceive anxiety reduction when consuming it (4.22/2.61-6.82) had a value of $p < 0.05$. Likewise, those who vape their siblings (7.17/4.19-12.25), partner (9.14/5.14-16.2), relatives (2.24/1.44-3.49) or close friends (23.56/7.36-75.3) showed values of $p < 0.05$. **Conclusions:** During the pandemic, the use of Vape in young people increased, having as associated factors being of a high socioeconomic level, low educational levels, being a worker and having close contacts who are consumers.

Food insecurity and inadequacy of micronutrient intake in Brazilian children

Érica Priulli¹, Mariana de Santis Filgueiras¹, Juliana Farias de Novaes¹

¹Department of Nutrition and Health, Federal University of Viçosa (UFV), Minas Gerais, Brazil

Background and Objective: The relationship between food insecurity (FI) and micronutrient intake inadequacies is increasing in young ages. This study investigated the association between children's FI and micronutrient intake in Brazilian schoolchildren. **Methods:** This is a cross-sectional representative study conducted with children from the Schoolchildren Health Assessment Survey (PASE, in Portuguese). The sample consisted of 378 children aged 8 to 9 from all the schools in the urban area of Viçosa, Minas Gerais, Brazil, in 2015. The FI was evaluated by the Brazilian Food Insecurity Scale, and the food intake by three 24-hour-recall, being one of a weekend day. The consumption adequacy

was performed by the Estimated Average Requirement (EAR) method as a cut-off point. Poisson regression models were adjusted for sex, age, and race. Statistical analyzes were conducted by STATA 14 considering a statistical significance level of 5%. This study was approved by the Human Research Ethics Committee of the Universidade Federal de Viçosa.

Results: The majority of our sample were non-white (68.5%), and the mean per capita income was US\$ 242.28 ± 276.61. We identified a high prevalence of FI in children (48.4%). The prevalence of intake inadequacy of micronutrients was high as well, such as calcium (81%), iron (35.2%), zinc (47.6%), vitamin D (91.5%), phosphorus (47.9%), sodium (51.9%), copper (35.5%) and magnesium (52.9%). The FI was positively associated with intake inadequacy of calcium (PR: 1.21%; 95%CI: 1.10%; 1.33%), iron (PR: 1.41%; 95%CI: 1.07%; 1.86%), zinc (PR: 1.26%; 95%CI: 1.03%; 1.53%), phosphorus (PR: 1.27%; 95%CI: 1.08%; 1.49%), copper (PR: 1.43%; 95%CI: 1.10%; 1.89%), and magnesium (PR: 1.27% (1.08%; 1.51%). **Conclusions:** The high prevalence of food insecurity and its association with an inadequate intake of micronutrients indicate the need to implement public policies to improve access to micronutrients in children's diets in developing country as Brazil.

Coming of age: menstrual preparation for adolescent girls living in Palestinian refugee camps in the West Bank and Jordan

Rula Ghandour¹

¹Birzeit University, Occupied Palestinian Territory

Background: Menarche is the main milestone for adolescent girls marking the onset of their puberty. Adequate menstrual preparation is essential for a healthy menstrual life. This study aims to explore the menstrual preparation and related experiences of adolescent girls living in long-term Palestinian refugee camps in the West Bank and Jordan.

Methods: 39 in-depth interviews and 23 focus group discussions were conducted with 15-18 years girls between March and September 2018.

Results: The findings highlighted inadequate menstrual preparation of adolescent girls, which focused mainly on practical aspects and hygienic practices and neglected biological, emotional, or psychological aspects. Menstrual preparation was mainly the responsibility of mothers and to a lower extent, teachers, and usually hindered by a general culture of taboo and secrecy, what the girls referred to as "aib ʔʔʔʔ". Appropriate information usually started after menarche, leaving girls with limited knowledge on what to expect or how to deal with menstruation. Girls' own reports indicated that many had their first periods with almost no information, resulting in a dramatic reaction with fear and anxiety as dominant feelings.

Conclusions: This study highlights the need to address menstrual preparation for adolescents. Preparation needs to be initiated early, before menarche, with adequate information, practices, and emotional and psychological support to help girls expect and respect what is happening to their bodies. This can be achieved by schools acknowledging the need for adequate information as a first step, followed by a collaborative atmosphere between households, schools, and health services.

The use of essential oils in birth care

Teresa Ferreira¹, Leticia Domingues², Ana Santos³, Juliane Souza²

¹Municipal Health Department of Rio de Janeiro, Brazil, ²Health Department of Rio de Janeiro Prefecture, Brazil, ³Estate Institute of Cardiology, Aloysio de Castro of Rio de Janeiro, Brazil

Background and Objective: The World Health Organization (WHO) has a set of diverse practices, approaches, knowledge and beliefs in health, where plant, animal or mineral-based medicines are used, spiritual therapies, manual techniques that can be applied, separately or in combination, with the aim of maintaining well-being, treating, diagnosing and preventing diseases (WHO, 2002). Non-pharmacological methods are considered important for relieving parturients pain, fears and anxieties, reducing tensions caused by the parturition process, as well as providing comfort and well-being to women during labor. Among these methods, aromatherapy consists of the use of essential oils and has contributions to childbirth care. The objective of this study is to identify which essential oils (EO) can be used during childbirth and describe their applicability in childbirth care.

Methods: This is bibliographical research that used classic references in the field of aromatherapy, scientific articles and Ministry of Health Policies. **Results and Discussion:** Essential oils are precious for well-being, both for the body and for the spirit. Elevate the mind, mood and emotions. The use of the non-pharmacological method, for pain relief through massage with OE, can provide parturients with a

more comfortable, pleasant and less exhausting way of giving birth to newborns. The nursing team must have adequate knowledge and be trained to use it in their practice. The EO of French Lavender, Geranium, Sweet Orange, Ylang Ylang, Jasmine, Frankincense and others, always thinking about the conditions of the parturient.

Conclusions: EO can be an additional alternative for parturients, due to their effectiveness in relieving pain, anxiety and improving well-being during labor.

Descriptors: massage; aromatherapy; labor

Knowledge, attitude and practices on second hand smoke exposure among pregnant women

Badra Bannour¹, Rania Bannour¹, Imen Bannour¹

¹Farhat Hached Sousse, Tunisia

Background: Exposure to Second hand smoking (SHS) during pregnancy may endanger maternal and fetal health with long term consequences. The aim of this study was assess the knowledge, attitude, and practices of pregnant women in relation to environmental tobacco smoke exposure.

Methods: A cross-sectional study was conducted among a convenience sample of pregnant women who had a routine obstetrical appointment in the obstetrical gynecology department of the university Hospital Farhat Hached Sousse.

Results: Overall, 125 pregnant women were approached. The prevalence of exposure to SHS in pregnant women was 81.6%. The woman education level ($p=0.001$), the education level of the partner ($p=0.002$), living area ($p=0.001$) and the mother working statue ($p=0.034$) had significant association with the participant prevalence of exposure to SHS. The father's level of education (high school or university level) seems to be a determinant factor of both SHS ($p=0.006$; OR 5.1; IC: [1.53-17.53]) and avoidance practice ($p=0.04$; OR 8.62; IC: [2.03-36.6]).

Conclusions: We suggest strengthening health education for pregnant women on the health risks of active and passive smoking. These interventions should be comprehensive, multi-faceted and multi-sectorial involving primary health care providers, public health practitioners, policy makers, and media.

Epidemiological analysis of cases of syphilis in pregnant women and congenital in the city of Indaiatuba - SP - Brazil from 2012 to 2021

Luana Vianna¹, Willian Marchioli¹, Mariana Vianna², Johannes Lochter³

¹Unimax University Center, Brazil, ²Medicine Department, Unimax University Center, Brazil, ³Computer Engineering Department, Facens Center University, Brazil

The aim of the present study was to analyze the epidemiological profile and spatial distribution of gestational and congenital syphilis cases. This is a descriptive, exploratory and retrospective research, with a quantitative approach, conducted in Indaiatuba - SP (Brazil). Data from case reports confirmed by gestational and congenital syphilis of the Notification Recording Information System from 2012 to December 2021 were used. With the Global Positioning System technology, case coordinates were collected, and with the Quantum GIS program, version 1.7.0, the maps were built. There were 386 cases of gestational syphilis, presenting a growth of 73% in the period. The highest prevalence occurred in young, brown women with low schooling and housewives. Higher frequency of diagnosis in the third gestational trimester was evidenced, with higher prevalence of primary syphilis. There were 172 cases of congenital syphilis, with a 85% growth in detection rate and age prevalence between 1 and 28 days of life. It reveals the fragility in the research management, making it detrimental to permanent education, to qualify the professionals, in order to institute early identification, timely treatment and effective follow-up, to evaluate the quality of prenatal care in the municipality. Through the technique of simple regression artificial intelligence, the perspective for the coming years was analyzed in case the municipal management does not study ways to circumvent this public health problem.

Impact of the COVID-19 pandemic on smoking and vaping use among adolescents in Taiwan

Li-Chuan Chang¹, Pei-Ching Chen², Miauh-Shin Chen³, Po-Chang Tseng³, Yue-Chune Lee^{4,5}

¹Geriatric and Long-Term Care Research Center, College of Nursing, Chang Gung University of Science and Technology, Taoyuan City, Taiwan, ²Department of Health and Welfare, College of City Management, University

of Taipei, Taipei City, Taiwan, ³Health Promotion Administration, Ministry of Health and Welfare, Taipei, Taiwan, ⁴Institute of Health and Welfare Policy, School of Medicine, National Yang Ming Chiao Tung University, Taipei, Taiwan, ⁵Master Program in Transdisciplinary Long-term Care and Management, National Yang Ming Chiao Tung University, Taipei, Taiwan

Background and Objective: The coronavirus disease 2019 (COVID-19) pandemic had led to huge impact on society. The corresponding guidelines and legislation to limit social interaction, such as 2021 stay-at-home mandate for senior-high school level and below in Taiwan ("lockdown" restrictions), may have influence on health behaviors in various ways. This study aimed to examine whether 2021 COVID-19 lockdown in Taiwan is associated with the change in the use of cigarette and electronic cigarette (e-cigarette) among adolescents.

Methods: This population-based pooled cross-sectional analysis study was conducted using the 2019 and 2021 Taiwan Global Youth Tobacco Survey. A total of 70,804 participants (aged 12 to 18-years) was included. The outcome measures were cigarette and e-cigarette use. Multiple logistic regression was carried out to examine the association.

Results: The prevalence of current cigarette use decreased from 6.2% in 2019 to 5.4% in 2021; nevertheless, the prevalence of current e-cigarette use increased from 4.2% in 2019 to 6.3% in 2021. Multivariate analysis showed that adolescents were less likely to report use cigarette in 2021 ($aOR=0.79$, 95% CI: 0.66 to 0.95) than in 2019. In contrast, adolescents were more likely to report use e-cigarette in 2021 ($aOR=1.76$, 95% CI: 1.38 to 2.25) than in 2019. Male, disposable income, parental smoking, peers smoking, household second-hand smoke exposure, parents' education level and anti-smoke class were important factors for both the use of cigarette and e-cigarette use.

Conclusions: We found the diverse influences of 2021 COVID-19 lockdown on adolescents' tobacco product use. There was decreased use of cigarette yet increased use of vaping, though the sale of it remains illegal, among adolescents in Taiwan. Public health efforts to prevent and address the health harm from use of vaping or the potential switch from other tobacco products among adolescents is urgently needed.

Residential exposure to magnetic fields from high-voltage power lines and risk of childhood leukemia in an Italian population

Marcella Malavolti¹, Carlotta Malagoli¹, Tommaso Filippini¹, Maurizio Poli², Monica Cellini³, Giovanni Palazzi⁴, Marco Vinceti¹

¹University of Modena and Reggio Emilia, Italy, ²Emilia Romagna ARPAEE, Environmental Prevention Area - West, Italy, ³Pediatric Oncology and Hematology Unit, Department of Medical and Surgical Sciences for Mothers, Children and Adults, University of Modena and Reggio Emilia, Modena, Italy, ⁴Pediatric Oncology and Hematology Unit, Department of Medical and Surgical Sciences for Mothers, Children and Adults, University of Modena and Reggio Emilia, Modena, Italy

Background: An excess risk of leukemia in children living close to high-voltage power-lines and therefore exposed to extremely low frequency magnetic fields has been suggested, though not all studies yielded consistent results, and a possible role of confounding and exposure misclassification could not be entirely ruled out. Methods: We investigated the risk of childhood leukemia associated with magnetic fields exposure from 132+ kV power lines within a population-based case-control study in two Northern Italy provinces, Modena and Reggio Emilia. We included all the 182 registry-based childhood leukemia cases diagnosed from 1998 to 2019, and 726 age, sex and province of residence-matched controls. We assessed exposure by calculating distance from house to nearest power line in a geographical information system database and by modeling magnetic fields at the subjects' residence. We run analyses in the overall population, restricted to acute lymphoblastic leukemia (ALL) cases, and stratified by age (<5 and ≥5 years). Results: Compared to those living ≥ 400 m from high-voltage power-lines, children living <50 m and 50-100 m from power lines showed a disease odds ratio (OR) of 3.0 (95% CI 0.7-13.3) and 1.6 (95% CI 0.5-5.1), respectively. The excess risk close to the power lines was higher for the ALL subtype (OR 3.0, 95% CI 0.7-13.3) and among children diagnosed after 5 years (4.1, 95% CI 0.8-20.6). Results did not substantially differ when exposure was based on modeled magnetic fields, though risk ratio estimates became more statistically unstable. Conclusions: We found a statistically imprecise excess risk for childhood leukemia associated with close proximity to high-voltage power lines, which appeared to be stronger for the youngest children.

DOI: 10.18332/popmed/165697

What do children aged 5 to 14 years die from in the state of Rio de Janeiro? Analysis of the period 2000-2019

Cynthia Boschi-Pinto¹, Cynthia Boschi-Pinto¹, Helen Curvello¹, Sandra Fonseca¹, Pauline Kale², Helia Kawa³, Julia Correia⁴

¹Fluminense Federal University "Rua Marquês de Paraná, 303, 3º andar, anexo ao Hospital Universitário Antônio Pedro (Huap), Centro, Niterói - RJ E-mail: isc@id.uff.br" Brazil, ²Federal University of Rio de Janeiro Brazil,

³Fluminense Federal University, ⁴Fluminense Federal University Brazil

Background and Objectives: Until recently, mortality among children aged 5 to 14 years did not receive the same attention as that of children under 5 years, despite an estimated number of one million annual deaths in the former group. This lack of attention has resulted in an important gap in knowledge on child health. This study aimed to investigate the magnitude and trends of cause-specific mortality among children 5 to 14 years of age in the state of Rio de Janeiro (RJ) from 2000 to 2019. **Methods:** Population-based ecological study, using data from the Brazilian Mortality Information System (MIS). We calculated mortality rates per 100,000 children by chapters, groups, and categories of causes of death (ICD-10) and by age groups (5-9 and 10-14 years). Trends were estimated by Joinpoint regression. **Results:** Mortality rates among children aged 10 to 14 years were higher than those among children 5 to 9. The five leading causes of death were the same in both age groups, but they ranked differently. The two leading ones were external causes and neoplasms (31% and 15% among children aged 5 to 9 years; 45% and 11% among children aged 10 to 14 years). Among children 5 to 9 years, the mortality trend showed an 8.5% annual decline from 2011 to 2015. Among those aged 10 to 14 years, the annual decline was 1.3% from 2000 to 2019. Mortality due to external causes decreased in both age groups, except for the category "Assault by unspecified firearm" (boys, 10 to 14 years) and "Unspecified drowning and submersion" (boys, 5 to 9 years). Mortality caused by neoplasms remained steady in both age groups. Infectious and respiratory diseases decreased differently between the two groups.

Conclusion: Most causes of death are preventable or treatable, indicating the need for health and intersectoral investments.

The mutaba'ah Study: a cohort profile of the largest mother and child prospective cohort study in the United Arab Emirates

Luai Ahmed¹, Zufishan Alam¹, Iffat Elbarazi¹, Fatma Al-Maskari¹, Rami Al-Rifai¹, Tom Loney²

¹United Arab Emirates University United Arab Emirates, ²Mohammed Bin Rashid University of Medicine and Health Sciences United Arab Emirates

Background and Objectives: The effect of early-life exposures on health and development in childhood and adulthood is well established. The lack of cohort studies on maternal and child health in the United Arab Emirates led to the conception of the Mutaba'ah Study. The study aims to secure epidemiological data on maternal and child health from pregnancy until the child reaches 18 years to investigate the mother's health and maternal outcomes and the maternal and early-life determinants of infant, child and adolescent health.

Methods: The Mutaba'ah (meaning follow-up in Arabic) Study is a large ongoing prospective mother and child cohort study in Al Ain city, targeting to recruit 17,000 mother and baby pairs. Recruitment started in 2017. Participants are recruited from major hospitals in Al Ain and include pregnant women from the Emirati population aged ≥18 years, preferably in the first trimester, able to provide informed consent, and their offspring. Data is collected via questionnaires and medical records at various time points.

Results: To date, more than 13,000 participants aged 18-54 years have been recruited, reflecting a response rate of 87.0%. The average maternal age was 31 years, and around 29% were primiparous, unemployed (67.4%), had higher than secondary education (53%), and perceived they had sufficient social support (91%). Most initiated antenatal care late in pregnancy (54%) and were worried about birth (65%). The majority had not taken vitamin D (78%), folate (77%) or iron (85%) prenatally. One-third were found to be exposed to passive smoking (34%), whereas nearly one-third of the multigravida women had a history of gestational diabetes (30%).

Conclusion: The Mutaba'ah Study is establishing a valuable and rich scientific database to provide research-based evidence on the factors affecting maternal health during pregnancy and childbirth and their implications and other early-life exposures on children's future growth, development, and health.

Parents of children with a congenital anomaly or cerebral palsy

identified needs when interacting with health services

Ana Santos¹, Paula Braz¹, Teresa Folha¹, Ausenda Machado¹, Carlos Matias-Dias¹

¹National Health Institute Doutor Ricardo Jorge, Department of Epidemiology, Portugal

Parents of children with a Congenital Anomaly or Cerebral Palsy identified needs when interacting with health services.

Children with a Congenital Anomaly (CA) or Cerebral Palsy (CP) have special health needs, with frequent use of healthcare services (HCS). Evidence suggests that parents positive engagement with healthcare providers is associated with health outcomes improvement and reduced healthcare costs.

A mixed-method modify research design was employed in a cross-sectional study with a convenience sample of parents of children diagnosed with CA (severe heart anomalies; spina bifida; orofacial clefts or Down syndrome) and/or CP. A semi-structured online questionnaire was sent by web link to focal points of five institutions in Portugal. Data was analysed through thematic content analysis (open-ended questions) and descriptive analysis (closed-ended questions).

A total of 254 questionnaires were returned. Findings support the need for better collaboration between services and professionals and the importance of information - which elicited apparently divergent results. Of the 15 closed items, two were less frequently rated as a reality within HCS: receiving written information (51.2%) and being encouraged to ask questions (42.7%). Inversely, most parents believed that the health services and professionals taught them how to care for one's child (81.6%) and felt to be informed them about what affects the child's development (74.4%). Thematic analysis indicated that parents perceived lack of information and professional's lack of knowledge and training about their child specific conditions.

The mixed methods results indicated perceived lack of collaboration between health services and professionals. On the other hand, while parent perceive that HCS provided enough information on child health care and illness, they felt professional specific knowledge on the child condition as insufficient. This apparent divergent result may be related to parents perceiving health care to emphasize acute illness in detriment of the long-term management of chronic conditions and disabilities.

Gaps in doctors' practice: gestational diabetes mellitus diagnosis in the United Arab Emirates

Fatma Al-Maskari¹, Maryam Bashir¹, Luai Ahmed¹, Rami Al-Rifai¹, Iffat Elbarazi¹, Shamma Aldhanhani¹, Safeya Almadhaani¹, Hajar Alktifan¹, Mohammed AlJailani¹, Juma Alkaabi¹, Fatma Al-Maskari²

¹United Arab Emirates University, Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, ²United Arab Emirates University, United Arab Emirates

Background: Gestational diabetes mellitus (GDM) screening and diagnosis is still a contentious topic worldwide, and guidelines used by medical doctors are widely inconsistent¹. Different diagnostic criteria make it difficult to accurately combine or compare GDM burden, locally and globally². In the United Arab Emirates (UAE), the local guideline recommends using the WHO 2013 criteria in diagnosing GDM. This study assessed doctors correct use of the recommended criteria. This will inform targeted practice recommendations and areas of emphasis in future guidelines.

Methods: We conducted a cross-sectional study among medical doctors who attend to pregnant women at 11 facilities in Al Ain, Abu Dhabi, UAE, from October 2021 to June 2022. A validated self-administered questionnaire³ collected data from the doctors, online or in person. Data analysis was conducted using STATA statistical software version 16.1.

Results: 120 doctors were recruited. 87% were females. 43% were Family Physicians, 37% were Obstetricians, 10% were Endocrinologists, and 10% were General Practitioners. 60% vs. 40% worked at primary vs. tertiary facilities, respectively. About 40% specialized outside the Middle East and North Africa (MENA) region.

Only 31% of the doctors assessed were using the recommended GDM diagnostic criteria correctly. Factors associated with the correct use of the criteria include the doctors place of specialization (Abroad (US and UK) vs. MENA, 50.0% vs. 24.3%, $p=0.013$), place of practice (Tertiary vs. Primary facilities, 43.8% vs. 20.4%, $p=0.011$) and specialty [ObGyn (46.7%), Endo (41.7%), Family physicians (16.7%) and GPs (0.0%) ($p=0.003$)]. Up to 16% of the doctors were using multiple GDM guidelines.

Conclusion: Our study has shown gaps in doctors practice regarding GDM diagnosis in the UAE. We recommend training and re-training doctors with

regular monitoring and evaluation by UAE Health Authorities regarding the use of GDM guidelines. Further qualitative research could reveal specific challenges experienced by doctors in GDM management.

Teens talk vaping: a co-produced participatory study on the micro-geographies of teen vaping in Canada

Stephanie Coen¹, Kendra Nelson Ferguson², Danielle Tobin², Shauna Burke², Timothy-Jireh Dela Cruz², Laila Girum², Rebecca Haines-Saah³, Tanya Iwas², Bhargav Kandlakuti², Aliana Manji², Purushoth Megarajah², Ricardo Soto Canales², Terry Spencer⁴, Jason Gilliland²

¹University of Nottingham, School of Geography, United Kingdom, ²Western University, Canada, ³University of Calgary, Canada, ⁴London District Catholic School Board, Canada

Background and Objective: The increase in vaping (e-cigarette use) among youth in Canada and elsewhere has become a serious public health concern. Among teens in Canada (16-19 years), vaping prevalence increased from 29.3% in 2017 to 40.6% in 2019. The 2019 Canadian Tobacco and Drug Survey found that among youth aged 15-19, 87% had vaped nicotine and 40% had vaped cannabis in past 30 days. The history of failed tobacco cessation and substance use campaigns targeted at youth has shown that effective health promotion begins with evidence that centres young people's experiences in meaningful ways. The "Teens Talk Vaping" project sought to co-produce research about teen vaping with teens to inform the development of evidence-based vaping education materials in collaboration with local public health authorities and school board partners.

Methods: Our participatory approach included a capacity-building programme to train teen team members to contribute to the project as 'co-researchers', equipping them with the research skills necessary to contribute to all phases of the project, from data collection through to knowledge translation. Paired with adult team members, teen co-researchers facilitated 7 online focus groups with teens (n=17) from across Canada, including teens who vaped and those who did not, to better understand how vaping features in their everyday environments.

Results: Our thematic analysis generated five themes: (1) Secrecy and surveillance at school; (2) Online omnipresence; (3) Social pressures and positionings; (4) (Un)restricted mobilities and access; and (5) Re-thinking school-based vaping education.

Conclusion: Our findings reveal the extent to which exposure to vaping is deeply embedded and normalised in the everyday micro-geographies of teens in Canada.

Children's passive smoking - a small contribution to a big problem

Mária Bartušová^{1,2}, Katarína Dostálová¹, Ondrej Hinčák^{1,2}, Katarína Gazdíkova^{2,3}, Eva Horváthová¹, Štefánia Moricová^{1,2}

¹Faculty of Public Health, Slovak Medical University, Bratislava, Slovakia,

²Slovak Medical University, Bratislava, Slovakia (Slovak Rep), ³Faculty of Medicine, Slovak Medical University, Bratislava, Slovakia

Introduction: Worldwide, 40% of children, 33% of male non-smokers, and 35% of female non-smokers were exposed to second-hand smoke in 2004. This exposure was estimated to have caused 165,000 from lower respiratory infections, 36,900 from asthma, and 21,400 from lung cancer.

The main objective of the study was to determine the impact of passive smoking on the population of three to five-year-old children from the Bratislava region. The side objective was to determine the effect of second-hand smoke on the incidence of pneumonia or bronchitis in the same group.

Methods: The data were available from selected ELSPAC (the European Longitudinal Study of Pregnancy and Childhood) questionnaires. The study group consisted of 1,286 boys and girls between the ages of three and five from the Bratislava region exposed to passive smoking.

1,273 children were evaluated about the effects of passive smoking on occurrence of pneumonia and bronchitis and 763 were evaluated about the effect of passive smoking on height of children.

Results: We did not confirm a statistically significant relationship between passive smoking and the occurrence of pneumonia or bronchitis $p=0.285$ (exposure to passive smoking over the weekend); $p=0.166$ (over the week) in our cohort. We did not confirm significantly lower height among children who had been exposed to passive smoking during weekend ($p=0.373$) nor during week ($p=0.874$). Out of 1,034 parents, guardians and legal representatives answered the question concerning the number of smokers in households. 57.4% answered that no one smokes in the household, 25.9% that there is 1 smoker in the household, 16.7% answered that at least 2 household members smoke in the household.

Conclusion: Children are the most vulnerable group to the effects of passive smoking. We do believe that the need for further studies aimed at monitoring the impact of passive smoking of children is still urgent.

Evolution of maternal mortality in West Africa (2000-2017)

Francisco Guillen Grima¹, Sara Guillen-Aguinaga², Laura Guillen-Aguinaga³, Ines Aguinaga-Ontoso⁴, Lucas Onamebele⁵

¹Dept of Health Sciences, Universidad Publica de Navarra, Facultad de Ciencias de la Salud. Universidad Publica de Navarra. Avda Baranain sn, 31008 Pamplona, Spain., ²Dept of Health Sciences. Universidad Publica de Navarra, Avda Baranain, s/n 31008 Pamplona, Spain., ³Clinica Universidad de Navarra, Department of Nursing, Clinica Universidad de Navarra, Clinica Universidad de Navarra, Avda Pio XII 36, 31008 Pamplona, Spain., ⁴Universidad Publica de Navarra, Dept of Health Sciences, Universidad Publica de Navarra, Avda Pio XII 36, 31008 Spain, ⁵Catholic University of Central Africa, School of Health Sciences, Catholic University of Central Africa, Nkolbisson Yaoundé B.P: 11628 YAOUNDE 237 CAMERÚN, Cameroon

Background: Maternal Mortality is one of the leading causes of death among African women. United Nations Sustainable Development Goals state that by 2030, the global maternal mortality rate should be lower than 70 per 100,000 live births. This research aims to study the evolution of Maternal Mortality in Central Africa.

Methods: Maternal and population data of the countries in Central Africa ((Burundi, Cameroon, Central African Republic, Chad, Congo, DR Congo, Equatorial Guinea, Gabon, São Tomé and Príncipe) were extracted from UNICEF mortality databases from 2000 to 2017 (2017 being last the available data) The Regional mortality rates were estimated by weighting each country mortality rate with its population. Joinpoint regression was performed. The annual percentage change (APC) with 95% confidence intervals (95% CI) was calculated for the region and each country. **Results:** In the Central African region, maternal mortality decreased by 35.84%, from 798.35 per 100,000 in 2000 to 512.19 in 2017. The APC during the whole period was -2.7% per year (95% IC -2.8; -2.5). We detected three joinpoints in 2002, 2006, and 2011. Since 2006, the APC has been progressively decreasing, first to -2.4% in 2006-11 and later to -2.0% in 2011-14. Congo was the country with a higher decrease with an APC of -4.1% (95% IC -4.8;4.1), while Chad was the country in the region with the lower APC1.4% (-1.5;-1.3). We detected a slowdown in maternal mortality reduction in the region since the economic crisis that began in 2007.

Conclusion: Although Central Africa has experienced a considerable reduction in maternal mortality, there is still a long way to go to reach the target United Nations Sustainable Development Goals.

Assessment of the diet quality index-international in a sample of Italian primary school children: the I-MOVE project

Rossella Sacchetti¹, Francesco Sanmarchi¹, Francesco Esposito¹, Carolina Poli¹, Susan Scrimaglia¹, Laura Dallolio¹, Alice Masini¹

¹University of Bologna, Italy

Background and Objective: Assessment of diet quality is a major public health concern, considering the impact of nutrition on health status. Nutritional transition, intended as a modification of food preferences from traditional to unhealthier dietary patterns, greatly affects diet quality, especially for younger generations. The aim of this study was to evaluate the overall diet quality in a sample of primary school children using the Mediterranean adaptation of the Diet Quality Index-International (DQI-I).

Methods: This cross-sectional study was conducted among 112 children (6-10 years) in a primary school in Imola (Italy) in 2019. DQI-I explores four aspects considered necessary for a healthy diet: 1) variety 2) adequacy: the intake of those dietary elements that are required to protect against under-nutrition 3) moderation: the intake of food and nutrients related to chronic diseases which may need restriction 4) overall balance: macronutrients ratio. The analysis of the different categories of the DQI-I helps to identify which aspects of the diet need to be improved.

Results: The mean total DQI-I score was 59.14 (SD=8.48) on a 0 to 100 scale. Out of the 112 included children, only n=55 (49,1%) had a total score higher than 60 (indicating an intermediate/good diet quality). Adequacy had the highest score (27.13±5.64; min 0-max 40), followed by moderation (18.27±3.21; min 0-max 30) and variety (10.21±3.41; min 0-max 20). Overall balance had the lowest score (3.54±1.34; min 0-max 10). According to the adequacy category, the majority

of the sample reported adequate intake (>50% recommendations) for grains, fibers, proteins, iron, calcium and vitamin C. Most children failed to meet the recommended levels of vegetables and fruits intake.

Conclusion: Health education is necessary to improve the overall quality of children's nutrition habits, especially about the recommended intake of macronutrients and proper intake of fruits and vegetables.

Femininity and gender inequalities: narratives of men authors of violence

Dherik Santos¹, Fabiane Simões², Jeremias Simões³, Margareth Conceição³, Caroline Castro², Rafael Caliarí³, Gabriela Martins³, Stephania Demarchi³, Maria Andrade³, Rita Lima³

¹Universidade Federal de Catalão, Departamento de medicina, Brazil,

²Universidade Federal do Espírito Santo, ³Universidade Federal do Espírito Santo, Programa de pós-graduação em saúde coletiva, Brazil

Background: Gender inequalities in Brazil have foundations in patriarchy, capitalism and racism, studies need to be carried out to question the naturalization of social roles assigned to genders (male and female) that naturalize the dynamics of gender violence.

Objective: To analyze the narratives about femininity and gender inequalities from the point of view of male perpetrators of violence indicted by the Civil Police, referred to the Specialized Police Station for Women, a reference in Greater Vitória-ES.

Methods: This is a descriptive and exploratory study, with a qualitative approach, with 20 male perpetrators of violence (MPV) referred to a service of the Specialized Police Station for Assistance to Women, a reference for the municipalities of Greater Vitória-ES, Brazil. Data collection took place between September and October 2021, using a semi-structured interview. The narratives were transcribed and, with the help of Atlas.ti software, version 9.0, underwent an analysis of enunciation under the theoretical lenses of Habitus, by author Bourdieu, and Domination-exploration, by Saffioti. The research question was: what are the MPV narratives about femininity that, therefore, strengthen practices of gender inequalities?

Results: Male perpetrators of violence referred to the following central ideas about what it means to "be a woman": to be affectionate/caring, companion, faithful, respectful; have dialogue, posture; does not prevent man from carrying out his will; it is not vulgar; it is not conflictual; it does not go out alone for leisure or sell itself for money; no gender swap. It was observed that most cases of gender violence were motivated by jealousy.

Conclusion: These characteristics attributed to the female figure are a fertile ground for gender inequalities, as well as for violence against women, addressing women to the role of a docile, passive and submissive body. This view helps maintain the culture of men's domination over women.

Men's involvement in Early Exclusive Breastfeeding (EEBF) - "a qualitative study of the causes of low men's involvement in early exclusive breastfeeding in Nigeria"

Sammy Joel Panwal¹

¹Datahub360, Abuja - Nigeria, Nigeria

Background: It is believed that breast milk alone is all an infant needs to survive. Out of the 6.9 million children under the age of five who were reported dead globally in 2011, a million lives would have been saved by efforts like exclusive breastfeeding. Although the rates of exclusive breastfeeding for the past two decades have been increasing, it is still a long road to achieving the 100% global target coverage recommended by UNICEF. In Nigeria, men's participation in exclusive breastfeeding is perceived to be lower than in other countries. This situation is assumed to hinder men's support for exclusive breastfeeding. Thus, this study aims to explore the factors responsible for low men's involvement in exclusive breastfeeding.

Method: A qualitative research approach was adopted to properly explore the attitudes, practices, and factors responsible for men's low participation in Early Exclusive Breastfeeding (EEBF). Four (4) focus group discussions (FGDs) were carried out with thirty-two (n=32) men who were recent fathers aged 20 - 40 in four (4) states with each group comprised of 8 men using a purposive sampling method. The data was analyzed using thematic analysis. NVIVO software was used for coding and data management.

Result: Findings showed that attitudes and cultural practices/beliefs influence men's decision to support or not support exclusive breastfeeding, limited men's

knowledge and lack of access to exclusive breastfeeding information impede men's readiness to support their wives/partners in exclusive breastfeeding, and men's perception of exclusive breastfeeding as women's role (gender role) hinders men from contributing in exclusive breastfeeding.

Conclusion: This study revealed that men's low involvement in exclusive breastfeeding is linked to attitudes and practices, knowledge limitation and lack of access to exclusive breastfeeding information, and gender perception of exclusive breastfeeding. Hence, this study recommends that exclusive breastfeeding interventions should target both men and women.

Popul. Med. 2023;5(Supplement):A1195

Prevalence of congenital anomalies in newborns from a city in the southern region of Brazil

Luana Silva¹, Vera Ribas¹

¹Secretaria Municipal de Saúde de Campo Bom, Brazil

Introduction and Objectives: Congenital anomalies are characterized by structural or functional changes that occur during intrauterine life and can be identified before or at birth, or later in life. Approximately 50% cannot be linked to a specific cause, however, known causes include: genetic, infectious, nutritional, environmental, multifactorial factors. An estimated that these anomalies represent 6% of births in the world and 0.7% in Brazil.

The objective is to evaluate the epidemiological profile of congenital anomalies registered in the Live Birth Information System (SINASC) of the city of Campo Bom, localized of the state of Rio Grande do Sul, Brazil.

Methods: In Brazil, the notification of congenital anomaly is performed in the SINASC. Annually, approximately 24,000 newborns are registered in Brazil with some congenital anomalies.

The data were evaluated from January/2012 to August/2022 through quantitative analysis.

Results: In almost 10 years, 7,757 children were born in Campo Bom, of which 84 were diagnosed with congenital anomaly and of these 14 died. The information on congenital anomaly was blank and ignored at 11 and 16 times, respectively.

Congenital anomalies with higher prevalence in the city are: unspecified polydactyly, other congenital deformities of the foot, unspecified hypospadias, unspecified congenital deformity of the foot, Down syndrome, other defects of upper limb reduction.

Conclusion: The information regarding congenital anomalies is under reported, there is failure in the records, and the diagnosis at birth is quite heterogeneous in different regions of the country. It's necessary to improve the records in the SINASC, strengthening the notification of these diseases to obtain more subsidies and improve the surveillance of congenital anomalies. In addition, we need to provide guidance on the measures to prevent these injuries, since 50% less can be prevented.

Fetal mortality: the challenges of knowledge and intervention (FetRisks) - research protocol, São Paulo, Brazil

Osmara Alves Viana¹, Hillegonda Maria Dutilh Novaes¹, Marcia Furquim de Almeida¹, Rossana Pulcinelli Vieira Francisco¹, Gerusa Maria Figueiredo¹, Gizelton Pereira Alencar¹, Zilda Pereira da Silva¹, Mara Sandra Hoshida¹, Luciana Duzolina Manfré Pastro¹, Lays Janaina Prazeres Marques¹, Heitor de Andrade Junior¹, Clarisse Martins Machado¹, Luciana Regina Meireles Jaguaribe Ekman¹, Andrés Jimenez Galisteo Junior¹, Rodrigo Melim Zerbinati¹, Suely Fazio Ferracioli¹, Renata Monteiro¹, Paulo Saldiva¹, Regina Schultz¹, Luis Fernando Ferraz¹, Nelson Gouveia¹

¹São Paulo University, Brazil

Background: Fetal mortality is still insufficiently known, valued, and studied in different contexts.

Objectives: This is a study protocol designed to identify a large and innovative number of epidemiologic and biological risk factors (demographic, social and environmental, maternal infections, placental alterations and angiogenic factors, gestational and fetal disorders, and prenatal care) and to understand their complex relationships, as well as factors related to fetal loss.

Methods: This is a prospective case-control study with estimated 415 cases (stillbirths) and 415 controls (live-births) carried out in 15 public hospitals in São Paulo City, Brazil. Data is being collected for cases and controls from mother's interviews, hospital records and antenatal cards. And from multiple genetic and serological analyses in samples of maternal and umbilical cord blood and the placenta. For a smaller number of cases traditional and non-invasive autopsies of the stillbirths are being performed and compared to imaging techniques. In

a subsample of 100 women additional interviews and psychometric scales are being performed.

Results: The COVID19 pandemic had a high impact on health services and on the research activities, a team offered constant field support and supervision to reduce case losses and technical and scientific meetings were offered. Until Nov-2022 269 cases and 269 controls were enrolled and carried out interviews, representing 64.8% of the defined sample. Data from antenatal cards and medical charts are being extracted of cases and controls. Placentas were obtained for 262 cases and controls and 265 maternal blood samples of cases and controls collected, 22.6% of the fetuses were referred for autopsy, and 93 (93%) interviews carried out with bereaved mothers.

Conclusion: The results will enable us to develop multiple analyses of the complex relationships of social, environmental, biological risk factors and health services and participate in the efforts to reduce stillbirths and its impact.

The impact of palivizumab reimbursement criteria on neonatal RSV hospitalizations and drug prescriptions: an area-based cohort study from the Tuscany Region, Italy

Vieri Lastrucci¹, Giorgia Alderotti¹, Martina Pacifici², Lorenzo Stacchini³, Monia Puglia², Elettra Berti⁴, Giulia Hyeraci², Giuseppe Roberto², Rosa Gini², Fabio Voller²

¹Epidemiology Unit, Meyer Children's Hospital, Florence, Italy, ²Observatory of Epidemiology, Regional Health Agency of Tuscany, Florence, Italy,

³Medical Specialization School of Hygiene and Preventive Medicine, University of Florence, Italy, ⁴Neonatal Intensive Care Unit, Meyer Children's Hospital, Florence, Italy

Background & objective: respiratory syncytial virus (RSV) is a leading cause of hospitalization in infants aged <2 years and palivizumab is a high-cost prophylaxis for RSV. In Italy reimbursement restrictions regarding palivizumab prophylaxis approved in 2016 have been revoked in 2017, restoring use in infants with Gestational Age (GA) >29 weeks. The study aimed to evaluate the impact of the 2016 restrictions (intervention) on RSV hospitalizations and palivizumab prescriptions for infants aged <2 years.

Methods: the study was funded by Tuscany Region. Four RSV epidemic seasons were considered: before-intervention (2015/2016), intervention (2016/2017) and after-revocation (2017-2019). For each season, all the Tuscany infants aged <2 years were retrospectively followed-up in administrative databases to evaluate the occurrence of a RSV infection-based hospitalization. Incidence rates (per 1,000 person-days) were calculated. Furthermore, palivizumab prescriptions were also evaluated.

Results: in a population of 274,810 infants aged <2 years, RSV hospitalizations were 1,210. In the intervention season, an increase in the incidence rate of RSV hospitalization and severe hospitalization were observed (before-intervention: 5.47 (95%CI 5.20-6.27) and 0.35 (95%CI 0.28-0.59); intervention: 7 (95%CI 6.7-7.91) and 1.46 (95%CI 1.32-1.9)); no differences in the distribution of the RSV hospitalizations for GA were observed. In the after-revocation seasons no significant differences were observed in RSV incidence rate compared with the intervention season. Palivizumab prescriptions showed a reduction of 44% in the intervention season; in the after-revocation seasons prescriptions increased compared with the intervention season (+38%), but remained below the numbers registered in the before-intervention season (-23%).

Conclusion: several reasons may be associated with the GA-unrelated increase in the RSV hospitalization rates observed after the restrictions and the lack of further significant changes after their revocation, including an increased attention in notifying RSV. The restrictions were associated with a reduction in the number of palivizumab prescriptions even after their revocation.

DOI: 10.18332/popmed/164167

Malnutrition and anemia in children aged 6 to 59 months in the Autonomous Region of Príncipe and its relation to maternal health

Carina Castro Silva¹, Elisabete Catarino²

¹USP Espinho/Gaia Portugal, ²Faculdade de Ciências da Nutrição e Alimentação da Universidade do Porto

Introduction: In low-income countries, malnutrition, including anemia, is a major cause of morbidity among children. Undernutrition and anemia in children will affect their growth, physical and cognitive development later in life, with consequences that extend beyond the individual. An analysis of malnutrition and anemia among children aged 6 to 59 months in the Autonomous Region of Príncipe was conducted.

Methods: A cross-sectional study was conducted in August 2018 on 218 children aged 6 to 59 months who accessed to health care. Weight for height/length, weight for age, and height/length for age were used to measure nutritional status, and hemoglobin concentration was determined using a portable hemoglobin analyzer. First, uni- and bivariate analyses will be conducted, followed by multiple logistic regression models.

Results: The prevalence of wasting was 3.7%, stunting 12.8%, low weight 6%, overweight 3.7% and obesity 0.9%. It was found that 83% of the children were anemic, with most cases being moderate to severe. Child anemia was significantly associated with fever in recent weeks ($p=0.017$ adjOR 4.6 IC 1.3-16.0) and the lack of sanitary facilities ($p<0.05$ adjOR 2.2 IC 1.0-4.8) and in children between 6-11 months ($p=0.01$ adjOR 8.5 IC 1.7-42.7) and 12-23 months ($p=0.03$ adjOR 3.3 IC 1.1-10.0) comparable with children aged 48-59 months. Wasting was more frequent in rural areas ($p<0.013$, OR=4.5 IC 1.2-16.6). Low birth weight was significantly associated with stunting ($p<0.012$, OR=3.9 IC 1.4-10.6) and low weight ($p<0.001$, OR=10.1 IC=3.0-33.7).

Conclusion: Anemia and stunting were most prevalent among children under two. The importance of vitamin supplementation at this stage is evident. Furthermore, the present study emphasizes the importance of maternal education in improving nutritional and anemia conditions. It also contributes to the development of strategies aimed at achieving the Sustainable Development Goals and improving health outcomes.

& Behavioural Health Sciences, University of Toronto Dalla Lana School

of Public Health & Women's College Hospital Research Institute, Toronto,

Canada, ⁶TUM School of Social Sciences and Technology, Technical

University of Munich, Germany

Background and objective: Adolescent pregnancy is an important health indicator of the Sustainable Development Goals. In South Asia about one in five adolescent girls give birth before the age of 18 and in India, nine percent of 15-19 years old girls become pregnant each year. The aim of this study was to investigate the demographic, behavioural, social and external factors associated with adolescent pregnancy among girls aged 13-18 years in the state of Maharashtra, India.

Methods: Primary data from a cross-sectional study with adolescent girls aged 13 - 18 years in two regions in Maharashtra: around the city of Pune and rural villages of Sangli district was analysed. Quantitative data were collected face to face by trained local enumerators, and qualitative data were collected from seven in-depth interviews. Data analyses were done using StataMP 17 for descriptive, bivariate and multivariable logistic regression analyses.

Results: The final analysis was undertaken for 3049 respondents. At bivariable analysis, all variables except for participant's higher secondary education were significantly associated with adolescent pregnancy. The final model in the multivariable analysis showed that participant's age, marital status, number of sexual partners and COVID-19 related economic vulnerability increases the likelihood of adolescent pregnancy. Furthermore, predictors including residence in a rural location, participant's education, female sibling and mother's education decreases the likelihood of adolescent pregnancy. Thematic analysis of qualitative data revealed four potential channels linked with adolescent pregnancy: i) economic hardships and early marriage, ii) safety, social norms and early marriage, iii) social expectations and iv) lack of knowledge on contraceptives.

Conclusion: Demographic factors including age, place of residence, participant's education, mother's education, marital status and female sibling, behavioural factor including number of sexual partners and external factor including COVID-19 economic impact are important predictors of adolescent pregnancy in Maharashtra, India in the aftermath of COVID-19 pandemic.

Impact of covid-19 pandemic on lifestyle habits and mental health

among italian adolescents: Results from the coalescent (change among italian adolescents) study

Loredana Covo¹, Barbara Zanini², Monica Marullo², Silvia Marconi³, Gaia Viviana Viola², Umberto Gelatti¹, Roberto Maroldi¹, Nicola Latronico¹, Maurizio Castellano²

¹University of Brescia Department of Medical and Surgical Specialties, Radiological Sciences and Public Health Italy, ²University of Brescia Department of Clinical and Experimental Sciences Italy, ³Department of Clinical and Experimental Sciences Italy

Background and Aim: COVID-19 pandemic affected people's health in different ways. Our study aimed to investigate the impact of containment measures in a sample of Italian adolescents, two years after the beginning of the pandemic.

Methods: In collaboration with the Territorial School Office, we submitted an online survey to high school students in the province of Brescia (Northern Italy), investigating their change in food consumption habits and in physical and screen activities, sleep quality, psychological distress and smartphone addiction. The Smartphone Addiction Scale - Short Version and the Matthey Generic Mood Questionnaire were also part of the survey.

Results: We collected 1686 questionnaires, 48% male, 52% female, mean age 16 ± 1.5 y. Among respondents, 63% did not perceive a substantial change in their diet, 48% improved their physical activity level, 38% declared an increase in body weight, and 26% reported that they had improved their eating habits, while only 11% reported that these had worsened. Half of participants showed a presence of a psychological distress and 46% were smartphone addicted. Compared to pre-pandemic period, time spent on digital device increased a lot especially for studying purposes (54%) compared to entertainment (28%) or boredom (30%). The psychological distress was significantly higher only in case of increased time spent on digital device for studying purposes (56% vs 37% who declared unchanged time, $p < 0.0001$). According to a multivariate logistic analysis presence of a psychological distress was associated with female gender (OR 4.5, $p < 0.0001$), age (OR 1.1, $p = 0.001$), sleep duration < 8 hours (OR 1.8, $p < 0.0001$), and smartphone addiction (OR 1.4, $p = 0.005$).

Conclusions: The findings highlighted slight changes in lifestyle behaviour, but a relevant presence of psychological distress and smartphone addiction. There is a need to understand how to promote good practices among young people, helping them to stay healthy after the COVID-19 pandemic.

Adjusting protocol for outdoor food marketing exposure for piloting in serbian school's neighborhood developed by working package six of the best remap joint action project

Jelena Rakic¹, Biljana Kilibarda¹, Milena Vasic¹, Verica Jovanovic¹

¹Institute of Public Health of Serbia "Dr Milan Jovanovic Batut" Serbia

Background and Aim: Exposure to food marketing not only increases food consumption but also has a significant impact on food choices in children and adolescents. At the same time, prevalence of overweight and obese individuals in this age group is constantly increasing, reaching epidemic proportions. Restricting the marketing of foods that promote unhealthy dietary habits to children and adolescents is the focus of public health action. The objective is to adjust the methodology for outdoor food marketing exposure in a school neighborhood developed by WP6 of the Best ReMap Joint Action Project for use in Serbia.

Methods: A cross-sectional design is proposed to capture outdoor advertisements within a 500 - meter radius around the school perimeter. The proposed items eligible to be registered as food marketing include billboards, posters, bus shelters, advertisements for services and products, and any logo or form of branding that is present, as well as any outdoor promotional material displayed including promotional flyers, branded furniture and/or fencing. Recording is performed using a smart phone camera. It is proposed to record all advertising in order to provide a measure of the proportion of food marketing within all marketing. Two schools are selected for piloting the protocol.

Results: Majority of schools in Serbia have distributive school kitchens. However, schools with less than 100 students according to the national regulation related to school size, are not obliged to have school kitchen. In those schools more than half of the children buy food in the school neighborhood so recording of fast-food outlets in school neighbourhoods is also needed.

Conclusion: Outdoor advertising around schools presents a potential frequent source of childrens exposure to unhealthy foods. Therefore, policy interventions to reduce exposure and regulate the content of outdoor food marketing near schools are needed.

Preconception health in women of childbearing age and lifestyles

Emanuele Gatta¹, Drieda Zaçe², Anna Viteritti³, Alessia Orfino⁴, Luigi Petrella¹, Maria Pietro¹

¹Università Cattolica del Sacro Cuore Italy, ²Università Cattolica del Sacro Cuore Albania, ³Fondazione Policlinico Universitario A. Gemelli IRCCS Italy, ⁴ASL Roma 2 Italy

Background: Daily lifestyles, including diet, BMI control, physical activity, smoking, alcohol and drugs play an important role in preconception health of women of childbearing age. The aim of this cross-sectional study is to describe, in the Italian context, the lifestyles of young women of childbearing age that may have an impact on preconception health.

Methods: From July 2020 until April 2021 an anonymous validated online questionnaire was administered to a sample of 340 women aged 18-25 years who were attending secondary grade schools and universities in Italy.

Results: In the previous 3 days, the wide majority of participants had at least one portion of pasta or rice (93.82%), bread (80.59%), meat (90.29%), fruit (81.76%), while less than half had fish (45.59%) or legumes (42.65%). 28.24% of the women was a smoker, in average 5.35 cigarettes/day (SD 3.33), and in average started smoking when aged 16.79 years (SD 2.25). 38.82% of women drank alcohol, more frequently wines and beer (71.88% and 69.53%, respectively), and mainly started drinking, particularly for cocktails, when aged 14-17 (63.57%). 18.53% of women used drugs, mostly marijuana (79.37%). Only 53.53% of women did physical activity, however 94.27% of the remaining had done it in the past. 69.03% of participants stopped doing physical activity due to a lack of time. A higher prevalence of alcohol drinkers was found among stressed women, compared to not stressed ones (41.79% vs 25%, $p = 0.015$). Among most socially fulfilled women, compared to least ones, were found higher prevalences of underweight (18.75% vs 7.69%, $p = 0.016$) and smoking (39.58% vs 21.43%, $p = 0.045$).

Conclusion: To improve lifestyles of young women, it is crucial promoting policies to encourage healthy diets for improving fish and legumes intake, physical activity, mental health and personal fulfilment, as well as to raise awareness and discourage adolescents from unhealthy behaviours.

Factors influencing the practice of breastfeeding among healthcare workers mothers

Rania Nakhli¹, Imene Kacem¹, Mohamed Kahloul², Imen Mlouki³, Mohamed Ajmi², Najja W², Mrizak N¹

¹Department of Occupational Medicine, Farhat Hached Academic hospital, Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia,

²Department of Anesthesia and Intensive Care, Sahloul Academic Hospital, Faculty of Medicine of Sousse, University of Sousse, Sousse, Tunisia,

³Department of Preventive and Community Medicine, Mahdia Academic Hospital, Faculty of Medicine of Monastir, Tunisia

Background: The benefits of breastfeeding concern both the health of the mother than that of her child, and are observed at short and long term, resulting in a reduction in infantile morbidity and mortality. WHO recommends exclusive maternal breastfeeding during the six first months of the baby life. However, breastfeeding rates are still below the desired expectation.

The aim of this study was to assess the perceptions of healthcare workers (HCW) regarding early weaning from breastfeeding and to study the factors associated with this practice.

Methods: This cross-sectional study was conducted over a period of 2 months among HCW at the Farhat Hached teaching hospital who have at least one child under the age of five years. Early weaning was defined as the cessation of exclusive breastfeeding before the age of 3 months.

Results: A total of 100 women participated in this study. The mean age was 38 ± 9.1 years. Nurses were the most represented occupational category (54%) with an average seniority of 9.9 ± 9 years. Early weaning was reported in 58.3% of cases, imposed by obligations in 48.4% of cases. Satisfaction with the duration of breastfeeding was reported in 53% of cases. The main causes of early weaning were lack of sleep (53.3%), nervousness, stress and depression (40%) and lack of time (38.3%). After univariate analysis, only skin-to-skin contact was significantly associated with continued breastfeeding ($p < 0.001$).

Conclusion: Promoting the continuity of breastfeeding for HCW mothers should be a priority for decision makers. Thus a cooperative attitude must be encouraged in the workplace, to promote breastfeeding practices.

Perinatal anxiety and depression and birth-related post-traumatic

stress disorder: Prevalence and determinants in a cohort of portuguese women

Ana Chaves¹, Tiago Pinto², Inês Jongenelen³, Diogo Lamela⁴, Ana Morais², Raquel Costa⁵

¹ISPUP - Instituto de Saúde Pública, Universidade do Porto, Porto, Portugal; Instituto de Saúde Pública, Universidade do Porto Rua das Taipas, 135, 4050-600 Porto, Portugal; ²Digital Human-Environment Interaction Laboratory, Universidade Lusófona, Portugal; ³Digital Human-Environment Interaction Laboratory, Universidade Lusófona, Portugal; ⁴Digital Human-Environment Interaction Laboratory, Universidade Lusófona, Portugal; ⁵EPIUnit, Instituto de Saúde Pública, Universidade do Porto, Rua das Taipas, 135, 4050-600 Porto, Portugal; Laboratório para a Investigação Integrativa e Translacional em Saúde Populacional (ITR), Porto, Portugal; Digital Human-Environment Interaction Labo EPIUnit, Instituto de Saúde Pública, Universidade do Porto, Rua das Taipas, 135, 4050-600 Porto, Portugal; Laboratório para a Investigação Integrativa e Translacional em Saúde Populacional (ITR), Porto, Portugal; Digital Human-Environment Interaction Labo Portugal

Background: Perinatal anxiety, depression, and birth-related post-traumatic stress disorder (PTSD) are important Public Health problems. Comorbidity of these disorders may occur, with preventable short and long-term burden for women, children and families. The post COVID-19 pandemic period represents an opportunity for the collection of updated and empirical data, and for fostering screening and follow-up practices on perinatal mental health.

Objectives: The aims of this study are to assess (a) the prevalence and determinants of clinically significant symptoms of anxiety and depression during the perinatal period and birth-related PTSD; (b) the prevalence and determinants of comorbid profiles.

Design and methods

This longitudinal study, starting in 2023, expects to recruit 321 women and assess them during the third pregnancy trimester and at 2, 5, and 12 months postpartum. Sociodemographic, psychological and obstetric/gynecologic data will be collected. Perinatal anxiety and depression symptoms will be measured using the State-Trait Anxiety Inventory (STAI-S) and the Edinburgh Postnatal Depression Scale (EPDS), respectively, and birth-related PTSD will be measured using the City Birth Trauma Scale (City BiTS). Prevalence data will be analyzed using descriptive statistics and potential determinants of anxiety, depression, and birth-related PTSD will be determined using logistic regressions.

Conclusion: We expect this study to provide updated data on the (a) prevalence and determinants of anxiety, depression and birth-related PTSD; (b) comorbidity of symptoms of anxiety, depression and birth-related PTSD. Ultimately, the results can inform evidence-based decisions to improve perinatal mental healthcare policies and investments in mental health-friendly public policies.

Medicine, Mahdia Academic Hospital, Faculty of Medicine of Monastir, Tunisia, ⁷Intensive Care Unit Department, Center for Urgent Medical

Assistance, Tunis, Tunisia

estimates for cigarette smoking "at least once in a lifetime" were studied. Binary logistic regression model was used to assess associated factors and Adjusted Odds Ratios (AORs) were presented. The independent factors included were: sex, area of residence, private or public sector, alcohol and cannabis use, and being exposed to tobacco smoking in family and peer's environment. CSRpro and STATA software were used for data entry and statistical analysis, respectively.

Results: Among 6.201 participants with a mean age of 16.8 years, 60.4% were girls; the prevalence of cigarette smoking was 24,75% 95% CI[23.24,26.32], significantly higher among boys (41.1% versus 14.2%,p<10-3). Univariate analysis revealed a significant difference in cigarette smoking by region(p-value< 10-4). The highest prevalence of cigarette smoking was observed in the capital city. Cigarettes were perceived as easily accessible by less than a third of the students (38.46% and 20.94% of boys and girls respectively,p=10-4). In multivariable analysis, the only independently associated factor to this behaviour was male sex (AOR=1.5[0.15 – 2.9],p-value=0.03).

Conclusions: Our study revealed a high prevalence of smoking among students with male sex as an associated factor. Developing a healthy school environment and implementing school-based intervention programs are therefore, highly required.

The epidemiological burden of pediatric metabolic syndrome in Europe: A systematic literature review

Anna Scardigno¹, Francesca Orsini², Floriana D'Ambrosio¹, Roberto Ricciardi³, Giovanna Calabrò⁴

¹Università Cattolica del Sacro Cuore, Rome, Italy Section of Hygiene, University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²Graduate School of Health Economics and Management (ALTEMS), Università Cattolica del Sacro Cuore, Rome, Italy, ³VIHTALI (Value In Health Technology and Academy for Leadership & Innovation), Spin-Off of Università Cattolica del Sacro Cuore, Rome, Italy, ⁴VIHTALI (Value In Health Technology and Academy for Leadership & Innovation), Spin-Off of Università Cattolica del Sacro Cuore, Rome, Italy, ⁵Section of Hygiene, University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy; VIHTALI (Value In Health Technology and Academy for Leadership & Innovation), Spin-Off of Università Cattolica del Sacro Cuore

Background and Objective: Metabolic syndrome (MetS) prevalence in children and adolescents is increasing, in parallel with the increasing trends in obesity rates. Consistent diagnostic criteria to define MetS are not available to date for pediatric population. There is common agreement that the main features defining MetS include disturbed glucose metabolism, hypertension, dyslipidemia, and obesity. However, settings of cut-off values are still heterogeneous in the pediatric population. Prevention and management of MetS consist in lifestyle modifications, behavioral interventions, pharmacological and surgical interventions as needed. Therefore, knowing the MetS epidemiological burden is necessary in order to identify adequate prevention strategies for this condition that, if not managed, can lead to important complications in adulthood.

Methods: A systematic literature review was performed querying two database (PubMed, Web of Science) from 2012 to 2022. All studies in English language, focused on the epidemiological burden of MetS in the pediatric population and conducted in Europe were included.

Results: Overall, 15 studies were included, conducted in 7 countries, in which Spain was highly represented (33.3%), followed by Italy, Slovakia, Poland and Romania (13.3% per country), Czech Republic, Lithuania (6.7% per country). It was described a MetS prevalence, according to International Diabetes Federation criteria, ranged from 1.4% to 55.8%. MetS was most represented in the 11-16 year age group, in males and in overweight/obese subjects.

Conclusions: MetS is a serious disorder associated with multiple diseased states. The definition and criteria for MetS in childhood remains uncertain to date. Obesity

Snyamkumar Sriram^{*}, Snyamkumar Sriram^{*}

¹Ohio University Ohio University "Grover Center Athens Ohio USA" United States, ²Ohio University Ohio University United States

Introduction: Pakistan has high prevalence of childhood malnutrition amongst developing countries. National Nutritional Survey 2018 showed 44% of children were stunted. Different circumstances have the potential to create inequality of opportunity in child health. This study aims to identify the drivers of inequality of opportunity in childhood malnutrition among children below five years of age in Pakistan.

Methods: This study used Pakistan Demographic and Health Survey, 2017-18 to identify the role played by various factors in inequality of opportunity in child malnutrition. Dissimilarity index (D-index) and Oaxaca decomposition of D-index, and Shapely decomposition were used to measure and decompose inequality in opportunity in stunting. Regional variation in child health under various circumstances was analyzed using GIS.

Results: The burden of stunting is exceptionally high in Pakistan. Prevalence of stunting in rural areas far exceeded the urban areas through 1990-2018. Shapely decomposition of the contributors of inequality in opportunity indicates that maternal education contributed to 24 % of total inequality for rural and 44% for the urban children. Water and sanitation contributed 22% to overall inequality in the rural and only 2% in urban areas, implying a critical part played by the lack of water and sanitation in rural areas. Wealth index predominantly contributed to inequality nationally and in the urban region. Southern regions have a high higher prevalence of stunting and higher proportion of households without adequate water and sanitation. Proportion of mothers without education and stunted children are largely concentrated in Baluchistan and Sindh.

Conclusions: Lack of mothers' education, inadequate access to water and sanitation services, and poverty are contributing factors to inequality of opportunity in stunting among under-five children in Pakistan. Understanding the critical part played by various circumstances would help policy makers to address the situation and take concrete steps to enhance equal opportunities for child health.

Serbia oral health problems among children and mothers indicated need for maternal oral health initiative in serbia

Natasa Pejcić¹, Hyewon Lee², Vanja Petrović³

¹School of dental medicine, University of Belgrade School of dental medicine, University of Belgrade Dr Subotica 8, Belgrade Serbia, ²Ida Society United States, ³School of Dental Medicine, University of Belgrade

Background and objective: Pregnancy is an extremely important and sensitive period, for general health and also oral health. During pregnancy, it is important to emphasize on maintain the oral health of both, the future mother and her baby. However, in order to prevent diseases of deciduous teeth, it is necessary for parents to get acquainted with the importance and ways of maintaining oral health in children from the earliest age.

Methods: Systematic integrative review includes research from the last 10 years, conducted at the Republic of Serbia. Review of scientific database Pubmed, Scopus and Scholar, was done in order to determine three key questions: level of oral health status, attitude and habits among pregnant women and prevalence of early childhood caries among children in Republic of Serbia.

Results: Latest research in Serbia population emphasize, need for maternal oral health initiative in Serbia. The recent studies showed a high prevalence of poor oral health in Serbian children -41.1% of children aged 36 to 71 months had early childhood caries, while in group of children aged 12-36 months was also high 13.4% (Marković et al. 2020). Prevention of premature birth as a most common adverse pregnancy outcome should be one of the more important goals of maternal oral health initiative. The results of recent studies conducted in Serbia indicate the potential impact of periodontal disease to an increase in the level of inflammatory mediators, which are also biochemical labor markers (Perunovic et al.2015).

Conclusion: Considering the mounting oral health needs in young children in Serbia, we truly believe maternal oral health is one of the key primary prevention agendas and we can join our efforts in achieving oral health equity in Serbia by developing this maternal oral health initiative.

The association between lifetime history of drug use and experience of stillbirth among adult women in the united states: findings from the national health and nutrition examination survey 2009-2018

Lindsay Wilson¹

¹University of British Columbia 2062 Cypress St Canada

Background: Stillbirth is a major health issue, but relatively little research has been conducted to determine whether drug use increases the risk of stillbirth. The objective of this cross-sectional study was to determine whether any history of drug use was associated with stillbirth in the United States. Effect modification by ethnicity was considered as a secondary objective.

Methods: Data were drawn from the National Health and Nutrition Examination Survey between 2009-2018 and included women between the ages of 20-59 years. Multivariate survey design-adjusted logistic regression was conducted. Effect modification by ethnicity was assessed using simple slopes analysis. Missing data were imputed using multiple imputation by chained equations.

Results: Among 6,045 participants, drug use was associated with higher odds of stillbirth after adjusting for confounding, but this was not statistically significant (OR 1.13, 95% CI 0.80;1.62). Among Hispanic women, drug use was associated with significantly lower odds of stillbirth (OR 0.54; 95% CI 0.23;0.84). No significant interactions with drug use were identified among other ethnicities.

Discussion

The primary analysis found no statistically significant association between drug use and stillbirth, but this relationship may be modified by ethnicity. The small number of events identified in the dataset likely explains the lack of statistical significance identified, and the unexpected findings among Hispanic women. Further exploration into this potential effect modification is warranted to ensure pregnant people who use drugs receive prenatal care that best meets their needs.

Cannabis use in tunisian high school adolescents: medspad 2021

Salsabil Rejaibi^{1,2,3}, Rym Mallekh¹, Majdi Zid¹, Ahlem Silini¹, Nada Zoghalmi¹, Ibrahim Ben Slema¹, Sarra Ben Youssef¹, Mariem Zribi¹, Nabil Ben Salah^{3,4}, Hajer Aounallah-Skhiri^{1,2,3}

¹National Institute of Health, Epidemiology Department, Tunisia, ²SURVEN, Research Laboratory, Nutrition Surveillance and Epidemiology, Tunisia,

³Medical Faculty of Medicine Tunis El Manar University, Tunisia, ⁴Intensive Care Unit department, Center for Urgent Medical Assistance, Tunis, Tunisia

Background and objectives: Cannabis use is wrongly deemed "safe" by teenagers worldwide, despite its increased tetrahydrocannabinoids content and its psychosocial and cognitive harmful effects. We aimed to estimate the prevalence of cannabis use, identify associated factors among Tunisian adolescents and assess the risk of problem cannabis use among users.

Methods: The 2021-Mediterranean School Survey Project on Alcohol and Other Drugs (MedSPAD) is a national survey, targeting Tunisian high school adolescents in 1st and 2nd level of secondary education. Based on a self-administered questionnaire, adolescents were asked about their engagement in several risky behaviours including cannabis use. The 6-item Cannabis Abuse Screening Test (CAST) was intended for users to assess risk of problem cannabis use. Binary logistic regression was performed to identify associated factors to cannabis use and Adjusted Odds Ratios (AORs) were presented with 95% confidence intervals (CI). Cspiro and STATA software were used for data entry and analysis respectively. **Results:** Among 6,201 participants (girls: 60.4%), weighted lifetime prevalence of cannabis use was 7.9% 95% CI [7.0, 8.9], significantly higher among boys (16.1 % Vs. 2.5 %, p<10-4). Early initiation (at 13 or younger) was reported by 8.6% of users. Multivariate analysis showed that cannabis use was more prevalent in Tunis district, the capital city (p=0.04), and significantly associated to alcohol, tobacco and E-cigarettes use (AOR of 6.2, 4.2 and 2.6 respectively, p<10-3). Absenteeism for non-medical reasons and nights spent away from home were also independent factors significantly associated with cannabis use (p<10-3). The CAST indicated a high risk of cannabis-use-related problems in 67.2% of respondents.

Conclusions: Cannabis use becomes a real threat to Tunisian adolescents' mental health. Moreover, the alarming risk of problem cannabis use warrant the urgent need to implement school-based interventions to increase awareness about this issue, to detect psychological vulnerability and offer timely appropriate help.

¹Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua Italy, ²Azienda ULSS 6 Euganea Hospital Direction, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy Via Casa di Ricovero 40, Cittadella (Padua) Italy, ³Azienda ULSS 6 Euganea, ⁴Region of Veneto

Integrated Care Pathways, Veneto Region, Italy

Background and objective: The promotion of breastfeeding, recommended by Unicef and WHO, is an important health goal for Public Health. Human breast milk provides optimal nutrition for preterm infants and prevents various diseases. In Italy, the 41 donated human milk banks (Banche del Latte Umano Donato-BLUD) offer a service that aims to select, collect, store and distribute donated human milk, to be used for specific medical needs in the event of prematurity or critical issues. In this project we report data regarding the donation of human milk and the implications and limitations related to the COVID-19 epidemic in the Province of Padua.

Methods: Veneto Regional Council established the Regional Network of 5 BLUDs currently active in the Neonatologies of Padua, Treviso, Verona, Vicenza and Cittadella involving all birth points of the Region according to the Hub and Spoke model. In all birth points the donors are selected according to specific certified protocols in which women's clinical history (including COVID19), infectious disease tests and thorough analysis of the milk are taken into consideration in compliance with the Ministerial Guidelines.

Results: The Italian BLUDs have provided, even during the pandemic, an efficient and safe service guaranteeing the usefulness and quality of the service. In the past year, in Cittadella (nearly 1000 births per year) 66 mothers have donated their milk, providing a total of 110 liters of milk for 500 in term newborns and 36 premature infants.

Conclusion: This project highlights the capacity of human milk banks to surmount the difficulties given by COVID-19 pandemic. It also states the importance of specific protocols issued by the Italian National Health System and the Italian Association of Donated Human Milk Banks that continue to monitor the appropriateness and management of BLUDs in Neonatal Intensive Care and Neonatology promoting the donation culture.

Prevalence of micronutrient deficiency in Brazilian pregnant women

Lívia Zina¹, Fabiane Silva¹, Janice Paula², Júlia Campos¹, Lorrany Rodrigues¹, Rafaela Pinto¹, Luana Santos²

¹Universidade Federal de Minas Gerais Adjunct Professor Avenida Antônio Carlos, 6627 - Pampulha CEP 31270-901 - Belo Horizonte - Minas Gerais State Brazil, ²Universidade Federal de Minas Gerais

Background and objective: The pregnant women health is a powerful indicator of a country's health. Diseases caused by micronutrient deficiency in pregnancy represent a public health concern due to the probable risk of perinatal morbidity and mortality, and surveillance of the values of these deficiencies needs to be performed periodically by health systems for the evaluation of mother and baby health care strategies. The aim of this study was to nationally evaluate the prevalence/incidence of micronutrient deficiency in Brazilian pregnant women.

Methods: A systematic review was performed. Nine electronic databases, including grey literature, were searched without language restrictions. Paired independent reviewers selected cross-sectional and cohort studies reporting the deficiency on vitamin A, B, C, D, E, calcium, iron, zinc, magnesium and selenium among Brazilian pregnant women, extracted data, and assessed risk of bias. A meta-analysis with a random effect model was conducted.

Results: of the 895 references initially identified, 32 were considered eligible for this systematic review. A risk of bias was found in the key area related to the study population (target population, sampling, selection, non-responders). No one study presented data on the incidence of deficiency. In meta-analysis, the prevalence ratios ranged from 12% to 92% depending on the type of micronutrient. The overall prevalence of micronutrient deficiency was 32.8% [0.3280 (IC 95% 0.2382-0.4324)]. Anemia was the most standardized outcome among studies and its prevalence ratio was 20.0% [0.1998 (IC 95% 0.1554-0.2531)]. No pattern was found for the geographic distribution of micronutrient deficiency.

Conclusion: The prevalence of micronutrient deficiency among Brazilian women is high. Iron deficiency was prevalent all over the country and anaemia rates justify iron supplementation as a public policy in the Brazilian Health System.

Availability, awareness, and quality of adolescents' sexual and reproductive health services in cameroon: a mixed methods study

Roseline Dine¹, Valentine Uwamahoro², Bertrand Ayuk³

¹Rinda Ubuzima -Rwanda (<https://rindaubuzima.rw>) Rwanda, ²Intrahealth Rwanda Rwanda, ³University of Buea Cameroon

Introduction: Developing nations such as Cameroon have a shortage of sexual

and reproductive health (SRH) services. This has led to an increased prevalence of sexually transmitted diseases such as HIV/AIDS in the country. The study aims at investigating the availability, accessibility, and quality of SRH provided to young people in selected towns within the North-West and South-West regions of Cameroon.

Method: The study is a cross-sectional study that made use of both qualitative and quantitative methods and was conducted from December 2021 to September 2022 among 88 randomly selected participants; 28 are healthcare providers and 59 are young people between 10 and 24 years old. A checklist was developed, validated, and used in the data collection, with ATLAS T1 version 5.2 and SPSS version 26.0 used to code and analyze the qualitative and quantitative data, respectively.

Results: Young people indicated that the following services are available: HIV testing (89.1%), pregnancy testing (77.8%), contraception (72.9%), circumcision (68.3%), fertility awareness (50%), antenatal care (65.9%), and postnatal care (65.9%). From our results, only 24.6% of young people revealed that information is disseminated regularly to raise awareness about the availability of SRH services, and most (65.4%) of the providers revealed that they do not raise awareness of SRH services. Concerning the quality of services provided, 64.4% of the young people said their needs are satisfied when they receive SRH services. Qualitative findings revealed shyness, lack of knowledge, resistance from religious groups and families, insecurities from political instability, and inadequate training, among others, as barriers to SRH accessibility.

Conclusion: The study shows the availability of SRH services. However, information dissemination about SRH services by service providers was poor. Targeted interventions are required to overcome barriers to the uptake of SRH services and guarantee the health and well-being of young people in Cameroon.

Prenatal care for women in drug abuse in the context of primary health care in the Brazilian healthcare system

Taís Oliveira¹

¹National School of Public Health Sergio Arouca (ENSP/FIOCRUZ) National School of Public Health Sergio Arouca (ENSP/FIOCRUZ) Brazil

Objectives: To analyze the actions of primary health care in the Brazilian healthcare system regarding the approach on the drug abuse use during pregnancy. It also aims at analyzing the approach of health professionals, the interdisciplinary articulation and the activation of the intersectoral network and the health care network.

Methodology: The study is an integrative literature review whose sample was chosen based on the combination of descriptors in health sciences (decs): "prenatal" and "substance use disorders". The search was carried out in the virtual health library (vhl) and scientific electronic library online (scielo). selection criteria: publication year from 2006 to 2021, based on the national primary care policy (pnab) launching year; publications in portuguese, english and spanish. Exclusion criteria: duplicate results and publications that did not address the reality of Brazilian services.

Results: This study consisted on the characterization and categorization of fifteen publications on prenatal care and substance use disorders. From the publications selected for research, two categories emerged: perceptions and practices of pregnant and postpartum drug abusers regarding the services provided and analysis of professional practices and services based on information from pregnant and postpartum drug abusers. This analysis showed that the biomedical aspects outweigh the social aspects in prenatal consultations performed by health professionals and that the moralizing actions of drug abuse persist in health services on women.

Conclusions: The logic of fetal care and biomedical actions are still very frequent when it comes to the nursing professional, who is the protagonist in prenatal care. It is observed that there is a lack of intersectoral articulation that encompasses other knowledge and other professionals; a greater approximation to the territory is necessary, as well as a greater and better multiprofessional articulation within the family health strategy (esf) in Brazil.

Knowledge of adolescents about contraceptive methods and prevention of sexually transmitted infections

Paula de Sousa e Castro¹, Beatriz Zapala², Karen Virginia³, Michelly Thauany⁴, Paulo Figueiredo⁵

¹Universidade Paulista, Sao Paulo, Brazil Priscilla Sete De Carvalho Onofre, ²Universidade Paulista UNIP Brazil GABRIELA DA SILVA BARBOSA

Universidade Paulista UNIP Brazil, ³Da Silva Universidade Paulista UNIP Brazil, ⁴Da Silva Barros Universidade Paulista UNIP Brazil, ⁵Cardoso Universidade Paulista UNIP Brazil

Adolescence is a time of significant change for human beings, bringing new forms of social interaction and exposure to risks. At this stage, concerns arise around early pregnancy and sexually transmitted infections (STIs), which are considered public health problems and are directly related to low adherence to condom use. The objective was to analyze the level of knowledge of adolescents about STIs and contraceptive methods. This is a descriptive-exploratory research of a quantitative nature, carried out with students between 14 and 15 years old, from two educational institutions, public and private, through the application of printed questionnaires and via the Google Forms platform, on the knowledge of contraceptive methods and STI prevention. Regarding the results, 98 students were interviewed, 44 from the Public School (GEP) and 54 from the Private College (GCP). The female audience gained prominence in both schools, totaling 54 students. The prevalent age in both groups was 14 and 15 years. With regard to knowledge about STIs and contraceptive methods, in both samples the adolescents were aware of and had been instructed about STIs. Regarding contraceptive methods, 38 (86.4%) were instructed in the GEP and 54 (100%) in the GCP. In the case of contraceptive methods, in both groups as a whole, they know the male condom, however, in the GEP 6 (13.6%) know about coitus interruptus, in the GCP, in turn, only 15 (27.8%) know the vaginal ring. GCP adolescents are more aware of contraceptive methods than GEP. Given the above, it is possible to understand that the knowledge presented by the students on the subject is ineffective in both schools, and it is essential to expand the activities proposed by the schools, since the students themselves consider them necessary for a better understanding of issues involving sexuality.

Assessing the effects of knowledge and attitude on high school students' milk consumption in hoang mai district, hanoi, vietnam in 2022

Le Dat¹, Chu Ngoc², Cao Que Anh², Nguyen Nguyen², Nguyen Cuong², Do Duy², Le Hung²

¹Vietnam Public Health Association Viet Nam, ²Hanoi Medical University Viet Nam

Introduction: High school students who consume adequate amounts of milk have a lower risk of developing non-communicable diseases, have higher bone density, are better able to absorb nutrients, and have improved academic performance. Milk consumption in Vietnam is still low and ineffective in this area. A problem like this may be explained by factors like knowledge and attitude.

Method: Cross-sectional description of 590 high school students in Hoang Mai district, Hanoi. The questionnaire consists of 33 questions (general information, knowledge, attitudes, and behaviors of using canned milk) based on referenced questionnaires from previous related studies.

The data has been cleaned, processed, and analyzed using Jamovi software, etc. Descriptive statistics are presented by frequency and percentage for qualitative variables. Statistical analysis was performed to find the correlation, determined by the correlation coefficient r and the 95% confidence interval. The correlations were statistically significant when $p < 0.05$. Assess the knowledge and attitudes of individuals according to 3 levels: Not good (=90%).

Results: General knowledge about canned milk is at "Not Good" (Mean Score: Male - 69.8%, Female - 68.6%), Attitude is at "Pretty Good" (Mean Score: Male - 76.8%, Female - 78.1%). Grade 12 has lower knowledge and attitudes than other grades ($p < 0.001$). Understanding of nutritional value is better than knowledge of the health benefits of milk. There is a positive correlation between knowledge about nutritional value with milk consumption behavior ($r = 0.144$), attitude towards milk consumption behavior ($r = 0.233$), and knowledge with attitude towards using condensed milk. box of high school students ($r = 0.411$).

Recommendation

Strengthen educational programs to improve knowledge and attitudes to positively improve the students' behavior using milk-canned milk at this age.

Astute exploration of collective mental health events among the residents of elderly care homes in Bangladesh

Nasrin Akter¹, Bilkis Banu², Sujana Chowdhury², Tahsin Tabassum³, Kazi Islam², Sarder Hossain²

¹Department of Public Health, Northern University Bangladesh (NUB), Banani, Dhaka, Bangladesh, ²Department of Public Health, Northern

University Bangladesh, Bangladesh, ³Department of Community Medicine, East West Medical College, Bangladesh

Background and Objective: Developing countries are presently witnessing a great burden of rapid aging followed by losing the social values of older adults due to age-related cognitive impairment as well as rising depression levels. This study was designed to assess the cognitive impairment and depression status combinedly among older adults in elderly care homes.

Methods: It was a cross-sectional survey among randomly selected 200 older adults aged between 60-80 years residing in some old homes in Dhaka district, Bangladesh. Data were collected through face-to-face interviews while Cognitive function and level of depression were assessed by applying the Standardized Mini-Mental State Examination (MMSE) and Geriatric Depression Scale (GDS).

Results: Among all the respondents, the majority (81.5%) were staying in old homes for 1-5 years. Mostly (91.0%) had difficulties with vision, 40.7% had difficulties with hearing and 19.6% had difficulties in moving around. The MMSE test revealed that 43% had moderate cognitive impairment, 36% had mild and 19.5% were found normal while more than half (56%) had severe depression. Significant cognitive impairment was found among the illiterate respondents who did not have any family care support. In addition, higher educated respondents were found to have more severe depression ($OR/p = 6.33 / < 0.01$; $CI: 2.36-16.96$). Furthermore, severely depressed respondents had more severe cognitive impairment ($COR/p = 3.83 / 0.01$). Functional disabilities were also a greater concern for cognitive impairment and depression.

Conclusion: An increasing number of old home residents are suffering from significant mental disorders while there is no mental health support in the elderly care homes in Bangladesh. Finally, there is a great need to develop packages and programs of mental health care for senior citizens and their caregivers residing in old homes, which can be scaled up across the country's mixed healthcare delivery system.

The relationship among social contact pattern, crowded living space and the anxiety level of young adults in Hong Kong during the COVID-19 pandemic

Hui Sze¹, Hor Lai², Ka Chong¹

¹The Jockey Club School of Public Health and Primary Care, The Chinese University of Hong Kong, Hong Kong, ²Department of Applied Social Sciences, The Hong Kong Polytechnic University, Hong Kong, China

Background: Young adults in Hong Kong, especially those who live in crowded living spaces, are at risk of anxiety during the pandemic. The social contact patterns of young adults have been greatly affected by the implementation of social distancing measures which can possibly affect their anxiety levels. This study aimed to investigate the effect of social contact patterns on buffering the negative effect of crowded living environment on anxiety level as well as the relationship between social contact pattern and anxiety level of young adults in Hong Kong. **Methods:** Participants were asked to complete the online questionnaire, including demographic information, self-developed social network survey, living environment, items related to the susceptibility and severity of COVID-19 and DASS21 (anxiety sub-scale).

Results: To this end, 427 participants were included in the study. A significant association between crowded living environment and anxiety level was showed ($P = 0.009$), as well as the positive effects of non-physical contact ($\beta = -0.418$, $p < 0.001$), physical contact ($\beta = -0.257$, $p = 0.015$) and closed contact ($\beta = -0.576$, $p < 0.001$) on the anxiety level of young adults. A significant buffering effect of social contact patterns on the association between moderate ($\beta = -0.120$, $p = 0.005$), highly crowded living environment ($\beta = -0.307$, $p < 0.001$), and anxiety level is observed. **Conclusions:** Social contact patterns have a positive impact on reducing the anxiety level of young adults in Hong Kong and it can act as a buffer for people living in highly dense environments who have a higher anxiety level.

Physical Distancing and Mental Well-Being in Youth Population of Portugal and Brazil during the COVID-19 Pandemic

Jesus Cortes¹, Pedro Aguiar², Sofia Azeredo³, Patrícia Soares⁴, Heriederson Moura⁵, Ricardo Arsênio⁵, Ana Goes⁶, Ana Gama², Rita Pedro², Ana Feliciano², Pedro Laires⁶, Sonia Dias², Rosa Sousa⁷, Liana Pinto⁷, Alexandre Abrantes⁶, Carla Nunes²

¹Escola Nacional de Saúde pública, ENSP Portugal, Portugal, ²Escola Nacional de Saúde pública, Portugal, ³NOVA Medical School Faculdade de Ciências Médicas (NMS|FCM), Portugal, ⁴National School of Public Health-

ENSP, Portugal, ⁵Escola de Enfermagem de Ribeirão Preto da Universidade de São Paulo, Brazil, ⁶ENSP, Portugal, ⁷Escola Nacional de Saúde Pública Sergio Arouca, Fundação Oswaldo Cruz, Brazil

Background: The COVID-19 pandemic may affect youth's physical and mental well-being, partially because of the countries' rules to contain the virus from spreading. However, there is still uncertainty about the impact of physical distancing on youth's mental health. We aimed to estimate the prevalence of feeling agitated, anxious, down, sad, or low mood (FNF) due to physical distance measures and verify which factors are associated with young Portuguese and Brazilian people. **Methods:** We used cross-sectional data from the instrument "COVID-19 Barometer: Social Opinion" in Portugal (March 2020 and September 2021) and from "COVID-19 Social Thermometer" in Brazil (August 2020 to April 2021); these surveys included data regarding the health and socioeconomic impact on the population. The health and sociodemographic variables of the two countries were summarized as absolute and relative frequencies. A multivariable logistic regression model was fit by country to estimate the relation between FNF and selected variables of interest.

Results: Approximately 36% of the sample studied reported anxiety, agitation, sadness, or low mood almost every day in Portugal and 52% in Brazil due to physical distancing. In Portugal, having more than two comorbidities represented a greater chance of experiencing FNF every day or almost every day (odds ratio [OR] = 1.51 [CI: 1.22–1.87]) than those without comorbidities. In contrast, having a university education level represented a protector factor (OR = 0.76 [CI: 0.67–0.88]). In Brazil, being unemployed increased the chance of FNF compared to students (OR = 11.2). **Conclusions:** Physical distancing measures have impacted the mental well-being of the young population in Portugal and Brazil. The countries must make a quick effort to attend to and protect young people's well-being and mental health in the changing context of the current pandemic.

Eating patterns according to NOVA classification and mental health: COVID inconfindentes population survey

Mariana Menezes¹, Julia Carraro², Hillary Coletro³

¹Universidade Federal de Ouro Preto, Bauxita, Ouro Preto, Brazil, ²Federal University of Ouro Preto, Brazil, ³Federal University of Ouro Preto, Ouro Preto, Brazil

Background and Objective: Psychological disorders are one of the major health problems worldwide, not being determined solely by intrinsic factors. Our aim was to evaluate how the different types of food consumption, are associated with the presence of symptoms of depression during the COVID-19 pandemic, in Brazilian adults. **Methods:** Cross-sectional study from a population-based survey, with face-to-face interviews, in Ouro Preto and Mariana, based on stratified and conglomerate sampling in three stages. Food consumption was assessed by a food frequency questionnaire and categorized by NOVA in fresh/minimally processed (FMP) foods, and ultra-processed foods (UPF), by the weekly consumption. Thus, four types of food consumption were evaluated: i) Low consumption of UPF and FMP (used as reference); ii) High consumption of UPF and FMP; iii) High consumption of UPF and low consumption of FMP; iv) Low consumption of UPF and high consumption of FMP. The presence of depression symptoms was measured by the patient health questionnaire-9 scale, validated, and categorized into absence or presence of depression symptoms. We used prevalence ratio (PR) and 95% confidence interval (95%CI) by Poisson regression to verify the association tested, adjusted by gender, age, medical diagnosis of anxiety disorder or depression, family income and marital status, selected by a directed acyclic graph.

Results: Among the participants, 51.1% were female and aged between 35 to 59 years (45.9%). About 15.6% presented symptoms of depression. From the four types of food consumption, it was observed the high consumption of both categories, was associated with a higher PR for the occurrence of symptoms of depression (PR: 2.53; 95% CI: 1.63 - 3.92). **Conclusions:** The consumption of ultra-processed foods represents an important part of the world food supply. There is a need for the reformulation of public policies that consider the processing extent and purpose on human health.

Adverse perinatal outcomes among Aboriginal women with mental health disorders

Akilew Adane¹

¹Ngangk Yira Institute for Change, Murdoch University and Telethon Kids Institute, Murdoch, Australia

Background and Objective: Maternal mental disorders are implicated in a range

of adverse perinatal outcomes, although few studies have examined these links among Australian Aboriginal populations. We aimed to evaluate the association between maternal mental disorders and key adverse perinatal outcomes among Aboriginal neonates.

Methods: We used whole population-based linked data to conduct a retrospective cohort study (N=38,592) using all Western Australia singleton Aboriginal births (1990–2015). Maternal mental disorders were identified based on the International Classification of Diseases codes and grouped into six broad diagnostic categories (severe mental disorder, common mental disorder, personality disorder, substance use disorder, and all other adulthood- and childhood-onset mental disorders). Perinatal outcomes evaluated included preterm birth, small for gestational age, perinatal death, major birth defect, fetal distress, low birth weight, and low Apgar score. We employed log-binomial/-Poisson models to calculate risk ratios (RRs) and 95% confidence intervals (CIs).

Results: After adjustment for sociodemographic factors and pre-existing medical conditions, having a maternal mental disorder (within the five years prior to birth) was associated with adverse perinatal outcomes, with RRs (95% CIs) ranging from 1.26 (1.17, 1.36) for fetal distress to 2.00 (1.87, 2.15) for low birth weight. We found similar associations between each maternal mental disorder category and birth outcome, with slightly stronger associations for maternal mental disorders within the year prior to birth and for substance use disorder. The strongest association was found between maternal substance use disorder within the year prior to birth and low birth weight (RR=2.34, 95% CI: 2.16, 2.53).

Conclusions: This large population-based study demonstrated an increased risk of preterm birth, low birthweight, perinatal mortality, and other adverse outcomes among births to Aboriginal women with mental disorders. Holistic perinatal care, treatment, and support for women with mental disorders may reduce adverse outcomes among Aboriginal births.

The mediating effect of internet addiction on the relationship between exposure to extra familial violence and sleep disorder among youth

Imen Mlouki^{1,2,3}, Arij Naimi¹, Imen Souid¹, Sana El Mhamdi^{1,2,3}

¹Department of Preventive and Community Medicine, University Hospital Tahar Sfar Mahdia, Tunisia, ²Research laboratory "Epidemiology Applied to Maternal and Child Health" 12SP17, Tunisia, ³Department of Community Medicine, Faculty of Medicine of Monastir, Tunisia

Background and Objective: Recent researches showed short and long term deleterious consequences of Adverse Childhood Experiences (ACEs) on mental as well as physical health. Sleep disorder is one of the harmful well-known ACEs outcomes that should be considered. The real knowledge gap consists in the mechanisms by which ACEs lead to sleep disorders later on in life. Specifically, we aimed at investigating the mediating role of internet addiction in the link between exposure to extra familial ACEs and sleep disorders among schooled adolescents in Gafsa city (Tunisia).

Methods: We conducted a cross-sectional study, in February 2020, including youth registered in all secondary schools of Gafsa city. Sleep disorders were evaluated via the Pittsburgh Sleep Quality Index, internet addiction via the Internet Addiction Test and Social ACEs via the Adverse Childhood Experiences-International Questionnaire.

Results: Overall 650 schooled youth were initially included. Among them, 414 returned the questionnaire (response rate=63.7%). Girls represented 63% of the studied population. Social violence exposure was higher in males (91.9% vs 79.6%, p=0.002). The majority of students (76.8%) revealed being victim of community violence. Peer violence was reported by 57.1% of adolescents. Sleep disorders were more prevalent among females (95.4% vs 91%, p=0.001). Males presented highest rates of internet addiction (82.9% vs 78.3%, p=0.001). We found a statistically significant partial mediation effect by internet addiction for social ACEs as the exposure variables and sleep disturbances as the outcome variable (p=0.005, % mediated =28.7%).

Conclusions: Our study is the first in Tunisia and in the Arab countries to demonstrate the role of internet addiction in the association between social ACEs and sleep disorders.

Estimated impact of the COVID-19 pandemic on the prevalence and treatment of depressive symptoms: an interrupted time series analysis in 2014-2021

David Villarreal-Zegarra¹, Mahony Reátegui-Rivera², Gloria Yantas-Alcantara³,

Percy Soto-Becerra⁴, G. Melendez-Torres⁵

¹Instituto Peruano de Orientación Psicológica, Lima, Peru, ²Universidad Nacional Mayor de San Marcos, Peru, ³Instituto Peruano de Orientación Psicológica, Peru, ⁴Universidad Continental, Peru, ⁵College of Medicine and Health, University of Exeter, United Kingdom

Purpose: The COVID-19 pandemic increased the burden of mental disorders worldwide. Peru has been one of the countries most affected by COVID-19, yet its impact on Peruvians' mental health remains unknown. We aimed to estimate the impact of the COVID-19 pandemic on the prevalence and treatment of depressive symptoms using nationally representative surveys in Peru.

Methods: We carried out a time series cross-sectional analysis based on the National Demographic and Health Survey of Peru, collected using a complex sampling design. The patient health questionnaire-9 was used to measure mild (5-9 points), moderate (10-14 points) and severe (15 points or more) depressive symptoms. The participants were men and women aged 15 years and older, living in urban and rural areas of all regions of Peru. The main statistical analysis used Newey-West standard errors, taking into account that each year of the evaluation was divided into four measures (quarter measure).

Results: We included 259,516 participants. An average quarterly increase of 0.17% (95%CI: 0.03%-0.32%) in the prevalence of moderate depressive symptoms was identified after the onset of the COVID-19 pandemic. The percentage of cases treated for mild depressive symptoms increased quarterly by an average of 0.46% (95%CI: 0.20%-0.71%) after the onset of the COVID-19 pandemic.

Conclusions: In Peru, increases in the prevalence of moderate depressive symptoms and the proportion of cases treated with mild depressive symptoms were found after the COVID-19 pandemic. Therefore, this study is a precedent for future research assessing the prevalence of depression and the proportion of cases receiving treatment during the pandemic and post-pandemic years.

Mental well-being of COVID-19 survivors in Karachi, Pakistan: an exploratory case study

Salima Meghani¹

¹Aga Khan University, Pakistan

Introduction: COVID-19 pandemic has affected every individual's mental well-being. It is estimated that the burden of mental health issues will increase globally during and after the COVID-19 pandemic. There is a dearth of literature on the mental well-being of COVID-19 survivors in the Pakistani population. Hence, this study explores the experiences of survivors, family caregivers, and healthcare providers regarding the mental well-being and healthcare needs of the COVID-19 survivors in communities of Central Karachi, Pakistan.

Methods: The exploratory case study design was used in the context of the population of Ayesha Manzil and Karimabad, areas in central Karachi. Through the snowball sampling technique, those adult survivors who quarantined themselves at home were included. Family caregivers of survivors and healthcare providers of area were also interviewed to triangulate the study. In-depth and key informants interviews were used to study the mental well-being of survivors during the illness. For analysis, thematic analysis method was used.

Results: The key effects on COVID-19 survivors mental well-being, coping strategies, and the response of healthcare providers were identified through six themes which include self-acceptance of life changes, personal growth, purpose in life, relationship with others, autonomy, and environmental mastery. The study's Findings also indicate a non-availability of public-funded mental health services. The presence of any such facility in the area may help COVID survivors to mitigate the negative consequences of quarantine and isolation

Conclusions: Study Findings explicitly concluded that COVID survivors of central Karachi have suffered from negative mental well-being. The study suggests initiating community-based mental health services and programs to cope with negative mental well-being. In addition, training LHW and CHW for barefoot counseling for COVID patients are recommended. Moreover, training all general practitioners in mental health, which will Results in early diagnosis of survivors mental well-being issues and reduces the countrys mental health burden.

Nutritional interventions for the prevention of cognitive deterioration in patients with mild cognitive impairment and Alzheimer's disease: a network meta-analysis of randomised controlled trials

Qian He¹, Kei Chan¹

¹Department of Biomedical Sciences, City University of Hong Kong, China

Background and Objective: As ageing of the population accelerates, cognitive impairment, in the form of conditions such as Alzheimers disease (AD) and mild cognitive impairment (MCI), is an important public health issue that has drawn a lot of attention. Nutritional intervention is a promising non-pharmacological therapy for cognitive dysfunction, but it is unclear which type of nutritional intervention is the best. This study involved a systematic review and network meta-analysis (NMA) to inform clinical practice by comparing different nutritional interventions. **Methods:** A pair-wise and network meta-analysis were adopted to analyse the intervention effectiveness according to direct and indirect evidence. In this study, 11 comparative nutritional interventions, which were: multi-ingredient (such as omega-3 fatty acid with antioxidant) nutrition, omega-3 fatty acid, vitamin B complex, vitamin E complex, Vitamin D, minerals, chemical compounds, dietary interventions, triglycerides, coenzyme Q, Chinese herbs, and a placebo group, were included. The mini mental state examination (MMSE) was the primary outcome and the cognitive subscale of the AD assessment scale (ADAS-cog) was the secondary outcome.

Results: Fifty-one trials were included, in which 8,420 people took part in the study. For the primary outcome, 39 trials were eligible, which involved 6,698 participants. Our NMA analysis indicated that multi-ingredient nutrition (standardised mean difference (SMD) = 1.30; 95% confidence interval (CI) = 0.43, 2.30) was statistically superior to placebo, and this finding was confirmed through the application of pair-wise meta-analysis (SMD = 0.45, 95%CI = 0.14, 0.77). The subgroup analysis indicated that multi-ingredient nutrition (SMD = 1.30, 95%CI = 0.64, 2.0) was superior to placebo as measured by MMSE in the MCI group. In the AD group, no potentially promising intervention was identified.

Conclusions: Our study concluded that multi-ingredient supplementation might be the most effective nutritional intervention to prevent cognitive decline among patients with cognitive impairment, especially those with MCI.

Work life balance and its association with job satisfaction among government medical officers in Ampara district

Muhammed Fouzad¹

¹MOIC/ Regional Directorate of Health Services Kalmunai (RDHS), Kalmunai, Sri Lanka

Introduction: The medical profession is a noble profession and it is a stressful job as well. Doctors experience extreme physical or mental tiredness due to their extended working hours, night shifts, increased workload, on-call duty, and less flexibility at work, which eventually significantly impacts their Work Life Balance (WLB) and Job Satisfaction (JS). Prevalence and relationship study about WLB and JS among medical officers has not been undertaken in the Sri Lankan context. This study focused on describing the prevalence of WLB and its relationship with JS among government medical officers in the Ampara district. **Objectives:** To describe the levels of WLB and JS, their association and the impact of WLB on JS among government medical officers in Ampara district.

Methods: A descriptive cross sectional study was performed among 424 government medical officers working in hospitals using a stratified random sampling technique. A pre-tested and self-administered questionnaire was used and data were analyzed using SPSS. Pearson's correlation coefficient, linear regression, and chi-square tests were deployed to examine the relationship between WLB and JS. **Results/analysis:** Out of 366 respondents, 66.1% and 17.8% of medical officers were having moderate and high levels of WLB respectively. Whereas 60.7% and 23.5% had moderate and high levels of JS respectively. WLB showed a significant association with and impact on JS.

Conclusions: This study provided a good understanding regarding the prevalence of the WLB and JS among government medical officers in Ampara district, Sri Lanka. A significant proportion of medical officers (66.1%) with a moderate level of WLB are at risk of developing low satisfaction in the future and significantly low prevalence of WLB and JS would affect the performance, well-being, patient care, and satisfaction if proper policies and programs are not incorporated. Good WLB and JS are important for medical officers to enhance the quality of life and quality of care.

DOI: 10.18332/popmed/164914

Integration of peer-support groups into public AOD treatment

Ariel Roxburgh¹, Victoria Manning¹

¹Turning Point, Monash University, Clayton, Australia

Background and Objective: Research suggests peer-support groups can amplify and extend treatment effects and enhance long-term recovery from Alcohol and Other Drug (AOD) problems. However, the benefit of peer-support at different

stages of recovery is not well known. Further, peer support groups are rarely integrated into public treatment programs, Resulting in a missed opportunity for cost effective adjunct treatment.

Methods: Study 1: 488 participants in recovery from AOD problems in Australia completed the Life in Recovery survey. Social factors were explored at each stage of recovery (1 year, 1-5 years, > 5 years) to determine the factors that contribute to recovery capital (DV) at each stage of recovery. Study 2: Self-Management and Recovery Training (SMART) was integrated into three public AOD treatment providers in Australia. Questionnaires, attendance, and qualitative interviews were used to determine the uptake, impacts, and participant experiences of the pilot program. Lived-experience: Dr. Ariel Roxburgh integrates his own lived experience of addiction to bring to life the learnings from each study.

Results: Study 1: Having a portion of a social network in recovery was associated with greater recovery capital in early (5 years) recovery. Study 2: The integration of SMART Recovery into formal AOD treatment Resulted in good uptake (M = 6), benefits (e.g., 94% reported reduced substance use or maintenance of abstinence), and the qualitative Results revealed the active ingredients underpinning these benefits (e.g., peer-to-peer learning).

Conclusions: Having peers in recovery is important during early recovery, and introducing SMART Recovery into public AOD treatment services is a cost effective way to meet this need. Further, the Introduction of SMART Recovery provides unique benefits and is met with good uptake by participants. Together, the findings highlight the potential benefits of integrating SMART Recovery into public AOD treatment services.

What young adults need in order to not feel lonely

Eric Schoenmakers¹, Tina Bruggencate²

¹Fontys University of Applied Sciences, The Netherlands, ²Fontys University of Applied Sciences, Netherlands

Background and Objective: Many young adults have experiences with loneliness. The COVID-19 pandemic increased the number of lonely young adults. Loneliness is related to poor mental and physical health outcomes. In this study we set out to discover how young adults cope with loneliness. They were asked to share their personal experiences with loneliness and discuss what they learned from these. The research question of this study is 'what do emerging adults need in order to not feel lonely?'. Methods: In depth interviews with University students, aged between 20 and 26 years were conducted (N=29 participants; N=31 interviews). Diversity within the sample was attempted through variation in study background, gender and ethnicity. Participants did not have to self-identify as being lonely at the time of the interview. An open, inductive approach was used for analysis.

Results: All participants mentioned experiences with loneliness. There is great variety in length and intensity of these experiences. In order to not feel lonely, participants mentioned inter- and intra-individual factors. Regarding inter-individual factors, participants need functional, available social networks in which the 'inner circle' is essential for not feeling lonely. They need to make active efforts to be in contact with their social network. Regarding intra-individual factors, participants mentioned they need realistic expectations about others and they need to know and accept themselves.

Conclusions: Results are in line with coping theory. Loneliness is addressed in two ways. First, by making active efforts to have and maintain a functional, available network. Second, by cognitive efforts in which young adults learn and accept themselves and learn to formulate realistic expectations about others, making the threshold for potential stressors to Results in loneliness higher. Loneliness interventions for young adults should address both inter- and intra-individual factors.

The cost of mental illness for patients attending the outpatient department at Queen Elizabeth Central Hospital, Blantyre

Alex Zumazuma¹

¹Kamuzu University of Health Sciences (KUHS), Blantyre, Malawi

Mental disorders contribute to 20% of all cases seen at primary health facilities in Malawi. Despite this, the governments budgetary allocation for mental health services is only 1% of the total annual health budget. In spite of global studies showing the cost (direct and indirect) of mental illnesses to be high, In the Malawian context, no data exists on the cost of mental disorders incurred by individual patients. Therefore, we conducted a retrospective cross-sectional study to establish the cost of living with mental illness for outpatients at Queen Elizabeth Central Hospital, Blantyre. Patients with an established mental illness

were recruited and information for costs incurred over the previous 3 months was captured. Data analysis was performed on 97 participants recruited in March and April 2019 (52 males; 45 females). Our study found that 51% of the participants were unemployed, 9% had formal employment and 24% had informal employment. Eighteen per cent (18%) of participants walked to the clinic (mean duration 74 minutes (SD 51) and 82% used public transport (mean duration 62 minutes (SD 48); mean cost 1.54 (SD 1.54) USD per visit, range: (0.41 USD to 10.95 USD)). Thirty-five per cent (35%) of participants were asked to buy medication at least once during the preceding 3 months (mean cost 6.77 (SD 6.61) USD). Furthermore, 18.3% reported job loss, 18.3% reported dropping out of school; 4.6% separated from their spouses and 30.3% reported stigma or depressed mood because of their illness. With the majority of Malawians living below the poverty line, the Findings from the study require an urgent need for interventions to reduce the costs and burden on people living with mental illnesses.

Influence of core-self evaluation on academic burnout among Pakistani university students: mediating role of life satisfaction

Dur Tariq¹

¹Pakistan

The study is aimed to access the relation of Core-Self Evaluation and Academic Burnout among university students. Four Hundred and Sixty students (N=460) with age 18-32 including both undergraduate and postgraduate and male and female students. They were assessed using the Core-Self Evaluation Scale (CSES) (Judge et al.2003), the Copenhagen Inventory (CBI) proposed by Kristensen et al. (2005) and the Satisfaction with Life Scale (SWLS) (Diener E,1984). Convenient sampling technique was used to examine the relation between core-self evaluation and academic burnout, mediating role of life satisfaction and the existence of difference of experiencing life satisfaction by males and females. Results indicate that significant and negative relation between core-self-evaluation and academic burnout. A partial mediating role of life satisfaction is also observed. Also, a significant difference in experiencing life satisfaction among the two gender is also seen by the results.

Effectiveness of a structured training program on mentoring and mental well-being for officers and instructors in the Indian air force

Kolar Meena¹, Prasanthi Nattala¹, Poornima Bhola¹

¹National Institute of Mental Health & Neurosciences (NIMHANS), India

Background and Objectives: Military environment is characterized by uncertain situations and stressors that range from combat to separation from family. For personnel from the Indian Air Force (IAF), stress is habitual in everyday life. Stigma, lack of knowledge and negative attitudes towards mental health act as barriers to treatment. The new trainees join the Indian Air Force during a crucial stage of adolescence and effective mentorship can foster success in their career and aid in mental well-being. The sample consisted of 70 Indian Air Force instructors/officers who attended a week-long training workshop on mentorship and mental well-being. This study aimed at evaluating the effectiveness of a structured training program on mentoring and mental well-being for officers and instructors in the Indian Air Force. Furthermore, this study investigated the relationship between age, experience, educational qualification and pre-training knowledge, attitude and self-perceived competence. Methods: The study employed a quasi-experimental design with single group pre and post test. The questionnaire measured 3 components- a) mentorship and mental health knowledge b) attitude c) self- perceived competence in addressing mental health distress. Descriptive statistics, paired sample t tests and Pearson's product correlation were used for data analysis through SPSS software.

Results: Post-training, a positive effect was found on mental health knowledge, attitude and self- perceived competence at statistically significant levels. There was an increase in mental health knowledge, self-perceived competence and a decrease in negative attitude towards mental health. Furthermore, a positive relationship was found between service experience, attitude and competence. Conclusions: With high rates of unattended mental health needs and increasing rates of suicides, mental health distress in members and veterans of armed forces developing effective programs for reducing barriers to care is essential. Therefore, structured training programs could be an effective key in addressing the urgent need for crucial mental health needs.

Fear of cancer recurrence and its predictive factors in Moroccan cancer survivors

Amina Aquil¹

¹Higher Institute of Health Sciences, Hassan First University of Settat, Morocco

Background and Objectives: Cancer is a real public health problem worldwide as well as in Morocco. Advances in cancer diagnosis and treatment methods have increased the number of cancer survivors. However, the psychological and mental health care of cancer survivors in Morocco remains understudied, and often underestimated by the health system. Our study aims to assess the fear of cancer recurrence and its associated sociodemographic and clinical factors in cancer survivors.

Methods: A cross-sectional study was conducted among a population of (n = 200) patients followed at the oncology and hematology hospital of the university hospital center Mohammed IV, Marrakech, Morocco. The data collection instrument consists of standardized scales validated and translated into dialectal Arabic.

Results: The main results we obtained from this study indicated that 51% of the patients present a clinical level of fear of cancer recurrence, 33% of the patients suffer from the anxiety disorder and 21.5% suffer from depression. Significant inter-correlations have been revealed between fear of cancer recurrence, anxiety disorders and depressive disorders.

Conclusions: At the end of this study, important recommendations were made to improve the conditions of care for the mental health of cancer survivors. In particular, the establishment of programs and protocols for psychological care.

Keywords: cancer survivors, anxiety, depression, fear of cancer recurrence.

Can interventions to improve social wellbeing reduce health care utilisation? A systematic review and meta-analysis

Neta HaGani¹, Daniel Surkalim¹, Philip Clare¹, Dafna Merom², Ben Smith¹, Ding Ding¹

¹The University of Sydney, Australia, ²Western Sydney University, Australia

Background: Poor social wellbeing is associated with health risks and excessive health care use. Identifying individuals at risk for poor social wellbeing and providing them with social care may improve their wellbeing, and also reduce costs from unnecessary health care utilization. Psychosocial interventions have been suggested to contribute to decreased health care use, however, such evidence has not been systematically quantified or synthesized.

Objective: To systematically examine and meta-analyze all available evidence on the effect of psychosocial interventions on health care utilization.

Methods: The databases Medline, Embase, PsycInfo, CINAHL, Cochrane and Scopus were searched in May 2021. Studies were included if they were randomised controlled trials that reported on health care utilisation and social wellbeing outcomes. A multi-level meta-analysis was used to derive pooled effects of interventions. Sub-group analyses examined participant- and intervention-level characteristics associated with intervention effects. **Findings:** Twenty-nine studies were included from 14,622 citations; 25 were eligible for meta-analysis. Data were analysed across 6357 participants, including older adults, post-natal women, people with chronic illnesses and caregivers. The overall effect was in favor of the intervention group, with 28% reduction in health care utilization [OR = 0.68; 95%CI = 0.48, 0.94]. Decreases in the use of emergency care, primary care and inpatient care were found. An improvement was observed in social support [SMD = 0.32; 95%CI = 0.04, 0.61]. Short (< 6 months), one-on-one interventions delivered by health professionals and interventions targeting caregivers had more favourable health care utilisation outcomes. A sustained reduction in inpatient care was observed for 6-12 months post-intervention.

Conclusions: There is evidence that psychosocial interventions have the potential to reduce the burden on the health care system. Participant and intervention delivery characteristics, as well as intervention duration, could potentially affect outcomes and should be considered when designing and implementing future interventions.

How is the association of childcare attendance in the first five years of life with psychological wellbeing between 11-17 years confounded by socioeconomic position?

Kathrin Burdenski¹

¹Loughborough University, United Kingdom

Background and Objective: UNESCO and other organisations have outlined the importance of early childcare for children's psychological wellbeing. We aimed to

investigate how the age of starting and the intensity of formal childcare in under-5s were associated with self-esteem trajectories between 11 and 17 years and life satisfaction at 11 and 14 years.

Methods: Data from 5484 children from the UK Millennium Cohort Study were used. Childcare intensity (no childcare, part-time and full-time) and age of starting (0-1, 2-3, and 4-5 years) were measured between birth and 5 years. Self-esteem was self-reported at 11, 14 and 17 years, life satisfaction at 11 and 14 years. Ordered and binary logistics regression were used to analyse the association between childcare and life satisfaction, and multilevel logistics models to analyse the association between childcare and self-esteem. To understand the confounding by socio-economic position, models were first analysed unadjusted and then adjusted for socio-economic position, demographic information, maternal mental health and temperament.

Results: Most results were null. In unadjusted analyses, later age of starting was consistently associated with lower odds of good life satisfaction (e.g., OR = 0.79 for children who started childcare aged 3-5 years compared to < 1 year). However, upon adjustment for family socio-economic position, effect sizes attenuated and became null (OR = 1.01). Childcare estimates were confounded as children from a lower socio-economic position started childcare later and had lower odds of good psychological wellbeing. Further investigation revealed that income was the SEP measure that confounded the association the most. The adjustments for demographic information, maternal mental health and child temperament did not alter the unadjusted estimates.

Conclusions: We find limited evidence that childcare is related to life satisfaction. Evidence that children who start childcare later might have worse psychological wellbeing is likely due to positive confounding by socio-economic position.

DOI: 10.18332/popmed/165161

Evaluation of the National Suicide Prevention program and its association with suicide mortality in Chile

Francisco Bustamante-Volpi¹, Paula Bedregal-García²

¹Department of Epidemiology and Health Studies, Faculty of Medicine, Universidad de los Andes, Chile, ²Department of Public Health, Pontificia Universidad Católica de Chile, Santiago, Chile

Objectives: To analyze the association between the implementation of the national suicide prevention program (NSPP) and mortality from this cause in Chile.

Methods: An exploratory longitudinal observational analytical study was carried out. Indicators regarding its implementation were requested from all the country's regional government agencies in charge of the NSPP, and the statistical association between the decrease in suicide mortality and its degree of implementation was analyzed, comparing mortality in the six years prior to the program with the subsequent six years.

Results: Chile experienced a statistically significant decrease in the suicide mortality rate after starting the NSPP (from 13.98 to 11.58 per 100,000 inhabitants older than 10 years), however, it could not be correlated with the implementation of the program (r = 0.18; p = 0.52), probably because most of the NSPP components failed to be fully installed (average national implementation of 36.61%).

Conclusions: The decrease in the suicide mortality rate in Chile seems to be due to factors unrelated to the implementation of the NSPP, which has also been insufficient. It is necessary to explore these factors in depth as well as to identify the causes that have interfered with a complete implementation of the program.

Schizophrenia's patient journey: a participatory model

Luisa Brogonzoli¹, Matteo Porcellana², Stefano Barlati³, Antonio Vita³, Mauro Percudani², Maria Iardino⁴, Anna Lascari¹

¹Fondazione The Bridge, Milano, Italy, ²Niguarda Hospital, Milano, Italy,

³ASST Spedali Civili of Brescia, Italy, ⁴Fondazione The Bridge, Italy

Background and Objective: Schizophrenia, a severe mental disorder, in up to 60% cases has a variable but chronic course, worsening quality of life and psychosocial functioning. In response to its complexity, a two-year project was built to design a schizophrenia patient journey, including care and disease management in his path towards recovery. This survey-based study aims to share evidence-based information and real-world experiences, examining patients' needs during their care path, and identifying gaps and areas for improvement.

Methods: Three most significant steps in the journey of a patient with schizophrenia were defined: early diagnosis, management of the acute phase, long-term management. Physicians, patients as experts by experience and caregivers were involved in the surveys, to establish current best practices in the management of schizophrenia by Departments of Mental Health (MHD). For

each area answers focused on agreement or disagreement on the importance of each statement, and the level of implementation. The survey was conducted through a computer-assisted Web Interviewing approach in Lombardy in 2021, and widespread throughout Italy in 2022. Finally, two multi-stakeholder Consensus Meetings are envisaged to draw a draft of the Patient Journey, also on the basis of the surveys' results.

Results: The national survey and the Consensus will be closed by the end of the year. The results collected up to now indicate a gap in the long-term management phase, in particular concerning family care, home interventions, work/study support, psychoeducational/psychotherapeutic interventions. Important gaps were also found for pharmacological restraint, collaboration with the general practitioner and in the role of experts in peer support and multiprofessional care teams.

Conclusions: The survey offers an updated assessment of the priority areas of intervention for MHD Heads and covers the current limits of the NHS. Chronicity management represents a limit to be addressed in the patient journey of people with Schizophrenia.

Quality of life among the partners of the TBI survivors

T.R. Kanmani¹, Chandrashekhara Goud¹

¹National Institute of Mental Health and Neuro Sciences, India

Introduction: Traumatic brain injury can significantly change among partners in several functions of their life. Unexpected role changes can arise suddenly without preparation; this may be temporary or even permanent. This indicates significant impact on partner's quality of life. Hence, current study aimed to measure the quality of life among partners of TBI survivors.

Methodology: The study adopted descriptive research design; data was collected from 43 spouses at the time of admission and follow up after 3 months. Semi-structured questionnaire was used to collect the patient and spouse's demographic details. WHOQOL was administered to measure the quality of life at the time of discharge and during the follow up. Data was analysed by using R software.

Results: 7(17.5%) male spouses and 33(82.5) female spouses had participated in the study. The Results Findings identified significant differences in physical health (pre 35.89±8.89 and post 43.39±7.16) ≤ 0.001 . Environmental support was statistically significant differences ≤ 0.042 (pre-52.57±9.80 and post 56.09±7.03). However, there is no statistically significant differences were not observed in the domains of social support and psychological health domains.

Conclusions: The study concludes timely surgical interventions and long-term psychosocial intervention can improve the quality of life of the partners of the TBI survivors. Keywords: TBI, partners, QOL

Art in mental health: more than a therapeutic approach

Martina Giusti¹, Persiani Niccolò²

¹Department of Experimental and Clinic Medicine, University of Florence, Florence, Italy, ²Departmental of Experimental and Clinic Medicine, University of Florence, Florence, Italy

The WHO has recognized the role of art as effective therapeutic approach in mental illness and useful tool in the humanization of care. Nonetheless, this methodology is still rarely used. The research aims to investigate the extension of art therapy and the possible use of art also as instrument for primary prevention. The mental health department of Italian Local Health Authority Roma 1 was chosen as case study. Here the art is used both as therapeutic approach in outpatient of mental health and as means of communications in initiatives of mental health education and sensibilization campaigns for the population. Data about this experience were collected by semi-structured interviews addressed to the top management of the health facility and focus groups with a multi-professional and multidisciplinary team made up of professionals involved in mental health services. With the term "art", the interviewees referred not only to the art therapy and but also to the historic and artistic ambient, in which they work. The contextualization of the mental health department in a monumental complex, influences positively the interpersonal relationships and the organizational climax. In addition, the focus group underlines how art therapy is used because it is suitable for multiple types of patients, who are favoured to work sincerely and hardly on themselves, obtaining a positive impact. Moreover, art is identified as well as an effective communicational method in projects of primary prevention related to mental health coming from the direct experience developed in the museum "Laboratory of Mind". In this moment of profound reorganization and remodelling of the mental health department in the post-COVID-19, the use of art in primary prevention

initiatives is an innovation to adapt. The limits of this work are the evaluation of a single case study. Possible research's developments can be the comparison with other similar realities.

Is community Health workers mental health affected by community violence? A study in a Brazilian metropolis

Anyá Vieira-Meyer¹, Ana Moraes², Helena Santos³, Aisha Yousafzai⁴, Isabella Campelo⁵, José Guimarães², Ana Sales², Mayara Rodrigues², Rebeca Silva², Thaís Moreira², Raul Menezes⁶, Tanandra Rodrigues⁷

¹Fundação Oswaldo Cruz e Unichristus, Brazil, ²Universidade Estadual do Ceará, Brazil, ³Prefeitura Municipal de Fortaleza, Brazil, ⁴Harvard T. H. Chan School of Public Health, United States, ⁵Unifanor, Brazil, ⁶Escola de Saúde Pública do Ceará, Brazil, ⁷Unichristus, Brazil

The Family Health Strategy (FHS) is the main primary health care system in Brazil. FHS is organized through a multidisciplinary team that include Community Health Workers (CHWs), which play a critical role, by strengthening the bond between families and FHS teams. However, they are also exposed to adverse factors such as violence in the territories served. Violence is a major social problem in Brazil with serious repercussions on the health care sector. In this study, we analyzed the relationships between adverse working conditions and dimensions of violence in the territory on the prevalence of common mental health disorders (CMHD) among CHWs in Fortaleza, a Northeastern Brazil capital. Information was collected with a self-report questionnaire containing items on sociodemographics, job-related violence, psychoemotional signs and symptoms (Self-Reporting Questionnaire-20), mental health care, and absence from work due to general or mental health issues. The prevalence of CMHD among CHWs in Fortaleza was shown to be influenced by high levels of violence in the territory and on the job. Based on the responses of 1,437 CHWs, the prevalence of CMHD (32.75%) was shown to be associated with violence perceived, witnessed or suffered in the work territory. In the hierarchical analysis, CMHD was associated with age, sex, religious identity, years of experience as a CHW with the FHS, activities in the community, considering the absence of bond with families as an obstacle, having suffered domestic violence, use of medication for emotional dysregulation, identifying the neighborhood as violent, considering violence a physical or mental health determinant, and identifying impunity as a cause of violence. Thus, the work and mental health of CHWs were significantly impacted by dimensions of violence. Our findings are relevant to the adoption of strategies to mitigate the effect of violence on the work and mental health of CHWs., 2013).

Assessing the acceptability of group model building as a method of engaging people with lived experience of mental ill-health and recovery

Tari Forrester-Bowling¹, Renae Carolin², James McLure², James Lucas¹, Stephanie Bennetts¹, Josh Hayward¹, Andrew Brown¹, Anna Peeters¹

¹Deakin University, Australia, ²Barwon Health, Australia

Background and Objectives: In Australia, the Royal Commission into Victoria's Mental Health System identified a complex and fragmented system ill-equipped to address the needs of people living with mental illness or psychological distress, along with their families, carers and supporters (1, 2). To begin to address these systemic failings, recommendations included calls for co-designed systems-level innovations responsive to the voice of those with lived-experience (3, 4). Group model building (GMB) is a participatory systems-based approach to enhance problem understanding, increase engagement and co-design systemic solutions. This research aimed to assess the usefulness and acceptability of GMB as a process for co-design within the mental health sector and provide clear translation of the methodologies.

Methods: A scoping review on participatory methods used within mental health services informed the co-design approach. Focus groups and GMB workshops with health service lived-experience workforce, clinicians, and other healthcare workers were run to identify person-centred growth-oriented language to be used, acceptability of existing GMB Methods, and the co-creation of adaptations to improve efficacy as a methodological approach.

Results: Person-centred growth-oriented language identified and adopted into vocabulary. A co-created systems approach for stakeholder engagement tailored to the context of mental health services.

Conclusions: This research seeks to elevate people with lived experience to transform mental health services from within, delivering an evidence based, person-centred and co-designed approach to mental health service improvement.

This co-created systems approach for stakeholder engagement will be piloted with an acute mental health inpatient unit to ascertain and foster a shared understanding of the problem scenario and identify contextually relevant and sustainable intervention strategies.

The relationship between the strength of atheistic and theistic beliefs and risky drug use: a public health issue

Camila Chagas¹, José Galduróz², Leonardo Martins³, Wellington Zangari³

¹Institute for Collective Health, Universidade Federal de São Paulo, Brazil,

²Universidade Federal de São Paulo, Brazil, ³Universidade de São Paulo, Brazil

Introduction: Religiousness has been pointed out in the public health literature as a protective factor for drug use; as religiosity increases, drug consumption decreases. However, such an Interpretation may not include other variables such as the type of religion, levels of religiosity and strength of belief. Belief strength refers to how and to what extent a persons belief system is well established and active in his/her life and worldview. Regardless of being theistic or atheistic, belief strength has been negatively correlated to depression and anxiety, and positively to quality of life. However, public health studies on risk and protective factors for drug use neglect the variable "belief strength". Therefore, this research investigated such dimensions in theistic and atheist people as a risk or protective factor for the consumption of alcohol and other drugs. **Methods:** The study was conducted online in Brazil, with adults aged 18 years or older. We used the ASSIST, AUDIT and Fargestrom scales to assess patterns of drug use and scales to assess degrees of religiosity (Centrality of Religiosity Scale) and atheism (Dimensions of Secularity scale). **Results/Discussion:** 5.256 people participated in the study, including atheists, agnostics, Evangelicals, Umbandists, Catholics, esotericists, spiritualists, Buddhists and people who declared themselves not to be adherent to any religion, but to believe in a superior power/a God. The types of drugs and more frequent consumption patterns in these religious or non-religious groups are presented. The results are compared with those from studies in other areas of health, in which a curvilinear relationship emerged. The association between drug use patterns and secular social variables such as participation in voluntary work (compared to attendance at religious services) are discussed. In addition, we discuss the differences among men, women and the LGBTQ population in drug consumption patterns.

Socioeconomic and transcultural determinants of mental health in medical students of four countries

Anna Zimovjanova¹, Anna Zimovjanova², Frederick Wekesah³, Jan Brož⁴, Jana Urbanová⁵, Fatemeh Firouzabadi^{6,7}, Jeffrey Mechanick⁸, Masih Babagoli⁹, Ramfis Nieto-Martinez¹⁰, Natalia Sulbaran¹¹, Andrea Medina¹¹, Maritza Torres¹², Geraldo Neto², Juan Rivas², Monika Kunzova², Martin Pesl²

¹International Clinical Research Center (ICRC), St Anne's University Hospital (FNUSA) Brno, Czech Republic, ²International Clinical Research Center, St Anne's University Hospital Brno, Brno, Czech Republic, ³African Population and Health Research Center, Nairobi, Kenya, ⁴Department of Internal Medicine, Second Faculty of Medicine, Charles University, Prague, Czech Republic, ⁵Faculty Hospital Kralovske Vinohrady, 3rd Faculty of Medicine, Charles University, Prague, Czech Republic, ⁶ENT and Head and Neck Research Center, The Five Senses Institute, Iran University of Medical Sciences, Tehran, Iran, ⁷Iran University of Medical Sciences, Tehran, Iran, ⁸Divisions of Cardiology and Endocrinology, Diabetes and Bone Disease, Icahn School of Medicine at Mount Sinai, New York, United States, ⁹School of Medicine at Mount Sinai, New York, United States, ¹⁰Department of Global Health and Population, Harvard TH Chan School of Public Health, Harvard University, Boston, Massachusetts, United States, ¹¹Escuela de Medicina, Facultad de Medicina, Universidad de los Andes, Mérida, Venezuela, ¹²Ministry of Public Health of Ecuador, Quito, Ecuador

Background and Objective: Medical students experience poorer psychological well-being than age-matched individuals. Social determinants and cultural factors influence an individuals health. The association between social determinants and the mental health of medical students is poorly understood. This study aims to compare the association of stress, anxiety, and depression in medical students with different social determinants and cultures from four countries, Czechia, Iran, Kenya, and Venezuela.

Methods: An online cross-sectional survey was implemented in the spring of 2022. The levels of anxiety, stress, and depression were assessed using the validated

psychiatric questionnaire DASS 21.

Results: In total, 2033 medical students were evaluated, with a median age of 23.0 and 64.8% were female. By country, 1127 were from Czechia, 391 from Venezuela, 331 from Iran, and 184 from Kenya. The prevalence of high-level symptoms was: stress 56.2% (mild to moderate [M-M] 32.7% and severe to extremely severe [S-E] 23.5%), anxiety 57.8% (M-M 29.8%, and S-E 28.0%), and depression 60.8% (M-M 32.5% and S-E 28.3%). The prevalence of high stress and anxiety levels were higher in females than in males ($p < 0.001$). Subjects with low socioeconomic status, low personal budget, and poor involvement in social life presented higher levels of stress, anxiety, and depression than those in the higher categories ($p < 0.001$). The prevalence of S-E stress was higher in Venezuela (26.6%) and Iran (24.2%); S-E depression was higher in Iran (37.5%) and Czechia (28.2%); and the prevalence of anxiety was similar among countries.

Conclusions: The prevalence of high levels of stress, anxiety, and depression in medical students affected more than half of the subjects, and about a quarter of the total experienced severe symptoms. Students with low social determinants presented higher symptoms than students with higher levels, and this association was different across countries.

Physical activity and workers' quality of life during the COVID-19 pandemic: a possible strategy to deal with emotional exhaustion

Federica Ghelli¹, Domenico Sanseverino², Chiara Ghislieri², Roberto Bono¹

¹Department of Public Health and Pediatrics, University of Turin, Italy,

²Department of Psychology, University of Turin, Italy

Background and Objective: Working life is a delicate balance between demands and abilities to meet them. Challenges exceeding individual resources can affect both job performance and the overall workers' Quality of Life (QoL). Assuming Emotional Exhaustion (EE) acting as a mediator, our aim was to assess the role of Physical Activity (PA), number of diseases, and some work-related factors (workload (WL), Job Insecurity (JI), and autonomy (JA)) in modulating workers' QoL. **Methods:** A web survey was administered in July 2021 to 650 Italian workers. A series of regressions were carried out to test the role of EE as mediator between socio-demographic (Sex, Age, n° of diseases), lifestyle (Smoking habit, PA level), and work-related factors (WL, JI, JA, and Classification) and the four domains of QoL defined by the WHO (physical, psychological, social relationships, and environmental).

Results: The response rate was 51.1% (21-63 yrs., 66% males, 79% white-collars, 76% providing a complete report). Concerning the physical domain, WL ($B=0.42$, 95% C.I. (0.331, 0.509), $p<0.0001$) and medium-to-high PA level ($B=-0.11$, 95% C.I. (-0.213, -0.012), $p=0.029$) significantly affected EE, which had a negative relationship with QoL ($B=-0.48$, 95% C.I. (-0.580, -0.380), $p<0.0001$). We observed a full mediation for WL while PA still maintained a positive impact on QoL ($B=0.11$, 95% C.I. (0.023, 0.198), $p=0.014$). EE did not mediate the negative effect of diseases ($B=-0.32$, 95% C.I. (-0.400, -0.231), $p<0.0001$) and JI ($B=-0.14$, 95% C.I. (-0.232, -0.054), $p=0.002$) on QoL. PA seemed to not affect the remaining QoL domains. **Conclusions:** EE is a core component of burnout syndrome, a condition that, although being a widely discussed issue in modern societies, is still not recognised clinically. The suggested possible role of PA in reducing EE and improving workers' QoL, at least physically, could be worthy of attention in defining strategies to promote workers' well-being.

Exploring the impact of task shifting to widen access to treatment for depression for patients with non-communicable-disease and depression multimorbidity on health workers in South Asia

Karen Coales¹

¹Department of Health Sciences, University of York, York, United Kingdom

Background and Objective: Low-and-middle-income countries (LMICs) are experiencing growing demand for non-communicable disease and mental health healthcare services yet face a persistent shortage in access to specialist health workers (SHWs) in these services. Task shifting is an approach used to address this gap in service provision in which specific healthcare tasks are shifted to larger cadres of non-specialist health workers, including lay health workers (NSHWs) with SHWs potentially taking on supervisory roles. Previous evaluative studies have demonstrated that task shifting is both clinically and economically effective, however the impact of task shifting on NSHWs is not fully understood. This information is important given health workers are a key resource in addressing the growing gap in healthcare provision in LMICs. Understanding what challenges and benefits health workers encounter when engaging in task shifting will contribute

to accommodating their likely support needs when implementing future task shifting initiatives. Using a feasibility trial evaluating the effectiveness of a brief talking therapy for depression as an exemplar, the aim of this study is to explore how diabetic health workers in publicly funded diabetic healthcare services in Bangladesh and Pakistan experience delivering a mental health intervention for patients with diabetes and depression multimorbidity. Methods: Using grounded theory methodology, we will make field observations and interview diabetic health workers trained in delivering culturally adapted behavioural activation about their experiences of integrating mental healthcare into their usual practice. Recruitment to the study will begin in December 2022 and continue until theoretical saturation is reached.

Results: We will present preliminary Findings contributing towards the development of an explanatory theory about how mental health task shifting impacts on diabetic health workers in Bangladesh and Pakistan.

DOI: 10.18332/popmed/165291

Neighborhood deprivation and aging sexual minority people's mental health

Wook Yang¹, Shelley Craig²

¹California State University Los Angeles, United States, ²University of Toronto, Canada

Background and Objective: Previous studies have explored the impact of interpersonal level factors on sexual minority people's mental health outcomes. Even though increased number of studies are discussing sexual minority aging and mental health, the importance of neighborhood level factors has not been discussed extensively. Hence, the current study examined how neighborhood social and material deprivation levels contribute to aging sexual minority people's depression.

Methods: The current study used the baseline data of the Canadian longitudinal study on aging (CLSA) in order to conduct a series of regression analysis. The Canadian urban environmental health research consortium (CANUE) data was also linked to the CLSA data to investigate the relationship between sexual minority identity and depression while considering the role of neighborhood deprivation. 48,792 adults, over the age of 45, were included in the analyses (47,792 heterosexual, 760 homosexual, and 240 bisexual adults). Each model had a moderator (material or social deprivation) to explore the neighborhood deprivation's influence. Analyses were stratified by gender and age was included as a control variable.

Results: The results indicate that lesbian identity and neighborhood material deprivation levels contribute to aging lesbian adults' depression levels when compared to their heterosexual and bisexual counterparts. For aging men, bisexuality and neighborhood material deprivation influenced aging bisexual men's depression levels when they are compared to aging heterosexual and gay men.

Conclusions: The current study shows that neighborhood material deprivation level significantly contributes to aging sexual minority people's mental health outcomes. Such results point to the need of community level services for aging sexual minority adults, especially for those residing in materially deprived neighborhoods. Further efforts to develop intervention strategies to serve this vulnerable population would elicit positive aging experiences for aging sexual minority people.

Depression in healthcare workers in Czechia during COVID-19 pandemic

Pavla Cermakova¹, Katrin Wolfova¹, Barbora Frycova¹, David Novak¹, Marie Kuklova¹, Jaroslav Pekara², Matej Kucera¹, Miroslava Janouskova¹, Jana Seblova¹, Dominika Seblova¹

¹Charles University, Czech Republic, ²Medical College, Czech Republic

Background and Objective: Health care workers were at risk for poor mental health during the COVID-19 pandemic. We investigated whether they experienced a change in the occurrence of depression and associated factors.

Methods: Data comes from the COVID-19 HEalth caRe wOrkErS (HEROES) Study. The baseline wave 0 in Czechia was conducted in June 2020 (n=1,778) followed by wave 1 in spring 2021 (n=1,840). Depression was defined as ≥ 10 points on the Patient Health Questionnaire. Logistic regression estimated odds ratio (OR) with 95% confidence interval (CI) for the association of participants' individual and work-related characteristics, simultaneously entered into the model, with depression.

Results: In wave 0, 11% of the participants had depression, while 22% had

depression in wave 1. Irrespective of wave, depression was associated with stress (OR 4.38; 95% CI 3.25-5.95), physical illness (OR 1.5; 95% CI 1.14-1.97), contact with COVID patients (OR 1.53; 95% CI 1.04-2.25), necessity to prioritize patients (OR 1.90; 95% CI 1.34-2.68), stigmatization (OR 1.64; 95% CI 1.25; 2.17), and experience of death due to COVID (OR 1.46; 95% CI 1.06-2.00). Lower odds of depression were predicted by resilience (OR 0.32; 95% CI 0.26-0.40), male gender (OR 0.62; 95% CI 0.44-0.86), sufficient personal protective equipment (OR 0.72; 95% CI 0.54-0.95), trust in management (OR 0.65; 95% CI 0.45-0.94), and professions of physician (OR 0.51; 95% CI 0.31-0.84) and nurse (OR 0.48; 95% CI 0.26-0.80) when compared to working in management. Age, education, informal daily caregiving, support from loved ones, work sector, and change in work tasks were not associated with depression.

Conclusions: The occurrence of depression in health care workers in Czechia has doubled during the pandemic. Both individual and work-related factors seem to have played a role.

The moderating effect of socio-demographic variables on the 'character-strengths' of rural frontline workers: a formative study in India

Radhika Sharma¹, Priha Singh², Abhishek Singh², Ameiya Bondre³, Deepak Tugnat³

¹Sangath, India, ²Sangath, Madhya Pradesh, India, ³Sangath, Bhopal, India

Introduction: Accredited Social Health Activists (ASHAs), who deliver village-level primary healthcare in India, experience substantial work-stress due to the 'emotional labor' contributed by the interplay between personal (domestic) and workplace factors. Negotiation with work-stress tends to involve, among others, personal attributes, or 'character-strengths' as termed in the positive psychology literature. Little is known about the background variables that influence the expression and usage of these strengths. We aim to explore the moderating effects of specific socio-demographic variables on the character-strengths of ASHAs, to inform designing of an intervention to address their work-stress. Methods: A cross-sectional study was conducted in rural Madhya Pradesh (central India) to assess the self-reported 'character-strengths' of ASHAs (N=274) using a 24-item vignette-based six-point Likert measure, 'Self-Perceived Strengths' (Mehrotra et al, 2015). Secondary analysis using descriptive and two-tailed unpaired t tests explored the relationships between socio-demographic variables (e.g., ASHA's age and work experience in years; number of family members; monthly household income and number of close friends) and mean scores of individual strengths.

Results: The strengths of "persistence" and "gratitude" showed significant differences in mean scores by age-groups, with greater expression in older (>33-year-old) ASHAs. Between ASHAs with different levels of work experience, "spirituality" and "close and loving relationships" showed a significant difference in means, with greater expression among more experienced ASHAs (>10 years). Concerning monthly household income, "practicality and far-sightedness" showed a significant difference in means, with greater expression in ASHAs with lesser incomes (\leq ₹80). No strength showed significantly different expressions between ASHAs having varying number of family members or close friends. Discussion: Self-perception of character-strengths is culture-dependent and moderated by varied socio-demographic characteristics. Interventions aiming to reduce work stress among ASHAs (and similar frontline workers) by leveraging character-strengths should consider a contextualization of their strategies for optimal absorption by individuals having different underlying socio-demographic moderators.

Depression, anxiety, and quality of life of Afghan women under the Taliban Government

Ahmad Neyazi¹

¹Afghanistan Center for Epidemiological Studies, Herat, Afghanistan

Background: According to the World Health Organization (WHO), depression is a common mental health illness that is characterized by a persistent feeling of sadness and loss of interest. The present study examined the association of two mental health variables (i.e., depression, anxiety) with quality of life (QoL), and the socio-demographic characteristics of Afghan women living under the rule of Taliban government in Afghanistan. Methods: A cross-sectional study was administered across major provinces of Afghanistan (Herat, Mazar-e-Sharif, Kabul, and Samangan). Logistic regression models were used to examine the association of depression, anxiety with QoL and socio-demographic characteristics among women (N=465).

Results: The prevalence of depression symptoms were 80.6%, and mild to

extremely severe anxiety was 81.3%. Depression symptoms among Afghan women were associated with being older, having more children, lower education level, other individuals' bad behavior, traumatic events, and feeling physically ill. Multiple regression analysis indicated that poor physical domain of quality of life (aOR:4.3; 95%CI: 1.748-11.029, $p=.002$), and poor psychological domain of quality of life (aOR:22.168; 95%CI: 7.50 – 65.49, $p<.001$) were significantly associated with depression. Conclusions: The prevalence of depression was high women living under the government of the Taliban in Afghanistan. Considering the high prevalence of depression, anxiety, and their impact on quality of life and the overall quality of healthcare services, international health organizations should implement programs for regular screening of depression and anxiety, and there should be psychological counselling services available for vulnerable women living under the government of the Taliban. Keywords: depression, anxiety, quality of life, women, Taliban, Afghanistan

Popul. Med. 2023;5(Supplement):A1249

Study conditions and university students' mental health 20 months after the COVID-19 outbreak in Germany - Results from a cross-sectional study

Eileen Heumann¹, Jannis Trümmeler², Christiane Stock¹, Stefanie Helmer³, Heide Busse⁴, Sarah Negash⁵, Claudia Pischke²

¹Institute of Health and Nursing Science, Charité - Universitätsmedizin Berlin, corporate member of Freie Universität Berlin and Humboldt-Universität zu Berlin, Berlin, Germany, ²Institute of Medical Sociology, Centre for Health and Society, Heinrich-Heine-University Düsseldorf, Düsseldorf, Germany, ³Institute for Public Health and Nursing Research, Prevention and Health Promotion, University of Bremen, Bremen, Germany, ⁴Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, ⁵Martin-Luther University Halle-Wittenberg, Halle (Saale), Germany

Background and Objective: University students are generally vulnerable to mental health problems. This vulnerability was further exacerbated by the COVID-19 pandemic as students experienced restrictions in public and academic life. The aim of this study was (1) to describe students' perception of study conditions, (2) to identify study conditions that may be associated with symptoms of anxiety and depression, and (3) to analyse the use of counselling services at universities during the pandemic.

Methods: The cross-sectional COVID-19 German Student Well-being Study (C19 GSWs) was conducted at five universities in Germany in autumn 2021 (N=7,267). Descriptive analyses were performed to describe students' perceived study conditions, self-rated mental health and counselling utilisation patterns. Additionally, linear regression models were applied to analyse the associations between study conditions and mental health outcomes.

Results: More than one third of the students felt burdened by their study conditions: 44.1% indicated that they were less aware of what was expected of them in their study modules during the pandemic and 39.6% reported that their workload had significantly increased since the first COVID-19 outbreak. A total of 42.4% of university students reported feeling down, depressed, or hopeless and 44.5% that they felt nervous, anxious or 'on edge' several days per week. Higher academic stress and dissatisfaction were associated with depressive symptoms and anxiety. Only 7.1% indicated that they had utilised counselling services. Those who had were more likely to be female, enrolled in a Bachelor's programme, and had more than one reason for utilisation.

Conclusions: Our research underlines the need for universities to review their study conditions and to provide targeted counselling services and intervention strategies to promote students' mental well-being.

Comprehensive mental health needs assessment study: the case of Slovenia

Irena Makivić¹, Špela Selak²

¹National Institute of Public Health, Ljubljana, Slovenia, ²National Institute of Public Health Ljubljana, Slovenia

Background and Objective: Needs assessment is important especially during the times of change within the health care system, aiming to prepare good evaluation and valuable implementation of practices that best suit the people in need. It is also an important factor within a continuous process of quality improvement. In order to address the needs comprehensively the aim of the study was to assess them from different perspectives.

Methods: At the systemic level the Delphi study (with 49 stakeholders: service providers, decision-makers and service users) was carried out. Individual needs

of people with mental health problems were assessed using Camberwell needs assessment tool by professionals (206 patients participated) and through measuring patient experiences within newly developed mental health centres (64 patients participated).

Results: The major needs recognized at the systemic level are the needs for companionship and peer support; continuous implementation of destigmatization campaigns; continuous training, supervision and connected work among all professionals and in all sectors within each service; accommodation facilities with different levels of support; needs for strengthening the network of day-care centres. According to professionals one third of the patients are dealing with the needs about self-care, intimate relationship and company. Around half of the patients feel psychological distress and have the needs in physical health, on daytime activities and needs information on condition and treatment. The majority of patients have reported that they can manage their mental health problem better than before joining the treatment. The needs for quality and patient-centred care were addressed. The treatment timeframe is a potential unmet need since a quarter of patients reported to have mental health problems for more than three years before seeking professional help.

Conclusions: Future qualitative needs assessment is vital to address the problems of help seeking as well stigma from patients' as well as professionals' perspective.

Evaluation of a university medical faculty students in terms of mental disorders with SRQ-20

Sevda Sungur¹, Sevil Gedik², Ayşegül Mutlu¹, Tuğçe Torba¹, Mine Tepetas¹, Alaettin Ünsal³, Didem Arslantas³

¹Department of Public Health, Faculty of Medicine, Eskisehir Osmangazi University, Eskisehir, Türkiye, ²Eskisehir Odunpazari İlçe Sağlık Müdürlüğü, Eskisehir, Türkiye, ³Department of Public Health, Faculty of Medicine, Eskisehir Osmangazi University, Eskisehir, Turkey

Background and Objectives: Mental disorders are common in the community, can become chronic, result in disability, decrease academic achievement, and often cannot be adequately treated because they are not noticed. For this reason, mental disorders are a public health problem that concerns not only the individual but also the society and has a high cost. In this study, it was aimed to evaluate the students of Eskişehir Osmangazi University (ESOGÜ) Faculty of Medicine in terms of mental disorders. **Methods:** This cross-sectional study was conducted on 742 ESOGU Medical Faculty students between 2021-2022. The Self-Report Scale (SRQ) and the General Health Questionnaire (GHQ) were used to assess the participants' mental disorders. An online questionnaire form was prepared and distributed to students. Mann Whitney U, Kruskal Wallis, and Spearman correlation analysis were used.

Results: Of the study group, 376 (50.7%) were women, and the mean age was 21.03 ± 2.05 years. The mean score of the SRQ was 7.02 ± 5.22. Being women, worsening income, living alone, having a history of mental disorder, chronic illness, experiencing significant trauma, and not getting enough social support increase the probability of experiencing a mental disorder. It was determined that there was a strong positive correlation between SRQ and GHQ scores ($p<0.001$, $r=0.740$). **Conclusions:** The probability of experiencing a mental disorder was low in the study group. Gender, economic conditions, living conditions, family history of mental disorder, chronic illness, life traumas and social supports predicted the probability of mental disorder. Influencing individuals trained in the field of health can lead to significant disruptions in the health system when they are involved. For this reason, individuals at risk should be identified and necessary preventive and therapeutic interventions should be applied.

Multidimensional and intergenerational impact of severe mental health conditions

Wubalem Fekadu¹, Tom Craig², Abebaw Fekadu¹

¹Addis Ababa University, Ethiopia, ²Kings College, London, United Kingdom

Background: Severe Mental Health Conditions (SMHCs) affect multiple generations although this is poorly studied. The aim of this study was to investigate the intergenerational and multidimensional impacts of SMD in rural Ethiopia.

Methods: This comparative study was nested within an existing population-based cohort study. We collected data from a total of 5762 family members of 532 households (266 households with at least one family member with SMHCs and 266 sex and age-matched mentally well controls from the neighborhood) in 2019. The main outcomes were multidimensional poverty, mortality, food insecurity, and family satisfaction. Findings: Multidimensional poverty Index was higher

in the households of persons with SMHCs (74.44%) than in the comparison households (38.35%). School attendance was lower in children of people with SMHCs (63.28%) than in children of the comparisons (78.08%). The median years of schooling were also lower among children of people with SMHCs than the controls. This lower attendance was also true among siblings of people with SMD (35.52%) than the comparisons (49.33%). Over the course of 20 years, family members who have a person with SMHCs in their household had a 23% increased risk of death compared to family members who did not have a person with SMHCs in their household. Severe food insecurity was also higher in the SMHCs households (20.68%) than in the comparison (13.53%) while family satisfaction was lower. Interpretation: Families of people with SMHCs experience pervasive multidimensional and intergenerational impacts. Interventions should consider the broader family social and healthcare needs of the broader family.

Self-reported knowledge and confidence of clinical associates in South Africa in providing mental health services

Saiendhra Moodley¹, Jacqueline Wolvaardt¹, Christoffel Grobler¹

¹School of Health Systems and Public Health, University of Pretoria, South Africa

Background and Objective: COVID-19 has exacerbated the pre-existing mental health pandemic globally. Additional human resources will be needed to provide mental health services. Clinical associates, the mid-level medical worker cadre in South Africa (SA), could potentially be used to deliver these services as similar cadres have been used elsewhere in Africa. The study aimed to determine the self-reported knowledge and confidence of clinical associates in providing mental health services. **Methods:** A cross-sectional study of clinical associates was conducted between December 2021 and July 2022. The questionnaire was finalised after expert validation and cognitive interview processes. The link to the electronic (Qualtrics) questionnaire was distributed to all clinical associates that could be reached using alumni databases and social media. Data was imported into Stata v17 for analysis.

Results: Of the 209 clinical associates included in the analysis, 205 (98.1%) indicated they had training on management of patients with mental illness during their clinical associate undergraduate degree and 192 (91.9%) indicated they had a mental health rotation. Approximately one-tenth of participants (10.7%) had some additional mental health training after qualifying. Most participants rated their knowledge of various mental disorders that are considered important in the SA context as 'good' or 'excellent' with the only exception being attention-deficit hyperactivity disorder (29.5%). Only 43.2% of participants felt 'quite confident' or 'very confident' in carrying out a mental health examination. Most participants rated their knowledge of suicide risk (59.0%), the aggressive patient (55.6%) and the confused patient (66.3%) as 'good' or 'excellent' though fewer participants felt 'quite confident' or 'very confident' to manage patients presenting with suicide risk (44.9%), aggression (46.9%) and confusion (53.1%).

Conclusions: Clinical associates have a contribution to make in mental health service provision based on their existing mental health knowledge but this may need to be supplemented by additional practical training.

Healthcare workers' emotions, perceived stressors, and coping strategies at workplace during the COVID-19 pandemic in Palestine

Muna Ahmead¹

¹Al Quds University, Occupied Palestinian TerritoryOccupied Palestinian Territory

Background: Evidence about the impact of the COVID-19 pandemic on the mental health of Palestinian healthcare professionals is lacking and has been disregarded during the COVID-19 pandemic. This study aims to describe Palestinian healthcare workers (HCWs) emotions and factors causing stress, and factors used to reduce the stress experienced at the workplace and to examine the relation [1] ships between HCWs level of stress and their coping strategies and motivational factors during the COVID-19 pandemic.

Methods: A self-reported online survey was completed by 506 doctors and nurses working in healthcare facilities that provide COVID-19 care. Descriptive statistics, bivariate, and multivariate regression models were developed to adjust for the association between HCWs coping and motivation factors with HCWs' perceived stressors.

Results: The findings showed that 24.1% of the participants had a high-stress level, and 25.7% had a low level of stress. The participant's main coping strategy

was avoidance and the key emotional factor was the ethical and professional obligation to continue working. A major cause of their stress was their personal safety and having the COVID-19 infection. Findings showed a positive association between stress and the younger age of participants, with physicians being less stressed than nurses. Furthermore, there was a significant positive correlation between stress scoring and coping strategies scoring but not with motivation score. **Conclusions:** This study shows that Palestinian healthcare workers experienced emotional turmoil during the COVID-19 pandemic. These results indicate the necessity of providing supervision, psychological counseling and intervention to professional healthcare workers who work directly with COVID-19 patients in health settings during the current pandemic or in the event of future outbreaks. Policymakers and managers must also conduct training and provide interventions on how to cope with stress in pandemics, in order to assist HCWs in developing their adaptive coping strategies and increase their motivation.

Loneliness in emerging adulthood: a qualitative study using cultural probes and in-depth interviews

Berit Nielsen¹, Lise Nielsen², Mathias Lasgaard³

¹Advanced Wellbeing Research Centre, Defactum, Department of Public Health Research, Social and Health Services and Labour Market, Aarhus, Denmark, ²Defactum, Department of Public Health Research, Social and Health Services and Labour Market, Aarhus, Denmark, ³Defactum, Department of Public Health Research, Social and Health Services and Labour Market, Denmark

Background: Loneliness has become a great public health concern in the Western world. Most vulnerable to loneliness are emerging adults. Prolonged loneliness in emerging adults is associated with poor mental health such as symptoms of depression and anxiety that may have negative implications for health and well-being in later life. **Aim:** To explore and gain a better understanding of how prolonged loneliness is experienced and coped with in the everyday life of emerging adults. **Methods:** The study is a thematic analysis of qualitative data consisting of cultural probes and in-depth interviews. Participants were recruited through targeted advertising on social media. Over a week, participants aged 18-25 completed a cultural probe that included open and evocative activities for them to delve into in their own time thereby contributing to depicting their story about loneliness in everyday life. After reviews of the cultural probes, in-depth interviews were conducted. The interviews were recorded and transcribed verbatim.

Results: Participants were 21 emerging adults (mean age 21.3), three men and 18 women. Except for one, they all completed cultural probes that were returned prior to the interview and used as a starting point for conversation. At present (December 2022), the coding of the transcribed interviews has been completed and thematic analysis is underway. The final Results will be presented at the conference. **Perspectives:** A wider understanding of emerging adults' lived experiences with prolonged loneliness can contribute to new perspectives on the reasons underlying loneliness. The material from the cultural probes are strong testimonies and formed the basis for creating a traveling exhibition to set the stage for dialogue. The exhibition is currently traveling around various cultural and educational venues in Denmark. Going forward, the study can contribute as a direct voice of emerging adults when developing interventions aimed at reducing loneliness.

Background: Research has indicated an increased risk of self-harm repetition and suicide among individuals with frequent self-harm episodes. Co-occurring physical and mental illness further increases the risk of self-harm and suicide. However, the association between this co-occurrence and frequent self-harm episodes is not well understood. We examined the profile of individuals with

Background and Objectives: Although workplace wellbeing (WWB) has been receiving increasing research interest, there have been few studies in East Asian countries. This study seeks to examine factors associated with low WWB in Hong Kong, a high-income Asian city.

Methods: Using a newly validated Chinese language instrument, an anonymous telephone survey was conducted among working adults in Hong Kong (n=400) in November 2022. **Methods:** Using a newly validated Chinese language instrument, an anonymous telephone survey was conducted among working adults in Hong Kong (n=400) in November 2022.

The sociodemographic factors associated with low WWB (45, being married, lower income, lower education, being a non-professional worker, high weekly work hours, and non-flexibility of work location were significantly associated with low WWB levels (OR: 1.87-6.91).

Results: In the unadjusted analysis, age>45, being married, lower income, lower education, being a non-professional worker, high weekly work hours, and non-flexibility of work location were significantly associated with low WWB levels (OR: 1.87-6.91, p<0.05). However, the multivariable regression noted that only non-tertiary educated (OR=3.10) and high working hours (OR: 2.09-6.61) were associated with lower WWB. Gender, having dependent children, and commute time were not associated with WWB. Seven of the eight WWB subscale scores (Emotional WB, Social WB, Psychological WB, Job Benefits, Spillover Effects, Organizational Culture, Work Nature) were positively correlated with self-rated health scores (p: 0.12-0.32, p<0.05) and likelihood of changing jobs while the Physical Environment WB score showed only marginally significant associations (p< 0.10).

Of respondents, 33.8% reported that WWB had worsened during the COVID-19 pandemic (3.5% reported improvement). Compared with workers in the financial services, those employed in education (OR=3.79), healthcare (OR=3.50), retail (OR=4.20), and manual labor (OR=8.17) were more likely to report that their WWB had worsened after the pandemic; 21.5% attributed their worsened WWB to lowered income or work opportunities while 14.1% reported that their workload had greatly increased during this time.

Conclusion: Workers with lower education and high work hours are at risk of low WWB. The COVID-19 pandemic had varying levels of effects on different industries due to economic difficulties and work overload.

Popul. Med. 2023;5(Supplement):A1261

DOI: 10.18332/popmed/163654

Racial disparities and anxiety symptoms association with nutritional status during the COVID-19 pandemic

Júlia Cristina Cardoso Carraro¹, Ana Cláudia Morito Neves², Mariana Carvalho de Menezes³, Raquel de Deus Mendonça², Adriana Lúcia Meireles⁴

¹Universidade Federal de Ouro Preto, Clinical and Social Nutrition Department, "Rua Dois, 90, Apto 301", Brazil, ²Universidade Federal de Ouro Preto, Program in Health and Nutrition, School of Nutrition, Brazil,

³Universidade Federal de Ouro Preto, ⁴Universidade Federal de Ouro Preto, Clinical and Social Nutrition Department, Brazil

Background and Objective: Some evidence shows an increase in anxiety symptoms among undergraduate students during the covid-19 pandemic. However, anxiety symptoms can be different between individuals of different races/skin color, especially in a country with social inequalities linked to skin color, as Brazil. So, this study aimed to assess the interaction between different races/skin color and anxiety in relation to body weight status in university students during the covid-19 pandemic.

Methods: This cross-sectional study was conducted with 610 undergraduate students from Brazil during the first wave of covid-19. Data were collected using an online questionnaire between July and August 2020. Self-reported race/skin color was categorized into white and black or pardo. Symptoms of anxiety disorders were assessed by depression, anxiety and stress scale-21 scale, validated in Brazil. Body mass index (bmi) was obtained using self-reported weight (kg) and height (m), being $bmi \geq 25 \text{ kg/m}^2$ for adults, $\geq 27 \text{ kg/m}^2$ for the elderly and z-score ≥ 1 for adolescents, used as the cutoff point for excess weight. For data analysis, it was used adjusted logistic regression to estimate the odds ratio (or) and 95% confidence interval (CI).

Results: Of the 610 university students, 51.31% were black or pardo, 62.95% were female, 56.89% were ≥ 23 years old, 42.79% had anxiety symptoms, and 48.52% were overweight. In the multivariate analysis, being black and having anxiety symptoms had higher odds of being overweight (or= 2.04; 95% ci: 1.21-3.45) compared with white individuals without anxiety symptoms. There was no interaction between race/skin color and anxiety in relation to being overweight.

Conclusion: The findings suggest a possible racial disparity in weight status among undergraduate students, where those who declared black or pardo skin

race/color and having anxiety symptoms were more likely to be overweight when compared to white without anxiety symptoms.

Exploring diffusion and spillover effects of an evidence-based mental health intervention among peers and caregivers of youth in rural regions of Sierra Leone

Alethea Desrosiers¹, Laura Bond², Morgan Hoffman², Praveen Kumar², Carolyn Schafer³, Alpha Vandi⁴, Miriam Hinton⁴, Isha Metzger⁵, Theresa Betancourt²

¹Brown University, United States, ²Boston College School of Social Work, United States, ³NorthWestern University, ⁴Caritas-Freetown, Sierra Leone, ⁵Georgia State University, United States

Background: Given the large mental health treatment gap in low- and middle-income countries (LMICs), harnessing the naturalistic processes of diffusion- the untargeted and unplanned spread of new practices across networks- and spillover- the phenomenon of beneficial effects among nonparticipants- could shed light on the wider benefits of evidence-based mental health interventions in LMICs, including Sierra Leone. This study explored potential diffusion and spillover effects of an evidence-based mental health intervention- the Youth Readiness Intervention (YRI)- among peers and cohabitating caregivers of Sierra Leonean youth (aged 18-30) who participated in the intervention.

Methods: We recruited index participants who had completed the YRI delivered within entrepreneurship training (N=165) and control index participants (N=165). Index participants nominated three of their closest peers and one primary cohabitating caregiver. Nominated peers (N=879) and caregivers (N=284) were recruited and enrolled into this study. Sub-samples of caregivers, index participants and peers were selected to participate in 20 key informant interviews, 11 dyadic interviews, and two focus group discussions (N=16), respectively. Qualitative data was analyzed using grounded theory. Multivariate regression analysis compared YRI knowledge levels among YRI participants' peers relative to control participants' peers.

Results: Qualitative analysis indicated that spillover effects occurred among caregivers, via improvements in sense of well-being, household dynamics, and caregiving burden. Qualitative analysis supported diffusion of several YRI components among peers, particularly progressive muscle relaxation and diaphragmatic breathing. Sharing occurred mostly via verbal explanation or demonstration with same-aged peers. Regression analysis indicated that YRI participants' peers ($\beta=0.02$, p<.00) demonstrated significantly greater YRI knowledge compared to control participants' peers.

Conclusion: Diffusion and spillover of evidence-based interventions can occur naturally in a post-conflict, LMIC setting. Disseminating evidence highlighting the wider societal benefits of evidence-based mental health interventions to key stakeholders and policy-makers in LMICs could help increase investments in scaling up services.

The effectiveness of integrated mental health and psychological support interventions in reducing postpartum depression of mothers in palestine: a randomized control trial

Salam Khatib^{1,2,3}, Nuha Sharif⁴, Hana Rabadi^{3,5}

¹Al-Quds University, Faculty of Health Profession, Abu Dis Campus, Al

Quds University, Palestine, ²Abu Dis Campus, Al Quds University, Palestine,

³Palestinian Territory, Occupied, ⁴Al-Quds University, ⁵Al-Quds University, Abu Dis Campus, Al Quds University, Palestine

Background and Objective: Various sources indicate the high prevalence rate of depression during prenatal and postnatal periods in Palestine. Therefore, the aim of this study was to test the effectiveness of an integrated mental health and psychosocial support (PSS) intervention in reducing depressive symptoms of mothers in vulnerable communities in Palestine.

Methods: A cluster randomization trial, conducted on 26 vulnerable communities in the West Bank, was included in the study. A total of 469 pregnant mothers were included in the study, of which 231 were assigned randomly to the control group and 238 were assigned to the intervention group. Data were collected from both groups at the baseline and the end-line of the survey using Edinburgh Postnatal Depression (EPDS) questionnaire. Pregnant women in the intervention clusters were supported with the integrated package including PSS, while pregnant women in the comparison group received routine care by trained community

health workers.

Results: In the pre intervention phase, the prevalence rate of antenatal depression was 10.5% in intervention group and 25.5% among the control group. While in the post intervention phase, postpartum depression level among the intervention group was lower in comparison to the control group (7.5; 13.7 respectively). In addition, during this phase 4.6% of mothers in the intervention group had an EPDS score > 13 (severe depression), whereas 2.9% had an EPDS score of 10–12 (mild depression). Conversely, 7.9% of mothers in the control group had an EPDS score > 13, while 5.8% had an EPDS score 10–12; this indicated the effectiveness of intervention on decreasing postpartum depression level.

Conclusion and Global Health Implications

Providing PSS intervention to pregnant women was found to be effective in reducing depressive symptoms, thus it is crucial to integrate it within primary health programs to mothers.

Male victims of intimate partner violence in Greece during the COVID-19 pandemic: prevalence and risk factors

Maria Papadakaki¹, Roxane Eftychidi¹, Joannes Chliaoutakis¹

¹LaHeRS Lab, Social Work Department, Hellenic Mediterranean University, Greece

Background: Male victimization is neglected both in research and policy. Social stereotypes serve as a barrier in prevention and efficient management of the problem. The current study aimed at exploring the manifestation of violence against male and the factors associated with its occurrence, in a country with the lowest gender equality score among EU member states (based on EIGE index).

Methodology: Non-random sampling survey was carried out on a sample of 211 men, aged 18 and over, residents of rural and urban areas of one prefecture of Greece. The profile of the male victims of partner abuse, the level of mental resilience, the frequency of victimization and the response strategies were studied. Results: Most subjects reported experience of psychological and socioeconomic abuse (24.2% physical, 18.0% sexual 74.7% psychological, 58.1% socioeconomic). Resilience had weak to moderate association with victimization. The age, duration of the relationship in years and monthly salary had negative association with the victimization. The higher the educational level and the professional achievement of individuals, the higher the frequency of victimization. Single and divorced individuals were more victimized than married individuals and those in a relationship. Income and educational inequalities between participants and their partners were not correlated with the frequency of victimization. Most subjects chose the strategy of direct confrontation when victimized (35.6%), whereas few chose to report their abuse to the authorities (3.2%).

Conclusions: Psychological and socioeconomic victimization by intimate partners is prevalent among men. Certain socioeconomic characteristics could distinguish males most at risk. Further research is needed to understand and tackle the phenomenon.

DOI: 10.18332/popmed/163828

Determining associations between co-use of tobacco & cannabis products and mental/behavioral health outcomes: a narrative literature analysis

Taichi Murata¹, Gideon St Helen², Neal Benowitz³

¹University of California San Francisco (UCSF) School of Pharmacy, United States, ²UCSF School of Medicine, ³UCSF School of Medicine/San Francisco General Hospital, United States

Studies suggest that co-use of tobacco and cannabis, which is highly prevalent among cannabis users, has detrimental effects on user mental health and public health. Thus, we reviewed extant literature to determine associations between co-use of tobacco and cannabis on mental and behavioral health outcomes such as depression.

We conducted a narrative literature review of manuscripts published between 2007–2022. Using two Boolean search terms, we performed a literature search across 4 databases (PubMed, Embase, PsycINFO, and Web of Science). TM reviewed the titles and abstracts for relevance to the topic. Abstracts that were not obviously relevant were discussed by the three investigators and included or excluded based on consensus. Data were extracted from the included manuscripts, including study design, population, sample size, measures of cannabis and tobacco use, and mental and behavioral health outcomes.

From 19,153 literature search results across four databases, 31 articles are relevant to the narrative literature analysis. There were 15 prospective cohort studies, 7 cross-sectional studies while 9 studies included mixed methods

(exploratory survey, qualitative/quantitative, longitudinal cohort). Across numerous prospective cohort and cross-sectional studies: there were consistently higher odds ratio of depression [range: 1.93 (1.27–2.93) to 3.4 (1.70–7.00)] among co-users of tobacco and cannabis compared with single or non-users. Mixed Methods studies discovered that there were higher 9-item Patient Health Questionnaire (PHQ-9) scores indicating higher severity of depression symptoms among co-users of tobacco and cannabis.

Our narrative review found co-use of tobacco and cannabis is associated with increased risk of mental health disorders. While associations between cannabis and tobacco co-use and mental illness is strong, current research cannot determine whether co-use is causally related to mental illness, or whether mental illness is causally related to co-use. By understanding current trends of co-use of tobacco and cannabis research, we could develop public policy to improve public health.

Roles of wantedness of pregnancy and childbearing on depression among married adolescent girls in Bangladesh: evidence from a nationally representative cross-sectional survey

M Haider¹, Karar Ahsan², Mizanur Rahman³, Shusmita Khan³, Quamrun Nahar¹, Anadil Alam¹, Kanta Jamil⁴

¹International Centre for Diarrhoeal Disease Research, Bangladesh, 68 Shaheed Tajuddin Ahmed Sarani, Mohakhali, Dhaka, Bangladesh, ²University of North Carolina at Chapel Hill, ³Data for Impact, University of North Carolina at Chapel Hill, United States, ⁴IAP World Services, United States

Background: Near half of the adolescent (15–19 years) girls in Bangladesh are married. Complex physical and emotional states lost childhood in marriage and childbearing affects their mental well-being. One of the adverse consequences is living with major depressive disorder (MDD). We aim to examine the MDD among currently married female adolescents aged 15–19 (CMFA) by their wantedness of pregnancy and birth.

Methods: We used data from the nationally representative 2019 Bangladesh Adolescent Health and Wellbeing Survey that collected data on MDD from 2280 CMFAs, and adopted the patient health questionnaire (PHQ-9) to assess MDD. We examined MDD by seven statuses – no child, pregnancy wanted or later, a child born in the last 0–5 months wanted then or later, and a child born in the last 6+ months wanted then or later. Finally, a multivariable logistic regression model adjusts MDD for background characteristics.

Results: 15% of the CMFAs had MDD with wide variation across childbearing status. While 13% of the CMFAs with no child had MDD, it was 17% among pregnant CMFAs if the pregnancy was wanted, and 24% for unwanted pregnancies. MDD levels among CMFAs having a birth in the last 0–5 months by wantedness of the child were similar to that of wantedness of pregnancy. However, MDD among CMFAs who had birth before six months was close to CMFAs with no child. CMFAs with unwanted pregnancy and birth in 0–5 months were found to have significantly higher MDD after controlling for socio-demographic and marital characteristics, gender attitude, and recent experience of physical violence, sexual harassment, and verbal bullying.

Discussion

Unwanted childbearing increases MDD among CMFAs in Bangladesh. However, a playful child aged six months and above perhaps helps her to be normal. Social awareness and strengthening family planning programs may protect CMFAs from MDD.

DOI: 10.18332/popmed/163955

Experiencing Domestic Violence in Urban Spaces- Issues of Psycho-Social Wellbeing

Dr Singh¹, Dr. Acharya²

¹Mindfield Research Services, "Flat-13, Pocket- D2, Opp Post Office, Sector - 15, Rohini, New Delhi - 110085", India, ²Jawaharlal Nehru University, New Delhi

Background and Objective: There is a significant association between domestic violence and psycho-social wellbeing. Women who have experienced domestic violence or abuse are at higher risk of experiencing a range of mental health conditions. Lack of coping mechanisms and social support leaves women to stay in distress condition throughout their life. Thus, this paper attempts to evaluate the relationship between empowerment, social support, and psycho-social wellbeing of women who have experienced violence and their awareness level and coping mechanism.

Methods: The study is based on both quantitative and qualitative data collected from men and women in rural and urban slum sites in four cities of India (Delhi,

Hyderabad, Jaipur and Lucknow). The research adopted a mixed methods approach. Statistical methods such as principal component analysis for index creation, cross-tabulations, chi-square tests were applied.

Results and Conclusion: The finding shows that around 78% of women faced any form of domestic violence across the four cities. The physical form of violence was around 59.6%, emotional violence was 73% and sexual violence was 34.7%. The highest prevalence of domestic violence was in Jaipur, followed by Lucknow, Delhi, and Hyderabad. The relationship of violence with social support and empowerment shows a significant association: i.e with decreasing social support the chances of facing domestic violence increase by 83% (OR: 1.83; $p < 0.01$), and with lower empowerment the chances of facing domestic violence increases by 14% (OR:1.14; $p < 0.05$). To cope with domestic violence, more women from Jaipur and Hyderabad sought help. Most women relied on their own families for help, while some knew about the 181-helpline number and tried seeking help. The findings show the lack of policies and programs on the psycho-social wellbeing of women.

DOI: 10.18332/popmed/163984

Risk and protective factors of youth crime: An umbrella review

Rosa Alati¹, Getinet Ayano¹

¹Curtin University, School of Population Health, Curtin University, Perth, Australia

Background and Objective: Several systematic reviews and meta-analyses have been conducted on the risk and protective factors of youth crime. This study aims to consolidate this evidence using an umbrella review methodology.

Methods: A systematic electronic search was conducted on Web of Science, PubMed, PsychINFO, and Scopus to identify relevant studies. The protocol was registered in PROSPERO (CRD4201707652), and A Measurement Tool to Assess Systematic Reviews (AMSTAR) was used to assess the quality of the studies. Inverse variance weighted fixed- and random-effect meta-analysis was conducted to pool odds ratios from the included studies.

Results: In total, 29 systematic reviews and meta-analyses were sourced. Sixty-three risk and protective factors of youth crime were considered in the final analysis and grouped into individual, family, school, social, and victim-level risk domains. Within the individual risk domains, substance use, previous history of crime, moral development, psychopathology, genetics, and adverse childhood experiences were key predictors of youth crime. At the family level, the main risk factors included poor parental supervision, maltreatment or neglect, lower educational level, and poor attachment. Whereas school bullying and negative school climate were identified as important risk factors for youth crime within the school domain. Additionally, economic inequality, discrimination, and peer pressure from the social domain, gender, age, and the relationship of the offender with the victims within the victim domain were found to be important risk factors for youth crime. Effective parental supervision, good attachment, and supportive school environments were found to be protective.

Conclusion: The evidence-based atlas of key risk and protective factors identified in this umbrella review could be used as a benchmark for advancing research, prevention and early intervention strategies for youth crime.

Self-efficacy, work-related autonomy and work-family conflict and their role on employee's stress level during home-based remote work

Martin Lange¹, Ina Kayser¹

¹IST-University of Applied Science, "Erkrather Straße 220a-c, 40233 Düsseldorf, Germany"

Background: The facets of home-based remote work are multifaceted and can become stressors that affect a person's health. At the same time, self-efficacy is an important personal resource to deal with health-related stressors (Charalampous et al., 2019). The objective of this study is therefore to explore the relationship between self-efficacy (SE), work-related stress (WRS), health outcomes (health and anxiety), contributing factors (autonomy and experience) and work-family conflict (WFC) in a remote work setting.

Method: A cross-sectional design with a probabilistic sample of $n=5.163$ recruited from January to February 2021 was chosen. Validated instruments with a total of 38 items were selected to assess SE, WRS, WFC, autonomy, experience, health, and anxiety (Staples et al., 1999). For evaluation we used a PLS-SEM approach (partial least square-based structured equation model).

Results: Results show that SE significantly reduces WRS ($\beta = -0.164$; $p < 0.001$). Moreover, WFC increases WRS and anxiety, while SE reduces WFC and mediates

health outcomes (anxiety: $\beta = -0.065$; $p < 0.001$; health: $\beta = -0.048$; $p < 0.001$). At the same time, autonomy ($\beta = 0.260$; $p < 0.001$) and experience ($\beta = 0.215$; $p < 0.001$) increase SE.

Conclusion: Our results have high practical implications for employers and employees, underlining the importance of self-efficacy as a personal resource to buffer work-related stress and work-family conflict while promoting overall health at the same time.

Anxiety and depression among young people in Lithuania under the exposure of the war in Ukraine

Marija Jakubauskiene¹, Ausra Berzanskite¹, Audrius Jakelaitis¹, Dovydas Gavenavicius¹, Jelena Stanislavoviene¹

¹Vilnius University, Faculty of Medicine Lithuania

Introduction: The Russian-Ukrainian War (RUW) after the covid-19 pandemic once again exposed societies and economies around the world to insecurity and suffering. The surrounding countries in the eastern Europe are widely affected due to geopolitical reasons, social and cultural proximity to Ukraine and overwhelming mass media exposure. Mental ill-health consequences have already been reported in several European countries. Though long-term consequences of the RUW on mental health are yet to be evaluated, the main aim of our study was to assess the prevalence of anxiety and depression among young people in the exposure of RUW. **Participants/Methods:** A cross sectional e-based study has been conducted in October - November 2022 among 410 students aged 18-30 years in Lithuania. Research instrument consisted of general anxiety disorder (GAD-7) and patient health questionnaire (PHQ-9) scales supplemented by the self-constructed scale on involvement in Ukraine support activities. The final outcomes of anxiety and depression (GAD-7 score, PHQ-9 score) were assessed by sociodemographic variables, as well as by involvement.

Results: 40% and 49% prevalence of moderate to severe anxiety and depression respectively was assessed among young adults. 31.5% of young adults reported being highly involved in Ukraine support and information/communication activities. Females and people with high level of involvement in Ukraine support had more higher levels of anxiety and depression. Weak associations between involvement, anxiety and depression were disclosed (respectively $p = 0.24$, $p = 0.18$). Anxiety was strongly correlated with depression ($r=0.725$).

Conclusions: High involvement in Ukraine support activities and intensive exposure to media coverage of RUW were associated with moderate to severe levels of anxiety and depression in young adults in Lithuania. These findings can help in understanding and addressing long term impacts on population mental health in exposure to the war in Ukraine.

Together at Social Sciences - the ABCs of mental health at the university

Line Nielsen¹, Cecilie Madsen¹, Line Nielsen¹, Malene Nelausen¹, Charlotte Meilstrup¹

¹Department of Psychology, University of Copenhagen Denmark

Background and objectives: For most young people, the study years are a good period of their lives, socially and academically. Unfortunately, there are also an increasing number of young people who experience mental health problems or low levels of mental well-being. Much research on university student wellbeing has focused on psychological distress and the use of support services by students experiencing mental health problems. More research on how to promote mental well-being in this context is needed. The objective of the complex ABC-uni intervention is to promote mental wellbeing among students by 1) increasing mental well-being literacy among students and staff and 2) to promote a mental health promoting study environment.

Methods: 'Together at Social Sciences - ABCs of mental health at the university' (ABC-uni) is an adaptation of the ABC of mental health (ABC) to the university setting. ABC is the first universal research based public mental health promotion initiative in Denmark. ABC-uni applies a whole university approach focusing on students, surroundings, staff and other parties that can influence students' mental well-being. It includes several elements: elective course for students on mental

health promotion (MHP) in theory and practice, online module on MHP for students based on podcast interviews with experts and students, capacity building in MHP among staff and student organisations, photovoice-based mapping of health promoting assets and needs at campus, and communication campaigns on MHP. Results: The elements of the complex intervention is under development and are being pilot tested during 2023. At the conference, we will present preliminary experiences and findings.

Conclusion: Universities play an important role in promoting mental well-being at the individual, group and university level. The salutogenic approach applied in the ABC-uni may provide valuable experiences that can support this.

Movimento Biologico: an innovative training program based on mindful movement that can contribute to salutogenesis

Chiara de Waure¹, Manuela Chiavarini¹, Francesco Iorio¹, Giancarlo Pocetta¹, Livia Buratta², Roberta Carestia³, Antonio Cosenza², Camilla Gobetti¹, Chiara Lupi¹, Guglielmo Sorci¹, Claudia Mazzeschi², Andrea Biscarini¹, Stefano Proietti¹

¹Department of Medicine and Surgery, University of Perugia, Perugia, Italy,

²Department of Philosophy, Social Sciences and Education, University of Perugia, Perugia, Italy, ³Department of Medicine and Surgery, University of Perugia, Perugia, Italy; Italy

Background and Objective: Movimento Biologico (MB) is a form of mindful movement that integrates interoceptive, proprioceptive, kinesthetic, tactile, spatial, emotional, psychological, and relational aspects "through" and "into" movement. We set up a training program based on MB for students attending the 2nd and 3rd year of the Degree in Sport Sciences at the University of Perugia, Italy, and we investigated its feasibility and impact in terms of psychological well-being and sense of coherence, a salutogenic concept related to the way of viewing life. The objective of this work is to describe how the program was organized and launched and to report on students' participation.

Methods: The program was conducted by an expert in MB and developed over a period of 8 weeks, with one day session per week for a total of 48 hours. A meeting was held before and after the program to collect data on participants' characteristics, lifestyles, psychological well-being and sense of coherence. The program started on October 2022 and was advertised through the website of the Degree in Sport Sciences and students mailing list and WhatsApp group. The enrolment was voluntarily, and applications were collected in the second half of September. The number of participants was set at 40 for logistical issues and a maximum number of 8 hours of absence was allowed.

Results: Out of 56 applications, 38 students (mean age 21.2 years; range 20-25; 60.5% males) followed the program. The majority of students (84.2%) attended the required number of training hours. From participants' feedbacks emerged the creation of a favorable environment to develop soft skills such as teamwork, empathy, self-awareness and adaptability.

Conclusion: The MB program was attractive and feasible as the expected number of students to enroll was almost achieved and most participants complied with the required attendance reporting overall positive feedback.

Assessing risk perception and its associated factors of university students in the COVID-19 era

Qi Zhao¹, Jiasheng Xiong¹, Xiaoqin Guo¹, Biao Xu², Genming Zhao¹, Na He¹

¹Department of Epidemiology, School of Public Health, Fudan University, Shanghai, China, ²Songjiang Municipal Center for Health Promotion, Shanghai, China

Background: The health belief model states that individuals' adoption of health behaviors is influenced by one's risk perception, and health education is often connected with effective management of risk perception. This study was to investigate the factors associated with risk perceptions of China's university students in the face of an infectious disease outbreak such as coronavirus disease 2019 (COVID-19), thereby providing scientific basis and implications for constructing targeted health education system.

Methods: A cross-sectional survey study covered 3627 participants was conducted in April 2020 in Songjiang district, Shanghai, China. A self-administered questionnaire was distributed via an online platform, which aims to assess to what degree the factors are associated with students' risk perceptions of public health emergencies, particularly COVID-19. Descriptive analysis and the chi-square test were used to identify the differences in respondents' risk perceptions, while factor analysis and logistic regression were used to analyze the public factors

associated with risk perceptions.

Results: University students in both high-risk and low-risk regions were likely to have higher risk perception than those of in medium-risk regions, and female students tended to have higher perceptions of risk than male (both $P < 0.01$). University students with high-risk perceptions showed higher sensitivity to public opinion ($P = 0.002$) and disease seriousness ($P < 0.001$). Female students or students in high-risk COVID-19 regions were more concerned about disease seriousness, while those in low-risk regions were more concerned about public opinion.

Conclusion: Female students or students in high-risk and low-risk regions of COVID-19 have higher risk perceptions for COVID-19, and their risk perceptions are identified to be mainly associated with disease seriousness. The risk perception of students in low-risk regions were mainly associated with public opinion. Health departments should take account of different profiles of risk perceptions among varying public groups when promoting and implementing health education under public health emergencies situations.

Levels and sources of stress in medical students at a Pakistani medical school pertaining to year of study and gender

Nimra Ishfaq¹

¹Aligarh College of Nursing Pakistan

Background and Objectives: Medical Training is regarded as stressful and stress is prevalent amongst medical students. However, studies assessing whether stress is uniform across year of study and gender in a Pakistani Medical school are lacking. The study primarily aims to examine levels and sources of stress in students at a Pakistani Medical school with regards to year of study and gender. This study also looks at the effects of demographics on self-reported stress.

Methods: A cross sectional survey was distributed to 350 medical students of year 1, 4 and 5 at Combined Military Hospital, Lahore Medical College, Lahore. It contained a consent form, general demographic information and the MSSQ questionnaire consisting of 40 items to identify levels and sources of stress.

Results: The response rate was 241/350 (68.84%). Year 1 reported a Moderate stress level of 1.890, Year 4 reported a High stress level of 2.039 and year 5 reported a Moderate stress level of 1.925 where academics were the stressors. Males reported a lower stress levels than females ($p < 0.000$). The common sources of stress were academic and social. Linear regression analysis indicated that daily hours of study was positively correlated with academic stressors ($p < 0.026$) and social stressors ($p < 0.028$). Daily hours of sleep was negatively correlated with academic stressors ($p < 0.045$). Year of study ($p < 0.036$) and Marital Status ($p < 0.024$) were negatively correlated with social stressors.

Conclusion: The stress levels and sources did change with year of study. Stress and stressors were found to be gender specific with males reporting lesser perceived stress.

Promoting family well-being at scale: Optimising and re-designing a digital parenting programme for reducing violence against children in Imics using the 6squad framework

Maxwell Klapow¹, Paula Zinser², Jamie Lachman³, Chiara Facciola⁴, Qing Han⁵, Maria Ambrosio³, Francisco Calderon⁶, Khanyile Brukwe⁷, Ross Sheil⁸, Ytske Van Winden⁹, Shanoy Combs¹⁰, Bernice Mamauag¹¹, Reyes Jennel¹², Camille Habacon¹², Liane Pena Alampay¹², Samantha Erika Mendez¹³, Rumaya Binti Juhari¹⁴, Moa Schafer³, Lily Clements⁴, David Stern⁴

¹University of Oxford Postgraduate student United Kingdom, ²Global Parenting Initiative, University of Oxford, United Kingdom, ³University of Oxford United Kingdom, ⁴IDEMS International United Kingdom, ⁵University of Oxford, ⁶University of Oxford United Kingdom, ⁷Clowns Without Borders South Africa (NGO), ⁸UNICEF - Jamaica, ⁹UNICEF United States, ¹⁰UNICEF - Jamaica Jamaica, ¹¹University of the Philippines Visayas Philippines, ¹²Ateneo de Manila University Philippines, ¹³University of the Philippines Diliman Philippines, ¹⁴University Putri Malaysia Malaysia

Background and Objective: In response to the increased levels of emotional and physical violence against children due to the COVID-19 pandemic and existing barriers to taking parenting programs to scale in Imics, parenting for lifelong health (plh) adapted its parenting programmes into a self-guided chatbot, parenttext. Initial acceptability and engagement with parenttext was tested in multiple pilot studies with results indicating that engagement was a significant barrier to the impact and effectiveness of the digital intervention. Using pilot data, this presentation describes the process of re-designing the intervention to

increase engagement and retention.

Methods: Mixed methods pilot studies were conducted in Jamaica, Malaysia, and the Philippines. Quantitative data from Jamaica ($n = 1,114$), Malaysia ($n = 82$), and the Philippines ($n = 97$) was analysed descriptively, examining average length of participation, number of modules completed, and interaction rates with different message types. Qualitative interviews with parent text participants from the Philippines and Malaysia ($n = 9$), and implementers in Jamaica and Malaysia were conducted and thematic analysis was performed. After data collection, a working group conducted workshops to re-design the intervention using the 6squad/mrc framework.

Results: Quantitative analysis showed an average length in the programme of 5 days before disengaging regardless of the percentage of the intervention completed. The working group identified four main areas for re-design: 1) adding personalisation features, 2) introducing mechanisms to trigger re-engagement within the intervention, 3) removing structural features contributing to disengagement, and 4) ease of use given a lack of in-person technical support. A new structure for parent text was created along with a set of recommendations to address limitations of the current programme.

Conclusion: Our findings demonstrate a pragmatic approach for improving digital violence-reduction interventions in LMICs and also represent the first use of the 6squad framework for designing a digital programme for family wellbeing.

Mental health complexity in post-acute care for acquired brain injury: informing mental health screening development

Georgina Mann¹, Georgina Mann², Lakkhina Troeung³, Angelita Martini⁴, Romola Bucks²

¹University of Western Australia School of Psychological Science Australia,

²University of Western Australia Australia, ³Brightwater Care Group,

⁴Brightwater Care Group Australia

Background and objectives: In Australia, mental health and acquired brain injury (ABI) services are distinct and funded independently, preventing the development of effective methods to identify psychological support needs in this group. This is despite up to 80% of adults with ABI experiencing comorbid anxiety or depression in the 5 years following injury. This study aims to identify mental health conditions commonly comorbid in individuals with ABI, to allow an early-intervention mental health screening tool to be developed.

Method: Retrospective cohort study of 1,011 adults with ABI admitted to neurorehabilitation or disability support services in Western Australia (WA), 1991-2020. Mental health symptomatology and diagnoses were identified using electronic medical records, and hospital and emergency department data from the WA Data Linkage System. Mental health presentations were examined across 15 diagnostic categories (e.g. substance use disorders, anxiety disorders) and 3 non-diagnostic categories (e.g. self-harm) using the International Classification of Diseases 9th and 10th edition and WA Data Linkage System codes.

Results: Preliminary results indicate that mental health comorbidities are common, with 56.1% presenting with a mental health condition within 12 months of their admission to services. This indicates the presence of significant mental health burden, with difficulties likely persisting beyond admission to post-acute services.

Conclusion: Mental health comorbidities are common in individuals with ABI. Identification of these conditions will allow appropriate management and intervention. Cluster analysis will be conducted to identify commonly co-occurring mental health conditions. Development of key diagnostic clusters will inform a new mental health screening tool, permitting early identification of mental health complexity in ABI, and provide data to inform effective interventions.

Mental health in Serbia - transitional context or are we going towards reform

Dragana Atanasijevic¹, Dragana Atanasijevic², Petar Djuric³, Perisa Simonovic², Aleksandar Medarevic², Snezana Perisic³, Verica Jovanovic², Milena Vasic²

¹Institute of Public Health of Serbia "Dr Milan Jovanovic Batut" "Dr Subotica

511 000 Belgrade" Serbia, ²Institute of Public Health of Serbia "Dr Milan

Jovanovic Batut" Serbia, ³Institute of Public Health of Serbia "Dr Milan

Jovanovic Batut"

Background: Since 2012, when Serbia became a candidate for membership in the European Union (EU), an extensive process of reforms is being carried out for the reason of harmonization of national legislation with the standards and regulations of the European Union. This also applies to the field of mental health care (MHC).

To assess the current situation, it has been decided to participate in the EU joint action ImpleMENTAL project that brings together more than 20 European countries and focuses on the implementation of two best practices in mental health (MH), a model of MH service delivery reform in Belgium and a suicide prevention program from Austria. The OBJECTIVE of the study is to present the current status of the MHC system in Serbia with an emphasis on the availability of community-based services and show the need for further improvement.

Method: The situation analysis has been performed through the JA ImpleMENTAL project and it is based on data gathered through the questionnaires delivered by the project. SWOT analysis has been performed to investigate the situation of community-based MH service provision as a basis that can be used as a response to specific needs in future steps of the reform.

Results: Although MH is a national asset, still it is seen as a low priority. There is still an accent on inpatient care, especially long-term hospitalization. Cooperation between inpatient and primary health care is not adequate and general practitioners do not have enough knowledge and skills in the field. There are not enough community-based MH centers. Data that more closely describe the work of MH service is missing or are of low quality.

Conclusion: Given to the findings the reform of the highly centralized MH system is needed, including its payment.

Jordan Jordan

Background: COVID-19 pandemic, constitute an extraordinary health, social and economic global challenge. The impact on peoples mental health is expected to be high. This paper sought to assess mental health in AL-Nasr camp (Amman, Jordan). This demographic was selected due to being under represented in general research surveys, while also suffering from low income and overcrowding, and so mental parameters were expected to be high, and even more so with the rise of the pandemic in these areas.

Method: This cross-sectional study included 372 participants of camp's residents. Data was collected using an interviewer questionnaire that captured general demographic parameters, and DASS scale (Depression Anxiety Stress Scales-21) which assess depression, anxiety and stress levels. Data were then analyzed using SPSS version 25.

Results: A high percentage of respondents reported Extremely Severe levels of Depression (74.3%) according to DASS, (70%, 69%) reported Extremely Severe Anxiety, Stress levels, respectively. Around 32% of participants had COVID19 last 2 years, data showed no significant association between COVID diagnoses and DASS scores. Unlike expected, there was no significance association between income and levels of Depression, Anxiety, and Stress, even though the level of participants' monthly income was low in 67% of participants (less than 300JD). However, the data showed statistical significance in depression and anxiety levels in participants who have persisting COVID symptoms after the initial 2 weeks. Most of residents weren't afraid from eating outside, contacting with people were abroad or with flue symptoms. However, most of them wear masks, wash hands frequently, cover when sneeze and stay home if sick.

Conclusion: Overcrowded camps such as AlNasr camp suffer from elevated levels of Depression, Anxiety, and Stress. And would benefit greatly from counseling programs and raising awareness about mental illness.

³School of Public Health, Vita-Salute San Raffaele University Milan School

of Public Health, Vita-Salute San Raffaele University Milan, Italy, IRCCS San

Raffaele Scientific Institute, Milan, Italy Viale Olgettina 60 Italy

Background and objective: Cancer diagnosis and treatment can be a challenging

experience for patients. A good doctor-patient relationship is fundamental to support them throughout the disease path. The objective of this study is to explore the perception of a group of oncologists concerning the relationship with their patients, in order to plan interventions that may promote patient engagement in San Raffaele Hospital Cancer Center.

Methods: A focus group of five doctors was interviewed in November 2022 with a semi-structured questionnaire to analyze their perception concerning how their cancer patients face treatment process, their needs, difficulties and how the relationship with the doctor works.

Results: Communication issues turn out to be one of the major obstacles to a therapeutic alliance: patients were described as unaware of their own disease state, while doctors struggle to make the treatment path understandable. One of the causes is the limited time doctors have to update patients about their conditions, which makes it difficult for them to provide necessary emotional support. As a result, patients no longer trust their doctor and prefer to ignore their status, withdrawing into fear and anxiety. Often even caregivers represent a barrier to communication and in the end doctors feel overburdened by the roles they are required to take. One further point to note is that medical reports are quickly sent by e-mails and SMS, preceding doctors that should be the reference figure.

Conclusions: To promote patient engagement, it is fundamental to develop an action plan: to improve their work, doctors need support from a multidisciplinary team. A training in the humanization of care should be highly recommended, with the purpose of developing empathy and enhancing communication, while also taking into account cultural and social differences as well as the psychological characteristics of each patient.

Prevalence and associated factors of suicidal ideation among married women in himalayan mountain villages: Project silkroute to healthy future

Alia Parveen¹, Syed Shah¹

¹Institute of Public Health, College of Medicine, and Health Sciences, United Arab Emirates University, Al Ain, UAE Institute of Public Health, College of Medicine, and Health Sciences, United Arab Emirates University, Al Ain, UAE Tawam Street post code 7666, Al-Ain, Abu Dhabi United Arab Emirates. United Arab Emirates

Background and Objectives: Suicide is a leading cause of death among women in Himalayan villages of Pakistan. So this study aimed to determine the prevalence of suicidal ideation and associate factors among married women in the Himalayan Mountain villages of Gilgit Baltistan (GB) in Pakistan.

Methods: We used a cross-sectional study design to recruit a random sample (N=830) of married women aged 18-49 years. Trained nurses obtained sociodemographic information, self-reported suicidal behavior using the WHO suicidal ideation module. Multivariable logistic regression analyses were used to estimate significant correlates of suicidal ideation.

Results: The mean age of study participants was 38.3 years (SD: ±12.8).

The 12-month prevalence of suicidal ideation, plans, and attempts is 18.8% (95% CI 16.2-21.7), 4.1% (95% CI 2.9-5.7), and 3.4% (95% CI 2.2-5.3). Significant risk factors for suicidal ideation included lack of cash income (adjusted odds ratio (aOR)=2.78 (95% CI 1.09-7.09), poor relationship with the mother-in-law (aOR=1.63 (95% CI 1.09-2.14), self-perceived poor quality of health (aOR=2.15; 95% CI 1.47-3.13), poor quality of life (aOR=2.79; 95% CI 1.46-5.34), positive history of intimate partner violence (aOR=2.58 (95% CI 1.75-3.82) and positive symptoms of depression (aOR=7.24; 95% CI 4.83-10.82). College or higher levels of education had a protective effect (aOR=0.44; 95% CI 0.23-0.83). Among those reporting suicidal ideation, 13.5% (95% CI 8.8-20.1) attempted suicide, by hanging (47%), jumping into a river (18%), use of pesticide (18%), an overdose of sleeping pills (12%), and use of sharp instruments (5%).

Conclusions: Suicidal behavior is a serious public health problem in the study population. Prevention efforts should focus on upstream risk factors.

A qualitative study to explore various meanings of mental distress and help-seeking in the yamuna valley, north India

Meenal Rawat¹

¹University of Edinburgh "9D Holyrood Road HRRH133, OShea Reshall" United Kingdom

Context

In rural India, mental healthcare remains limited due to scant state services and incongruity between provider- and patient-framing distress. Help-seeking by

people with mental health problems is related to how meanings of distress are understood differently by individuals, based on their interaction with various actors in the community and the available cultural explanation within their local ecologies.

Methodology: This study examines the mutually constituted relationship between meanings of mental distress and help-seeking among people residing in the Upper Yamuna Valley, Uttarakhand, North India. This qualitative study builds on six in-depth interviews with people with severe mental health issues and one person with epilepsy, referred to as people with psychosocial disability (PPSD) in the study. The data analysis was iterative and followed a thematic approach.

Results: The study found that personal beliefs based on one's experience, such as negative self-judgment and broader cultural explanations, such as supernatural beliefs, as well as gender roles, impacted the way people address their mental health problems, in turn shaping their help-seeking behaviour. Participants lost hope for a cure after years of trying to find an effective solution. Moreover, the lack of access to care and the remoteness of the mountainous area made help-seeking and recovery impossible.

Conclusions: This study underscores the need for researchers and policy professionals to explore the local context and culture to improve care and treatment quality. The study also explains that personal explanations of psychosocial problems and help-seeking are not unidirectional. It is a complex phenomenon layered with the local contexts that should be addressed in clinical practice and future research. Finally, clinicians training should address the local cultural language of distress to identify the problem and suggest an effective solution.

Examining the economic approaches in mental health promotion targeted towards black asian and minority ethnic communities in the uk: a critical discourse analysis

Phillipa Peart¹

¹University of Wolverhampton None "25 preston house, Tantarra street, Walsall West Midlands, WS1 2HT" United Kingdom

It is well documented that people from Black Asian and Minority Ethnic (BAME) communities are more at risk of developing mental health disorders, mainly because they are more exposed to unfavourable social, economic, and environmental circumstances. However, the majority of BAME mental health intervention studies focus on the effectiveness of treatment and rarely use economic methods to evaluate their effectiveness; as a result, little is invested in the economic assessment of psychosocial interventions. The need to focus on value for money has become increasingly important as the UK government's austerity program has resulted in reduced funds for public health services.

This research study explores the mental health initiatives targeted at BAME communities in the West Midlands region of the UK. Mental health services were invited to take part in the study - their evaluations as well as interviews with key members of staff were examined, and these were discussed alongside the political drivers that frame, shape, and direct their work. Using critical discourse analysis as an approach and method, the study analysed the techniques used when examining the cost-effectiveness of mental health initiatives for BAME mental health communities. In doing so, the study highlights how mental health policies initiatives are directing this work and the value and need for accessible economic models of evaluation.

This study enhances our understanding of how adequate and cost-effective mental health services can be provided for BAME communities but also has wider application in a range of public health practice areas where the outcomes of interventions are difficult to quantify.

A clustered randomized controlled trial to evaluate the effectiveness of a school-based intervention on the mental health of adolescents

Kazi Ahmed¹, Asaduzzaman Khan¹

¹The University of Queensland, Australia Australia

Background and Objective: Schools are an ideal setting for promoting student mental health and well-being. This study aimed to evaluate the effectiveness of a

school-based multi-component intervention on the mental health of adolescents. Methods: A clustered randomized controlled trial was employed in eight high schools in Dhaka city, Bangladesh, which were randomly assigned to either intervention or control group; 40 students in grades 8-9 (aged 13-16 years) from each school took part in the trial (n=160 per group). Students in the intervention schools participated in a 12-week multi-component physical activity intervention, developed using the WHO's Health-Promoting Schools framework. Control group schools continued their usual practice. Participants completed baseline and endline surveys measuring depressive symptoms (Centre for Epidemiologic Studies Depression Scale), and life satisfaction (Cantril ladder), along with other socio-demographic and behavioral characteristics. Linear mixed-effects modelling was used to evaluate the intervention effects.

Results: Depressive symptoms in the intervention groups decreased by 41% at the post-intervention, while remaining stable in the control group. There was a 24% increase in life satisfaction in the intervention group while a 3% decrease in the control group. Multivariable modelling showed that students in the intervention group had significantly lower levels of depressive symptoms ($\beta = -4.60$, 95% CI: -5.76 to -3.46) and higher levels of life satisfaction ($\beta = 1.43$, 95% CI: 0.77 to 2.10) compared to their counterparts in the control group. Sensitivity analyses supported the positive effects of the intervention.

Conclusions: Our school-based multi-component intervention is effective in enhancing mental health indicators in school children. Future trials should be scaled-up to include schools in rural and regional settings and use robust measures of mental well-being.

⁵Université McGill Canada, ⁶Université Laval Canada, ⁷McGill University Canada, ⁸Université de Montréal Canada, ⁹Institut Universitaire de Santé Mentale de Montréal Canada

Background: Psychiatric medications are often prescribed to patients with cluster B personality disorders (PDs). This study aimed to explore sex differences in the use of psychiatric medications in the 1-year before and after the first diagnosis of PD and to identify trends and patterns between 2002 and 2018.

Methods: We used the Quebec Integrated Chronic Disease Surveillance System (QICDSS) to identify all Quebec residents (≥ 14 years) insured with the public drug plan and with a first diagnosis of a cluster B PD. We retrieved all the claims for psychiatric medication classes during the one year before and after the diagnosis and calculated yearly and monthly proportions of individuals exposed to psychiatric medications. We also tested age and sex-adjusted trends in medication use changes using robust Poisson regression models.

Results: We identified 87,778 individuals with a first diagnosis of a cluster B PD. The mean age was 44.5 years (SD: 19.5), and 57.5% were women. Psychiatric comorbidities were common, with the most prevalent being depression (50.9%), anxiety (49.7%), and psychotic disorders (37.5%). The proportion of medication users increased after diagnosing a PD for both sexes. Women were more frequently exposed than men to at least one psychiatric medication (74.3%-80.5% vs 68.0%-71.0%). Among patients diagnosed in 2018-19, women were more likely to use antidepressants (60.6% vs 46.9%) and anxiolytics (33.2% vs 27.4%), while men were more likely to use antipsychotics (38.3% vs. 35.2%) and ADHD medications (11.2% vs 10.5%). Mood stabilizers had similar proportions (11.2% of women and 11.4% of men). Trends over the study period showed a marked increase in ADHD medications use, while anxiolytics use decreased.

Conclusions: Differences in psychiatric medication use exist between men and women with cluster B PDs according to medication classes. Changes in prescriptions over the last decade are similar for men and women.

Burden on caregivers of schizophrenic patients at polyclinic outpatient psychiatric department, edward francis small teaching hospital, the gambia

Jarra Marega¹, Haddy Bah²

¹Edward Francis Small Teaching Hospital; University of The Gambia Ministry of Health, The Gambia Banjul, The Gambia, ²Department of Nursing, University of The Gambia

Background: Caring for schizophrenic patient is associated with a significant burden. This study determines the burden of caregivers of schizophrenic patients at the Edward Francis Small Teaching Hospital (EFSTH), The Gambia

Methods: Using a cross-sectional study design, a sample of 161 caregivers of schizophrenic patients were randomly recruited from the EFSTH psychiatric clinic. A 12-item General Health Questionnaire (GHQ-12) and Zarit Burden Scale were used to measure the burden of caregivers. A General Linear Model (GLM) multivariate regression was used to determine the socio-demographic variables predicting the burden of caregivers.

Results: The results showed that the majority (93%) of caregivers experienced psychological burden followed by social (78.3%), physical (70%) and financial (55.3%) burdens. Results of GLM multivariate regression showed that self-employed ($\beta = 2.76$; 95% CI, 0.41~5.09) and unemployed ($\beta = 4.27$; 95% CI, 2.48~6.06) and being a Wolof tribe ($\beta = 2.64$; 95% CI, 0.03~5.24), were significantly associated with financial burden on the caregivers. The total score of social burden was also significantly higher among the unemployed caregivers ($\beta = 2.73$; 95% CI, -5.09~0.37) compared to their self-employed and employed counterparts. The caregivers with junior secondary education reported a significantly lower level of psychological ($\beta = -2.76$; 95% CI, -5.38~0.4) and physical burden ($\beta = -3.20$; 95% CI, -6.09~0.32) compared to those with no education. Up to 36% of the caregivers rated poor health status (OR, 5.10; 95% CI [2.71, 9.62]).

Conclusion: The main findings showed a significantly high psychological, social, physical and financial burden on the caregivers. Initiation of routine screening of caregivers will help to determine the needed help to reduce the incidence of burden.

Examining the association between sports participation and mental health of adolescents

Asaduzzaman Khan¹, Kazi Ahmed²

¹The University of Queensland, Australia, ²The University of Queensland, Australia

Background and objectives: Sports participation has been linked to various health outcomes; however, such understanding is somewhat limited in low-income countries. The aim of this study was to examine sports participation and its relationship with the mental health outcomes of Bangladeshi adolescents.

Methods: Using a mixed method approach, this paper explored sports participation and their relationship with mental health outcomes of 320 adolescents aged 13-17 years (59% boys) in Bangladesh. Participants completed a survey that included participation in team and non-team sports, depressive symptoms, and life satisfaction. Four focus group discussions (FGDs; 16 boys, 16 girls) were conducted to explore preferences for, and barriers to, sports participation.

Results: Regression analysis showed that both team and non-team sports participation were inversely associated with depressive symptoms in boys ($\beta = -1.22$, 95%CI: -2.55, -0.10, $\beta = -2.50$, 95%CI: -3.83, -1.16, respectively), while team sports was inversely associated with depressive symptoms in girls ($\beta = -2.44$, 95%CI: -4.63, -0.24). Both team and non-team sports participation were positively associated with life satisfaction in both genders. Analyses of FGDs showed that boys preferred playing football and cricket, while girls preferred skipping and running. Prolonged time on electronic devices was reported by both genders as a barrier, while involvement in household chores, family restrictions, and unsafe environment were reported by girls. Participation in team sports may provide mental health benefits for both genders, while non-team sports may be more beneficial to boys than girls.

Conclusions: This study offers cross-sectional associations between sports participation and mental health outcomes and hence contributes to the growing evidence of the relationships in resource-poor settings. Gender-based differences in preference for, and barriers to, sports participation found in the current study can help inform future research as well as strategies to promote sports participation in adolescents in Bangladesh and other countries that share similar cultures and traditions.

Study-related stress among healthcare students in a university of southern Italy

Roberto Venuto¹, Vincenza Fauci², Roberta Pappalardo³, Cristina Genovese¹,

Raffaele Squeri², Miriam Gorgone¹, Ioselita Giunta¹, Daniela Giudice¹, Sebastiano Calimeri¹, Valeria Alessi¹

¹University of Studies of Messina, Messina Italy, ²University of Studies of Messina, Messina, ³University of Campania "Luigi Vanvitelli", Napoli Italy

Background and objective: Many studies have shown that the stress level among students is often as high as in workers who experience burnout, occurring this especially in healthcare university students. Our study investigated if it is possible to observe the burnout syndrome in these kind of students, able to significantly alter the quality of life, their approach to daily activities and relationship life.

Methods: The study was conducted from March 2022 to May 2022 through the administration of an anonymous questionnaire, distributed online through messaging apps, during the breaks between lessons, in the middle of the semester. It was formulated using the perceived stress scale (PSS) in its short formula in order to evaluate feelings and thoughts and the WHOQOL-AGE, in order to evaluate the quality of life.

Results: The sample consisted of 292 university students aged between 18 and 49, 70% females and 30% males, with an average age of 22.42 ± 4.65 . In the previous month, 16.4% often did not feel able to control the important things in life, 42.8% often was unable to manage personal problems. The PSS score of all our university students showed a low stress level in 36.6%, an average stress level in 57.2% and a high stress level in 6.2%. The WHOQOL score shows that only 4% had a poor quality of life, 54% had an intermediate quality of life and 42% had a high quality of life. Half of the sample was satisfied with the way he felt every day.

Conclusion: Stress prevention should start since childhood through correct communication and information, in order to overcome stress also using strategies able to teach students how to exploit their resources, so that they are capable to meet the demands that come from outside and adapt successfully.

Organizing primary mental healthcare for older persons in India: Challenges and opportunities from the perspective of key stakeholders

Tom Kafczyk¹, Kerstin Hämel², Tom Kafczyk³, Kerstin Hämel⁴

¹School of Public Health, Bielefeld University Universitätsstraße 25, 33615 Bielefeld, Germany, ²School of Public Health, Bielefeld University, Bielefeld, Germany, ³School of Public Health, Bielefeld University, 2) HelpAge Deutschland e.V. "1) Universitätsstraße 25, 33615 Bielefeld 2) Arndtstraße 19, 49080 Osnabrück, Germany, ⁴School of Public Health, Bielefeld University Universitätsstraße 25, 33615 Bielefeld Germany

Background and objective: Health systems able to address the mental health needs of older persons contribute to health equity. Primary mental healthcare (PMHC) is considered a key strategy for promoting mental health. India has embarked on improving PMHC in legislations, strategies and programmes that identify older persons as vulnerable to impaired mental health. This study analyses perspectives of key stakeholders on the challenges and opportunities in strengthening age-inclusive PMHC in India.

Methods: We conducted semi-structured interviews with 14 stakeholders from the PMHC system in India. Data analysis was based on thematic analysis. Themes were organizationally structured alongside the six WHO health system building blocks; challenges and opportunities were derived through inductive coding.

Results: The stakeholders support the policy discourse on strengthening PMHC for older persons in India which ties into already established concepts of community-oriented primary health care (PHC). They denote, however, that the health system still focuses overly on medicalizing mental health problems by this shifting towards secondary and tertiary care levels failing to reach most older people vulnerable to mental health issues through PHC. Experts see as a main obstacle to further development of PMHC that policies built on unrealistic promises such as functioning primary care structures. Improving PHC capacity in general and the integration of viable PMHC approaches, such as building capacity among primary care physicians, and targeting community health workers to improve older peoples' mental health are seen as important. Experts argue that unaccountable governance structures, poor monitoring-structures, inappropriate public spending, and a still widely spread lack of awareness of the mental health needs of older people in the health sector would need to be addressed.

Conclusion: While first steps have been taken in India to strengthen PMHC, more structured and integrated approaches are needed to unfold PMHC policies' visions.

Increasing antidepressant consumption among adolescents and young adults following the covid-19 outbreak: Results from an

interrupted time series analysis on the population of the emilia-romagna region, Italy

Zeno Valerio¹, Marco Montalti², Dario Tedesco³, Davide Gori², Daniela Fortuna³, Alessio Saponaro⁴, Elena Berti⁵, Maurizia Rolli³

¹University of Bologna Unit of Hygiene "Giovanni Battista Delponte 18" Italy, ²University of Bologna Unit of Hygiene Italy, ³Emilia-Romagna Region Directorate-General for Health and Welfare, Emilia-Romagna Region, Department of Innovation in Healthcare and Social Service Italy, ⁴Emilia-Romagna Region Directorate-General for Health and Welfare, Emilia-Romagna Region, Department of Primary Care and Mental Health Services Italy, ⁵Emilia-Romagna Region Directorate-General for Health and Welfare, Emilia-Romagna Region, Department of Innovation in Healthcare and Social Services Italy

Background: The COVID-19 pandemic has had a relevant impact on mental health by influencing a series of well-known predictors: frequency and quality of socialization, income security, and physical activity. As society returns to normality, the potential mid-to-long term impact of such a major event on mental wellbeing must not be underestimated.

Methods: We performed an interrupted time series analysis to evaluate the change in trends of antidepressant consumption (ATC Classification: N06A) 24 months before and after the March 2020 COVID-19 lockdown in the Emilia-Romagna region of Italy. Using the Regional Outpatient Pharmaceutical Prescriptions database, we extracted the monthly amount in Defined Daily Doses (DDDs) of dispensed antidepressants. An OLS regression was performed with Newey-West standard errors. A Cumby-Huizinga test was used for autocorrelation; the model was subsequently corrected for seasonality. Separate analyses were performed for different age groups and genders.

Results: Between 2018 and 2022, patients who were dispensed antidepressants in the Emilia-Romagna Region varied from a minimum of 337.141 (69.0% females) in 2020 to a maximum of 348.925 (69.1% females) in 2021, while 77.306.004 and 79.512.128 DDDs were dispensed in the same years, respectively. We found increasing trends in antidepressant consumption both before and after the lockdown. Significant changes in slope of monthly trends from pre- to post-lockdown were found: +11.039,50 DDDs/month ($p=0.035$) among the general population; in age groups 14-19: +1065,50 DDDs/month ($p<0.001$), 20-34: +1983,08 DDDs/month ($p<0.001$). These represent 308%, 461% and a 199% increases from pre-pandemic monthly growth trends, respectively.

Conclusions: Our study found increasing trends in antidepressant consumption before and after the start of the COVID-19 pandemic. However, the pandemic may have caused an acceleration in these trends, particularly evident among adolescents and young adults. These categories might have suffered more due to a need for socialization, vulnerability in labor markets, and overburdening in family settings.

Using integrated data to explore the geography of citizens in mental distress in aotearoa new zealand

Daniel Exeter¹, Annie Chiang², Arier Lee¹

¹University of Auckland New Zealand, ²University of Auckland

There is extensive research into the population health effects and experiences of people living with mental illness, however, little is known about the socio-demographic characteristics of people who call the police while in mental distress. Calls to New Zealand Police about people in mental distress are coded by police as "1M", while events related to suicide are coded "1X". Between 2009 and 2016, there was a 77% increase in 1M-related calls. Previous research found that mental health was one of the six major demands of police resources, with approximately 280 hours per day of police time spent on mental health-related calls. There remains little research that provides an evidence-base for police, together with health and social care services, to better respond to the increasing mental distress in the community. This research investigates the socio-demographic context of approximately 43,000 people in mental distress who have sought support from the NZ Police in response to 1M or 1X calls, between 2013 and 2019, using a whole-of-population cohort of deidentified individuals created in Statistics New Zealand's Integrated Data Infrastructure (IDI). We describe the spatial and temporal distribution of 1M and 1X calls, and use statistical modelling to investigate whether people in mental distress contacting police (1M/1X) have also sought support for their challenges from relevant publicly-funded health and social support services. *Dear reviewers. Our study data are not released from the IDI yet, so we cannot provide detailed numbers sorry.

Health behaviours and subsequent mental health problems during the COVID-19 pandemic: A longitudinal analysis of adults in the UK

Kenisha Jonsson¹, David Taylor-Robinson², Nicholas Adjei², Viviane Straatmann³, Gabriella Melis¹

¹School of Public Health and Community Medicine, Institute of Medicine, Gothenburg University, Box 463, Göteborg, Sweden, ²University of Liverpool, Department of Public Health and Policy, Waterhouse Building 2nd Floor, Block F, Liverpool, L69 3GL, UK, ³Stockholm University Visiting address Albanovägen 12 Plan 5 Postal address Institutionen för folkhälsovetenskap 106 91 Stockholm United Kingdom

Background: Public health mitigation policies aimed at slowing the spread of COVID-19 led to an increase in mental health problems (MHPs). This study examines the association between multiple pre-pandemic health behaviours and MHPs prior to, and during, the COVID-19 pandemic.

Methods: We analysed a representative population sample of 11,256 adults (aged 20-65 years) from Understanding Society – The UK Household Longitudinal Study. Baseline data from participants interviewed in 2017/2019 (wave 9) were linked to web surveys conducted during the COVID-19 pandemic. We used latent class analysis (LCA) to identify mutually exclusive health behaviour (physical activity, alcohol consumption, eating habits and smoking tobacco) clusters by gender, and examined the sociodemographic correlates of each cluster. We assessed how pre-pandemic clusters of health behaviours were associated with changes in MHPs during the pandemic using fixed effects regression models.

Results: Three health behaviour clusters were identified: positive (33 %), moderate (24%) and high risk (43%), where similar behaviours clustered within individuals and sociodemographic circumstances. In particular, gender, age, migrant status and ethnicity were found to have strong associations with cluster membership. Our results also demonstrated a clear association in MHPs with health behaviours both prior to, and during the pandemic. There were significant increases in MHPs between 2017/2019 and January 2021, with fluctuations coinciding with changes in public health mitigation policies. Assessments across the three clusters showed about 25.2%, 16.9% and 0.7% increases in MHPs in the positive, moderate and high risk health behaviour clusters respectively.

Conclusion: This study shows that pre-pandemic health behaviours were significantly associated with mental health before and during the pandemic. Holistic policy interventions and promotions targeting multiple health behaviours may be an effective strategy to improve mental health in the pandemic recovery period.

Remote delivered psychosocial support to improve the wellbeing and functioning of adults affected by covid-19 in new york city: Remote problem management plus (pm+)

Kendall Pfeffer¹, Adam Brown¹, Brandon Kohrt², Manaswi Sangraula¹, Samantha Bakke¹

¹The New School for Social Research United States, ²George Washington University

Background: COVID-19 shed light on a global mental health crisis and underscored a host of barriers to mental health support for historically marginalized groups. Critical among these barriers to care for those living in high income countries is an underrepresentation among mental health professionals. Evidence from the implementation of brief psychological interventions delivered by non-specialist providers offers a community-based pathway to expand the provision of representative mental health support. Problem Management Plus (PM+), a five-session intervention designed for adults affected by adversity and impaired by psychological distress, has demonstrated effectiveness in reducing distress in low-income countries and humanitarian context settings, but only recently has its feasibility and acceptability been explored when delivered remotely in high income countries, like the United States.

Methods: In this single-arm feasibility trial, participants recruited from several sites in New York City (a university training clinic and two community-based organizations) were offered five sessions of PM+ delivered via Zoom. A mixed-methods design was used to assess the feasibility, acceptability, perceived utility, and impact of remotely delivered PM+. Data was collected via structured participant interviews at pre, post, and three-month follow-up and in-depth interviews were conducted with participants and providers. The primary clinical outcomes were depression symptoms assessed using the Patient Health Questionnaire (PHQ-9) and distress related to client-generated problems using the Psychological Outcomes Profile (PSYCHLOPS) administered at baseline and one-week post-intervention.

Results: Quantitative and qualitative results of the 45 recruited participants demonstrated feasibility, acceptability and utility for non-specialist community providers delivering remote PM+ in NYC. Though the study was not powered to assess for effectiveness, improvement was demonstrated in both primary outcomes.

Conclusion: Remote PM+ was acceptable to participants, and both participants and providers found it beneficial. A fully powered cluster randomized controlled trial is now being conducted to determine the effectiveness of PM+ in NYC.

Age of depression, age of melancholy? age, period, and cohort trajectories of mental health in ten countries between 1991-2020

Frans Van Leeuwen¹

¹European University Institute Netherlands

Background and objective: It is often claimed that mental health issues have become increasingly prevalent, especially among young people from more recent generations. This has been described as the advent of a new 'age of melancholy' or 'age of depression' originating in changes in social and economic conditions. However, surprisingly little is known empirically about to extent to which these popular claims actually apply in modern societies. This study assessed contemporary trends in mental health and their drivers using high-quality panel data in a cross-national perspective.

Methods: I used longitudinal data on mental health from ten different countries (n = 329,321 individuals, N = 1,534,863 observations) collected between 1991 and 2020, focusing on the age range between 18 and 79 and the birth cohort range between 1930 and 2000. Each of the datasets contained some commonly accepted instrument for measuring mental health in the general population (e.g. GHQ-12, CES-D-10, SF-12).

After assessing the presence of general period trends, I applied hierarchical linear growth curve modeling to account simultaneously for change with age, change across cohorts, and change in age patterns across cohorts. Finally, I investigated if intercohort trends in mental health could be explained by compositional changes in education distribution, household income, marital status, and number of children.

Results: Though some countries showed a decrease in mental health across periods and across cohorts, others showed no change, and still others showed an improvement. Adding covariates to the models made cohort effects more negative in some countries, while it did not change cohort effects in others.

Conclusion: Rather than being a global phenomenon, developments in mental health differ substantially across countries. This heterogeneity likely reflects a variety of social and institutional factors driving changes in mental health trajectories.

First step for the cross-validation of the arabic emirate version of "the subjective scale to investigate cognition - emirates" (sstic-e)

Fadwa Mugaddam¹, Fadwa Al Mugaddam²

¹CMHS, UAEU Public Health Institute (PHI), College of Medicine and Health Sciences (CMHS), United Arab Emirates University (UAEU). Abu Dhabi, United Arab Emirates, ²CMHS, UAEU Public Health Institute (PHI), College of Medicine and Health Sciences (CMHS), United Arab Emirates University (UAEU). Abu Dhabi, United Arab Emirates

Background: Cognitive complaints and lack of cognitive insight are not specific to schizophrenia. It could be depression, mild cognitive impairment, dementia, Alzheimer or addiction. Hence, scales in this field can be very useful to assess and collect data for populations at risk of developing cognitive decline.

Objectives: To develop and validate the Subjective Scale to Investigate Cognition-Emirates (SSTIC-E) adopted from The subjective Scale To Investigate Cognition In Schizophrenia (SSTICS).

Methods: This study is a cross-sectional validation study design. At the start, we did the cross-translation process starting with translation and back-translation. Following that we tested the Arabic version of the scale (SSTIC-E) on 13 subjects, to insure whether there are semantic or cultural aspects that need to be taken into consideration. Finally, we had to assess the validity of the scale on clinical and non-clinical subjects, to do that we enrolled the eligible subjects, obtain their consent, and asked them to do the STIC-E, MoCA, and the sociodemographic questionnaire all in the Arabic language.

Results: Based on our preliminary findings, 210 participants of whom 126 were clinical subjects and 84 were non-clinical subjects were recruited; 123 of them were women and 87 were men. Our samples include 81 non-Emirati participants,

36 of whom were patients, and 129 Emirati individuals, of which 90 were patients. Patients average SSTIC-E scores were 44.06 (SD= 15.19), higher than the control groups score of 22.55 (SD=12.04). The average MoCA score for the patient group was 22.71 (SD=4.59), which is considered outside of the normal range, while the average score for the control group was normal at 27.19 (SD=2.24). Conclusion: It's essential for any community to provide a culturally adapted and validated psychometric instrument, that will fit their needs in all cultural aspects.

A global lens of Party n Play/ Chemsex: mental health and resilience for GBMSM, and cultural and clinical competencies for clinicians working with GBMSM

Devan Nambiar¹

¹Gay Men's Sexual Health Alliance, Toronto, Canada

Party n Play (PnP), also known as Chemsex, is a global phenomenon (Blanchard, 2019) of the sexualized use of recreational substances, injecting drug use, and other drugs by gay, bisexual, and men who have sex with men (GBMSM). PnP is associated with increased condomless sex, group sex, transactional sex, STBBIs, stigma, and discrimination. PnP involves using various depressants and stimulants such as alcohol, cocaine, MDMA, crystal meth, ketamine, poppers, and Viagra. PnP is used by GBMSM to increase acceptance by peers, reduce inhibition, promote closeness, sustain sex, pleasure, and intimacies, and manage trauma. The persistence of health inequities persists for GBMSM who experience intersecting forms of oppression, stigma, discrimination, and trauma. Healthcare providers and services are not equipped or knowledgeable of practices of PnP/ Chemsex (Card et al. 2021) and "because of a lack of knowledge of practices, associated vocabulary, and a failure to integrate sexual health with drug services" (Florian et al., 2021). The workshop will explore PnP and its definitions, drugs used, stimulants, depressants and drugs interactions, range of use and intake, psychological roots of Chemsex, and case scenarios of intersectional needs of GBMSM who PnP. The workshop will showcase videos from clinical providers on best practices to provide cultural safety, cultural competence, and clinical competencies when caring for cis and trans-GBMSM who PnP. Additionally, we will explore the Four Zones of Engagement: PnP Landscape a New Concept of Current Evidence. In the Zones of Engagement, we will explore the biopsychosocial component (Platteau et al. 2019) of client-centered care in PnP, utilize a trauma-informed practice, educate clients on drug-drug interactions, including interactions with anti-HIV medication via a harm reduction lens. Objectives: 1. Describe PnP/ Chemsex, and populations that are disproportionately impacted, 2. Demonstrate knowledge of the biopsychosocial context of PnP/Chemsex in the global GBMSM communities, 3. Practice a harm reduction approach to substance use in the context of sex, 4. Develop competencies in cultural humility, cultural safety, and clinical care. References: Blanchard, S.K. Prevalence of bullying victimization and associated factors in Brazilian teenagers

Guilherme Wendt¹

¹Public Health Lab, Postgraduate Program in Applied Health Sciences, Western Paraná State University, Francisco Beltrão, Brazil

Background and Objective: Bullying is a serious type of antisocial behavior that mainly takes place during school years. Reports are abundant indicating that experiencing bullying – as a victim, perpetrator, or bystander – can have negative consequences, affecting also physical health. Thus, the current study aimed to investigate the prevalence of bullying victimization and its associated factors in Brazilian teenagers.

Methods: A cross-sectional study was carried out with 291 Brazilian students, aged between 11 to 17 years old (M = 14,7, SD = 1,5). Most of the participants

reported being female (57,7%). Data was collected at different public schools in a major metropolitan area in Southern Brazil using self-reported questionnaires. The Statistical Package for the Social Sciences (v. 23) was used for data analysis. Phi (φ) was adopted for measuring the effect size in the 2 x 2 contingency tables. Results: The prevalence of bullying victimization was 43% (95% CI: 37 – 49%). Among the school variables, only the question about school climate was significantly linked with bullying victimization (X² (1, N=275) = 8,26, p=0.004; φ=0.17). Differences in gender and age group (such as younger vs. older adolescents) were not significant.

Conclusions: The prevalence of bullying victimization found in this study is aligned with estimates from several other countries, thus indicating that bullying is a rather frequent experience for school-aged students. Moreover, the association between school climate and higher self-reported occurrence of bullying victimization emphasizes the multifactorial nature of this type of antisocial behavior, although the magnitude of the effect was in the weak to moderate range. Finally, the results indicating no gender and age groups differences are mixed in the literature and deserved further research.

Childhood neighborhood quality, peer relationships, and trajectory of depressive symptoms in middle-aged and older Chinese adults

Lei Yang¹

¹Department of Sociology, Minzu University of China

Background: From the life course perspective, the childhood living environment exerts long-term effects on adulthood mental health. This study aims to examine childhood neighborhood quality, peer relationships, and trajectories of depressive symptoms among middle-aged and older Chinese adults using a large and representative set of survey data. Methods: The data were derived from the China Health and Retirement Longitudinal Study (CHARLS, 2011-2018). Depressive symptoms were measured using the 10-item Center for Epidemiological Studies Depression Scale (CES-D-10). Childhood neighborhood quality and peer relationships were measured via a standardized questionnaire. Latent Growth Curve Model (LGCM) was used to study the trajectories of depressive symptoms according to different levels of childhood neighborhood quality and peer relationships.

Results: The mean level of depressive symptoms increased first and then decreased in the follow-up period. Poorer childhood neighborhood quality and peer relationships were associated with higher levels of depression in adulthood (β=0.15 and β=0.29, p <0.001) at baseline and a faster increase in depressive symptoms with age for childhood neighborhood quality (β=0.10, p <0.05). Quadratic growth factors were generally not significant for both childhood neighborhood quality and peer relationships. Conclusions: Poorer childhood neighborhood quality are associated with a faster increase in the rate of change in depressive symptoms in later life. Efforts toward improving living conditions may help to prevent the detrimental health effects of such early-life disadvantages.

Polydrug use and suicidal behaviors among secondary school students in a nationally representative sample in Puerto Rico

Juan Reyes¹, Linnette Rodríguez¹, Margarita Moscoso², Héctor Colón¹

¹Department of Biostatistics and Epidemiology, University of Puerto Rico, Puerto Rico, ²School of Medicine, Universidad Central del Caribe, Puerto Rico

A great deal of research on adolescent suicidal behavior has focused on depression and alcohol use. Major depression and mood disorders have been shown consistently to be the psychiatric disorders most highly associated with attempted suicide in adolescence. However, less attention has been given to illegal drug use, specifically polydrug use. The Objective of this study is to determine the association between suicidal attempts and polydrug use in a nationally representative sample of secondary school students in Puerto Rico. Consulta Juvenil X is a monitoring program that Aims to study the prevalence of substance use and violent behavior as well as the risk factors associated with those practices. The survey was conducted during the 2018-20 academic year. The study utilizes a self-administered questionnaire. Use of two or more substances (tobacco, marijuana, cocaine, heroin, or amphetamines) in addition to using alcohol was defined as polydrug use. The sample included 4668 (54%) females and 3977 (46%) males. Half of the sample was between seventh and ninth grade with a median age of 15 years old. The prevalence of polydrug use in the public and private schools participating in the study was 9.4% and the suicide attempts was 7.6%. Multiple logistics regression analyses revealed that students

who use multiple substances during the last year were significantly more likely to report suicide attempts after controlling for depression symptoms and other sociodemographic variables (OR=3.07; 95%CI: 2.53-3.72). Adolescents who used three or more substances (95%CI=7.00-10.84) were 8.7 times more likely to attempt suicide than those who did not use drugs. Findings of this study suggest that adolescents who use multiple substances seem to be at higher risk for suicide behaviors. Understanding who is most likely to report polydrug use is important in developing interventions to prevent suicidal attempts.

DOI: 10.18332/popmed/164864

Using community-based research to enhance mental health services for teen mothers

Giulia Puinean¹, Melissa Tremblay²

¹School of Public Health, University of Alberta, Canada, ²Faculty of Education, Department of Educational Psychology, University of Alberta, Canada

Background and Objective: The transition to motherhood carries significant challenges. Teen mothers in particular are at disproportionate risk for mental health problems such as anxiety and depression which, if not addressed, can negatively affect maternal well-being and child development. Experiences of stigma and perceptions of being judged for seeking help aggravate these issues, compounding barriers to accessing mental health services. Teen mothers are disproportionately impacted by inequities in the social determinants of health, yet their perspectives are rarely solicited in Discussions of research and practice. Exploring the needs and lived experiences of this population is crucial for enhancing mental health services in ways that reflect their preferences and values. **Methods:** This research is being conducted in partnership with the Terra Centre, a non-profit organization supporting pregnant and parenting teens in Edmonton, Alberta. Using a community-based approach and qualitative descriptive design, this study Aims to: (1) explore teen mothers experiences with accessing and receiving mental health services; and (2) determine how mental health service providers can best meet their unique needs. Teen mothers and service providers, including therapists and Terra staff, were interviewed. A thematic analysis was conducted on interview transcripts.

Results: Although the study is still underway, preliminary Findings highlight the importance of relationship-building with mental health service providers, where trust and mutual respect are essential for continued engagement. Participants identified attributes of an ideal provider such as being present, laid-back, and respectful of boundaries. Mothers also emphasized the need for both formal and informal mental health support, while providers touched on their experiences working with this population.

Conclusions: This study provides insight into an issue that has been under-researched in the Canadian context. A mental health service delivery model will be developed based on the Findings. Research and practice implications will be discussed.

Mediating role of physician's empathy between physician's communication and patient's satisfaction

Maham Arshad¹, Shyamkumar Sriram², Saira Khan³

¹Quaid-i-Azam University, Islamabad, Pakistan, ²Ohio University, Athens, United States, ³Quaid-i-Azam University, Pakistan

Introduction: Physician communication is vital for an effective physician-patient relationship. Physician empathy is crucial to patient communication. The relationship between physician empathy, physician communication, and patient satisfaction is not very clear. This study Aims to study the mediating role of physician's empathy between physician's communication, physician's empathy, and patient's satisfaction.

Methods: A cross-sectional study was conducted at the National Institute of Psychology, Quaid-i-Azam University during the time period of December 2018 to February 2019. Employing the technique of purposive convenience sampling, data was collected (N = 238) from psychiatric, cardiology and dermatology wards of public and private sector hospitals of Islamabad and Rawalpindi. The Communication Assessment Tool, specifically the Patient's Perception of Physician's Empathy and Patient Satisfaction Scale were used to assess study variables. The measures used in the research assess the Patient's Perception of Physician's Communication, Empathy and Patient's Satisfaction. Formal permission for the research was taken from the hospital administration with the approval from the institutional review boards. Participants were briefed about the purpose of research. Both verbal and written informed consent was taken from

them.

Results: Results shows that Physician's Empathy plays mediating role between Physician's Communication skills and Patient's Satisfaction. Moreover, Pearson product moment correlation indicated a significant positive relationship between doctor's communication skills, doctor's empathy and patient satisfaction.

Conclusions: Building a positive doctor-patient relationship would not only lead to improved patient satisfaction but also reduce the likelihood of medical malpractice. Therefore, steps should be taken to enforce the trust, interaction, and empathy in doctor-patient relationships, with patient-centered services. Physician's empathy plays a mediating role between Physician's Communication skills and Patient's Satisfaction.

"A whole fruit salad there": a systematic review exploring collaboration between traditional healing systems and biomedicine in mental illness

Shingirai Dzapas¹

¹Teesside University, United Kingdom

Background: Existing clinical research suggests that efforts have been taken to address the treatment gap between mental illness. However, the treatment gap is a complicated, multi-dimensional phenomenon because asylum seekers and refugees may continue to hold different explanatory models of illness which influence help-seeking behaviour. This paper critically analyses medical pluralism in mental health, focusing on existing literature discussing collaborative efforts between biomedicine and traditional healing systems in managing mental illness. **Methods:** A systematic literature review was performed to identify and critically analyse articles discussing collaboration initiatives in mental illness which included traditional/faith healing systems and biomedicine. Electronic and hands searches revealed 659 citations, 11 articles fulfilled the criterion.

Results: The following themes recurred throughout the dataset: open-mindedness, awareness, unidirectional, clinical outcomes, and feasibility. Results indicated statistical significance ($p < 0.0001$) in patients receiving collaborative shared care in comparison to the control group (Gureje et al., 2020). Biomedicine and prayer camps working collaboratively Resulted in positive symptom control for patients. However, the number of days patients spent in chains was not reduced (Ofori-Atta et al., 2018).

Conclusions: Ensuring appropriate systems, services and support for asylum seekers and refugees should be a priority for healthcare services to improve access and clinical prognosis. The present Results are significant in clinical practice and provide clear evidence of feasibility, awareness and an openness for the two paradigms to work together. So far, patients using collaborative strategies expressed a deep appreciation of the collaborative efforts of biomedicine and traditional/faith healers "A whole fruit salad there". More efforts to improve the partnership are warranted as the collaboration remains unidirectional. Efforts to reduce the treatment gap need to start with the de-stigmatisation of traditional healing systems as taboo, evil, and shameful. Future studies are warranted to analyse the effectiveness of the collaboration by monitoring relapse rates for patients.

Pilot evaluation of a digital mental health first aid program for adolescents

Noor Yusef¹, Joemer Maravilla²

¹Institute for Social Science Research, University of Queensland, Australia,

²Institute for Social Science Research, University of Queensland, Australia

Background: Despite high rates of mental health problems, including suicide, self-harm, and panic attacks, adolescents do not usually seek help from adults and are more likely to seek help from their peers. To prepare adolescents to support each other, a digital mental health first aid program, called Brain Pilot, was designed for young people. **Objectives:** The Brain Pilot program Aims to improve adolescents' mental health literacy, resilience, and self-efficacy in order to support themselves and their peers. Our study will evaluate the effectiveness of Brain Pilot program in achieving its outcomes, as well as the appropriateness of the program. This evaluation research will also assess the type of support provided by teachers to students who completed the program.

Methods: Using a mixed-methods approach, we will analyse pre and post training survey data to measure changes in mental health outcomes among adolescents aged between 15 and 18 in Australia. A focus group with 6-8 program participants (Youth Advisory Group members) and semi-structured interviews with 10 other adolescents will be conducted to explore the key Findings from the surveys. To

participate, adolescents will be required to obtain parental consent and provide assent. To understand suitability of the teachers training guide, trained teachers will be surveyed and interviewed.

Discussion: Our study will highlight digital strategies to address youth suicide, self-harm, and panic attacks by improving young people's capacity in supporting their peers. Our evaluation will also provide insights on co-design with adolescents to ensure appropriate messaging and ongoing support for trained adolescents. Our process evaluation findings will help in informing future implementation of Brain Pilot in Australia and overseas.

Senior managers' experience with health, happiness, and motivation in hospitals and the perceived impact on health systems: the case of Meru county, Kenya

Rose Muthuri¹

¹KEMRI Wellcome Trust Research Programme, Kenya

Hospitals play a significant role in health systems. Studies among the health workforce have revealed their experiences with mental health challenges. In comparison, there is limited literature on their positive mental health. The purpose of this study was to explore senior managers experiences with health status, happiness, and motivation in hospitals and the perceived impact on the health system in Kenya. This qualitative study applied a phenomenological research design. Senior managers within the hospital management teams were selected using purposive sampling. Semi-structured interviews were carried out among senior managers across eleven hospitals in Meru County, Kenya. Among the eleven participants 63.6% were female and 36.4%, were male and the mean age was 44.5 years. The audio-taped data were transcribed and analyzed using Colaizzi's phenomenological approach. The five themes revealed were: (1) Happiness in the health system; (2) Health status in the health system; (3) Motivation in the health system; (4) Challenges in the health system; (5) Possible solutions to the challenges in the health system. This study revealed the positive and negative impact of the three domains, challenges, and solutions, from the senior managers perspective. Healthy, happy, and motivated senior managers and healthcare workers are more responsive and perform better. Policy interventions and programs promoting happiness, health status, and motivation are necessary for strengthening the health workforce and health system.

DOI: 10.18332/popmed/164991

Demographic and behavioural differences between gamblers with and without Gambling Disorder

Špela Selak¹, Mark Žmavc¹, Irena Makivič¹

¹National Institute of Public Health, Slovenia

Background and Objective: The rapid rise of internet related technologies has made gambling accessible to a wider audience. The risk for Gambling Disorder (GD), i.e. excessive, problematic or uncontrolled gambling behaviour, has been established as a key concern by non-substance addiction experts. In order to better understand the phenomenon, our study provided a detailed description of the differences between gamblers who meet criteria for GD and those who don't (hereinafter gamblers with and without GD). Methods: As part of the National Survey on the Use of Tobacco, Alcohol and Other Drugs, conducted in 2018 in Slovenia, nationally representative data on 1,686 Slovenian gamblers in the age range between 15 and 64 years was obtained. Gamblers were categorised into a GD and non-GD group based on their responses to the Berlin Inventory of Gambling Behavior – Screening, which assesses the presence of the 9 gambling disorder criteria, according to DSM-V. Additionally, data on various health-related behaviours was collected to investigate the intergroup differences.

Results: Group comparisons between gamblers with GD (4.3% of gamblers) and gamblers without GD (95.7%) revealed many notable differences. Gamblers with GD were significantly more likely to be males, students, gambling online, watching pornography, playing videogames, using drugs in the past year and less likely to be living with a partner than gamblers without GD. Correlation analysis further revealed that lower age and excessive alcohol use are significantly related to GD symptoms, while education and monthly income are not.

Conclusions: The findings of the present study highlight key demographic groups and factors associated with increased risk for GD and outline those with little to no effect on GD. Data also shows that certain behaviours (e.g., substance use, gambling online, watching pornography, playing videogames) were much more likely in the GD group, and can be considered risk behaviours.

DOI: 10.18332/popmed/165066

BURTOOLA: a digital evidence-based tool to reduce burnout syndrome in medical students

Júlia Mas¹, Marilina Santero², Irene Rexach¹, Inés Clavero¹

¹Universitat Autònoma Barcelona, Spain, ²Cochrane Iberoamerica, Spain

Background: Studies suggest that medical students experience mental distress in a proportion higher than the rest of the population. For instance, burnout prevalence in Spanish medical students was 37%, significantly higher among 6th year than among 1st-year students. Moreover, burnout syndrome seems to be associated with an increased likelihood of subsequent suicidal ideation.

Aim: The objectives of this study are to design and implement a tool to assess medical students burnout risk allowing students and their universities to reduce the prevalence of burnout in Spain.

Methods: Burtoola (burnout + tool + accessibility) is a digital evidence-based tool connecting clinical data and patients reported outcomes (proms). Our intended audience is over 45000 students from 43 medical schools in Spain. A 3-5 years timeline plan considers 3 phases: 1) instrument development (~1 academic year) includes validating the burnout risk scale, development of predictive software and data collection; 2) clinical phase (~2 years) evaluation of stress, burnout and cortisol levels; 3) implementation phase (~1.5 years) strategies to adopt and integrate evidence-based health interventions into the university setting. Expected results: Burtoola has been selected as the winner of the hackathon healthtech 2030 celebrated recently in Barcelona organized by the Xartec Salut Network. As part of being selected as the best idea, we will be awarded by sponsors and receive mentorship to develop the winning project towards a proof-of-concept phase. We are now looking for collaboration, trust, and funding to build our first prototype (phase I study).

East coast kitchen party - Creating an inclusive community for queer and transgender immigrants through cooking and conversation in Halifax, Canada

Liane Khoury¹

¹Nova Scotia Health, Dartmouth, Canada

Background and Objective: East Coast Kitchen Party (ECKP) is a community program connecting Queer and Transgender (Trans) immigrants through food. Immigrants often experience isolation from the dominant culture upon arrival. Queer and Trans immigrants additionally may feel unwelcome in their cultural community and not yet connected to the local Queer and Trans community. Our objective is to develop a sense of community and promote mental wellness among Queer and Trans immigrants. Methods: At the start of each ECKP session, a participant led the group in cooking a traditional or favourite meal. Culturally appropriate ingredients were sourced from local grocery stores, teaching participants where to find familiar items. Participants ranged from recent newcomers to immigrants living in Canada for over 10 years. At the end of each session, we shared a meal and guided participants in conversations around themed topics, such as stigma around mental health.

Results: Through facilitated conversations, participants discussed thoughts and views on mental health through the lens of their initial displacement and transition to Canada. Having participants with various immigration statuses provide peer support for navigating both the immigration system and a new city. We found that participants needed a sense of belonging, experienced social isolation, and felt stigma discussing mental wellness. Participants expressed a need for programming targeting Queer and Trans immigrants and a desire for connection with the local Queer and Trans community. Conclusions: Helping immigrants increase their food autonomy and access culturally appropriate foods is vital for mental wellness; there is a barrier to immigrants accessing familiar foods and ingredients. Sharing meals with others promotes mental wellness and community development. The conversations from our "kitchen party" will help to inform decisions around community programming for Queer and Trans immigrants, and provide evidence of the need for better funding and access to mental health care.

Building mental health and psychosocial support capacity in higher education: psychological first aid training to support displaced Afghan student refugees

Nicole Ross¹, Aline Lanes², Caroline McEaney², Adam Brown²

¹Trauma and Global Mental Health Lab, The New School for Social Research, The New School, New York, United States, ²The New School for Social Research and The Trauma and Global Mental Health Lab, New York, United States

Background and Objective: In recent years, a growing number of universities have welcomed refugee students. Given the high levels of Mental Health (MH) stressors associated with displacement, there is a call for institutions to prepare delivery of Mental Health and Psychosocial Support (MHPSS). A growing body of research points to scaleable, non-specialist delivered mh strategies as both effective and a way to build capacity. Specifically, Psychological First Aid (PFA) trains populations to identify and respond to people in distress, while emphasizing self-care and personal resilience. The aim of this study was to adapt and deliver pfa trainings for higher education institutions serving as a home for refugees. Objectives were to train participants in pfa to support Afghan refugees, and to collect data on the perceived efficacy of the training.

Methods: A team trained in delivering pfa, held 7 online sessions in fall 2022 across 5 institutions in the US, central Asia and Europe. In total, 50-75 faculty, staff, students, and administrators participated. After the sessions participants rated content of the training, facilitators, perceived understanding of material, and their confidence in assisting individuals in distress. They were then asked qualitative questions regarding their experience of the training.

Results: Preliminary results demonstrate trainees felt a high degree of confidence ($m=8.6$, 0=no confidence, 10=extremely confident) assisting people in distress. 89.5% strongly agreed that co-facilitators communicated the material clearly and concisely. 73.7% agreed that they understood the pfa action principles. 73.7% felt they understood the importance of self-care. Participants offered qualitative feedback demonstrating their enjoyment of and efficacy around pfa, but also identified areas for further adaptation.

Conclusions: This preliminary data is evidence for the effectiveness of pfa training in higher education contexts, especially those looking to support student refugees. Further research is needed to understand longer-term competency outcomes after receiving pfa training.

Interventional components for mental health apps: a scoping review

Hazwa Harith¹, Nik Daliana Nik Farid¹, Abqariyah Yahya¹

¹Social and Preventive Medicine Department, Faculty of Medicine, University of Malaya, Kuala Lumpur, Malaysia

Mobile phone apps are increasingly popular in usage especially in the health sector. Apps such as mHealth have been used internationally to address many concerns in particular those brought by non-communicable diseases such as diabetes. However, there seem to be a growing interest for mental health apps as a solution in reducing the barriers surrounding services uptake. Apps are seen to bridge the gap between self-care and the augmentation of the existing clinical treatment processes. With more research pertaining to mental health apps, there has been a recognizable knowledge of the importance of delivering effective treatment modalities within the app. Reviews of contemporary literatures supported the need for a scoping review as there is a lack of high-quality research such as randomized control trials done in determining the best current practice to provide interventions within a mental health app. This scoping review aims to ascertain the interventional domains that are most appropriate to supplement the screening tool in the current 2Heal mental health app. The scoping review will be done according to the Arksey and O'Malley (2005) methodological approach as a guiding framework. The steps involved will be identifying the research question, identifying the relevant studies, describing the study selection, charting the data and lastly, reporting the results. This scoping review will be reported according to the PRISMA Extension for Scoping Reviews. The summary and results of this study are expected to contribute to the future development of interventional content or mental health app that are evidence-based, reliable and suitable to the current best practice pertaining to mental health problems.

Translation of the Malay Version of the Depression Literacy Questionnaire (D-Lit)

Mohd Zahiruddin Mohd Khairi¹, Abqariyah Yahya¹, Nik Daliana Nik Farid^{1,5}, Rafidah Aga Mohd Jaladin², Feisul Idzwan Mustapha³, Rozaidah Jaafar³, Idayu Abdullah Mansor³, Lizawati Abd Sane⁴

¹Department of Social and Preventive Medicine, Faculty of Medicine, Universiti Malaya, Kuala Lumpur, Malaysia, ²Department of Educational Psychology and Counselling, Faculty of Education, Universiti Malaya, Kuala Lumpur, Malaysia, ³Ministry of Health, Putrajaya, Malaysia, ⁴Center for Counselling & Disability Empowerment, Universiti Malaya, Kuala Lumpur, Malaysia, ⁵Centre for Population Health, Faculty of Medicine, Universiti

Malaya, Kuala Lumpur, Malaysia

Background: Depression is a mental illness characterised by impairments in mood as well as mental and physical performance. It places a significant burden on society by restricting productivity and daily activities. Despite compelling evidence of depression-prevention interventions, the global prevalence remains high. On the other hand, the Depression Literacy Questionnaire (D-Lit) is a depression-specific assessment tool that has been translated and validated in multiple languages. To date, there is no Malay version that has been translated and validated. Hence, the primary objective of this study is to translate the Depression Literacy Questionnaire into Malay.

Methods: The D-Lit translation procedures were based on Wild et al translations guidelines. After obtaining the authors permission, the D-lit was translated from English to Malay by a psychiatrist and an English teacher who are both independent native speakers. The questionnaire was back translated from Malay to English by two independent bilingual English teachers with no prior experience with the D-Lit. The back translation was reviewed by an expert committee comprised of a psychologist, a public health consultant who specialises in noncommunicable diseases and a psychiatrist. Each sentences conceptual, item, and semantic quality was assessed in both translated versions. In the Malay version of D-Lit, a question that is irrelevant to the Malaysian context was removed.

Results: The Malay version of D-Lit had a content validity index of 1.00, which met the requirement of having fewer than five experts available. Item 5 was removed due to cultural equivalence considerations. As a result, the Malay version of D-Lit had 21 items instead of the original 22.

Conclusions: This study found a high level of I-CVI in the Malay translation of D-Lit. The translated questionnaire will be tested for construct validity, internal consistency, and test re-test reliability among 420 participants.

Mental health in asylum seekers and refugees: early detection at SAMIFO Center

Rossella Carnevali¹, Silvia Capretti¹, Enrico Francisci¹, Maria Guerra¹, Loredana Madonna¹, Antonio Spina², Emilio Vercillo³, Giancarlo Santone²

¹ASL Roma 1 (Public Local Health Authority), SAMIFO Center, Rome, Italy,

²SAMIFO Center, ASL Roma 1 (Public Local Health Authority), Rome, Italy,

³SAMIFO Center, Centro Astalli, JRS (Jesuit Refugees Service), Rome, Italy

Background: Refugees in Europe have prevalence rates 3 times higher than the general population regarding depression, anxiety, and poor mental well-being (Priebe et al 2016). At the arrival in Europe, asylum seekers and refugees (ASRs), who are often victims of torture and intentional violence, have a higher incidence of PTSD. 5 years after the arrival, the prevalence of anxiety, depression and psychosis also increases (Bogic 2015). Italian Ministry of Health Guidelines support the early detection of at-risk individuals (2017).

Objective: SAMIFO Center promotes early identification of at-risk ASRs, both in-house and in external services with the aim of treating and rehabilitating victims of violence, but also for secondary and tertiary prevention of post-traumatic and non-traumatic mental pathologies.

Methods: SAMIFO carries out early detection and treatment of at-risk ASRs. The identification is carried out in different ways: through the operators working in first and second level ASRs centers, who indicate the reason for referral by e-mail; through in-house physicians (general practitioners and specialists) who identify at risk patients through a 12-item questionnaire administered by the clinician during the first visit; through the Territorial Commissions or through the Court in the event that symptoms occur during the hearings; through self-referral.

Results: SAMIFO's mental health unit makes around 1600 visits a year, including 300 first attendances. In 2021, 73% of first attendances were referred by external services, 26% by internal physicians, 1% was a self-referral. The 33% of first consultations and 40% of total referrals were affected by PTSD. 80% of patients continued the treatment, 19% received counseling and 1% were referred to external services.

Conclusions: SAMIFO has developed a methodology for early identification and referral of at-risk individuals that extends beyond the service itself, promoting guidelines-compliance and best practices in ASRs services as well.

The impact of loneliness on post-stroke memory decline and depression in elderly (Bulgaria, 2019-2021)

Ivanka Veleva^{1,2}, Mirena Valkova³, Maya Stoimenova^{1,2}, Gena Grancharova²

¹Department of Psychiatry and Medical Psychology, Medical University of Pleven, Bulgaria, ²Bulgarian Public Health Association, Bulgaria, ³University

Hospital SofiaMed, Bulgarian Public Health Association, Sofia, Bulgaria

Background and Objective: Loneliness is an independent risk factor for stroke in both genders. It is associated with memory and cognitive decline in adults. Our objective was to examine the impact of loneliness on post-stroke functional outcome, memory and depression.

Methods: We examined 107 ischemic stroke (IS) survivors (65 males and 42 females), 85 of them were not lonely (NL) and 22 lonely living (LL). The baseline stroke severity was measured by National Institutes of Health Stroke Scale (NIHSS) and the functional outcome - by Barthel Index (BI). All patients were examined twice - at acute IS phase via 10 Words Memory Test (WMT) for short-term (STM), working memory (WM) and 21-Hamilton depression scale (HDS) for severity of depression and at 3rd month after IS via WMT, HDS, Benton Visual Retention Test (BVRT) and Subscales "Information" (for episodic memory - EM) and "Nonpersonal Memory" (for semantic memory - SM) from Blessed Dementia Information Memory Concentration Test. Groups were compared by T-test at 95% confidence level. Data processing was performed by SPSS 24.

Results: The stroke severity (NIHSS) of LL and NL groups were similar ($p>0.05$). NL patients had higher BI than LL (25.1 vs 15.3p., $p=0.0006$). LL showed poor STM (4.65 vs 5.63p., $p=0.0114$) and WM (2.87 vs 4.24p., $p=0.0069$), compared to NL at acute IS phase. At chronic IS phase LL had poor STM (4.76 vs 5.87p., $p=0.0018$), WM (3.05 vs 4.48p., $p=0.0050$), EM (9.91 vs 18.86p., $p=0.0041$), SM (1.04 vs 2.04; $p=0.01$) and more total number of errors on BVRT (17.0 vs 13.74, $p=0.0120$) than NL. Lonely living showed higher HDS results at acute (15.69 vs 19.8p., $p=0.0121$) but not at chronic IS phase ($p>0.05$).

Conclusions: Loneliness play important role as risk factor for memory decline in elderly post-stroke survivors. It is also associated with acute post-stroke depression.

Difficulties faced by caregivers of children with Autism spectrum disorder in getting their child diagnosis in Kazakhstan

Karina Nukeshbayeva¹, Bauyrzhan Omarkulov¹

¹Karaganda Medical University, Kazakhstan

Background and Objectives: Autism Spectrum Disorder is a developmental disorder associated with significant difficulties throughout a humans life and is characterized by repetitive sensorimotor behavior and social communication disorder. The purpose of this study is to overview the caregivers' journey to the diagnosis of Autism Spectrum Disorder in their children in Kazakhstan. To identify what influences parents decisions in matters of diagnosis and what problems families with children with Autism Spectrum Disorder face when providing them with diagnostic care.

Methods: This study is a mixed interview of caregivers of children diagnosed with Childhood Autism, Atypical Autism about difficulties in the process from initial concern about the child's development to formal diagnosis.

Results: There is the steady increase in the number of children with Developmental Disorders and the rather late age of the final diagnosis in Kazakhstan. Despite the fact that caregivers seek specialized help in a timely manner as soon as they notice alarming signs, the final diagnosis can only be obtained after a long time. Reasons for this may be both the low awareness of autism among health providers the environment, and the parents themselves, as well as the inaccessibility of diagnostic assistance in the form of long waiting lists.

Conclusion: Extremely important point is to increase awareness of ASD among medical workers who conduct routine screening of the psychophysical development of young children in Kazakhstan. Given the public health emergency posed by ASD and the long period between the first parental problems and a diagnosis of autism, there is an urgent need to improve our methods for early detection of ASD in Kazakhstan.

Employment status and bereavement after parental suicide: a population representative cohort study

Sissel Bélanger¹, Kim Stene-Larsen¹, Anne Reneflot¹, Solveig Christiansen¹, Per Magnus¹, Lars Hauge¹

¹Norwegian Institute of Public Health, Norway

Background and Objectives: Losing a loved one to suicide is associated with negative mental health outcomes. So work related outcomes might also be affected, but very little is known with regard to this. The objectives of this study was to examine employment status among adults bereaved by parental suicide at the time of bereavement and 2 and 5-years after the loss and to explore the importance of the gender of the adult child and the deceased parent.

Methods: Population-based register study including Norwegian residents aged 25–49 years in the period 2000–2014. Participants were divided into three groups: bereaved by parental suicide, bereaved by parental death of other causes and non-bereaved population controls. Logistic regression analysis yielded odds ratios (ORs) for the risk of non-employment at different time points.

Results: Those bereaved by parental suicide had a higher risk of non-employment already at the time of bereavement. Stratified analyses showed that women accounted for this difference, while no difference was found for men. Looking at the gender of the parent, there was only a significant association of non-employment when losing a mother, while not for losing a father. Among those working at the time of bereavement, offspring bereaved by suicide were more likely to be non-employed at both 2 and 5 years after the loss compared with the general population.

Conclusions: Women bereaved by parental suicide and those losing a mother to suicide were found to have a weaker attachment to the labour market already before losing their parent. Those who were employed when bereaved by suicide were somewhat more likely to be non-employed 5-years after the event.

Patterns of healthcare utilization prior to suicide according to educational attainment: a nationwide register-based population study

Carine øien-ødegaard¹, Lars Hauge¹, Kim Stene-Larsen¹, Solveig Glestad Christiansen¹, Espen Bjertness¹, Anne Reneflot¹

¹Norwegian Institute of Public Health Norway

Background and objective: Suicide prevention is complex and difficult. Timely help, improved quality of care and correct assessment by healthcare professionals can reduce suicide risk, but then the at-risk individuals must utilize healthcare services. Studies suggest that most of those who die by suicide have consultations with primary healthcare services (PHC) and about 25% with mental health services (MHS), the last year prior to suicide. Total healthcare utilization prior to suicide, and differences from the general population, are still unknown. The same is the association between educational attainment and healthcare service use prior to suicide. Therefore, the object of this nationwide register-based study is to examine patterns of healthcare consultations one month and one year prior to suicide.

Methods: Data stems from the Norwegian population registry, The Primary Health Care Database, The Specialist Health Care Database, The National Education Database and The Cause of Death Registry, which includes all Norwegian residents in the ages 18-65 from 2008-2021. This is a descriptive article, and the results will be presented in cross-tables and figures.

Results: Preliminary analyses indicate a clear association between educational attainment and any consultation within the healthcare services last year prior to suicide. This applies to both sexes, but stronger among men. We find an educational gradient among those with a consultation with MHS prior to suicide, in favor of those with higher education. Among men there is a significant association between educational attainment and contact with PHC the last month prior to suicide. Those who die by suicide utilize the healthcare system more than the general population.

Conclusion: Men without higher education utilize the healthcare system to a low extent. However, as they constitute over half of the suicides it is missed potential for suicide prevention measures. Actions for increasing healthcare use in this group should be investigated.

Impact of the COVID-19 pandemic on the mental health of health-care workers vs the adult general population in South Africa

Mutshidzi Mulondo¹, Sithembiso Ndlovu¹, James Ndirangu¹, Joyce Tsoka-Gwegweni¹

¹University of the Free State South Africa

Background and Objective: There has been 3 coronavirus outbreaks within the last 2 decades, SARS in 2003, MERS in 2012, and COVID-19. This review summarized and compared impact of the pandemic on the mental health of health-care workers (HCWs) and general population during the COVID-19 pandemic. The following objectives were addressed: Identify the impact of COVID-19 on HCWs' and on the general population's mental health; Compare the mental health impact of COVID-19 on HCWs versus that of the adult general population

Methods: A scoping review was conducted. Literature searches on EBSCOhost database, which also hosts other databases, produced 143 studies, after duplicates and ineligible studies were assessed, 5 studies met the criteria for

synthesis.

Results: The eligible studies found the impact of mental health among HCWs, specifically PTSD, to be more prevalent as opposed to rise of suicide cases among the general population. Both HCWs and general population had an increase of anxiety and depression during the pandemic. Among HCWs, mental health was negatively impacted by loss of infected patients, concern over personal safety, passing infections to family members and exhaustion from long working hours as colleagues contracted COVID-19. The general population had increased cases of anxiety due to fear of contracting the virus and increased levels of depression due to job losses, isolation, loneliness, substance abuse/ withdrawal and fear of the unknown.

Conclusion: Limited access to mental health services and low utilization rates in low resource settings may exacerbate mental health problems during and post-pandemic. There is need to increase community-based awareness and advocacy for mental health. The importance of utilizing lessons learnt in other countries is key to building a robust and responsive strategy. Lessons learnt from other countries include digital mental health support packages established for frontline HCWs using social media online chat groups.

The effects of social capital and built environment on depression in urban residents in South Korea

Kyeong-Sook Choi¹, Ji-Ae Yun¹, Hyemin Jang¹

¹Euiji University School of Medicine, Department of Neuropsychiatry Korea, Republic Of

Background and Objective: Social capital is an important factor related to health inequalities and has been reported to be related to depression independently of individual factors. Built environment associated with social capital. The purpose of this study was to find out how social capital and the built environment affect depressive symptoms in a Korean city resident.

Methods: A cross-sectional study was conducted with 20–69 aged people living in a city in South Korea through an online survey. Based on the literature review, questions related to social capital and built environment were collected, and finally a 23-item self-report questionnaire (5 items of cognitive social capital, 6 items of structural social capital, 12 items of built environment) was prepared. The social capital and built environment questionnaire's Cronbach's α was 0.91. Depressive symptoms were evaluated using the Patient Health Questionnaire-9 (PHQ-9) and depression was determined based on a score of 9. Logistic regression was used to find the relationship between related variables and depression.

Results: A total number of participants was 555, 163 males (35.8%) and 292 females (64.2%). In simple logistic regression analysis, cognitive social capital (OR=0.36, CI: 0.26-0.48), structural social capital (OR=0.44, CI: 0.35-0.57) and crime/safety-related built environment (OR=0.45, CI=0.33-0.61), Aesthetics-related built environment 0.61 (0.47-0.81) were all related to depression. After adjusting for gender, age, education level, family income, marital status, number of physical diseases, and presence of chronic diseases, structural social capital (social network/human resources) (OR=0.60, CI:0.43-0.84) and crime/safety-related built environment (OR=0.66, CI: 0.44-0.99) were still associated with depressive symptoms, however, cognitive social capital(social cohesion/trust), and aesthetics of built environments were not associated with depression.

Conclusion: This study shows that social capital and built environment are associated with depressive symptoms in urban residents.

Comparison of suicidality among Pacific Islanders in the Western Pacific and the United States

Davis Rehuher¹, Genesia Paolo¹, Jeanelle Sugimoto-Matsuda¹, Deborah Goebert¹

¹University of Hawaii at Manoa, United States

Background and Objective: Islands in the Western Pacific have among the highest suicide rates in the world. Gaps in suicide prevention efforts and mental health care are compounded by a lack of adequate mental health infrastructure and qualified mental health professionals. Over the past few decades, seeking better opportunities for education, employment, and health care, people from the Pacific region have been migrating to the United States and its Territories in increasing numbers. Similarly, suicide rates have increased among Pacific Islander migrants. This study examines suicide data in the Pacific region and among Pacific Islander migrants in the US. The study maps the extent of the problem, summarizes research findings, and identify gaps in the existing literature for this understudied population.

Methods: A systematic review of the peer-reviewed publications, theses and dissertations, and government and agency reports, and other grey literature was conducted. For the references found, their citations were also examined to see if any of the citations were relevant.

Results: Overall, there are few sources of information on Pacific Islander suicide. However, suicide rates among young Micronesian males have been as high as 100 per 100,000 among different island groups in the region. Rates have decreased over the past 40 years but are still high by global standards. According to estimates by the World Health Organization, as of 2019 the age-standardized suicide rate in the Federated States of Micronesia was 29.0 per 100,000. Among males, it was 44.3 per 100,000. In comparison, the global age-standardized rate was 9.0 per 100,000 for both sexes and 12.6 per 100,000 for males.

Conclusion: Suicide prevention efforts are needed to abate high rates of suicidality. Efforts must include awareness, enhanced training, screening, and the development and evaluation of interventions tailored to the needs of Pacific Islander young people.

Popul. Med. 2023;5(Supplement):A1318

DOI: 10.18332/popmed/163722

The emergency departments frequent user in Rome: an observational study in 13 hospitals

Giuseppe Furia¹, Antonio Vinci², Francesco Di Nardo³, Francesca Troiano², Patrizia Chierchini², Maddalena Quintili², Gianfranco Damiani⁴, Corrado De Vito¹

¹Sapienza University of Rome, Italy, ²Local Health Authority Roma 1, Italy,

³Local Health Authority NO, Italy, ⁴Università Cattolica del Sacro Cuore di Roma, Italy

Background and Objective: Frequent users are patients who repeatedly and inappropriately access the emergency department (ED), with low grade symptoms potentially treated outside the hospital setting. They contribute to increase the ED extra costs and risk to compromise the quality of hospital services. This study aims at investigating the phenomenon of frequent user in Rome, defining the profile and comparing the accesses to EDs.

Methods: The analysis was carried out considering the accesses to 13 EDs in 2021 in the Local Health Authority Roma 1 geographical area. According to the Italian Ministry of Health's categories, the EDs were classified into three levels of complexity (I, II, III level). A digital app collected demographic, geographical and clinical data, using the Lazio Region official data flows. Records were pseudo-anonymized. According to the literature, 3 categories of frequent user were identified: ≥ 4 access, ≥ 7 access, ≥ 10 access per year. Chi-squared tests were conducted to verify the differences between the three EDs categories in terms of the proportion of frequent user accesses.

RESULTS: A total of 110.761 ED accesses were registered and 81.406 users were included. ≥ 4 access user category represented 1.4% of all users, ≥ 7 access was 0.7%, ≥ 10 access was 0.2%. 77% were registered as not an emergency/urgency, 54% of users didn't need hospitalization. The mostly recorded diseases were chronic pathologies, often with social and mental health-related issues. Significant differences ($p < 0.001$) were found in the analysis of EDs: the II level ED received a lower proportion of accesses as compared to the other level.

CONCLUSION: The first profile characteristics are in line with the international literature, describing mostly non urgent chronic and social issues. The analysis of three ED level accesses underline the need of further studies to investigate the predictors of accesses and the geographical area of origins. This study can represent a first important step to strengthen the preventive policies outside the hospital setting.

Intimate partner violence among young women and men in KwaZulu-Natal, South Africa

Nuha Naqvi¹, Sarah Aheron¹, Ariana Paredes-Vincent¹, Mireille Cheyip¹, Jennifer Drummond¹, Edward Nicol², Mbuzeleni Hlongwa²

¹Centers for Disease Control and Prevention (CDC), South Africa, ²South African Medical Research Council, South Africa

Background/Objective: South Africa has one of the highest rates of intimate partner violence (IPV) globally. Although there is abundant research on IPV against women with men as perpetrators, there is limited research on men as victims of IPV. To address this gap, we conducted an analysis of reported lifetime physical IPV (PIPV), emotional IPV (EIPV), and composite IPV (CIPV) by gender.

Methods: We administered 2,581 questionnaires focused on sexual behavior and violence as part of a prospective cohort study among young women aged 15-24 years and men aged 15-35 years in uMgungundlovu District, South Africa between

August 2021-July 2022. Descriptive analysis and multivariate logistic regressions were performed.

Results: Of total participants, 16% (n=411) reported experiencing at least one form of IPV in their lifetime. Of 1649 women surveyed, 14.7% reported experiencing CIPV, 8.7% PIPV, and 9.5% EIPV. Of 941 men surveyed, 18.5% reported experiencing CIPV, 7.7% PIPV, and 14.4% EIPV. Women who consumed alcohol 2-4 times per week and those who always experienced condom refusal were more likely to report experiencing CIPV (adjusted odds ratios (aORs)=5.17, 2.36; 95% confidence intervals (CIs): 1.55-17.29, 1.19-4.70), EIPV (aORs=9.28, 2.72; 95% CIs: 2.42-35.54, 1.30-5.68), and PIPV (aORs=5.27, 3.64; 95% CIs: 1.40-19.90, 1.68-7.87), respectively. Men who reported high food insecurity and those who participated in transactional sex were more likely to report experiencing CIPV (aORs=4.29, 2.43; 95% CIs: 1.15-15.92, 1.39-4.27) and EIPV (aORs=5.34, 2.11; 95% CIs: 1.19-23.99, 1.02-4.33), respectively. HIV-positive men were more likely to report experiencing PIPV than HIV-negative men (aOR=7.17; 95% CI: 1.73-29.76).

Conclusion: We found differences in factors affecting young women and men who experience IPV, with proportionally more men than women as victims of CIPV and EIPV. Our findings indicate the need for additional research and interventions targeted towards men as victims of IPV, prioritizing those with high food insecurity and those who transact sex.

DOI: 10.18332/popmed/163827

Intimate partner violence against women and common mental disorders: an integrative literature review

Dinair Ferreira Machado¹, Natália Rezende de Freitas¹, Dinair Ferreira Machado¹

¹Faculty of Medicine of Botucatu, unaffiliated, Brazil

Background: Historically related to a persistent gender inequality, configured as a growing public health problem, accompanied by culturally determined actions, violence against women in the domestic environment has been the subject of research in various fields of knowledge, recognized as a complex and multifaceted phenomenon of human rights violation, which brings serious repercussions for the lives of victims, mainly related to mental illness.

Objective: To identify the association between the development of common mental disorders and domestic violence against women by an intimate partner.

Methods: This is an integrative literature review conducted in the month of July 2022, and the final sample of studies was 28 articles.

Results: After critical reading, the articles were categorized according to the method of analysis, electing three categories: 1) Complications of violence against women on the mental health of victims; 2) Violence against women as potentiators of suicide attempts and ideations; 3) Violence against women during pregnancy: correlations with depression in the postpartum period. The articles ratified the main focus of this study, stating that, regardless of the type of violence suffered and what led the perpetrator to such practice, it has harmful effects on the mental health of the victims and their families. It was also found that the patriarchal culture reinforces this practice, and, associated with the lack of preparation of professionals, these victims do not receive an adequate reception in the services where they seek help.

Conclusion: It is necessary to evolve in several aspects pointed out here, from overcoming patriarchy, to the preparation of future professionals, from graduation on, for the adequate care of victims of domestic violence, expanding the view beyond the biological aspect of this phenomenon, relying on joint and multiprofessional actions, aiming at the integral and longitudinal care of these women.

Universidad Publica de Navarra. Avda de Baranain sn. 31008 Pamplona, Spain

Background and Objective: Patients with schizophrenia have higher mortality than the general population, with cardiovascular diseases being the first cause of mortality. This study aims to estimate the excess cardiovascular risks in patients with schizophrenia.

Material and Methods: We did a crosssectional study within the "Navarre primary health care system cohort" (APNA study) APNA is a dynamical multipurpose prospective cohort of the population in the Region of Navarra, Spain. We selected 505,889 people over 18 years old. We collected age, sex, income status, and clinical variables (Body Mass Index (BMI), systolic and diastolic BP, smoking, and diagnoses of type 2 diabetes, hypertension, and dyslipidemia.) Data were analyzed with logistic regression using IBM SPSS.

Results: Adjusting by age, sex, and income, patients with schizophrenia have a higher prevalence of Type 2 Diabetes OR=1,911 (95% CI 1,363-2,010), Dislipemia OR=1,443 (95% CI 1,139- 1,829), smoking OR=1,565 (95% 1,395-1,755), Obesity (BMI>30) OR=2,295 (95% CI 2,026- 2,599), Morbid Obesity (BMI >40), Smoking OR=2,544 (95% CI 1,943-3,330) than the general population. The prevalence of hypertension was similar in both groups (p =0.06).

Conclusion: Schizophrenia patients have a higher prevalence of cardiovascular risk factors than the general population. General practitioners should be aware of this higher prevalence of cardiovascular risk factors in patients with schizophrenia and instruct nurses to monitor them and include them in their follow-up programs. Primary care nursing interventions should monitor these patients and reduce cardiovascular risk factors.

Mental Health Literacy Scale (MHLS) validation studies: a scoping review

Rouwida El Khalil¹

¹United Arab Emirates University Al Ain United Arab Emirates

Background and Objectives: Following a systematic assessment of mental health literacy tools in 2014, O'Conner and Casey developed a comprehensive mental health literacy measure in 2015, which was based on the six attributes endorsed by Jorm et al. in 1997. Since it was first developed, the Mental Health Literacy Scale (MHLS) has found widespread application in mental health literacy research worldwide. This scoping review aims to map the existing MHLS validation research and summarize its validity in different populations.

Methods: A scoping review was conducted following the guidelines of the Joanna Briggs Institute. A comprehensive literature search was conducted in December 2022 on PubMed, PsycINFO, Embase, CINAHL, Cochrane Library, Scopus, Medline, and ERIC from 2015 to 2022. The review focused on validation studies of O'Conner and Casey MHLS. The study participants and locations were not limited in the search. Reference list search and publication suggestions from MHLS authors were performed as well. Non-English studies and grey literature were excluded.

Results: The study included 14 articles that have validated the MHLS worldwide. The scale was validated and translated into Chinese, French, Persian, Portuguese, Slovenian, Arabic, Turkish, and Urdu. Seven studies performed Exploratory Factor Analysis, Six performed Confirmatory Factor Analysis (CFA), and one performed Principal Component Analysis. The sample size average was 662 (282-1189), the expert panel average was 9 (4-21), the Cronbach's alpha average was 0.818 (0.744-0.89), and the Interclass Correlation Coefficient (ICC) average was 0.85 (0.741-0.99). In addition, items 20, 21, and 22 were commonly removed based on the individual article's CFA results.

Conclusion: This review provided a compendium of MHLS validation research by systematically searching, selecting, and synthesizing existing publications. It also provided an evidence map for future researchers attempting to utilize the MHLS in their local settings.

Evidence-based status of forest healing program in South Korea

Geonwoo kim¹, sujin park¹, soojin kim², yeji choi¹

¹Korea National Institute of Forest Science Korea, Republic Of, ²Korea National Institute of Forest Science

Various effects of forest healing on health have been reported, but a certification system to assess the effectiveness of forest healing programs does not exist. In this study, a systematic review (SR) on the "health benefits of forests" and "meta-analysis of forest therapy" was conducted after analyzing the status and level of evidence of 75 forest healing programs that were conducted post-certification in South Korea. The SR for "health benefits of forests" distinguished between

activities and time, resulting in 90.9% of walking activities for more than an hour under psychological health, and 100.0% of exercise activities for less than an hour under physiological health. However, the effect of indirect activities performed for more than an hour was unknown. Thus, we confirmed that many indoor activities in the field had low effect size or no established basis regarding the feasibility of its operation. The SR on "meta-analysis of forest therapy" to check whether the program was effective. The highest number of healing effects were obtained for blood pressure (32), followed by psychological depression (24). The findings of this can serve as baseline data to facilitate future development and dissemination of evidence-based forest healing programs.

Mental health services in the school environment - future visions

Tiina Putkuri¹, Mari Lahti¹, Camilla Laaksonen², Anna Sarvasmaa³, Rauno Huttunen¹, Anna Axelin¹

¹University of Turku Finland, ²Turku University of Applied Science Finland, ³Finnish Student Health Service, Helsinki Finland

Background and Objective: The increased need for mental health care has challenged the role of schools and school health care. According to political guidelines, mental health services should be an integrated part of the general health services, such as school health care. There is a need for future visions concerning the mental health services provided in the school environment. The aim of this research was to describe the variation in stakeholders perceptions related to the desirable mental health services in school environments and to construct alternative future visions based on these perceptions.

Methods: The qualitative study was conducted with the phenomenographic approach using a visioning methodology. Interviews were conducted in Finland between February 2020 and February 2021. Professional stakeholders (n=15) participated in individual interviews and stakeholders advocating for adolescents or parents (n=10) in focus group interviews.

Results: Four alternative future visions were formulated based on the perceptions of the stakeholders. The visions emphasised different aspects: (1) non-medicalising the school environment, (2) early and extensive intervention by school nurses enabled by work distribution with mental health specialists, (3) a multiprofessional team providing help on overall health questions and (4) a focusing of the services on mental disorders.

Conclusion: The future visions are based on distinct and even opposite perceptions related to the mission and focus of school health care. One extreme emphasises overall health promotion for everyone, and the other treatment for those suffering from mental disorders. Selection of a desirable vision is challenging: the former may lead to inadequate help for mental health problems and the latter insufficient help for other problems.

Defense strategies developed by military workers in the intervention in suicide crises

Jeremias Campos Simões¹, Silvanir Destefani Sartori², Eloisio Moulin De Souza³, Gabriela De Brito Martins¹, Stephanie Mendes Demarchi², Rafael Vulpi Caliar¹, Margaret Nunes Neves Conceição¹, Caroline Feitosa Dibai De Castro⁴, Rita De Cássia Duarte Lima¹, Maria Carvalho Andrade¹

¹Federal University of Espírito Santo (Ufes) Postgraduate Program in Collective Health Postgraduate Program in Collective Health Federal University of Espírito Santo Av. Marechal Campos, 1468, 29047-105 - Vitória - ES, Brasil, ²Federal University of Espírito Santo (Ufes), ³Federal University of Espírito Santo (Ufes) Postgraduate Program in Administration Federal University of Espírito Santo. Postgraduate Program in Administration Av. Fernando Ferrari, 514, Goiabeiras | Vitória - ES - CEP 29075-910 Brazil, ⁴Federal University of Espírito Santo (Ufes) Postgraduate Program in Collective Health Postgraduate Program in Collective Health Federal University of Espírito Santo Av. Marechal Campos, 1468, 29047-105 - Vitória - ES, Brasil Brazil

Introduction: Suicide is considered a serious public health problem and has affected an increasing number of people in Brazil and Latin America, consequently leading to an increasing number of people affected by the suicidal crisis, regardless of having a bond with the attempting person.

Objective: To understand defense strategies developed by workers who intervene in suicidal crises.

Methods: This study consists of a qualitative approach, using psychodynamics of work as a theoretical and methodological category. Data were produced through semi-structured interviews, an intersubjective technique that allows the

interviewee to speak and the interviewer to listen. The analysis of these data was possible with the use of a content analysis technique: set of techniques that aims to analyze the communications, through the systematization of objective procedures allowing the inference of knowledge related to the messages.

Results: 15 workers with experience in interventions in suicidal crises, members of the military fire brigade, located and operating in the southeastern region of Brazil, were interviewed. Defense strategies were identified that occur in four distinct and interconnected moments: (1) moment when they receive the information that the crisis is happening, (2) followed by the teams displacement to the place of the crisis, (3) the intervention aiming to remove the trying subject from the risk and (4) the return to the base. The flow of work practices allowed us to understand defense strategies that act in the denial of suffering, while others act in the concealment of suffering.

Conclusion: The elaboration of these strategies inserts workers into true traps: dissimulation and denial of suffering allow the continuity of work, but also make suffering difficult to identify.

DOI: 10.18332/popmed/164217

Effectiveness of a meditation technique sudarshan kriya yoga (sky) on depression and anxiety: - A systematic review and meta-analysis

Jwenish Kumawat¹, Carla Perrotta², Mary Codd¹, Patrick Wall¹

¹University College Dublin School of Public Health, Physiotherapy and Sports science "University College Dublin, Woodview House, Belfield, D04 V1W8, Dublin" Ireland, ²University College Dublin

Background: Sudarshan Kriya yoga (SKY) is one of the proposed breathing techniques, which has proven to be an effective intervention for depression and anxiety in small studies. This study set out to retrieve, appraise and summarize the existing literature to assess the effectiveness of SKY to improve health outcomes in patients with mild to moderate anxiety and depression.

Methods: A systematic review of the literature was conducted to identify randomized control studies assessing SKY versus pharmacological intervention or placebo in patients with either depression and/or anxiety published from 1998 to June 2020. The studies were identified through database searches. Assessment of the quality of evidence included risk of bias, heterogeneity, directness of the evidence, risk of publication bias and precision of effect estimates.

Results: The pooled Standardized Mean Difference (SMD) for the effect of SKY on depression was 0.02[-0.20, 0.24] in 6 studies with 388 participants. The pooled SMD for the effect of SKY on anxiety was -0.05 [-0.63, 0.52] based on five studies with 428 participants. The robustness of the results was assisted by a sensitivity analysis that revealed the effect of each study predominantly affected the overall SMD in each clinical outcome. There was also high heterogeneity observed for depression (I²=93%; p < 0.001) and for anxiety (I²=97%; p < 0.001).

Conclusion: SKY in itself is diverse in nature and when it comes to its overall effectiveness it may be inferred that teaching has shown immense potential in treating depression and anxiety. Many small studies claimed the effects of SKY on a different range of outcomes. It has also shown to be effective among different segments of population with varying physical capabilities. However, future studies are needed to evaluate the short- and long-term impact of SKY on larger samples.

Resilience in the covid-19 pandemic: New meanings and evolution

Azzurra Foggi¹, Nicola Nante², Giovanni Guarducci¹

¹University of Siena Post Graduate School Of Public Health, University Of Siena Italy, ²University Of Siena Gabriele Messina University Of Siena Department Of Molecular Ad Developmental Medicine, University Of Siena Italy

Background and Objective: Since the end of 2019 there were several waves of COVID 19 pandemic. To limit contagion, governments have introduced measures that are able to exacerbate or identify psychopathologies, also because resistance to stressful conditions is helped by socialization and sharing of experiences. The study aimed to analyze the scientific literature produced on the subject of "resilience" during the pandemic, evaluating its evolution and possible new fields of development in psychological disorders.

Methods: Articles on MEDLINE were evaluated dividing them into four periods: first one 2019-2021, second one 2021-2022, total literature 2000-2022 and the sum of the first two periods. The following Medical Subject Headings were used: resilience AND mental health, resilience AND COVID 19. Inclusion criteria: articles in English, studies on psychological aspects in psychopathologies and eutimia. The exclusion criteria: studies on gender differences, psychopathology with disabling

conditions, cancer, infirmity, studies on children and adolescents, studies on elderly people rest home, studies focused on single psychiatric pathologies. Results: The literature on resilience during the COVID period showed a significant increase. Of the 1011 articles on resilience AND mental health written in 2000-2022, 645 were written in 2019-2022. Only 475 articles were written in the pre-COVID period; 645 in the entire period COVID 2019-2022 of which 561 only in the second period COVID 2021-2022. The same increase were for resilience AND COVID 19, highlights 598 articles written from 2019 to 2022, since before 2019 there were no pandemic, of these 506 articles were written from 2021 to 2022. Conclusion: It highlights the increase of literature on mental health issues during the covid period, mainly on individual resources and the inherent capabilities of response to stress factors. Attention can again be directed to the person not only as an individual but as a social resource

Mental Health of those who care: how can epidemiology help address the burden of depression?

Claudio Costantino^{1,2}, Vincenza Gianfredi^{2,3}, Nuno Amparo⁴, Alessandro Catalini^{5,6}, Giovanna Failla^{7,8,9}

¹Department of Health Promotion, Maternal and Child Care "G. D'Alessandro", University of Palermo, Palermo, Italy, ²Italian Society of Hygiene, Preventive Medicine and Public Health (S.It.I), Italy, ³University of Maastricht, Maastricht, The Netherlands, ⁴Central Alentejo Health Cluster's Public Health Unit, European Network of Medical Residents in Public Health, Évora, Portugal, ⁵Department of Biomedical Sciences and Public Health, Università Politecnica delle Marche, Ancona, Italy, ⁶Medical Residents' Assembly of the Italian Society of Hygiene and Preventive Medicine (S.It.I), Italy, ⁷Section of Hygiene and Public Health, Department of Life Sciences and Public Health, Catholic University of the Sacred Heart, Rome, Italy, ⁸High School of Health Systems Economics and Management (ALTEMS), Università Cattolica del Sacro, ⁹European Network of Medical Residents in Public Health (EuroNet MRPH) Cuore, Rome, Italy

Depression is one of the most prevalent mental disorders with a high burden of disease, affecting one in fifteen adults (6%). Moreover, because the COVID-19 lockdown has highly impacted on mental health, in each strata of the population (from the most to the least vulnerable, also including health professionals), projections estimate that depression will become the leading cause of disease burden in 2030. COVID-19 increased the emotional burden on health professionals working at the forefront, including the one involved in the public health field. Furthermore, although the etiology of depression is still not well known, multiple risk factors have been associated with it. How do these several factors interact and have an impact on depression? How has the COVID-19 pandemic played a role on health professionals mental health or even on informal caregivers, especially considering that during the pandemic many healthcare activities have been postponed, further burdening them? The workshop Aims to reply to these still open questions by bringing together experts in public health, epidemiology, statistics, and quantitative social sciences with topic knowledge on depression. The workshop will be structured as follows: we will first set the scene with an introductory presentation. We will then deepen the theme by focusing on two different topics, each presented by two speakers. This will allow us to compare different perspectives and stimulate the final debate. Audience participation will be encouraged with live polls, quizzes or word clouds. The introductory presentation will move from a quick overview of the past, present and future of Public Mental Health. It will then focus on the stigma of psychiatric pathology and the impact of the pandemic on it. Finally, it will approach the theme of mental health among health professionals, residents and students taking cues from the SMS-ME project (Sicilian Medical Student Mental Health). In the first contribution, we will present data from the Italian and European surveys among Public Health Residents deepening the impact of COVID-19 pandemic on their mental health. These two surveys were conducted respectively by the working groups on "Public Mental Health" from the medical residents Assembly of the Italian Society of Hygiene and Preventive Medicine and from the European Network of Medical Residents in Public Health (EuroNet MRPH). The second contribution aims at discussing the most recent evidence on how several lifestyle and socio-economic factors are associated with prevalent and incident depressive symptoms among the general population. A specific focus on the role of social support and informal caregiving will be discussed. Data presented will come from The Maastricht Study, a large population-based cohort study, and from evidence of the literature. Identifying risk factors of depression could guide preventive strategies with the final aim of reducing its high morbidity. We hope that the final debate will lead to a fruitful discussion on the data presented, also aimed at understanding how

to inform policy makers about health and economic consequences of the high burden of depression.

ABCs of mental health promotion in a world of Turmoil

Christina Pollard¹, Elin Färnstrand², Emma Hjalte³, Magni Mohr⁴, Monika Mohr⁵, Charlotte Meilstrup⁶, Line Nielsen⁶, Steinar Krokstad⁷, Rosa Alati¹

¹Curtin University, School of Population Health, Australia, ²Region Östergötland, Sweden, ³Karolinska Institutet, Sweden, ⁴University of the Faroe Islands, Faroe Islands, ⁵Board of Public Health, Faroe Islands, ⁶Department of Psychology, University of Copenhagen, Denmark, ⁷HUNT Research Centre, NTNU, Norway

Brief Outline of Workshop

COVID-19[1], natural disasters and protracted conflicts have taken a toll on mental well-being. The Act Belong Commit™ evidence-based campaign is a public health strategy to protect and promote mental well-being[2].

This workshop will engage participants in a journey outlining how the successful Western Australian ACT BELONG COMMIT™ social marketing campaign, first launched in 2008, has been replicated and adapted in Denmark, Norway, Sweden, and the Faroe Islands. Presentations by each country's team, will show how the campaign has evolved to transcend cultural, environmental, and target audience differences.

The campaign encourages individuals and organisations to engage in activities that strengthen mental well-being: ACT, be physically, mentally, socially, spiritually, culturally active; BELONG, connect with others through activities that promote mental wellbeing; COMMIT, to meaningful or personally challenging activities such as volunteering or setting personal goals.

In the Nordic countries the campaign is called the ABCs of Mental Health, and is tailored to the cultural context and settings in each country. Each partner will describe their approach, giving examples of its application to specific populations. This is the first time all ABC countries have been brought together to share their key learnings. Workshop attendees will participate in the face-to-face panel discussion that explores how to undertake mental health promotion in a world of turmoil.

Specific aims/objectives and components: The workshop aim is to showcase the Act Belong Commit / ABC framework and how it assists countries and organisations to promote mental well-being, in alignment with the UN Sustainable Development Goal #3, Ensure Healthy Lives and Promote Well-being for all at all ages[1][2] and the WFPHA's Global Charter for the Public's Health[3] objectives.

Moral distress and moral injury in the public health workforce during the pandemic

Farhang Tahzib¹, Jutta Lindert², Steven Bow³, Adrian Te-Patu⁴, Alison McCallum⁵, Peter Schröder-Bèck⁶

¹UK Faculty of Public Health, United Kingdom, ²University of Applied Sciences Emden /Leer, Germany, ³University College London, London, United Kingdom, ⁴World Federation of Public Health, New Zealand, ⁵The Centre for Population Health Sciences, Usher Institute, University of Edinburgh, United Kingdom, ⁶EUPHA ethics in public health section, Germany

Brief Outline

Moral distress and moral injury are the experience of psychological distress arising from participating in, or witnessing, ethically problematic actions, and the resulting injuries of that distress. Moral distress is said to be "the troubled call of conscience, an expression of fidelity to moral commitments seen as imperiled or compromised". Feeling ill-prepared or unable to pursue ethically-appropriate action – based on personal integrity or professional obligations – causes moral distress, which can lead to stress, burnout, lack of resilience and mental health issues.

The concepts of moral distress and injury were originally described among soldiers during wars and conflict, law enforcement agents, and nurses, with growing interest in their importance in other health professions. Public health professionals routinely face tough ethical decisions and face morally ambiguous situations, and are consequently vulnerable to moral distress. However, to date, this issue has received little attention in the public health arena.

The proposed workshop by a multidisciplinary team of researchers and practitioners will share and reflect on their recent robust cross sectional study on moral distress and injury in the public health workforce in the UK during the pandemic. They will outline the scale, nature, frequency, and severity of moral distress in the public health professional workforce during the pandemic and

its resulting impact on mental health. There will also be description of a major international longitudinal study among health care workers in hospitals and primary care units in Brazil, Bolivia and Germany considering the issue. It was found that 64% of the public health workforce in the UK had one or more experience of moral distress associated with their own action (or inaction), and 26% reported experiencing moral distress associated with a colleague's or organisation's action (or inaction) SINCE THE START OF THE PANDEMIC, AND THAT 14% of those with moral distress, reported MORAL INJURY severe enough to require time off work and/or therapeutic help. The main situations causing moral distress were developing or Implementing National Policy, Guidance and Law, Providing Public Health Advice, and Workplace Relationships and Environments. Moral distress was chiefly precipitated by moral judgements about Having Caused Injury, being Unable to do Good, Dishonest Communications, and Unjust Prioritisation.

The researchers will share analysis and insights on possible causes, aggravating factors and impacts in the public health workforce during the pandemic, and options for its prevention, amelioration and care.

The workshop will:

share recent research and insights on moral distress and injury in the public health workforce and options for its prevention, amelioration and care. Highlight the need to appreciate cultural dimensions and conflicting world views in practice create a space sharing knowledge and hearing the insights of the participants as part of interdisciplinary ethical, professional and policy efforts needed to better understand and consider interventions to increase the moral resilience of the workforce.

Key Questions the Workshop Will Address

What is the nature and impact of moral distress and injury in the public health workforce? What are options for its prevention, amelioration and care?

Popul. Med. 2023;5(Supplement):A1331

DOI: 10.18332/popmed/163877

Public health mental health - challenge for public health

Jutta Lindert¹, Jonathan Campion², Jutta Lindert³

¹University of Applied Sciences Emden University of Applied Sciences Emden Constantiaplatz 4 Emden Germany, ²South London and Maudsley NHS Foundation Trust, United Kingdom Bettina Borisch World Federation of Public Health, Switzerland, ³EUPHA University of Applied Sciences Emden Constantiaplatz 4 Emden Germany

Organised by EUPHA Section on Public Mental Health, WFPHA, University of Applied Sciences Emden / Leer, Emden, Germany; University of Geneva, Geneva, Switzerland

Brief outline of the overall workshop

Mental disorder is responsible for at least a fifth of global disease burden due to high prevalence, early onset in the life course and a broad range of public relevant impacts. Mental wellbeing is also an important asset and results in wide ranging impacts. Effective interventions exist to treat mental disorder, prevent associated impacts, prevent mental disorder from arising, and promote mental wellbeing and resilience. Such interventions are delivered by different sectors including public health. Prior to the COVID-19 pandemic, only a minority of those with mental disorder received interventions with negligible coverage of effective interventions to prevent associated impacts, prevent mental disorder or promote mental wellbeing and resilience. This implementation gap has further widened since the COVID-19 pandemic and results in population scale preventable human suffering, public health relevant impacts and associated economic costs.

Public Mental Health is therefore an important part of public health and supports the achievement of a range of public health objectives. However, to date, this issue has received little attention in the public health arena.

Specific aims / Objectives: The workshop session will

- * Share recent research and insights on mental disorders and wellbeing before and during the pandemic
- * Consider reasons for implementation failure of effective PMH interventions and required actions to address this through PMH practice
- * Create a space sharing knowledge and expertise hearing the insights of the participants as part of interdisciplinary ethical, professional and policy efforts needed to promote Public Mental Health.

The key questions that the workshop will address

- * What is the extent of mental disorder, poor mental wellbeing and associated risk/protective factors at population level and how to assess in order to inform population need?
- * What are options for mental disorder prevention, amelioration and care, and promotion of mental wellbeing and resilience?
- * What is the role of public health to support scale implementation of evidence based

PMH interventions?

Discourses of sexual violence and safety among transwomen of colour: an online forum analysis

Pranee Liamputtong¹

¹College of Health Sciences, VinUniversity, Hanoi, Vietnam

Background and Objective: Violence towards transwomen is common in many countries. It is well-known that transwomen of colour face very high rates of sexual and physical violence. This paper is based on an online forum analysis that explored the experiences of sexual violence and safety among transwomen of colour.

Methods: Four online forums that allowed research were chosen for the analysis. Thematic analysis method was used for data analysis.

Results: Three key themes were identified: dating and violence in intimate relationships, fear of violence and safety strategies, and coping after sexual assault. Forum posters faced heightened gender policing and scrutiny, due to not conforming to normative ideals of femininity. Femininity is also predicated on white, middle-class status, and associated with domesticity and romance. Therefore, expressions of femininity from non-white Background:s can be read as deviant or excessive. The intersection of deviation from gender norms and femininity based on whiteness means that transwomen of colour face disproportionate levels of violence, both in public and private spaces. Many face cumulative disadvantages due to gender non-conformity, participation in higher risk forms of sex work, low socioeconomic status and employment and institutional discrimination. Coping mechanisms to deal with cumulative disadvantage include seeking support from health professionals and transgender community networks. However, it includes more harmful forms of self-medicating such as heavy alcohol and drug use, self-harm and suicide attempts.

Conclusions: Healthcare providers need to develop an understanding of the impacts of trauma on transwomen, particularly when it may be intertwined with gender dysphoria. Transwomen of colour are likely to have less social support as many are isolated from their families and ethnic groups. Sexual violence survivors' groups need to be accessible to transwomen by developing inclusive policies or setting up specific groups for transwomen who are survivors of sexual violence.

Cardiovascular health of the population in situation of Rua de São Paulo 2019/2020

Andreia Menezes¹, Claudia Muniz²

¹Universidade Nove de Julho, São Paulo, Brasil, ²Universidade Nove de Julho, Brazil

Objective: To elucidate cardiovascular risks in the homeless population of São Paulo, stratifying through nursing diagnoses. methods This is a field research of a quantitative and transversal character, whose study target is the homeless population in the central regions of São Paulo. A questionnaire containing questions related to cardiovascular health was applied, Blood Pressure (BP) and anthropometric measurements were measured in volunteers aged between 18 and 60 years, between November 2019 and March 2020. the development of CVDs and then the results obtained will be presented.

Results: This population has several RF for cardiovascular diseases such as; the substitution of water for alcohol, insufficient knowledge to the RF, lack of access to health services, indicating the need for education and health prevention. When asked about drinking water consumption, 34% said they consumed more alcohol than water, in which the BP levels were 142 per 94 mmHg and the pulse was 91 beats per minute (bpm). This indicates the influence of exchanging water for alcoholic beverages on the elevation of blood pressure values. Conclusions: Nursing diagnoses: Risk of Unstable Blood Pressure, Risk-prone health behavior characterized by substance abuse. This study was carried out in the pre-pandemic, today São Paulo has more than 31000 PSR. It is evident that this is a matter of public policies and human rights that ensure that all citizens have the right to basic needs.

Feasibility and acceptability of involving Bilingual Community Navigators (BCNs) to improve access to health and social care services in general practice setting of Australia

Sabuj Mistry¹, Elizabeth Harris¹, Mark Harris¹

¹Centre for Primary Health Care and Equity, University of New South Wales, Sydney, Australia

Background and Objective: Patients from culturally and linguistically diverse (CALD) Background:s often face difficulties in accessing health and social care services. This is the first research conducted in Australian general practice setting exploring the feasibility and acceptability of involving bilingual community navigators (BCNs) in helping patients from culturally and linguistically diverse (CALD) Background:s access health and social care services.

Methods: Informed by the research conducted in overseas and previous phases of the current research, a total of 12 community health Workers (CHWs) were recruited and trained as BCNs. Three of them were placed for 8-10 weeks in two general practices in Sydney where most patients are from specific CALD Background:s (Chinese in one and Samoan in other). A mixed method design including quantitative analysis of a record of services provided by BCNs and post-intervention qualitative interviews with 16 participants including patients, practice staff and BCNs explored the feasibility and acceptability of BCNs' role.

Results: BCNs served 95 patients, providing help with referral (52.6%), information about appointments (46.3%), local resources (12.6%) or available social benefits (23.2%) with a critical role overcoming their language barrier. Overall, BCNs fitted in well within the practice and patients accepted them well. Felt need of the service, recruitment of BCNs from the patient community, motivation, and training of BCNs acted as facilitators for their roles. Major barriers included lack of awareness of BCNs' roles among some patients and practice staff, unavailability of information about local culture specific services, and inadequate consultation time of BCNs. Limited funding support and short project timeframe were major limitations.

Conclusions: In Conclusions:, while the intervention was found feasible and acceptable, sustainable funding is required to continue the intervention. Future research is needed to scale up this intervention to other culture groups and assess its cost-effectiveness.

The mitigating role of sense of belonging on the impact of racism on life satisfaction for Asian communities in Aotearoa New Zealand during the COVID-19 pandemic

Rebekah Jaung¹, Lynne Park², Changzoo Song³, Joohyun Park⁴

¹Faculty of Medical and Health Sciences, University of Auckland - Waipapa Taumata Rau, New Zealand, ²Department of Korean Studies, University of Auckland Waipapa Taumata Rau, New Zealand, ³Asian Studies, University of Auckland Waipapa Taumata Rau, New Zealand, ⁴Interdisciplinary Center for East Asian Studies, Goethe University Frankfurt, Germany

Introduction: Anti-Asian racism was a feature of the social response to the early phases of the COVID-19 pandemic, and its impact on the wellbeing of Asian communities warrants closer examination. The current study aimed to gauge the extent to which sense of belonging mitigates the adverse effects of racism on life satisfaction for Asian communities in Aotearoa New Zealand.

Methods: This analysis included 1,341 responses to a cross-sectional online survey conducted in 2021. Descriptive analyses outlined how components of sense of belonging are distributed among participants, key subgroups and those who experienced racism during the COVID-19 pandemic. Linear regression was used to examine the role of sense of belonging in mediating the association between experiencing racism and since-COVID life satisfaction. **Findings:** In this survey, four out of ten participants reported experiencing racism in the first eighteen months of the pandemic. Overall, respondents' life satisfaction decreased slightly since the start of the COVID-19 outbreak ($p=0.00$). Experiencing racism was associated with a 0.49 unit decrease in since-COVID life satisfaction. (95% CI -0.61 - -0.38). All the components of sense of belonging reduced the magnitude of this association, in particular, feeling comfortable expressing one's own ethnic identity (-0.19, 95% CI -0.29 - -0.09) and belonging in New Zealand (-0.18, 95% CI -0.28 - -0.08).

Conclusions: When considering racism as a determinant of wellbeing for minoritised ethnic communities, particularly in times of heightened social tensions such as a global pandemic, strategies to strengthen sense of belonging through thoughtful communications and responsive services may contribute to mitigating the harm of racism. These actions should be included alongside anti-racism initiatives in pandemic and other emergency response planning to support the wellbeing of these communities.

Process adaptations in delivering an epidemiological mental health survey for Urban Indigenous Australians

Tabinda Basit¹

¹Queensland Centre for Mental Health Research, University of Queensland, Australia

Background and Objective: Accurate prevalence rates of mental and substance use disorders amongst Indigenous Australians are largely unknown. The use of accurate and sensitive epidemiological processes and standardised diagnostic assessments with this population requires further exploration. The Queensland Urban Indigenous Mental Health Survey (QUIMHS) pilot study established an approach to data-collection that aimed to improve the cultural suitability of an epidemiological mental health survey in a sample of urban-residing Indigenous Australians.

Methods: The pilot was conducted over 10 weeks with Indigenous adult clients of two Aboriginal Medical Services in South-East Queensland. The survey instrument included a standardised diagnostic assessment: the Composite International Diagnostic Instrument v.3.0 (CIDI 3.0). To assess the cultural suitability of both the proposed survey processes and the survey instrument, feedback from project stakeholders, staff, and participants was sought. Additionally, the diagnoses produced by the CIDI 3.0 were compared to diagnostic summaries provided by Indigenous clinical psychologists in order to establish clinical concordance data. **Results:** The processes used for data-collection were deemed culturally appropriate by all survey participants. Several key adaptations and frameworks facilitated the successful delivery of the survey instrument. The diagnostic accuracy of the CIDI 3.0 differed by module. Importantly, the PTSD and Major Depression modules were accurate in their diagnostic utility, while the Mania module was deemed unsuitable for use with this population. **Conclusions:** The application of these processes and recommendations for delivering diagnostic epidemiological surveys using the CIDI 3.0 to Indigenous Australians are discussed.

Te Reo Hauora: protecting the prosperity of the māori language in Aotearoa's Health sector.

Janell Dymus¹

¹Heath Promotion Forum of New Zealand, Auckland, New Zealand

Aotearoa - New Zealand's colonial history of subjugation from lands, cultural expression, traditional knowledge systems and language has Resulted in abhorrent disparities in health outcomes for its indigenous peoples, Whilst some academic evidence (Dudley et al., 2019) exists that Te Reo Māori is a protective factor for health, it is well known within traditional knowledge systems, held within the proverb "tōku reo tōku ohooho" (My language, my deliverance) that language is a protective factor and a facilitator of wellbeing. 51 years after the Aotearoa Language petition, we are seeing the emersion māori language into white-stream settings. As the indigenous language of New Zealand shifts from a space of revitalisation to prosperity, there are risks associated with the vitality of the language, particularly within health. As new words are created with new technologies (e.g. vaping), and health messaging in te reo becomes critically necessary, there are numerous risks for the commodification of the language, and further challenges for the protection and prosperity of Te Reo Māori in the health sector. Te Reo Hauora looked firstly to collectivise the voices of all people leaning into the linguistic disposition of Te Reo Māori in health, sharing the aspirations and strategic thinking of people from all facets of society who have an impact on the way the Māori language prospers in health. This presentation will share the Findings of Hāpai's work in Te Reo Hauora, drawing on the project and its development, implementation and evaluation.

Supporting Syrian refugee mothers in the resettlement period in Canada: a longitudinal study using participatory action research

Joyce O'Mahony¹, Shahin Kassam²

¹Thompson Rivers University, Canada, ²University of British Columbia, Canada

Background and Objectives: Since 2015, Canada has resettled over 50,000 Syrian refugees in response to persistent humanitarian crises. Refugees may face overwhelming stress related to experiences of forced migration. Many women that have experienced forced migration are of childbearing age, experiencing pregnancy and mothering across their migration journey. Little is known about social factors that support Syrian refugee mothers across migration and resettlement. The aim of this study was to understand in-depth the intersecting contextual factors shaping social support from the perspective of Syrian refugee mothers in the Canadian context. **Methods:** Using a longitudinal intersectionality-framed participatory action research design, Syrian refugee mothers' perspectives

on social support during various phases of resettlement were explored. Four peer research assistants (PRAs) worked collaboratively to champion the research process. Forty Syrian mothers were recruited by PRAs and participated for 18 months. Data sources included in-depth interviews, monthly diaries, and telephone conversations with participants.

Results: Multiple themes emerged to impact the social supports of Syrian refugee mothers in resettlement: steps in the migration journey, pathways to integrated holistic health care, intersecting social determinants of refugee health, harnessing strength-based capabilities, pandemic impacts of resettlement and the PRA experience. **Conclusions:** Our in-depth analysis contributes to understanding Syrian mothers' journey's over time and across migration contexts. These findings bring nuanced understanding to Syrian mothers' capabilities and resilience as they intersect with multiple social factors during their integration and resettlement. Issues raised by Syrian mothers, combined with the supportive network of community members and researchers increase the likelihood of a stronger collective voice in enhancing appropriate support and access to community support services.

"My family abandoned me so I have to charge for sex in order to survive": exploring risk sexual behaviors among men who have sex with men in urban Uganda

Denis Muganga¹, Rehemah Nabbuye², Quraish Sserwanja³, Brendah Eyotaru⁴, Habibu Byamukama²

¹Multitech Business School, Uganda, ²Men of the Night Uganda, Uganda,

³Men of the night Uganda, Relief International, Uganda, ⁴Men of the Night Uganda, University Of Kisubi, Uganda

Background: Men who have sex with men (MSM) have an increased risk for sexually transmitted infections (STIs) and are disproportionately affected by the human immunodeficiency virus (HIV) Resultsing from risky sexual behaviors (RSB). There is a dearth of information about the prevalence of RSBs among men who have sex with men in Uganda. Therefore, we explored risk sexual behaviors among MSM in urban Uganda.

Methods: Using exploratory qualitative design and snowball sampling, 20 men who had sex with men from Lesbian, Gay, Bisexual, Transgender, Queer/Questioning associations around Kampala and Wakiso districts consented to participate in in-depth interviews. The recorded interviews were transcribed verbatim and analyzed using qualitative content analysis. Coding was done using Open Code software version 4.03. Codes and categories were developed.

Results: Risky sexual behaviors were highly prevalent, especially among the young men (20-25 years). The most common risky sexual behaviors reported included transactional sex, which was facilitated by dating apps and mediated by the need for financial support because most of them were rejected by their families. Group sex and having sexual intercourse when drunk were commonly reported and were mediated by the need for social acceptance and support. Some respondents reported having sex with females to avoid being suspected by their families. Knowledge of sexually transmitted infections was low, especially for respondents outside of Kampala in Wakiso.

Conclusions: There are key implications for HIV/STI transmission Resultsing from RSBs among MSM, worsened by difficulty in obtaining information and implementing preventive measures due to intense social stigma and social isolation. Effective interventions, including the use of social dating apps to ensure increased access to health awareness messages and access to condoms, lubricants, and pre-exposure prophylaxis, are urgently needed to limit the consequences of MSM as a bridge for HIV transmission to the general population.

Predictors of changes in physical activity and sedentary behavior during the COVID-19 pandemic in a Turkish migrant cohort in Germany

Lilian Krist¹, Thomas Reinhold^{2,3}, Katja Icke⁴, Ina Danquah⁵, Stefan Willich⁴, Heiko Becher⁶, Thomas Keil⁴

¹Epidemiology and Health Economics, Institute of Social Medicine, Charité-Universitätsmedizin Berlin, Germany, ²Institute of Social Medicine, Epidemiology and Health Economics, Germany, ³Charité-Universitätsmedizin Berlin, Germany, ⁴Institute of Social Medicine, Epidemiology and Health Economics, Charité-Universitätsmedizin Berlin, Germany, ⁵Institute of Global Health (HIGH), University Hospital Heidelberg, Germany, ⁶Institute for Medical Biometry and Epidemiology, University Medical Center Hamburg-Eppendorf, Germany

Background and Objectives: The new coronavirus (COVID-19) pandemic and the Resultsing response measures have led to severe limitations of people's exercise possibilities with diminished physical activity (PA) and increased sedentary behavior (SB). Since no data is available for migrant groups in Germany, this study aimed to investigate factors associated with changes in PA and SB in a sample of Turkish descent living in Berlin, Germany.

Methods: Participants of a prospective cohort study (adults of Turkish descent, living in Berlin, Germany) completed a questionnaire regarding COVID-19-related topics including PA and SB changes since February 2020. Changes in PA and SB were described, and sociodemographic, migrant-related, and health-related predictors of PA decrease and SB increase were determined using multivariable regression analyses.

Results: Of 106 participants, 69% reported a decline in PA, and 36% reported an increase in SB. PA decrease and SB increase seemed to be associated with inactivity before the pandemic and the female sex. SB increase appeared to be additionally associated with educational level and BMI. However, no migration-related factors were associated with a decrease in PA or an increase in SB.

Conclusions: The COVID-19 pandemic and the response measures had persistent detrimental effects on this migrant population. Since sufficient PA before the pandemic had the strongest association with maintaining PA and SB during the crisis, the German government and public health professionals should prioritize PA promotion in this vulnerable group.

A systematic review of qualitative research on substance use among refugees

Ebtesam Saleh¹, Felicia Lazaridou², Felix Klapprott³, Mayyada Wazaify⁴, Andreas Heinz³, Ulrike Kluge³

¹Department of Psychiatry and Psychotherapy, Charité Universitätsmedizin, Berlin, Germany, ²Department of Psychiatry and Psychotherapy, Charité University Medical Center, Berlin, Germany, ³Department of Psychiatry and Psychotherapy, Charité University Medical Center, Campus Charité Mitte (CCM), Berlin, Germany, ⁴Department of Biopharmaceutics and Clinical Pharmacy, School of Pharmacy, The University of Jordan, Amman, Jordan

Aims: To evaluate qualitative research on substance use and substance use disorders (SUDs) among refugees in terms of practitioners and substance users attitudes, beliefs, and experiences.

Methods: Six medical, allied health, and social sciences databases (EBSCO, PubMed, ScienceDirect, Web of Science, Scholar, and the Cochrane Library) were systematically searched in a time frame between January and April 2021 to identify original peer-reviewed articles describing qualitative Findings related to substance use among refugees (alcohol, illicit drugs, tobacco, and prescription drugs). Study selection, critical appraisal and detailed extraction were performed via the Joanna Briggs Institute (JBI) Database of Systematic Reviews and Implementation Reports according to PRISMA (2018). Three independent reviewers selected the relevant abstracts and articles. Synthesis of the evidence identified prominent themes relating to the context and consequences of substance use.

Results: Twenty-six studies were included in this review. Twenty-three studies applied qualitative methods and three applied mixed methods. Synthesis of the evidence from the included studies resulted in four main findings: (1) there is a considerable susceptibility of refugees to substance use and SUDs; (2) the harmful consequences of substance use are complicated by the social insecurities of refugees; (3) there are rather high barriers to treatment and health facilities for refugees in many host countries; and (4) there is a strong need to improve effective access to treatment, interventions, and prevention approaches.

Conclusions: Refugees are at high risk for substance use and substance use disorders and often face high barriers to treatment and interventions in host countries.

Impact of fairness-based techniques in optimization of vaccine allocation among refugees during pandemics: a scoping review

Sera Şimşek¹, Şevval Altay², İlker Kayı³

¹Public Health Department, Koc University Faculty of Medicine, Türkiye, ²Koc University Faculty of Medicine, Türkiye, ³Public Health Department, Faculty of Medicine, Koc University, Türkiye

Objective: The refugees' access to vaccination is an important operational issue to be solved for fair and equitable public health interventions. The objective is to explore the impact of fairness-based techniques in optimization of vaccine delivery during pandemics on the vaccination rate among refugees. **Methods:**

This is a scoping review conducted by using the Keywords such as modeling, distribution, pandemics, fairness, optimization, vaccine allocation and refugees. A librarian conducted the literature search in Pubmed, Scopus, Web of Science, Cochrane library, and Ovid MedLine databases for the period of 2009-2021. Two researchers completed the screening of the articles after literature search starting from title, abstracts, and full texts. The disagreement on selection of articles were solved by unanimous group decision of all researchers.

Results: A total of 4152 articles were obtained. In the first step, the title screening yielded in 280 articles for abstract screening that resulted in 31 articles for full-text reading. Eight articles published between 2015 and 2021 were included in the study and 23 articles were excluded due to exclusion of refugees in their Discussion on vaccines allocation. The study design used in the articles were cross-sectional (25%), qualitative (25%) and modelling study (12.5%). Half of the articles included only refugees, while the other articles included new arrived migrants. Methods such as community participation, digital health messages and national refugee centers have been used for varying definitions of fairness in vaccine allocation. The three main outcome measure observed in the studies were access to vaccines, vaccine acceptance and vaccination rate.

Conclusions: Studies evaluating fair distribution of vaccines in refugee populations during pandemic periods are scarce. Although they used different Methods, studies have shown that refugees and immigrants have a high intention to vaccinate, and barriers for fair vaccine allocation were the lack of information on vaccination strategy.

Experiences and needs of Chilean autistic communities for inclusion and well-being: a phenomenological study

Verónica Velasco¹, Daniela Martorell², Consuelo Astorga³, Mariluz Araya⁴, Caterina Avalos⁴

¹Department of Epidemiology and Health Studies, School of Speech and Language Pathology, Universidad de los Andes, Chile, ²School of Occupational Therapy, Universidad de los Andes, Chile, ³Universidad Católica de Temuco, Chile, ⁴Commautis, Chile

Background and Objective: The inclusion of the first-person perspective in the reflection of well-being issues that people on the autism spectrum (AS) faces is an essential aspect of the development of compelling, culturally relevant, and timely responses. However, most of these processes are carried out by neurotypical scholars. Few experiences exist worldwide that incorporate the vision of experts by experience in the research and decision-making processes in autism. Fewer experiences have been documented in Latin America. Due to the cultural and socio-economic differences that the region has concerning the Northern developed countries, revealing the perceptions of local autistic communities is essential. Accordingly, this study aimed to describe the experiences and needs of Chilean communities of people within the autism spectrum around three themes: social inclusion, supports, and accessibility.

Methods: A phenomenological design was employed. Participants were selected according to four statuses: 1) caregivers of children on the AS, 2) adults on the AS, 3) directors of advocacy organizations, and 4) teachers of students on the AS. The participants were grouped by each status in each zone of the country (i.e., north, center, south, and southern) to participate in focus groups. The focus group information was transcribed for further thematic analysis.

Results: Convergent data across participants revealed a great need for awareness, literacy, and education on autism issues for the general population in the communities. Also, more training of professionals and economic resources were stated as a need. Participants described all these elements as barriers that hinder autistic communities' well-being and as priorities that need to be taken by the stakeholders.

Conclusions: First-person perspectives provide relevant insights into the needs of communities. Further actions include strategies to address these needs through alliances with communities and the government.

Using eco-map to explore the social network of Ukrainian refugees as a determinant of mental well-being: a pilot study

Roberto Benoni¹, Anna Sartorello¹, Elena Paiola¹, Loretta Berti¹, Marina Sorina², Francesco Marchiori³, Chiara Postiglione³, Stefano Tardivo¹, Michela Rimondini¹, Francesca Moretti¹, Giovanna Varischi³

¹University of Verona, Italy, ²Malve di Ucraina NPO, Italy, ³Unità Locale Socio Sanitaria (ULSS) 9, Italy

Following the humanitarian crisis in Ukraine, an estimated 7,710,924 refugees

have fled (19 October 2022). Refugee status leads to a higher prevalence of mental illness, also driven by the process of settling into a new environment. Ecomap is a valuable tool used in qualitative health research. It makes it possible to visualize social relationships' distribution, quantity, and quality. This study aims to analyze the association between mental health and the social network of Ukrainian refugees. We conducted a pilot study on Ukrainian refugees housed in Verona administration (Italy). Mental well-being was assessed through the International Trauma Questionnaire (ITQ) and the General Health Questionnaire-12 (GHQ-12). The social network was explored through a semi-structured ecomap. The study sample sex distribution was 24(96%) females and 1 (4%) male. Median age was 37.0[IQR 29.9-47.2] years. At the GHQ-12, 11(50%) scored as having a severe and 5(23%) as having mild mental health deterioration. Regarding the ITQ, 4(16%) individuals scored positive for PTSD and 5(20%) for complex-PTSD. The highest number of supportive links was found in the micro-system, with a median number of 3.0 (IQR 2.0-4.7). Supportive links were significantly higher in the micro-system compared to both the exo- ($z=-3.2$, $p=0.002$) and macro-system ($z=4.3$, $p<0.001$). The highest number of stressful links was found in the macro-system and was significantly higher compared to the micro-system ($z=2.7$, $p=0.01$). Supportive links in patients with severe and mild mental health deterioration were 4.0[3.3-5.0] and 10.0[4.0-10.0]. The median number of supportive links in patients with complex-PTSD, PTSD, or none was 4.0[4.0-4.0], 7.0[4.5-10.0], and 5.0[4.0-10.0], respectively. Stressful links were more frequent, while supportive links were less, among individuals with complex-PTSD or a severe mental health disorder. The eco-map proved to be a useful tool for exploring the social network of refugees.

Promoting cultural safety in health care: co-developing an intervention with three Atikamekw communities in Québec, Canada

Marie-Claude Tremblay¹, Geneviève D'Avignon¹, Sandro Echaquan², Eniko Neashish³, Yvan-Rock Awashish⁴, Christian Coccoo⁵

¹Department of Family Medicine and Emergency Medicine, Université Laval, Canada, ²Centre de Santé Masko-Siwin, Manawan, Canada, ³Centre de santé de Wemotaci, Canada, ⁴Conseil des Atikamekw d'Opitciwan, Canada, ⁵Conseil de la Nation Atikamekw, Canada

Background and Objectives: Cultural safety is a decolonizing and transformative approach aimed at achieving health care that recognizes, respects and nurtures the needs, rights and identities of Indigenous peoples. This action-research project is anchored in respectful partnerships with the Atikamekw communities of Manawan, Wemotaci and Opitciwan (Québec, Canada). It aims to co-develop an intervention model to ensure cultural security of health care offered to the Atikamekw peoples.

Methods: The project uses a sequential design with successive stages of research (literature review, environmental scan, talking circles) and intervention development. An advisory committee composed of representatives from the three communities works closely with the research team to guide and orient each step of the project. The intervention model is being developed using a Two-Eyed Seeing approach, allowing for the respectful integration of Indigenous and Western knowledge.

Results: A model of cultural safety rooted in Atikamekw perspectives, values and knowledge has been developed by our collective. The model is based on a mapping that follows the care trajectory of Nin (the individual) and his family, starting from the contexts (family, community, organizational) where his wellness needs are expressed. Based on this mapping, it was decided that the intervention would focus on supporting Nins and the communities self-determination in relation to their care trajectory and health services, in accordance with Atikamekw values and conceptions of well-being and care.

Conclusions: This research project, carried out with and by the Atikamekw Nation, exemplifies how a decolonizing approach centered on the expertise of Indigenous communities can be used to develop culturally safe interventions that respect their needs, values and cultural practices.

Migrant status disparities in blood pressure: a multiple mediation analysis of modifiable factors

Teresa Zuanna¹, Erich Batzella¹, Gisella Pitter², Francesca Russo³, Cristina Canova¹

¹Department of Cardiac, Thoracic, Vascular Science and Public Health, University of Padova, Italy, ²Screening and Health Impact Assessment Unit, Azienda Zero, Veneto Region, Italy, ³Directorate of Prevention, Food Safety, and Veterinary Public Health, Veneto Region, Italy

Background and Objective: We examined differences in blood pressure (BP) levels between first-generation immigrants and native-born in a large population of adult residents in Northeast Italy, and investigated the role of lifestyle behaviours, body mass index (BMI), and education as potentially modifiable mediating factors.

Methods: We included 20-69 years-old participant of a Health Surveillance Program of the Veneto Region (n=37,710). Immigrant status was defined by being born in a high migratory pressure country (HMPC) and subdivided by geographical macro-areas. Hypertension was defined as abnormal measured BP values, self-reported diagnosis, or anti-hypertensive drug use. We used t-tests and chi-square tests to assess the association between migrant status and potential mediating factors, and generalized linear models to test the association of each covariate with the outcomes. A multiple mediation analysis including all covariates that satisfied the previous conditions was performed, applying the counterfactual framework by Yu. **Results:** Of the 37,380 subjects included in the analysis, 8.7% were born in a HMPC. BMI, education, alcohol, sweets and meat consumption were included in the models as potential mediators. A tiny advantage in Systolic BP levels was seen for immigrants compared to natives ($\beta = -0.71$, 95%CI: -1.30; 0.10). The direct effect (net of the included covariates) was a reduction of 1.62 mmHg (95%CI: -2.25; 0.98), among immigrants compared to natives. BMI played the highest suppressive role of this health advantage ($\beta = 1.14$, 95%CI: 0.99; 1.35), followed by education. The distribution of alcohol consumption instead increased the health advantage for immigrants. The BMI suppressing effect was particularly evident among females and North African immigrants compared to natives. Similar Results were seen for hypertension rates.

Conclusions: Although causation cannot be proven in this cross-sectional study, our findings highlight the important suppression role played by BMI in the differences of BP levels by migrant status, indicating a possible target to preserve the health advantage of immigrants.

Gendered differences in experiences of school violence and mental health among transgender and cisgender youth

Laura Sares-Jäske¹, Mercedesz Czimbalmos², Satu Majlander³, Reetta Siukola³, Reija Klemetti³, Jukka Lehtonen²

¹Institute for Collective Health, Finnish Institute for Health and Welfare, Finland, ²Finnish Institute for Health and Welfare, Finland, ³Finnish Institute for Health and Welfare, Finland

Background and Objective: Experiences of being bullied are associated with poorer mental health. Previous research shows that transgender youth have more mental health problems and more school violence experiences than cisgender youth. There is, however, limited knowledge on, whether the associations between bullying and mental health differ between gender identity groups. This study aimed to investigate how experiences of school violence are associated with mental health outcomes among different gender identity groups: cisgender girls, cisgender boys, transfeminine youth, and transmasculine youth.

Methods: We utilized data from the Finnish School Health Promotion study (N=152 880), conducted in 2021. Information on experiences of being bullied and on five mental health outcomes (self-perceived health, worries about own mood, anxiety disorder, depression symptoms, social anxiety) was collected with self-administered questionnaire. The associations between bullying and mental health outcomes were analyzed with linear and logistic regression.

Results: Trans youth had more bullying experiences and poorer mental health than cisgender youth. Transfeminine youth experienced most school violence, and transmasculine youth had most mental health symptoms. In each gender identity group bullying experiences were associated with poorer mental health. Compared to cisgender boys without bullying experiences, odds of poorer mental health were multiple among transfeminine youth and dozens-fold among transmasculine youth with weekly bullying experiences.

Conclusions: Our results highlight significant differences in experiences of school violence and in mental health symptoms between the four gender identity groups studied; while transfeminine youth experienced the most school violence, and transmasculine youth had the most mental health symptoms, cisgender boys reported the least of both. Trans youth should not be considered as uniform population group, but heterogeneity exists among the group as well. The results help to identify groups that are particularly vulnerable to the experiences and effects of bullying and violence. This allows for more effective interventions and support.

Popul. Med. 2023;5(Supplement):A1348

DOI: 10.18332/popmed/165337

Trends in LGBT+ research: a bibliometric analysis

Aldo Angelis¹, Giacomo Scaioli^{1,2}, Fabrizio Bert^{1,3}, Roberta Siliquini^{1,4}, Giuseppina Moro¹, Anna Maddaleno¹

¹Department of Public Health Sciences and Paediatrics, University of Turin, Italy, ²Health Local Unit "ASL T03", Turin, Italy, ³Health Local Unit ASL T03, Turin, Italy, ⁴AOU City of Health and Science of Turin, Italy

Background and Objective: Sexual and gender minorities have a higher risk of experiencing certain mental and physical health issues compared with cis-gender and heterosexual population. During the past years, there has been a greater recognition by the medical community of the health needs of LGBT+ persons. However, an updated analysis of medical publications about LGBT+ persons has not yet been carried out since 2007. This work was aimed to analyze scientific literature on LGBT+ population considering the 2008-2021 time range.

Methods: A literature search was performed in Web of Science database. Bibliometric data from the selected publications were exported and analyzed using R-Studio, Biblioshiny and VOSviewer software.

Results: A total of 31039 articles were found. The publications per year have shown rapid growth, going from 1156 articles in 2008 to 4338 in 2021. The most productive author was Mayer K. with 386 articles, who is also the author with most citations (15748) and the highest h-index (56). The USA were the most productive country with 16249 articles, followed by United Kingdom, Canada, Australia, and China. Co-occurrence analysis of the author's Keywords showed that the most important research focuses were on HIV, sexual transmitted diseases, and sexual identity. Analysis of the thematic map of author's Keywords revealed that the topics "HIV", "Men who have sex with men" and "pre-exposure prophylaxis" were of medium importance and development; the topics "sexual orientation", "lesbian" and "gay" were of high levels of relevance and development, while "transgender", "gender dysphoria" and "gender identity" were less important compared with other themes or may become new hotspots in the near future.

Conclusions: This bibliometric study provides an updated perspective on research about LGBT+ persons and may assist researchers in the further understanding of the fields hotspots, thus facilitating future studies.

Reflections on an Indigenous Led COVID-19 response in Aotearoa (New Zealand)

Zarah Allport¹

¹Te Whanau o Waipareira, New Zealand

This presentation describes an Indigenous led health protection response to COVID-19 in Aotearoa, New Zealand by an urban Māori (Indigenous peoples of New Zealand) health provider. With the arrival of COVID-19 in New Zealand in 2020, deeply entrenched health disparities for Māori became further exacerbated as Government public health responses failed to address Māori and reach effectively into Māori communities. Te Whanau O Waipareira is an urban Māori organisation with a long-standing history of providing health and social services to Māori in West Auckland. Alongside other initiatives rolled out by Iwi (tribe) hapū (subtribe) and communities, Te Whanau o Waipareira launched a Māori public health response to the burgeoning COVID-19 outbreak, which aimed to protect Māori not only in urban centres but across NZ. Te Whanau o Waipareira - as a member of a larger Māori provider network - launched its own COVID response for testing, vaccinating, caring for those isolating and also supporting those suffering from the economic fallout from COVID. This response was driven by whanau (family) and was culturally grounded, meaning it was 'by Māori for Māori' using advocacy, community and collective ideology to deliver care. Using novel frameworks such as lay community vaccinators and rangatahi (youth) vaccinators Waipareira was responsible for delivering over 100,000 vaccine doses for Māori and non-Māori. Since starting in February 2022 Te Whanau O Waipareira's covid care in the community service (Awhina) has supported over 500 vulnerable local Māori isolating with COVID with their physical and mental health as well as practicalities such as food, home supplies etc. This presentation concludes that the New Zealand government's COVID-19 response put indigenous Māori at risk and Māori providers such as Waipareira stepped up to protect communities using a novel indigenous community-based approach that has positively impacted on the health of Māori.

Health access for transgender people in Latin America: a scoping review

Livia Gonçalves¹, Norberto Rech¹, Luciano Soares¹

¹Federal University of Santa Catarina, Brazil

Background and Objective: Globally, trans people face barriers in living with

society due to cis-heteronormative standards that also interfere with access to healthcare. This study Aims to map and analyze the evidence on access to health services and goods for transgender people in Latin America.

Methods: A scoping review is being conducted by searching PubMed, SciELO, and LILACS databases on the health of transgender people in Latin America. The selection of studies occurs in three stages, performed in pairs: reading the title, reading the abstract, and floating the complete text, according to inclusion criteria and without language restrictions. Data extraction is conducted in pairs. Data synthesis and analysis comprise the categorization of the data involving facilitating factors, health needs, and individual health behaviors. The review is guided by the Joanna Briggs Institute Scoping Reviews Manual, and the reports follow the PRISMA extension for scoping reviews (PRISMA-ScR).

Results: From the 662 articles found in the bases, 97 were included and published between 2007 and 2021. The data analysis is still ongoing. The preliminary Results indicate frequent reports that trans people avoid seeking health services in Latin America. When they seek, they look for trans-specialized services or highly complex care. Self-medication was also evidenced. The main difficulty of access is: services do not address the integral health and the specific needs; poorly implemented, outdated, or absent public policy; health professionals pathologizing trans identities; discrimination, stigma, and negligence; lack of training and knowledge of health professionals; medical authoritarianism and relationship based on the hierarchy of biomedical knowledge; medicalization of trans identities; and lack of public funding.

Conclusions: Transgender people face difficulties accessing health in Latin America mainly due to economic barriers, unavailability of public politics and services, individual health behaviors, and disqualified training to meet their trans needs.

Challenges encountered by female migrants in accessing primary health care services - a case study of an urban informal settlement in South Africa

Joyce Shirinde¹, Paula Lehmann², Annalena Horst³

¹School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Gezina, South Africa, ²Department of Health Sciences, Fulda University of Applied Sciences, Germany, ³Fulda University of Applied Sciences, Department of Health Sciences, Germany

Background and Objective: South Africa have the highest number of migrants within the Sub-Saharan region of Africa. Feminisation of migration has become more and more prevalent over the last decades. Female migrants are reported to be particularly vulnerable and face many adversities during their migration process. The aim of the study was to investigate the experiences and challenges of female documented/undocumented migrants in accessing primary health care services through clinics and hospitals. Environmental and social drivers were also assessed.

Methods: The study was conducted at an informal settlement located in Pretoria, which falls under Greater Tshwane Metropolitan Municipality, located in the Gauteng Province, South Africa. An exploratory qualitative design was used for the study. Face to face in depth interviews were conducted with 18 female migrants using an interview guide.

Results: Through the interviews the following themes emerged from the analysis of the data, namely 1) Reasons for migration (social, political, economic, and environmental), 2) Migration and environment, 3) Migration process, 4) Living in the host country, 5) Access to health system (health challenges), 6) Right to health, 7) Utilisation of services, 8) Communication, 9) Discrimination and lastly, 10) the impact of riots against migrants at health facilities in the previous year.

Conclusions: This study adds to a growing body of knowledge about challenges faced by female migrants not only in South Africa but globally. The results may assist authorities in developing migrant sensitive policies to lower access barriers to health services in South Africa. The study intends to raise awareness for migrants health and processes of integration into host nations.

Keywords: female migrants, South Africa, access to healthcare services

Facing the COVID-19 pandemic: a mixed-method analysis of asylum seekers' experiences and worries in the canton of Vaud, Switzerland

Kevin Morisod^{1,2}, Tiffany Martin², Kevin Morisod³, Tiffany Martin⁴, Cloé Rawlinson², Véronique Grazioli^{1,4}, Christian Plessen^{2,5}, Marie-Anne Durand^{2,6,7}, Kevin Selby⁴, Marie-Annick Pogam⁴, Javier Zozaya⁸, Murielle Bochud⁴,

Nolwenn Bühler⁹, Patrick Bodenmann⁹

¹University of Lausanne, Switzerland, ²Center for Primary Care and Public Health (Unisanté), Switzerland, ³University of Lausanne and Center for Primary Care and Public Health (Unisanté), Switzerland, ⁴Center for primary care and public health (Unisanté), Switzerland, ⁵University of Southern Denmark, Odense, Denmark, ⁶University of Toulouse III Paul Sabatier, Toulouse, France, ⁷Dartmouth College, Lebanon, USA, ⁸Lausanne University Hospital (CHUV), Switzerland, ⁹University of Lausanne and Center for primary care and public health (Unisanté), Switzerland

Background and objectives: The burden of the COVID-19 pandemic remains high among migrant populations, especially asylum seekers (AS). Moreover, the social impact of COVID-19 public health measures disproportionately affected AS. In this context, we aimed to better understand the pandemic experiences and sources of worries of AS, as well as the associated social and structural factors.

Methods: We conducted a cross-sectional mixed-method study among AS in the canton of Vaud, Switzerland, which combined and integrated the results of the following quantitative and qualitative methods. First, participants answered questions in an online or paper survey about their worries, sleep problems and fear of dying. The associations with their socio-demographic characteristics were investigated using multivariable logistic regressions. Second, we conducted in person semi-structured interviews with participants who had not completed the survey. We performed an inductive thematic analysis focusing on how social and living conditions affected their experiences and worries.

Results: 203 participants answered the surveys and 13 took part in interviews. AS in community centres experienced more sleep disorders related to the COVID-19 pandemic than those living in private apartments. (aOR 2.01, p=0.045). Similarly, those with lower education had greater fear for their life due to the COVID-19 pandemic compared to AS with higher education (aOR 2.31, p=0.015). In addition, interviews showed that having to share living spaces was an important source of worries for AS. Protective measures were perceived to increase social isolation, with negative effects on their pandemic experiences.

Conclusions: Our study results suggest that a better understanding of AS experiences and worries could help decision-makers adapt public health policies for this population. These include avoiding high-density facilities, encouraging the transfer of AS from community centres to private facilities, and tailoring health recommendations to the language, cultural and health literacy barriers of AS.

Migration Background and hospital emergency department use by children : evidence from a cohort study in the Metropolitan Area of Lisbon, Portugal, in 2019 and 2020

Zelia Muggli¹, Zelia Muggli², Regina Amado², Helena Loureiro³, Maria Martiins⁴

¹Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa, Portugal, ²Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa, Portugal, ³Paediatrics Department, Hospital Prof. Fernando Fonseca, Amadora, Portugal, ⁴Instituto de Higiene e Medicina Tropical, Universidade de Nova Lisboa, Portugal

Background and Objective: Studies from Europe suggest that immigrant children tend to attend hospital emergency departments (ED) more frequently and more often for less-urgent conditions than non-immigrant children. In Portugal evidence on healthcare utilisation, particularly for immigrant children, is scarce. Objectives: To compare utilisation of ED in the Health trajectories of Immigrant Children (CRIAS) cohort, in 2019 and 2020.

Methods: Data from the 1st and 2nd waves of the CRIAS cohort were analysed. The cohort was set up in 2019 in Amadora municipality, in the Metropolitan Area of Lisbon; 420 children (51.6% immigrant) born in 2015 were recruited.

Results: In 2019, 1.3 times more immigrant children visited ED (53.5%vs40.4%; p=0.010); 19% of immigrant versus 16% of non-immigrant (p=0.006) children were frequent users. Clinical priority was low/moderate in about 90% of visits in both groups. Self-referral occurred in 89.4% of all visits, referrals to ED by a health professional were 3 times more likely among non-immigrant children (13.7%vs4.5%). Inpatient admissions occurred in 2 % of visits, with 2 times more admissions of immigrant children. Difficulties in accessing primary healthcare (48.4%) and perceived urgency (23.2%) were the main reasons given by the parents to attend ED; parents of immigrant children reported 1.3 times more difficulties in accessing primary care. In 2020, a marked reduction in ED visits were observed: 28.9% immigrant versus 26.7% non-immigrant used ED. There was a 2-fold increase in visits referred by a health professional mainly from the NHS helpline, yet immigrant children continued to use it less frequently (10.3%vs3.8%). Conclusions: Compared with non-immigrant children, Immigrant children have a

higher use of ED with their parents reporting more difficulties in accessing primary healthcare. Results suggest inappropriate use of ED by all children. Strengthening primary care and improving health literacy can address such inappropriate use of ED.

Determinants of access to primary healthcare for formerly incarcerated women transitioning into the community: a systematic review

Nisreen Agbaria¹, Margit Wirth², Marie Hout³, Volker Winkler¹, Heino Stöver⁴
¹Heidelberg Institute of Global Health, Heidelberg University Hospital, Germany, ²Swiss Tropical and Public Health Institute, Switzerland, ³Public Health Institute, Faculty of Health, Liverpool John Moores University, United Kingdom, ⁴Department of Health and Social Work, Frankfurt University of Applied Sciences, Germany

Background and Objectives: Women and girls are becoming the fastest growing segment of the global prison population. Women with a history of incarceration experience markedly poorer health and social vulnerability compared to both their male counterparts and women in the general population. Drawing on the patient-centered access to healthcare model, we conducted a systematic review of the literature to answer the following questions: 1) what are the determinants for primary healthcare use among formerly incarcerated women transitioning into the community? 2) What are the challenges and opportunities for access to primary healthcare?

Methods: Following the PRISMA guidelines, we applied relevant search terms in five databases, according to the Population, Concept, and Context framework. No restriction for country or language were made. **Findings:** 180 studies were retrieved for full-text screening, from which 23 studies were identified as eligible for inclusion. Several themes were identified, including: trends of healthcare utilization, compared to the general population; women's perception of their health and healthcare needs; the impact of health on coping and functioning after release; barriers to primary and preventive care; expectations and experiences of general practitioner care; quality and continuity of healthcare upon release, and stigma and perceived discrimination in the healthcare system. Finally, we report interventions that were designed to improve access to health care among formerly-incarcerated women population. To summarize the findings, we map identified determinants of access to care to the five dimensions of the access to healthcare model, and to the corresponding populations abilities to illustrate pathways in which access to primary healthcare for women transitioning from prison into the community can be affected.

Conclusions: Women with a history of incarceration have unique health experiences shaped by structural determinants of health during and after incarceration. We suggest areas of priority for future research and practice.

Tuberculosis in migrants arriving by boat to Malta, 2011-2021

Tanya Melillo¹, Tanya Melillo¹, Elaine Lautier²

¹Infectious Disease Prevention and Control Unit, Health Regulation, Ministry for Health, G'Mangia, Malta, ²Infectious Disease Prevention and Control Unit, Health Regulation, Ministry for Health, Malta

Background and Objective: Tuberculosis (TB) cases have been decreasing in Malta among the local indigenous population in the last decades but increasing among migrants arriving from high-incidence countries. To work towards national TB elimination, Malta implemented TB entry screening for third country nationals from high-incidence countries among other interventions. In this study we look at migrants that arrived at Malta by boat and were screened for active TB upon entry, the profile of cases and the time it took for them to present with active TB after arrival.

Methods: A retrospective analysis was done on all cases of active TB among migrants arriving by boat who did the entry screening, reported between January 2011 and December 2021. Incidence of TB of cases among arrivals were calculated overall and by nationality and a median was calculated to track the time to develop TB after arrival.

Results: Between 2011 and 2021, 14156 migrants arrived by boats and went through the TB screening process with an average of 1287 migrants per year (range 20-2279) as reported by Ministry of Home Affairs. Through the TB surveillance system 467 cases were reported between January 2011 and December 2021 among our study population. The most common country of origin was Somalia (41.6%), followed by Eritrea (24.5%), and Sudan (8.5%). The median duration of developing TB after arrival in Malta was five months (7.7, 4 and 3 months for

Somalia, Eritrea, and Sudan). All three countries had incidences of TB above 100 per 100000 in 2011.

Conclusions: It is important to have information on TB entry screening results and how long it takes for migrants to develop TB after arrival in Malta to target TB elimination programmes and in particular the follow-up of migrants for development of TB.

The cultural safety of publicly available maternity services in New Brunswick, Canada

Erika Powell¹, Jason Hickey¹, Jessica Webster¹, Tanisha Sacobie-Gruben¹
¹University of New Brunswick, Canada

Background: Pregnant Indigenous women in Canada suffer from a lack of access to culturally safe prenatal care. For prenatal care to become accessible, areas of inaccessibility and opportunities for improvement must be identified. This study was designed to explore how publicly available maternity services could be more culturally safe to Indigenous women in the province of New Brunswick. **Objectives:** 1) Explore the experiences of Indigenous women who have accessed publicly available prenatal care in New Brunswick in the last 5 years 2) Consult with Elders and other Knowledge Holders about traditional maternity practices and the future of maternity care 3) Use Findings to create a model of culturally safe care **Methods:** The research employed a community-based participatory action approach. Eight Indigenous mothers and three Elders shared knowledge (i.e., provided data) through community engagement sessions, group sharing circles, and individual conversations. Collaborative thematic analysis was used to examine the stories told by participants and to group these into themes. Preliminary findings were presented to Elders, whose reactions and commentaries added context to findings.

Results: Three overarching themes were identified. This included relationality (relationships with self, body, baby, partner, friends, family, the environment, and care providers); health systems (existing systems of medical care, including national and provincial health networks, hospitals, clinics, and the practices and policies within them); and Indigenous ways of knowing (recognizing that Indigenous people have always known and continue to know best-practice for ourselves and our people). These together with subthemes provide a preliminary model to improve culturally safe care for Indigenous mothers in New Brunswick. **Conclusions:** Indigenous-specific, community-based prenatal care that is guided by Indigenous nurses, doulas, midwives, Elders, Knowledge Holders, and mothers is needed. Traditional maternity practices should be maintained, revitalized, and available to all Indigenous mothers in New Brunswick.

What are effective ways of building trust and increasing inclusion of underserved communities in public health research?

Olatundun Gafari¹, Mary Barker², Maria Stokes²

¹School of Health Sciences, University of Southampton, United Kingdom,

²School of Health Sciences, University of Southampton, Southampton, United Kingdom

Background and Objectives: Inequalities in public health research engagement have been reported globally; marginalised communities, including ethnic minority groups in the UK, are particularly badly served. This presentation describes co-produced strategies for building trust and increasing inclusion of underserved communities in research.

Methods: This study formed one of five Work Packages (WPs) in a nationwide consortium and adopted Community Engagement (CE) and participatory research principles. Distrust caused by previous negative experiences represented major barriers to recruitment from underserved communities. Six actions were taken to build trust and increase inclusion: 1) face-to-face introductory meetings out in the community; 2) early recruitment of CE partners; 3) active involvement of CE partners in project planning, co-chairing and decision-making activities; 4) inviting and responding to feedback about research plans; 5) co-production of participatory workshops; and 6) a transformative action workshop.

Results: Widespread inclusion of underserved communities was achieved; six CE partners and 41 research participants from Asian, Black and Mixed ethnicities representing all adult age groups were recruited. Our engagement strategies led to the successful co-production of public health interventions to improve physical activity and healthy eating. This also impacted other WPs resulting in 51 CE partners being enrolled across the consortium. Trust was evident in the active participation of those who had initially declined to take part. Four CE partners attended a policy event at the UK Houses of Parliament. CE partners and

participants reported that ethnic minority representation within the research team contributed to building trust. Qualitative feedback also showed study participation improved CE partners' and participants' confidence, wellbeing and willingness to engage in future research.

Conclusions: Learning from feedback and facilitating underserved communities to actively drive research processes were effective in increasing trust. Such practices are recommended for research in all global contexts to increase inclusion of marginalised communities.

Possible Worlds - Where Glances Meet

Raquel Barros¹, Maysa Mazzon², Tatiana Alecrim², Isis Katayama²

¹Faculdade de Engenharia de Sorocaba (Facens), Sorocaba, Brazil, ²Facens, Sorocaba, Brazil

Background: Brazil is a culturally and ethnically miscegenated country, with great natural and economic wealth, however, it presents growing social inequalities. According to a report from the Brazilian Institute of Geography and Statistics (IBGE), poverty had record growth in 2021; 62.5 million people live below the poverty line, corresponding to 29.4% of the total population, and 17.9 million survive in extreme poverty. The COVID-19 pandemic intensified social inequalities and the emergence of mental illnesses, highlighting the need for psychology professionals who act beyond specific mental health issues and achieve a practice that guarantees rights and promotes human dignity. Given this scenario, a university extension project was created to contribute to mental health care and rights guarantee. Aim: Promote improved access to health care and better living conditions for vulnerable populations living at risk in communities in Brazil. Methods: Qualitative and descriptive study, professional experience report with cross-sectional time frame.

Results: Students from the second semester of Psychology course worked in different communities, such as: indigenous villages, homeless people, quilombo community, women victims of violence and children. From the territorialization, planning, survey of weaknesses and capabilities, home visits, team's subdivisions, educational groups, dialogue circles, interviews, partnerships with non-governmental organizations and community experience, it was possible to build actions based on Community Treatment, in addition to the records written and photographic, the interventions were recorded in a documentary. Conclusions: Psychology students promoted individual and collective actions that made it possible to discover "invisible" talents; among them dancers, poetesses, painters, musicians, artisans, entrepreneurs, and builders. Interventions contributed to a comprehensive care, acceptance, bonds strengthening, knowledge of rights and cure for mental illnesses through perspectives that make "worlds possible".

Mental health status, discrimination experience and resilience level among sexual and gender minorities of Kathmandu Valley

Manisha Hada¹

¹Institute of Medicine, Central department of Public Health, Institute of medicine, Maharajgunj, Kathmandu, Nepal

Background: Sexual and gender minorities (SGM) experience an elevated burden of stress, anxiety, and depression compared with heterosexuals. SGM is a hidden population in Nepalese society and there is little known about that burden and the factors generating it in the context of Nepal. The study aimed to identify mental health status and perceived discrimination and resilience among SGM in Kathmandu valley, Nepal.

Methodology: A quantitative cross-sectional study was conducted among 158 SGM. An online self-administered questionnaire was used to obtain the information related to DASS-21 (Depression anxiety stress scale), EOD (Experience of discrimination), and CD-RISC-10 (Connor Davidson Resilience Scale) using a standard tool. Data analysis was done according to the standard scoring procedure to compute the prevalence of stress, anxiety, depression, perceived discrimination, and resilience level among SGM respectively.

Results: Of 158 participants, 48.7% reported gay sexual orientation and 58.2% reported their gender identity as cisgender men. Among the total participants, 53.8% were current smokers and 80.4% had consumed alcohol in the past 12 months. The prevalence of stress, anxiety, and depression among SGM was found 82.3%, 65.2%, and 74.1% respectively. 88.6% of SGM faced discrimination in at least one setting where higher discrimination was reported in a public place like a street or park (63.3%). Nearly 25% of participants showed a low level of resilience. Conclusion: The results highlight a high burden of stress, anxiety, and depression and a higher discrimination among SGM of Kathmandu valley. Further, the mental

health status among SGM needs to be researched and explored by identifying the factors associated with poor mental health outcomes.

How can it be also queer? LGBTQIA+ adolescents' perceptions of gender tailoring and portrayal in a generic virtual reality-based alcohol-prevention tool

Christina Prediger¹, Katherina Heinrichs¹, Hürrem Tezcan-Güntekin², Gertraud Stadler³, Laura Pilz González¹, Patricia Lyk⁴, Gunver Majgaard⁴, Christiane Stock^{1,5}

¹Institute of Health and Nursing Science, Charité – Universitätsmedizin Berlin, corporate member of Freie Universität Berlin and Humboldt-Universität zu Berlin, Berlin, Germany, ²Department of Health and Education, Alice Salomon University of Applied Science, Berlin, Germany, ³Institute of Gender in Medicine, Charité – Universitätsmedizin Berlin, corporate member of Freie Universität Berlin and Humboldt-Universität zu Berlin, Berlin, Germany, ⁴SDU Game Development and Learning Technology, Mærsk Mc-Kinney Møller Institute, University of Southern Denmark, Odense M, Denmark, ⁵Unit for Health Promotion Research, University of Southern Denmark, Esbjerg, Denmark

Gender-sensitive interventions for alcohol prevention among adolescents often lead to binary tailoring for girls and boys. Increased societal and legal recognition of sexual and gender minorities and participatory research with the target group demand a broader understanding of gender. As a promising educational tool, virtual reality offers opportunities for tailoring interventions, e.g. by using gender avatars and corresponding scenarios. Therefore, the present study explores LGBTQIA+ adolescents' perceptions of gender tailoring and portrayal in the digital application Virtual LimitLab—a virtual reality-simulation to train refusal-skills towards peer pressure regarding alcohol consumption. The study aims at investigating how digital interventions should be further developed to include sexual and gender diversity.

Qualitative interviews with 16 LGBTQIA+ adolescents in Berlin, Germany were conducted after individual simulation testing. The collected data were analysed using Braun and Clarke's thematic analysis with a reflexive orientation.

Four themes were identified: statements on the relevance of gender and opinions on tailoring options, flirt orientation, and the other characters within the simulation. Deviating positions were found on the relevance of gender and different tailoring options by avatars to include queer users. Consensus was expressed on the wish for more representation of diversity among the characters, not only regarding sexual orientation and gender identity, but also regarding e.g. the inclusion of racialised peers among the main actors. Furthermore, the expansion of flirting options in the simulation by adding bisexual and asexual/aromantic options besides same-gender options was suggested.

In the case of the short virtual simulation Virtual LimitLab, no queer avatar is needed, but better representation of diversity among the characters and a more complex understanding of gender that goes beyond binarity and reflects diversity in its intersectionality.

Popul. Med. 2023;5(Supplement):A1362

DOI: 10.18332/popmed/163805

Antenatal care, birth outcomes and child survival among immigrants in Brazil: a nationwide data linkage study

Julia Pescarini¹, Ila Falcao¹, Enny Paixao¹, Poliana Reboucas¹, Nuria Sanchez², Elizabeth Brickley², Mauricio Barreto¹

¹Center of Data and Knowledge Integration for Health (CIDACS/Fiocruz) / London School of Hygiene & Tropical Medicine, Brazil, ²London School of Hygiene & Tropical Medicine, United Kingdom

Background and Objective: Although the health status of immigrants varies according to country of origin and resettlement, limited evidence exists on the health needs of those living in low- and middle-income countries (LMICs). Our study used large-scale linked socioeconomic and health records to understand the perinatal outcomes of immigrant mothers and their children living in Brazil.

Methods: We linked nationwide birth registries to mortality records and socioeconomic data from the CIDACS Birth Cohort and studied singleton live births to low-income women (i.e., monthly familial income)

Results: We studied 11,290,713 live births, of which 9,886 (0.1%) were born to immigrant mothers. Immigrant mothers were more likely older, literate, living in urban areas and less likely to receive social benefits. Immigrant women were more likely to have had a previous stillbirth (ORadj:1.16,95%CI:1.11-1.22), to delay the start of prenatal care (>1st trimester) (1.22,1.16-1.28), less likely to have C-section delivery (0.74, 0.71-0.77), to have a premature birth (0.89,0.82-0.95)

or with low birth weight (0.74,0.68-0.81). However, we found no differences in mortality between children from immigrant and non-migrant mothers. Conclusion: Our results suggest that, although immigrant mothers might face barriers accessing healthcare, their newborns present better birth outcomes, which is possibly related to mothers' health status. However, children born to immigrant mothers seem not to benefit from the same health advantages in their first year of life. The mechanisms underlying these relationships should be further investigated.

DOI: 10.18332/popmed/163809

COVID-19 and health disparities: a bibliometric summary of 5000 research publications by scholars from 165 countries

Barbara Slagel¹, Lana Ivanitskaya¹, Rene Shingles¹, Nina Yamanis²

¹Central Michigan University, United States, ²American University, United States

Background and Objective: Documented prior to the COVID-19 pandemic, many inequities and health disparities persisted during the pandemic. A plethora of pandemic-era studies on disparities, inequities, and inequalities by scholars from several disciplines, including public health, necessitates their systematic summary. We achieve this aim by doing a bibliometric review of English-language publications indexed in the Web of Science.

Methods: We summarized and visualized meta-data for a corpus of 5,001 validated publications from 2020-2022, obtained with a comprehensive search query. Performance analysis focused on research proliferation in journals and disciplines; VOSviewer was used to visualize networks of collaborators and terms extracted from titles and abstracts.

Results: Public health produced the most research related to COVID-19 health disparities, followed by disciplines related to health care, internal medicine, and psychology. No single journal published more than 4% of publications in our corpus. U.S., British, and Canadian researchers contributed the most articles, sometimes through international collaborations and much more often by co-authoring studies with colleagues from the same country. Compared to their international peers, U.S. authors tended to research COVID-19 disparities among African American, Latino/Hispanic, and sexual/gender minority populations. Bibliometric network analyses showed significant research activity in several distinct areas: COVID-19 predictors and outcomes (focusing on quantitative studies of pandemic disparities), global health (focusing on qualitative studies of pandemic inequities or inequalities), and mental health. We discuss the three areas in depth and show how medical and public health researchers use social science concepts to explain disparities. Funding agencies from the U.S., the European Union, and the UK were most likely to fund health disparities research. Conclusion: Our systematic overview of research that happened over the two pandemic years suggests opportunities for public health researchers to engage in multi-disciplinary studies, building upon the contributions of other disciplines and international scholars involved in disparities research.

DOI: 10.18332/popmed/163825

Calling for a community-driven pandemic response for Indigenous peoples: What can we learn from the HIV pandemic in Vancouver, Canada?

Krisztina Vasarhelyi¹, Chenoa Cassidy-Matthews², Andreas Pilarinos², Sandra Fox³, Brittany Bingham²

¹Simon Fraser University, Faculty of Health Sciences, Simon Fraser University, Blusson Hall, Room 11300, 8888 University Drive, Burnaby, B.C., V5A 1S6, Canada, ²University of British Columbia, Canada, ³Vancouver Coastal Health, Canada

Background and Objective: Vancouver, Canada was one epicenter of the HIV pandemic with severe waves in the 1980s and 1990s. Community-driven activism combined with innovative interventions led to the elimination of HIV as a major public health threat and demonstrated the power of a community-driven pandemic response. We aimed to assess perceptions within the urban Indigenous community in Vancouver of the appropriateness and effectiveness of the COVID-19 response through the lens of Vancouver's response to the HIV crisis.

Methods: We conducted semi-structured interviews with 15 representatives of Indigenous community-based organizations providing health and social services to Indigenous peoples in Vancouver's inner city. Thematic and interpretive analysis of the transcripts identified relevant themes.

Results: Indigenous Peoples in Vancouver are disproportionately impacted by the syndemics of opioid overdose and COVID-19 due to ongoing effects of colonialism. Community connection and cultural traditions are critical to the

health and wellbeing of Indigenous Peoples. Indigenous service providers felt that disruption to community supports due to public health restrictions have caused suffering and lack of critical health and social supports to Indigenous People. Participants called for an Indigenous-specific and Indigenous-led pandemic response to future public health emergencies.

Conclusions: The lessons of the HIV pandemic have not translated to a robust community-focused pandemic response for Indigenous Peoples in Vancouver. Early on, several rural Indigenous communities imposed strict, culturally appropriate measures beyond the governmental public health measures that initially kept COVID-19 away, demonstrating the value of self-determination and Indigenous knowledge. However, the later sharp rise in COVID-19 infections in Indigenous communities are attributed to persistent social inequities and significant racism in the health system. We need Indigenous-led approaches to pandemic planning and multidisciplinary perspectives to interpret the social context of the pandemic in Indigenous communities and guide the development of an effective pandemic response.

Popul. Med. 2023;5(Supplement):A1365
DOI: 10.18332/popmed/163880

COVID-19 infection rates and use of SARS-CoV-2 testing among immigrants in Portugal: a longitudinal study for Amadora, Metropolitan Region of Lisbon, Portugal

Sofia Carmezim Pereira¹, Maria O Martins², António Silva³

¹Public Health Unit, Amadora Primary healthcare cluster, Lisboa, Portugal, ²Global Health and Tropical Medicine, GHTM, Instituto de Higiene e Medicina Tropical, IHMT, Universidade Nova de Lisboa, Lisboa, Portugal, ³Public Health Department, Regional Health Administration of Lisbon and Tagus Valley, Ministry of Health, Lisboa, Portugal

Introduction: Available evidence from European countries suggests that migrants are at an increased risk of COVID-19 infection and present higher positivity rates. In Portugal, as in most EU countries, there are no studies on this subject. The aim of this study is to compare COVID-19 infection rates, use of SARS-CoV-2 testing and positivity rate between immigrants, particularly from outside the EU EFTA-UK, and native born in Amadora, Metropolitan Region of Lisbon, Portugal.

Methods: A longitudinal study was conducted between 1 May 2020 and 31 December 2021 using monthly data from Amadora residents collected from the National Epidemiological Surveillance System (SINAVE). COVID-19 infection rates, number of tests performed per person, and positivity rates were computed for native born, and immigrants (within EU EFTA-UK and outside) adjusting for sex and age using logistic regression.

Results: We analysed 299 272 tests from individuals living in Amadora. The COVID-19 infection rate was 12 890 per 100 000, positivity rate was 7.4% and the average number of testes per resident was 1.74. Native born COVID-19 infection rate was 13 278 per 100 000 compared with 11 329 per 100 000 regarding immigrants outside EU EFTA-UK. While native born performed 1.6 times more tests, immigrants outside EU EFTA-UK positivity rates were higher (9.8% vs 7.2%). When adjusting for sex and age, immigrants outside EU EFTA-UK had a higher odd of testing positive for SARS-CoV-2 when comparing with native born individuals (OR=1.42 [95% CI 1.36-1.49]).

Conclusions: Immigrants outside EU EFTA-UK are more likely to test positive for SARS-CoV-2 infection and less likely to perform COVID-19 diagnostic tests. This result suggests an unequal access to COVID-19 testing in Amadora, Portugal. Targeted efforts are needed to improve testing availability for immigrants and to understand reasons underlying these inequalities.

A culturally competent systems intervention in primary health care to reduce domestic violence among immigrant communities: HARMONY a pragmatic cluster-randomised controlled trial in Melbourne, Australia

Angela Taft¹, Kelsey Hegarty², Jane Yelland³, Danielle Mazza⁴, Richard Norman⁵, Gene Feder⁶, Douglas Boyle⁷, Cattram Nguyen⁸, Claudia Garcia-Moreno⁸, Felicity Young⁹, Bijaya Pokharell⁹, Molly Allen-Leap⁹

¹La Trobe University, Melbourne, AUSTRALIA, Judith Lumley Centre for Mother, Infant and Family Health Research, Level 3, GS Building, La Trobe University, BUNDOORA, VIC 3068, Australia, ²University of Melbourne, ³Murdoch Children's Research Institute, Australia, ⁴Monash University, Australia, ⁵Curtin University, ⁶University of Bristol, United Kingdom, ⁷University of Melbourne, Australia, ⁸(formerly) WHO, Switzerland, ⁹La Trobe University, Melbourne, Australia

Methods: 24 (FP) clinics randomised in 2019. Eligible clinics required ≥1 SA GPs

using common medical software programs.

Culturally competent DVA training for intervention clinics co-facilitated by a clinical educator and bilingual SA DVA advocate from Oct 2020 - May 2021. With the COVID19 pandemic, online training was implemented emphasising DVA safety. Following training, clinic staff and DVA affected women ≥ 18 were supported for 12 months by the caseworker/advocate. All clinics were trained to record ethnicity and DVA data.

Routine data extraction from both arms identified DVA, safety planning, referrals and a SA population estimate among female patients ≥ 18 . Outcome data is de-identified and aggregated. Adjusted regression analysis by intention-to-treat.

Outcomes: Despite COVID 19 and the study suspended from May to Sep 2021, with online training, just <70% clinical staff completed all 3 training sessions. The SA advocate supported intervention clinics online. At baseline, the eligible female population included 48,362 women (20% SA) of whom 0.55% were identified in routine data as DVA victim/survivors. Successful outcomes and limitations currently under analysis will be presented.

Conclusion: This is a world first study trialling culturally competent DVA FP care for diaspora communities.

Indigenous health and wellbeing program evaluation commissioning models: results from a scoping review

Summer Finlay¹, Amohia Boulton², Jenni Judd³, Margaret Cargo⁴, Yvette Roe⁵, James Smith⁶, Bronwyn Fredericks³

¹University of Wollongong, Australia, ²Whakauae Research for Māori Health and Development, ³Central Queensland University, Australia, ⁴University of Canberra, Canada, ⁵Charles Darwin University, ⁶Flinders University, Australia
Background/Objectives: Despite significant ongoing investments in Indigenous health and wellbeing programs, evidence regarding program effectiveness is limited. Where these evaluations occur, the quality of this evidence may be impacted by process stages. Yet little is known about the effect of commissioning practices in the Indigenous space. This scoping review aims to codify the spectrum of commissioning practices used in Australia and internationally in the evaluation of Indigenous health and wellbeing programs.

Method: Arksey and O'Malley and Levac et al. guided the review of literature from 2008 -2020 that address the commissioning of Indigenous health or wellbeing program evaluations in Australia, New Zealand, Canada and the United States. Forty-three documents were retrieved from four academic databases and the world wide web and coded against 13 Indigenous research and evaluation better practice principles derived from the literature.

Results: The research shows five models used for commissioning evaluations of Indigenous health and wellbeing programs: a) top-down; b) participatory; c) co-design; delegative and e) Indigenous-led. Models range in the level of engagement with, and decision-making power awarded to, Indigenous communities. Levels which have significant influence on the way the findings are perceived by Indigenous peoples. For instance, models negating Indigenous power produce evaluations lacking in cultural safety and reciprocity.

Conclusion: This scoping review, a first of its kind, provides insight into the spectrum of evaluation commissioning practices and how they align with better practice principles. Whilst, research suggests these better practice principles are often not considered, or their adherence hindered by a lack of institutional support, examples exist of commissioning practice supporting Indigenous engagement and leadership, which hold promise for broader application.

Global Mental Health: A Systematic Review of Burnout Syndrome in Latin American and Caribbean Teachers

Renan Oliveira¹, Katerina Lukasova²

¹Federal University of Bahia, International Relations Master's Student, Rua Augusto Viana, s/n - Palácio da Reitoria, Canela, Salvador - CEP: 40110-909, Brazil, ²Federal University of ABC

Objectives: First this paper seeks to theoretically discuss in which job world this Syndrome emerged, contextualizing and defining the BS in Latin America and the Caribbean (LAC) perspective. Secondly, it wants to review the quality of some of the published prevalence articles on BS among LAC teachers and highlight the intersectionalities of the subjects.

Methodology: A Systematic Review was carried out on BS prevalence articles in Education published between 2016 and 2020 and indexed on the LILACS and SCIELO platforms with the keywords: "teacher burnout" in Portuguese, Spanish and English; Works that did not fit (topic, repeated, samples outside LAC,

unavailability, not gone through peer review) were excluded; Out of 416, 46 final articles were selected. Its contents were analyzed with a qualitative analytical approach and tables were used to stratify the data about: sociodemographics, diagnostic instruments, prevalence.

Results: 87% asked sex/gender; 80% age; 74% professional experience; 63% type of contract; 50% marital status; 26% had children; 11% income indicators; 2% race/ethnicity. The most frequent diagnostic instrument was the Maslach Burnout Inventory and its variations (30 articles). 32 articles (out of 46) did not fully show the presence and degree of the condition found.

Conclusions: It is important for scientific research to present their disaggregated data, either within the text or through external links, so that it is possible to develop public policies and/or produce deeper analysis based on these works. LAC teachers were not treated in these articles according to their social, political or territorial specificities enough to establish correlations between the multidimensional intersectionalities faced by this professional class and their struggles against mental illness.

Racial harassment and workplace violence in hospitals towards physicians and nurses from Indigenous minority and non-Indigenous groups

Nihaya Daoud¹, Moatasem Jammal¹

¹Ben-Gurion University of the Negev, Israel

Background: Workplace violence (WPV) in healthcare facilities is an increasing global problem, particularly since the emergence of COVID-19. WPV can impact healthcare systems and patient's health, as well as healthcare workers (HCWs) job satisfaction and resignations. Racial harassment (RH) in healthcare services can add complexity to WPV, as it targets more minority HCWs and patients.

Aims

We examined associations between RH and WPV types (physical and psychological or verbal) among physicians and nurses in Israeli hospitals and compared these in different groups (Indigenous Palestinian-Arab citizens versus Jewish).

Methods: An online cross-sectional survey was conducted in July to September 2022, including a sample of 921 physicians and nurses working in ERs and internal medicine departments in four large hospitals. The online questionnaire was distributed via WhatsApp groups of physicians and nurses (response rate= 89.1%). The association between RH and WPV types was examined via multivariable logistic regression analysis for each study groups while considering relevant variables (age, gender, physicians vs. nurses, work position, years of work, education level).

Findings

Palestinian-Arab physicians and nurses reported significantly higher RH based on national identity compared to Jewish counterparts (42.5% vs. 24.3%). However, Jewish HCWs reported higher physical, and psychological WPV (24.9%, and 72.2%, respectively) compared to Palestinian-Arab HCWs (14.6%, and 54.1%, respectively). In the multivariate analysis, RH was associated with higher physical WPV in Palestinian-Arab HCWs (adjusted odds ratio and 95% confidence intervals, AOR, 95%CI=2.55, 1.39-.68) compared to Jewish HCWs (1.06, 0.49-2.26), and higher psychological WPV among Palestinian-Arab HCWs compared to Jewish (3.76, 2.44-5.79 vs. 2.39, 1.12-4.79 respectively).

Significance

RH was significantly associated with higher physical and psychological WPV in Palestinian-Arab minority physicians and nurses compared to their Jewish counterparts. Future research should explore mechanisms connecting RH and WPV in these groups and suggest interventions to eliminate WPV in hospitals.

FörGes 5 - An intervention for strengthening self-management competencies of family caregivers of persons with dementia of Turkish origin in Germany

Hürrem Tezcan-Güntekin¹, Yüce Yilmaz-Aslan², Tugba Aksakal³, Kübra Annac³, Oliver Razum²

¹Alice Salomon University of Applied Science Berlin, Germany, ²Bielefeld University, ³Witten University, Germany

Background and Objective: The majority of persons in need of long-term care who are of Turkish origin in Germany are cared for at home by their relatives. The home care situation can be accompanied by a high physical, psychological and social burden for the caregivers. It is necessary to support family caregivers to counteract possible overload and excessive demands. The aim of the project is the development, implementation, and validation of an intervention to strengthen the

self-management competencies of family caregivers of persons with dementia. Methods: A document analysis of caregiving-related information material in Turkish was conducted, and 10 family caregivers were interviewed about their needs and information wishes. Based on the results of the qualitative content analysis, an individualized participatory intervention was developed, consisting of weekly home visits by a Turkish-speaking specialist over six months. Interviews with participants were subsequently conducted again to evaluate the intervention. Results: Family caregivers often have information deficits on dementia caregiving and are exposed to stresses, e. g. financial worries, and social isolation. Wishes expressed support in everyday caregiving, in applying for services, offers for relief, and care by culturally sensitive professional caregivers. Implementation revealed that different family constellations, age groups, genders, and care situations are associated with different needs and requirements. Further, different stages of self-management support among family caregivers can be identified. The intervention reinforced the self-organization of family caregivers and empowered them to provide mostly independent health and nursing care for their family members.

Conclusion: To support and strengthen family caregivers of persons with dementia of Turkish origin, outreach and native-language interventions adapted to the individual persons and family situations are necessary for acceptance by the family members. The diversity of those affected is a central aspect that can be addressed through a diversity-sensitive orientation of interventions.

Differences in preterm births and birth weight between new-borns of roma and non-roma mothers in Slovenia

Tatjana Krajnc Nikolić¹, Barbara Mihevc Ponikvar¹, Victoria Zakrajšek²

¹National institute of public health National institute of public health "Trubarjeva 2 1000 Ljubljana Slovenia", ²National institute of public health

Background: The reproductive health of Roma women is largely influenced by socio-economic determinants, cultural and social values in the Roma community as well as by their lifestyle and use of preventive health services. Health of Roma new-borns is closely linked to health of their mothers. Data from other countries show differences in health between new-borns of Roma origin and others. This research examines whether these differences also exist in Slovenia.

Methods: The research included the analysis of data from the national health statistical database of the Perinatal Information System of the Republic of Slovenia for the period 2012-2014. The women with permanent residence in Roma settlements were defined as Roma women and all other women as non-Roma women. The research compared the incidence of preterm birth (less than 37 gestational weeks) and low birthweight (less than 2.500 grams). The statistical significance of the differences between two groups was verified by χ^2 Test ($p < 0,05$).

Results: During the period 2012-2014 there were 424 liveborns by women, residents of Roma settlements and 62.816 liveborns by other residents of Slovenia. Roma children had a 59% higher risk of preterm birth than other children and a 2.7 times higher risk of low birth weight than other children did. Only 19,6% of Roma new-borns were in the weight category 3500 grams or more, compared to 40,5% of other new-borns.

Conclusions: Roma new-borns had significantly lower birthweight and were more often born prematurely. More efforts should be directed toward increase of health literacy of Roma women, increased use of preventive health services and improvement of socio-economic determinants of their life.

Attitudes and self-assessed knowledge on substance use among people who work in migrant centers in Serbia

Biljana Kilibarda¹, Aleksandar Medarevic¹, Perisa Simonovic¹, Milena Vasic^{1,2}, Verica Jovanovic¹

¹Institute of Public Health of Serbia "Dr Milan Jovanovic Batut" Serbia,

²Faculty of Dentistry, Pancevo, Serbia Serbia

Introduction: Migrant children face different challenges including substance use. Prevention, including detection of early signs of experimentation with substances, and timely provision of treatment is highly dependent on support system including trained professional. For planning response to this issue, Institute of public health of Serbia "Dr Milan Jovanovic Batut" conducted a survey among persons engaged in migrant centers in Serbia on self-perceived knowledge and skills needed for prevention and support to migrants who use drugs.

Method: The survey in migrant centers in Serbia among employees involved in

provision of organisational, healthcare, psychological or social support to migrants. The questionnaire was designed for this survey and within a wider project aimed at improvement of prevention of substance use among migrant population in Serbia. The questionnaire was self-completed anonymously by respondents. In total 188 persons engaged in migrant centers completed the questionnaires.

Results: Results show that 68.9% of respondents agree (fully or partly) with the statement that they could recognize the client under the influence of substances and 40.2% agree they could provide first aid for acute intoxicated clients. Less than half respondents estimate their knowledge as adequate or excellent with regards of drug laws (40.9%) and where people who use drugs can seek help or treatment (39.8%). Only 33.9% fully agree that they would know who should be contacted for further support in case they face challenges in provision of support to migrants and their families. The differences exist according to the level of education and profession.

Conclusion: There is a need for further training of employees in migrant centers in Serbia and strengthening their knowledge and skills for early identification of young people who are addicted or experiment with drugs, existing referral system and legislation in Serbia as well as for procedures and steps in case of acute intoxication.

Coming across a hidden problem in an excluded population: professionals' experiences of disclosures of sexual violence by young migrants

Tanya Nystedt¹, Pia Svensson¹, Tobias Herder¹, Benedict Asamoah¹, Anette Agardh¹, Pernilla Ouis²

¹Lund University Sweden, ²Halmstad University Sweden

Background and Objective: International migration has been on the rise over the past decades and is expected to remain high. There is growing evidence on the vulnerability of young migrants including to sexual violence. With increasing numbers of young migrants at heightened risk for sexual violence and often lacking in family and social networks, there is an opportunity for professionals and service providers to be the recipients of disclosures of sexual violence. This study aimed to explore how professionals experience meeting young migrants who disclose experiences of sexual violence.

Methods: It was conducted using a qualitative design based on fourteen semi-structured in-depth interviews with professionals providing a range of services. The data was analysed using qualitative content analysis.

Results: The overarching theme emerging from the study was "coming across a hidden problem in an excluded population" supported by three themes 1) perceiving young migrants as being structurally marginalised and vulnerable to sexual violence; 2) sexual violence is not the point – needing to support young migrants holistically; and 3) trying to help young people who are seen as betrayed by society. Professionals' awareness of the complex vulnerability of young migrants and their lack of options for accessing services contributes to the strong sense of personal responsibility felt for trying to meet their needs. This coupled with the lack of guidelines for how to respond to these needs, including exposures to sexual violence, can lead to moral distress.

Conclusion: There is a need to strengthen support for professionals working with vulnerable young migrants including recognition of the ethical issues involved and establishment of more formal connections between organizations and service providers to make access more predictable. Improving support to professionals providing services to young migrants could facilitate their work supporting young migrants with experiences of sexual violence and improve those outcomes.

Towards more effective multilingual crisis communication - applying social marketing principles to the reality of covid-19 epidemic in finland

Laura Mustajoki¹, Natalia Skogberg¹, Tomi Mäki-Opas²

¹Finnish Institute for Health and Welfare Finland, ²University of Eastern Finland Finland

Background and Objective: Effective multilingual crisis communication can improve equity, inclusion, and access to information of linguistic minorities during crises. However, studies examining efficacy of multilingual crisis communications are scarce. This study examines how different strategies for improving effectiveness of multilingual and multichannel COVID-19 communications were utilized in Finland and whether the criteria for effective social marketing methods were fulfilled.

Methods: Data consisted of 25 semi-structured interviews with persons responsible

for development and dissemination of multilingual COVID-19 communications in municipalities (n=8), non-governmental organizations (n=7), and government officials (n=10). The interviews were conducted between April and September 2022. The data were analyzed using deductive theory-based qualitative content analysis. The researcher used social marketing principles as a starting point for analysis and compared findings from qualitative data to those principles.

Results: There were several efforts to improve and measure the effects of multilingual communications during the epidemic, but the efforts were inconsistent. The main effort was placed on understanding how to reach the target groups. The key elements for successful multilingual crisis communications mentioned were in consistency with social marketing principles including co-creation and cooperation, using already existing networks, and combining different communication methods. However, interviewees described that there were no resources to collect systematic knowledge to understand the reasoning behind the behavior of the target group nor to evaluate effectiveness of crisis response measures during the epidemic.

Conclusion: There were several useful methods for effective multilingual crisis communication utilized and developed during the epidemic, but more effort is needed to utilize those methods more efficiently and coherently in future crisis preparedness. This can be done by creating systematic multilingual crisis communication plans already before crisis. By further improving the plans can significantly improve the effectiveness of multilingual crisis communications and the social equity of linguistic minorities during crises.

The russo-ukrainian war crisis and the role of the healthcare services in the health management of ukrainian minors in an italian city

Andrea Gentili¹, Cecilia Panizzi², Vania Moroni³, Daniel Fiacchini², Francesca Diotallevi², Daniela Cimini²

¹Università Cattolica del Sacro Cuore Italy, ²Department of Prevention - ASUR AV2, ³it Italy

Background: Active call and convocation from the local health agency to test for COVID-19; clinical visit from foreign doctor; access to the Department of Prevention for the acquisition and certification of vaccination schedule, to screen against tuberculosis, and to be vaccinated for routine and COVID-19 vaccines.

Results: Of the 239 Ukrainian recruited through active call, 108 (45%) were minors. 224 Ukrainian presented to test for COVID-19, and 8 of them (2.8%) resulted positive. All registered Ukrainians have been called by the Department of Prevention, but only 128 presented to the clinic. Of those, 80 were minors that underwent to the Mantoux test for tuberculosis screening, with 10 positive results (12%). Subsequently, it was checked the vaccination schedule: of the 60 minors in possession of their vaccination schedule, 41 already had all the vaccination identified as mandatory by Italian laws. The remaining 19 accepted to complete the mandatory vaccinations. Finally, 15 out of 60 minors decided to get vaccinated for recommended but not mandatory vaccinations.

Conclusion: The proactive call from healthcare services resulted to be the main promotor to reach this vulnerable population. The creation of a solid network between different services demonstrated to achieve excellent results and should be promoted as a best practice.

Quality of Life and its influencing Determinants for People with Acquired Brain Injuries

Luise Koch¹, Mario Biggeri², Federico Ciani²

¹Technical University Munich Germany, ²Università Degli Studi Firenze Action Research for CO Development (ARCO) Italy

Background and objective: A person with an acquired brain injury (ABI) faces multidimensional capability deprivations which in turn affect their well-being and quality of life (QoL). Free time (FT) activities play an important role in subjective well-being as they provide opportunities to meet life values and needs. This is especially relevant for people with disabilities (PwD), as they are often unwillingly confronted with a large amount of FT. The motivation for this work is that health-related indicators are not sufficient to explain the QoL of PwD as their well-being is directly linked to their ability to use their time in a fulfilling way. Applying Amartya's Sens Capability Approach for the first time from a disability perspective allows for illustrating the complexity of the determinants of the well-being of PwD.

Methods: Data collected between 2012 and 2014 from a large-scale survey, in-depth interviews and focus group discussions of a sample of 378 families having

one member with an ABI in two districts in Northern and Central Italy, is analysed. The quantitative analysis allows for insights into the quantity and quality of FT in light of well-being indicators. The combination with the qualitative insights of the interviews allows for drawing a conclusion regarding their overall life satisfaction. Results and conclusion

The results indicate that the QoL of both PwD and their families are influenced by the household's economic vulnerability and low quality of social relations. Most importantly the research provides first indications of a negative correlation between the quantity and the quality of FT. This allows the formulation of policy implications for the improvement of the QoL of PwD, specifically that economic support alone is not sufficient. Public interventions must support the capability set expansion of PwD regarding their FT, i.e., the participation in purposeful, goal-oriented leisure activities, to improve their QoL.

Background and objective: The COVID-19 pandemic produced greater negative effects on vulnerable populations, potentially more exposed to contagion and severe outcomes.

This cross-sectional study aimed to compare the impact of the pandemic between Italian and immigrant residents in five Italian regions (Piedmont, Emilia-Romagna, Tuscany, Latium, and Sicily), taking into account the degree of urbanisation.

Methods: Age-standardised monthly rates (smR) of positivity, hospitalisations and 30-day mortality stratified by sex and citizenship were calculated pooling the data of the 5 regions for all levels of urbanisation and restricting to urban areas only (DEGURBA-EUROSTAT=1); residents were observed until July 2021.

Results: Among the 23,098,881 residents as of 31/12/2020, 9.4% had non-Italian citizenship.

Positivity rates were slightly lower among immigrants than Italians at the start of the pandemic (-46.7% and -30.4% smR differences among males and females, respectively, in March 2020) and during the peaks of November 2020 (-17.9% and -19.1%) and March 2021 (-15.0% and -8.4%). Conversely, from July to September 2020, positivity rates (+177.7% and +176.3%), hospitalisation (+88.3 and +53.3) and mortality rates (+253.9% and +260.2%) became higher in the immigrant population, and then tended to be the same as in Italians until early 2021. Since February and during the spring of 2021, the mortality rates among immigrants exceeded that of Italians (+32.5% and +31.0% in April 2022).

Differences by citizenship were more pronounced in urban areas, particularly among males for hospitalisations (+296% in September 2020) and mortality (+103% in April 2021).

Conclusions: In the five analysed regions, immigrant residents showed higher rates of hospitalisation and mortality due to COVID-19 in summer 2020 and from February 2021, with greater excesses in urban areas among men and in the last months of the study period, when the impact of vaccination campaign became important in the control of the pandemic.

Promoting afghan migrants' health through participatory research

Susan Coan¹, Louise Warwick-Booth¹

¹Leeds Beckett University United Kingdom

Background and objective: A UK university collaborated with an NGO which provides housing and support services in a neighbouring city to conduct some participatory research. The NGO invited volunteers and the people they support through the Afghan Relocations and Assistance scheme to undertake some peer research (also called community research).

Methods: Four people chose to become Community Researchers on this project: 3 Afghan men living in temporary hotel accommodation and one British woman who volunteers with the NGO. They received training and support from a university health promotion researcher; three training sessions on research, survey design, and research ethics. They chose to do some research on the mental health of Afghan people living for long periods in hotel accommodation. They designed a survey to investigate meaningful occupation that promoted good health and then spent 5 weeks collecting data. The Community and University Researchers analysed the data from the survey together.

Results: The Community Researchers spoke to 14 men individually and 15 women in a group. The respondents were aged 16 to 65. Cultural norms meant that the men could not ask women questions directly, so the female volunteer spoke to a group of women with an interpreter.

Respondents reported physical activity, social interaction and developing skills as the most significant factors in maintaining good health. Barriers to taking part in activities to promote health included language, caring responsibilities, and a lack of money. The Community Researchers produced recommendations regarding support which included: offering more opportunities to learn English; supporting independence through use of public transport; and facilitating connections with local people.

Conclusion: Community Researchers are experts by experience and bring important community knowledge. They gained a range of skills and increased confidence through the project and provided the NGO with practical advice on how best to support their community's health.

Evaluating vaccine and health literacy in European prisons: A cross-sectional study

Davide Petri¹, Laura Baglietto¹, Lara Tavoschi¹, Sara Mazzilli¹, Nicola Cocco², Roberto Ranieri², Vlad Busmachiu³, Babak Moazen⁴, Alicia Rosellò⁵, Fadi Meroueh⁶, Josefina Mavrou⁷

¹University of Pisa Italy, ²ASST-Santi Paolo e Carlo, ³National Administration of Penitentiaries Moldova, Rep, ⁴University of Frankfurt Germany, ⁵UK Health Security Agency United Kingdom, ⁶University Hospital Centre Montpellier France, ⁷Cyprus National Addiction Authority Cyprus

Background and Objective: Vaccination reduces the risk of getting infectious disease by increasing the body's natural protection provided by the immunity system. Prison population should be a priority target for vaccination, but vaccine coverage is low due to several factors including high turnover and low vaccine literacy. This study is part of RISE-Vac, a 3-year EU co-funded project looking to increase vaccine literacy and uptake in prison populations across Europe. The aim is to evaluate the vaccine literacy among people living in prison (PLP) and custodial staff.

Methods: This is a cross-sectional study carried in 18 different European prisons from Italy, France, Germany, Cyprus, Moldova and UK. For each country the sample include 500 PLP and 400 custodial staff; the questionnaire comprises the following sections: lack of confidence, risk perception, general health literacy, vaccine literacy and intention to vaccinate, in addition to some demographic information. The questionnaire has been administered in local languages by trained personnel for PLP or self-administered for custodial staff.

Results: Data collection is still ongoing; so far, we collected 142 questionnaires from PLP and staff in Italian prisons and described the principal demographic variables (age, gender, country of birth, education level, previous house and work condition for PLP). For the scores retrieved regarding the parameters described above, we found no differences except for general health literacy section where PLP showed lower scores than staff (Kruskal-wallis p-value: <0.0001).

Conclusion: Assessing vaccine literacy in prison population is crucial for advocacy decisions and it is a difficult-to-reach field. This is the beginning of a study that will last until 2024 with a repeated cross-sectional study design. An intervention devoted to increase vaccine and health literacy among PLPs and staff will be carried out between the two cross-sectionals and its effectiveness will be evaluated in the next survey.

Oral health socio-epidemiological characterization of an indigenous population in the northeast region of Brazil

Herika Mauricio¹, Lucas Santos², Tainá Mafra², Thatiana Fávoro¹, Rafael Fiocruz Pernambuco³

¹Universidade de Pernambuco Professor Brazil, ²Fiocruz Pernambuco PhD Student Brazil, ³Researcher Brazil

Background/Objective: The Xukuru do Ororubá people, one of the largest indigenous populations in Northeastern Brazil and the largest in the State of Pernambuco, have their Indigenous Land of 27,550 hectares organized into 3 socio-environmental regions (Serra, Ribeira and Agreste) and 24 villages located in the municipality of Pesqueira, sheltering 7,857 people. The aim was to characterize the indigenous people aged 18 to 23 years of age of the Xukuru do Ororubá ethnic group regarding the use of dental services, self-perception of oral health, oral hygiene practices and caries experience, as well as socioeconomic and demographic aspects.

Methods: This is a population-based cross-sectional study, nested in a cohort initiated in 2010, developed in the limits of the Xukuru do Ororubá Indigenous Land in 2018. Based on the performance of oral examinations and application of questionnaires, the study involved the participation of 131 indigenous people in the age group of 18 to 23 years old. Data were collected using Epi-Info software, and the statistical program SPSS 20.0 was used to develop descriptive statistics. To compare the pattern of caries experience identified among indigenous individuals with results from the National Oral Health Survey (SB Brazil 2010), graphs were constructed in the R software.

Results: The caries experience verified by the DMFT Index obtained a mean equivalent to 7.4 (SD=5.1), with the mean of the components of the Index corresponding to 22.8 for healthy teeth, 2.4 for decayed teeth, 0.2 for filled and decayed teeth, 3.5 for filled teeth, and 1.4 for missing teeth.

Conclusion: The oral health status of indigenous people is characterized by significant inequality when compared to the results of epidemiological surveys conducted in the country involving other population groups.

Changes in lifestyle habits and sociodemographic characteristics associated with these among migrant origin populations in Finland compared with the general population.

Natalia Skogberg¹, Tyler Prinkey¹, Eero Lilja¹, Päivi Koponen¹, Anu Castaneda¹

¹Finnish Institute for Health and Welfare Finland

Background and Objective: Impact of COVID-19 on lifestyles of migrant origin populations has been largely understudied despite evidence that this population group was more strongly impacted by the pandemic. This study compares the impact of COVID-19 on lifestyles of migrant origin population with the general population, and examines the sociodemographic characteristics of those reporting adverse changes.

Methods: Data from the Finnish population-based MigCOVID Survey conducted 10/2020-2/2021 among foreign-born persons aged 20-66 years (n=3668) was used, with participants in the FinHealth 2017 follow-up study (n=3490) as the reference group. Lifestyles included physical activity, snacking, and fruit and vegetable intake. Logistic regression was applied to examine the association of sociodemographic characteristics with adverse changes in lifestyles.

Results: Physical activity decreased more frequently in migrant (39.5%, 95%CI 36.6-42.6) than general population (30.4%, 95%CI 28.1-32.8), whereas differences in adverse changes in snacking and fruit and vegetable intake were not significant. Tertiary education (OR 2.79, 95% CI 1.71-4.55 for migrant; OR 2.61, 95% CI 1.67-4.08 for general population) and remote work (OR 2.22, 95%CI 1.54-3.20 for migrant; OR 1.53, 95%CI 1.05-2.25 for general population) were associated with decrease in physical activity after adjustment for other sociodemographics. Increase in snacking was more likely in higher education groups in general population only. The association of younger age with adverse lifestyles was more evident in the general population.

Conclusions: COVID-19 adversely impacted lifestyles particularly in

sociodemographic groups that generally tend to have more favourable habits, such as those with higher education and non-manual jobs. This was observed both in migrant and general population, however it was more consistent in the latter group. This may be due to some reporting bias, but our results point out the need to identify groups with higher impact when targeting health promotion measures.

Health literacy and COVID-19 in migrants: Results from the sprint2 project

Patrizio Zanobini¹, Patrizio Zanobini¹, Chiara Lorini¹, Giovanna Tizzi², Maria Caldes Pinilla³, Guglielmo Bonaccorsi¹

¹University of Florence Italy, ²Oxfam Italia Italy, ³Centro Salute Globale Spain

Background and Objective: Migrants generally reported low levels of health literacy (HL) thus increasing their difficulties in accessing and interacting with the healthcare system. This study aims to assess the HL level of 2 samples of asylum seekers and refugees residing in Tuscany, and to examine the relationship among HL, educational interventions, COVID-19 risk perception and preventive behaviours.

Methods: Questionnaires were administered to a voluntary sample of refugees and asylum seekers (group A) between June and September 2021 and to another sample between April and September 2022 (group B) who participated at least in one out of four health-related educational intervention. HL has been measured by the Italian version of HLS-EU-Q16.

Results: Among 171 subjects belonging to group A 25% had an inadequate HL level. Group B consisted of 102 respondents of whom 37% had an inadequate HL level. Group B compared with group A had higher percentages of respondents who considered COVID-19 a serious health problem (58.8% vs 41.1%), very likely to be infected by SARS-CoV-2 (58.2% vs 29.6%) and who thought quarantine (89.7% vs 75.9%), nasopharyngeal swabs (78.4% vs 61.2%), and to get COVID-19 vaccination (89.4% vs 66.1%) were important preventive measures.

HL level was found to be significantly associated ($p < 0.05$) with COVID-19 risk perception and propensity for handwashing, face mask use, and social distancing. At multivariate logistic analysis, low educational level and residing in Italy for less than 2 years were found to be predictors of inadequate HL level (OR 2.7 CI 95% 1.22-6.13; OR 3.9 CI 95% 1.93-7.79, respectively).

Conclusions: Findings suggest that HL and educational interventions are key to improve healthy behaviours. Structured educational interventions to increase HL levels will give contribution in the process of inclusion and integration of migrants thus reducing health related inequalities.

Violence against women by an intimate partner in primary care services: From neglect to medicalization

Dinair Machado¹, Margareth de Almeida², Ellen Castanheira¹

¹Faculdade de Medicina de Botucatu - Depto de Saúde Pública Brazil,

²Faculdade de Medicina de Botucatu - Depto de Saúde Pública

This article aimed to identify strategies for dealing with situations of violence against women by primary health care professionals, especially physicians. This is a qualitative research that combines documentary sources, medical records and interviews. This study brought together steps 2 and 3 of a larger survey in which reports of occurrences of gender violence perpetrated by an intimate partner were analyzed. Primary information was obtained through interviews with 16 women and secondary information from 14 medical records of the women's referral health services. The information was analyzed according to Bardins content analysis, revealing two main categories of analysis: professionals reiterated violence as a domestic phenomenon restricted to the private environment; and the medicalization of violence. It was found that when violence against women is not made invisible or neglected, it is medicalized.

Implementing video consenting for an indigenous Australian diabetes clinical trial

Mariam Hachem¹, Mariam Hachem¹, FlashGM Team²

¹University of Melbourne University of Melbourne, Austin Health 7 Finch

Street Australia, ²University of Melbourne Australia

Background: Diabetes is a major problem for Indigenous Australians. Clinical trials specifically for Indigenous Australians are necessary to provide evidence for the use of new diabetes technologies and therapies to reduce diabetes and its complications. However, consenting procedures for clinical trials are often

time-consuming and not culturally specific. We are conducting a national, multi-centre clinical trial using a wearable diabetes technology, flash glucose monitors, for Indigenous Australians with type 2 diabetes across metropolitan, regional, rural and remote Australia (FlashGM Study, in progress) (NHMRC funded). To ensure standardised and culturally specific consenting, we developed an informed consent video.

Objective: To implement an informed consent video as part of a large multi-centre, national, randomised controlled trial for Indigenous Australians. The overarching study aims are to assess the effects of flash glucose monitoring on haemoglobin A1c, time in range, reducing low glucose episodes and cost-effectiveness from baseline to 6 months.

Method: In April 2020, a plain language script was written by Indigenous researchers. An Indigenous artist with lived experience of type 2 diabetes designed the video artwork, with voice-over by an Aboriginal study team member. Video animation and production was facilitated by the University of Melbourne. Video completion occurred in June 2020. Iterative cycles of reviewing and feedback were undertaken by the Study team between May-June.

Results: The video was designed to supplement the participant informed consent form as part of consenting at the first trial visit. The 3-minute video is hosted on YouTube and includes subtitles (English): (<https://www.youtube.com/watch?v=u1T7u6expk> [1]). 100 participants across 10 clinical trial sites were consented using the video with positive feedback from clinical trial participants, staff and communities.

Conclusion: Video consenting is an innovative way of delivering culturally appropriate consent for clinical trials in Indigenous health settings. Consenting for clinical trials must be culturally appropriate and accessible for participants.

Black women's maternal health in the us and uk

Gwenetta Curry¹

¹University of Edinburgh 26 Learmonth Terrace, Flat 6 United Kingdom

Black women's maternal health in the UK and the US has suffered greatly due to the impact of racial inequality and structural racism. In both countries Black women's pregnancy related deaths have exceeded their white counterpart by more than three times the rate. According to the CDC US Black women experience 41.4 pregnancy-related deaths per 100,000 live births compared to 13.7 among white women between 2016-2018. The Mothers and Babies: Reducing Risk through Audits and Confidential Enquiries report show that Black women in the UK experience 40 maternal deaths per 100,000 pregnancies compared to 8 among white women between 2014-2016. Although socioeconomic status has clear links to poor health outcomes Black women experience higher rates of pregnancy-related deaths at every level of education. Black women are more likely to live in areas in low-income areas and work in occupations that put them at higher risk during pregnancy. Some of these deaths have been attributed to the lack of resources in Black communities while others have clear links to racist or discriminatory treatment by medical practitioners. During the COVID-19 pandemic, ethnic minority pregnant women in the UK experienced a higher rate of severe reactions. Previous studies have shown that Black women's pain has not been taken seriously and are assumed to be drug-seeking when requesting assistance with pain management. In this article, I aim to examine the link between maternal mortality in the US and UK and structural racism

Ten years (2013-2022) of health research among indigenous minorities in Colombia, Latin America

Marcela Arrivillaga¹

¹Pontificia Universidad Javeriana Cali, Cali, Colombia

Objective: This study aimed to describe the health research conducted among indigenous minorities in Colombia between 2013 and 2022. **Methods:** A scoping review of original research articles that met the criteria of quality, epistemological adequacy, relevance, validity, and reflexivity was conducted.

Results: In 10 years, 49 original studies were identified that reveal that health research has been carried out mainly on the indigenous cosmovision in relation to health and disease understandings, health services, sexual and reproductive health, infectious diseases, nutrition, mental health, non-communicable diseases and oral health. The regions of Colombia where more research has been carried out have been Cauca, Guajira and Amazonas; the studies have been oriented mainly by qualitative methods and techniques. **Conclusions:** Health research among indigenous minorities in Colombia has recognized intercultural differences linked

to the beliefs and practices of these groups. the authors highlight the importance of guaranteeing equitable access to quality health services. this review can promote research networks in Colombia and in other regions of the world. ethnic minorities require greater efforts to guarantee the right to health, prevent diseases and contribute to their general well-being.

The right to be yourself: a comparison of legal gender recognition policies in EU countries. The case of Hungary, the Netherlands and Malta

Juan Barrios¹

¹Faculty of Health, Medicine and Life Sciences, Maastricht University, The Netherlands

Background and objectives: "Everybody in the European Union should be safe and free to be themselves." is the initial statement in the European Union (EU) document on the LGBTIQ Equality Strategy 2020-2025. However, this reality does not apply to all. The aim of this study is establishing a comparison on the grounds of LGR procedures between EU member states, specifically Malta, the Netherlands, and Hungary, bringing to Discussion the impact of LGR for trans population across these countries.

Methods: This document has been developed under a two-stage Methodology. A quantitative method was carried out to review the 27 EU Member States' compliance on Legal Gender Recognition indicators for further clustering and country selection. TransRights Map (TRM) is an online database platform on trans rights and protections. This tool was reviewed along with local LGR policies and regulations (qualitative stage).

Results: EU Member States were clustered into three groups according to the indicators they met. Hungary (Cluster 1) has complied with 0 of the indicators for LGR, with a law passed on March 2020 continues to burden trans on their everyday lives. The Netherlands (Cluster 2) with 7 indicators complied, amended the Civil Code in 2014 providing the elimination of the sterilization requirement for LGR. However, it still requires medical and/or psychological diagnosis or testimony to start running the procedure. On the other hand, Malta (Cluster 3), by means of the Gender Identity, Gender Expression and Sex Characteristics Act of 2015 entitles their trans population to update their legal gender based on self-determination and bodily integrity.

Conclusions: Comparisons between the countries vary from existence or disregard for LGR procedures to barriers and difficulties to achieve LGR. Inclusion of transgender population in the professional provision of care and decision-making process should be reinforced through knowledge production of scientific evidence and lived-experience evidence.

Health of migrants and ethnic minorities - medical and social aspects in Bulgaria

Mariela Kamburova¹

¹Medical University-Pleven, Pleven, Bulgaria

Background: Migrants and ethnic minorities (MEM) often face serious inequities concerning their state of health and their access to health services. These inequities are increasingly being brought to light by public health researchers, but action to tackle them has lagged behind.

Objective: To explore medico-social problems of migrants and persons of Roma origin, aspects of their health care and effects of the COVID-19 epidemic among the Roma ethnic group in Bulgaria.

Materials and Methods: A complex observational cross-sectional study and participatory health research have been conducted. The migrant and minority status of the covered persons as factors determining the health risk factors and the preparedness of the health system in Bulgaria to respond to specific health problems of MEM was analysed. Quantitative and qualitative data were collected through an unstructured interview. Summary criteria for reporting qualitative research: COREQ - checklist was used. Data processing was performed by SPSS v.24.

Results: The study confirms the hypotheses: Roma population is characterized by an unfavourable risk constellation and an unfavourable health profile; the health services provided to the persons of Roma origin are inadequate to their needs; the opinion of the citizens of Roma origin about the effect of the anti-epidemic measures on their lives is negative; the health system in the country is not prepared to meet the health needs of migrants. The study does not confirm the hypothesis that the opinion of the society and front line specialist is that health status of migrants does not affect negatively public health in Bulgaria.

Conclusions: Negative aspects in health status and in the distribution of health determinants are more common among MEM in Bulgaria. In order to establish MEM friendly health system and to improve the quality of services provided development and enhance skills of professionals working at local level is crucial.

Impact of work and working conditions on low back pain among fisher women: a cross sectional study in Trivandrum

Jazeela A.¹

¹Sree Chitra Institute of Medical Science and Technology, India

Background: Musculoskeletal problems are observed to be higher in the low-income group of people who are engaged in physically demanding jobs. **Objectives:** The purpose of this study was to find the prevalence of Low Back Pain and associated factors for low back pain in coastal fisherwomen. **Methods:** Cross-sectional study was conducted among 336 fisherwomen aged 18 to 49 years from 7 out of 16 fishing villages in Trivandrum Corporation which were randomly drawn. Prevalence of Chronic Low Back Pain was estimated using Nordic Body Map and screening questions which rule out pain occurrence in the past 3 months, past 6 months, and past one year. Pearson Chi-Square test and binary logistic regression were performed to understand the association between chronic low back pain and pain severity with associated factors.

Results: The prevalence of low back pain in coastal fisherwomen was determined to be 45%. Higher BMI, histories of UTI, stress induced headaches, fall, physical abuses, higher frequency of drinking water collection, more years of fishing related work, not standing for long while working were found to be associated with chronic low back pain. Lesser income, not standing while working, improper seating while work, not designating stipulated time during work were found to be associated with pain severity in bivariate analysis. In binary logistic regression, all the factors except lesser monthly income and stipulated time for rest became predictors for pain severity. **Conclusions:** Our study demonstrated that Low back pain is a common problem among fisherwomen. Correcting the working environment and posture gains importance.

Evidence on tuberculosis in migrants at Brazil's international borders: a scoping review

Inês Fronteira¹, Débora Soares², Aline Placeres³, Ricardo Arcêncio⁴

¹Global Health and Tropical Medicine Institute, Lisbon N University, Lisbon,

Portugal, ²Global Health and Tropical Medicine Institute, Universidade

Nova de Lisboa, Portugal, ³Global Health and Tropical Medicine Institute,

Universidade Nova de Lisboa, Lisbon, Portugal, ⁴Escola de Enfermagem de

Ribeirão Preto, Universidade de São Paulo, Vila Monte Alegre, Brazil

Objectives: to map scientific evidence on the extent of tuberculosis in migrants from the international borders between Brazil and the countries of South America. **Design:** Scoping review of quantitative, qualitative and mixed studies. The research was conducted between February and April 2021. The terms "migrants", "tuberculosis", "Brazil", "Uruguay", "Paraguay", "Bolivia", "Peru", "British Guiana", "English Guiana", "French Guiana", "Suriname", "Venezuela", "Argentina", "Colombia" combined with Boolean operators "AND" and "OR" to identified relevant documents. Studies addressing tuberculosis on migrants from international borders of Brazil were included. Pubmed Central (PMC), LILACS (Scientific and technical literature of Latin America and the Caribbean/BVS), Scopus (Elsevier), Scielo (Scientific Electronic Library Online) and gray literature CAPES thesis database were searched. The study was carried out in three stages where the data was selected and extracted by two independent reviewers for full reading.

Results: A total of 705 articles were extracted from the databases chosen for the search, 04 master's dissertations and 01 doctoral thesis. A total of 58 documents were, thus, selected for assessment of the full text. Of these, 40 were further excluded for not meeting at least one of the eligibility criteria. A total of 18 studies were included for data collection: 15 articles, 2 master's dissertations and 1 doctoral thesis, produced between 2002 and 2021.

Conclusions: This scoping review mapped the existing evidence on tuberculosis at the international borders of Brazil and on access of immigrants with tuberculosis to health services in Brazil. Descriptors: tuberculosis; immigrants; public health surveillance; epidemiological surveillance; sanitary control of borders; health services accessibility

Perceived importance of interviewees' information when giving

health support interviews to former prisoners: a cross-sectional study of public health nurses in charge of lifestyle-related diseases in Japan

Ryoko Kawasaki¹, Mayumi Mohnishi¹

¹Graduate School of Biomedical Sciences, Nagasaki University, Japan

Background and Objective: This study targeted public health nurses (PHNs) who provide health support in lifestyle-related diseases as public servants of their local government in Japan, and investigated the influence of having or not having experience in providing health support to former prisoners on their perceived importance of collecting information during interviews.

Methods: A cross-sectional study was conducted using self-administered questionnaire. Three copies of the questionnaire were mailed to each of the 1,724 municipalities of Japan (5,172 copies in total) from November 5 to December 20, 2021. Responses were obtained on a four-point scale of "very important", "important", "not very important" and "not important" for seven types of information that should be ascertained when interviewing former prisoners. This survey was conducted after review and approval by the Ethics Committee of the presenters institution.

Results: A total of 1,371 responses were received (response rate: 26.5%), with 1,324 valid responses. Of the respondents, 204(15.4%) of PHNs indicated that they had experience in providing health support to former prisoners. Logistic regression analysis was conducted using the experience of providing support to former prisoners as the dependent variable, with years of experience and gender as adjustment variables, in relation to the perceived importance of information to be confirmed when meeting with former prisoners. The information that PHNs with experience providing support to former prisoners perceived as "most important" for health support were family structure (AOR:1.52, 95%CI: 1.09-2.10), economic status (AOR:1.64, 95%CI: 1.20-2.25), contact information of supporters (AOR:2.03, 95%CI: 1.48-2.79) and type of crimes (AOR:1.55, 95%CI: 1.10-2.20), while length of prison sentence (AOR:0.96, 95%CI: 0.64-1.45), medical history (AOR:0.97, 95%CI: 0.61-1.53) and educational status (AOR:1.17, 95%CI: 0.85-1.61) were not statistically significant.

Conclusions: When providing health support to former prisoners, PHNs more likely addressed type of crimes committed rather than their length of prison sentence.

University, Australia, ⁴Flinders Health and Medical Institute (FHMRI),

Flinders University, Australia, ⁵Indigenous Allied Health Australia, Australia,

⁶College of Healthcare Sciences, James Cook University, Australia, ⁷Flinders

University, Australia, ⁸Dhupuma Foundational Education Centre, East Arnhem

Land School, Australia

Background and Objective: In Australia's most remote regions, insufficient health workforce to prevent and manage serious chronic disease is one contributor to a high burden of poor health. The discourse around Australian First Nations people generally focuses on disadvantage while overlooking their cultural strength, capability and diversity. Our Objective was to co-design and deliver a culturally responsive student-implemented rehabilitation and disability service through a partnership that demonstrated strengths of First Nations Yolŋu culture, while at the same time, filled a workforce gap, addressed health inequities, and educated future clinicians in-place in remote East Arnhem Land (Northern Territory). **Methods:** In 2019, we co-designed, delivered and evaluated a student-implemented service with an emphasis on cultural immersion for the students. Our aim was to understand (via interview and service data) the feasibility and acceptability of the service to Yolŋu community members. Resuming post-covid, a 2022 project has involved an economic analysis of the student implemented service compared with other service models, and in 2023, the evaluation will specifically focus on a culturally responsive cardiac rehabilitation and prevention service. **Results:** To date, 17 students, more than 100 Yolŋu community members, and more than eight organisations have contributed to the service and the students learning. Cultural education and support have been provided through employed Yolŋu cultural experts. The service has been shown to be acceptable and feasible with two-way learning between students and Yolŋu participants as a key underpinning of the service demonstrating cultural responsiveness. The economic analysis is underway with Results available by the conference; the initial implementation of

the cardiac rehabilitation service will also be described. **Conclusions:** Embracing the strengths of First Nations Peoples is a critical component of culturally responsive healthcare to manage and/or prevent decline in chronic disease while addressing health inequities through student-implemented services.

Violence against sexual minorities in Brazil: analysis of the National Health Survey, 2019

Deborah Malta¹, Nadia Vasconcelos¹, Francielle Alves¹, Gisele Andrade¹

¹Universidade Federal de Minas Gerais, Brazil

Background and Objective: Prejudice against sexual diversity is one of the faces of Gender-based Violence. Lesbians, gays, bisexuals, and other sexual minorities (LGB+) are victimized all over the world and Brazil is considered the most violent country against this population. However, there is a lack of data on this condition in the country. Thus, the aim of this study was to analyze the association between self-reported sexual orientation and violence in the Brazilian population. **Methods:** Cross-sectional epidemiological study using the 2019 National Health Survey database. Total violence and its subtypes (psychological, physical, and sexual) in the last 12 months were analyzed. Prevalence and Adjusted Odds Ratio (ORaj) by age group were estimated, with their respective 95% confidence intervals (95%CI), according to self-reported sexual orientation of the population over 18 years in Brazil.

Results: The Brazilian population report themselves mostly as heterosexual (94.75%), and 1.89% declaring themselves LGB+. The prevalence of total violence in Brazil was 18.27%, being lower among heterosexual men (16.35%; 95%CI: 15.62-17.11), while LGB+ women had the highest prevalence (42.51%; 95%CI: 36.26-49.01). The LGB+ population was more than twice as likely to experience any type of violence (ORaj: 2.52; 95%CI: 2.08-3.07). LGB+ women were more than three times more likely to experience physical violence compared to heterosexual women (ORaj: 3.18; 95%CI: 2.09-4.83). Meanwhile, LGB+ men were almost eight times more likely to experience sexual violence than heterosexual men (ORaj: 7.76; 95%CI: 3.38-17.81). **Conclusions:** Violence against the LGB+ population was highly prevalent in the country. LGB+ women had the highest prevalence of all subtypes of violence and heterosexual men the lowest. Public Policies aimed at this population are necessary to address prejudice against sexual diversity and guarantee the rights of non-heterosexual people.

Causa-mortis: sex, gender, race, and ethnic disparities in AIDS obituaries in the US: 1982-2000

João Ferreira¹

¹Universidade de São Paulo, São Paulo, Brazil

There continue to be disparities in post-mortem descriptions of human immunodeficiency virus-acquired immunodeficiency syndrome (HIV-AIDS) deaths among homosexual men, lesbians, and trans people. In this research, we examined AIDS obituary records in the United States from 1982 to 2000, considering sex, gender, and racial/ethnic differences. To understand how the causes of death were recorded in obituaries of individuals who had died from HIV-AIDS complications, we studied two lesbian, gay, and transgender (LGT) obituary collections: (i) the obituaries from the Bay Area Reporter and (ii) the AIDS archive from the Arthur and Elizabeth Schlesinger Library. Five-thousand-three-hundred-eighty obituaries were extracted. Studying how AIDS deaths were publicised in the press, the intersectional analysis of sex, gender, race, and ethnicity showed that there were continuing inequalities in how post-mortem transcripts were publicised in obituaries in the 1980s and 1990s. Although the cause of death in AIDS obituaries of white homosexual men (n = 4140; 94.20%) was mostly informed by the generic term "cancer" – and its euphemisms and variations – among African Americans (n = 465; 85.30%) and Latino (n = 145; 87.90%) homosexual men, the cause of death transcript from "complications resulting from AIDS" was more prevalent. The obituaries, produced mostly by family members, friends, partners, and journalists, also showed how stigmatised communities learned to name the disease and portrayed it using the current pathological language. Not coincidentally, the more direct transcripts that pointed to the term "AIDS" were more prevalent in the obituaries of people racialised by colour, provenance, and social origin.

The impact of the COVID-19 pandemic on the mental health of Filipino migrant domestic workers in Hong Kong

Yeuk Tran¹, Leonard Lim^{2,3}

¹The Chinese University of Hong Kong, Hong Kong, China, ²College of Medicine, University of Philippines, Philippines, ³London School of Hygiene and Tropical Medicine

Background and Objectives: During covid-19, Filipino migrant domestic workers' lifestyles were greatly restricted, largely at the discretion of their employers. As these workers usually lived with their employers, they were asked to remain at home 7 days a week and cut off from their social network and other support systems. This study aims to explore the impacts of covid-19 on their mental health.

Methods: A territory-wide online survey was distributed to 205 Filipino migrant domestic workers in 2022. Participant's experience and perception of covid-19 were used as the main independent variables. General anxiety disorder-7 (gad-7) and patient health questionnaire-9 (phq-9) were used to assess the participant's anxiety and depression symptoms, respectively. A higher score in both the gad-7 and phq-9 meant worse mental health outcomes. General linear models were performed separately after adjusting for socio-demographic factors.

Results: Out of the 205 participants, 32 (15.6%) showed moderate to severe anxiety while 31 (15.1%) showed moderate to severe depressive symptoms. Support from friends in Hong Kong was associated with higher gad-7 (β 1.821; ci 0.363, 3.279) and phq-9 (β 1.833; ci 0.528, 3.138) scores. Support from employers (β -1.925; ci -3.362, -0.488) and from families in the Philippines (β -1.886; ci -3.334, -0.438) were associated with lower gad-7 scores. Support from family in the Philippines (β -2.389; ci -3.686, -1.093) was associated with lower phq-9 scores. **Conclusions:** There have been relatively high rates of anxiety and depressive symptoms amongst Filipino migrant domestic workers during the pandemic. Their support systems play an influential role in mental health outcomes. The changing nature of these support systems compared to pre-pandemic may affect the way mental health is impacted. Future studies can investigate how these support systems have changed over the pandemic.

At all times, we were accompanied by the association: the experiences of refugee families in access to health care in Portugal

Sónia Dias^{1,2}, Filipa Rodrigues^{3,4}, Sónia Dias^{5,6}, Maria Martins⁷

¹NOVA National School of Public Health, Public Health Research Centre, Universidade Nova de Lisboa, Lisbon, Portugal, ²Comprehensive Health Research Center, Universidade Nova de Lisboa, Lisbon, Portugal, ³NOVA National School of Public Health, Public Health Research Centre, Universidade NOVA de Lisboa, Lisbon, Portugal, ⁴Comprehensive Health Research Center, Universidade NOVA de Lisboa, Lisbon, Portugal, ⁵NOVA National School of Public Health, Public Health Research Centre, Universidade NOVA de Lisboa, Portugal, ⁶Comprehensive Health Research Center, Universidade NOVA de Lisboa, Portugal, ⁷Portuguese Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Lisbon, Portugal

Conflicts worldwide continue to force millions of refugees to displacement. Refugees are a group well known to experience social and health vulnerabilities. Refugee children's health is influenced by complex factors, including healthcare access of caregivers in host countries. Experiences of refugee families in navigating the health services are little known. This study aimed to explore the refugee caregivers' perceptions of their children's access to health care in Portugal. In this qualitative study, semi-structured interviews were conducted between July and November 2022 with n=22 refugee caregivers mainly from Afghanistan, Syria and Ukraine. The interview guide addressed refugee caregivers' opinions and experiences regarding their children access to health care in Portugal. Data were analysed through thematic analysis. Interviews were transcribed and coded independently by two researchers. Three themes emerged from the interviews: refugees' healthcare-seeking behavior, barriers and facilitators in access to health care. Parents reported to seek hospital care for children health emergencies or when were unable to access primary health care. The long waiting times for appointments and language difficulties were pointed out as major barriers. Lack of continuity of care for children and family health problems was reported as a consequence. Facilitators in access to health care included social support from local organizations, family members and community. Caregivers highlighted the role of this social support in helping them in accessing and navigating the health services, in becoming familiar with a new health system, in making appointments and in helping with communication during visits. Refugee families experience

structural barriers that are common to the general population but also specific constraints, such as language and communication difficulties, that must be addressed. Social support networks are crucial for refugee families' access to health care and integrating their resources may contribute to strengthen health systems responsiveness to minorities needs in access to healthcare.

Sociodemographic factors associated with the degree of medical knowledge in the care of transsexual and transgender patients in Veracruz, Mexico

Carolina Pérez¹, Iant Reyes¹, Josue Villegas-Dominguez², Carolina Taffoya³, Carlos Montero⁴

¹School of Medicine, Universidad Veracruzana, Mexico, ²Universidad Veracruzana, Mexico, ³Carolina S.A, Mexico, ⁴Carlos Montero Md, Mexico

Background: According to a survey carried out by the National Institute of Statistics and Geography, the LGBTI+ community constitutes 5.1% of the population over 15 years of age. Within the medical services that these patients use, 52.2% are treated in public institutions where they are attended by general practitioners. Mexico doesn't have doctors specialized in patients from the Trans community in public health institutions, so knowledge in the management of first contact doctors is essential to provide quality care to this population.

Objective: To determine the sociodemographic factors associated with the degree of doctors knowledge about the transsexual and transgender patient

Methods: An observational, analytical, cross-sectional and prospective study was carried out applying a Questionnaire of Knowledge about the Care of the Transgender Patient (a Cronbach 0.77) that has a maximum of 42 points. General practitioner, medical interns and family physician from Veracruz, Mexico was included. The variables age, gender, sexual orientation, training on the topic, religion, workplace, university graduation time, previous care of LGBT+ patients and having friends from the LGBT+ community were studied.

Results: 116 doctors were included, 54.3% were men, 87.9% were cisgender, 69.0% heterosexual, aged 30.4(±11.2) years. The results of the knowledge test show a score of 16.6 (±5.6) correct answers, with a maximum of 29 and a minimum of 4; 20.7% with a score higher than 21, showing differences (p<0.05).

Conclusions: The level of knowledge of primary care physicians is very low, so it is necessary to provide formal training in this area, since despite having factors associated with "higher" knowledge, this level is insufficient for according to the observed scores.

Attachment and disordered eating: a cross-sectional study of young Lebanese adults encompassing gender and sexual orientation differences

Rim Nehme¹

¹American University of Beirut, Beirut, Lebanon

At present, research indicates that insecure attachment is linked with disordered eating. However, there is no consensus on the potential differences in attachment and disordered eating considering people with conforming and non-conforming gender and sexual orientation. This study aimed to assess the differences among people of different genders and sexual orientations in attachment and disordered eating. In this study, 103 young Lebanese adults aged between 18 and 25 were recruited online and took the Experiences in Close Relationships Scale – Short Form (ECR-S) and Eating Attitudes Test (EAT-26). Conclusively, participants were grouped as either cis-heterosexual (n=62; 59%) or LGBTQ+ (n=41; 39%). Attachment anxiety was more prominent among persons who identify as LGBTQIA+ than cis-heterosexuals (U = 2.35, p = .019). Although there were no differences in levels of disordered eating between the two groups, disordered eating was positively correlated with attachment avoidance in cis-heterosexuals (rs = .27, p = .021) and with attachment anxiety in LGBTQIA+ individuals (rs = .38, p = .008). Women had significantly higher levels of disordered eating than men in the cis-heterosexual group (U = 238.5, p = .023), while this relationship was absent within the LGBTQIA+ group. The findings suggest the possibility of different expressions of attachment and mechanisms for disordered eating based on gender and sexuality. This study may drive future research to understand the expression of eating disorders considering the individual's underlying attachment, gender, and sexuality.

Health care access in times of COVID-19: the experiences of

refugees in Lisbon

Vanessa Portela¹, Sousan Hamwi², Maria Martins³

¹Institute of Hygiene and Tropical Medicine, Nova University of Lisbon, Portugal, ²Institute of Public Health of the University of Porto, Portugal,

³Global Health and Tropical Medicine, Institute of Hygiene and Tropical Medicine, Nova University of Lisbon, Portugal

Background and Objective: To address the health needs of refugees it is essential that health services are culturally competent and facilitate the access of this population to health care, especially in a context prone to the amplification of social inequities as the COVID-19 pandemic. However, no studies exist in Portugal exploring refugees' access to health during COVID-19 pandemic. The Objective of this study is to describe socioeconomic and demographic characteristics of refugees living in Lisbon and to identify their health care patterns during the COVID-19 pandemic.

Methods: A cross sectional descriptive study was conducted from May to November 2022. A 38-item questionnaire was applied to 36 refugees living in Lisbon through face-to-face interviews. Descriptive statistics were used to characterize sociodemographic and healthcare access profile during COVID-19. **Results:** The majority of participants were male (56%), with a mean age of 35 years, 72% were married, most had at least a secondary education (69%), but more than half were unemployed; the respondents came from seven countries and all had been integrated in the Refugee Reception Program; the median length of stay was 17 months. All were registered in a primary care center and during the pandemic, 94% used healthcare services. The majority tested negative for the coronavirus (58%), one was admitted to hospital due to severe COVID-19; most participants were compliant with preventive measures and 97% received COVID-19 vaccination; 69% had an incomplete schedule. More than half didn't seek health care because of structural and cultural barriers and most had difficulty getting medical advice by phone or email (57.7%) during the pandemic.

Conclusions: This is the first study exploring health care access among refugees in Portugal during the COVID-19 pandemic. Identified population characteristics and barriers signal the need to devise strategies necessary to the improvement of access to health care.

International immigrant health access and vulnerabilities in the context of COVID-19 dissemination in Brazil

Denise Martin¹, Daniel Granada², Silvia Viodres³, Mariá Lanzotti⁴, Nicolas Neves⁴, Regina Matsue⁴, Cássio Silveira⁵

¹Department of Preventive Medicine, Universidade Federal de São Paulo, Brazil, ²Universidade Federal de Santa Catarina, Brazil, ³PROMIGRAS - Unifesp, Brazil, ⁴Universidade Federal de São Paulo, Brazil, ⁵Faculdade de Ciências Médicas da Santa Casa de São Paulo, Brazil

The aim is to identify the problems related to the health access and social protection of international migrants and refugees regarding the needs of this population during the pandemic of COVID-19 in Brazil. Considering the social and territorial inequalities in Brazil, the consequences of the pandemic are more severe due to critical situations of social vulnerability that intensely harm the most impoverished populations, including international migrants. This research seeks to investigate how confinement and the subsequent health crisis impacted the lives of migrants in terms of healthcare access and their vulnerability, aggravated by the pandemic. We conducted qualitative research based on Anthropology from 14 in-depth interviews and participant observation with migrants and refugees living in Sao Paulo metropolitan area. The interviews were conducted from October to December 2022 with migrants from Bolivia, Venezuela, and Haiti. Preliminary Results show that most live in vulnerable neighborhoods, enhancing structural violence. Migrants shared situations of job insecurity, struggle to maintain household income, and sometimes, cases of bare subsistence. Despite financial emergency assistance from the government, many needed help accessing it due to a lack of access to technology and bureaucratic burdens. Fake News plays an essential role in health misinformation, especially regarding vaccination. Some women interviewed commented about obstetric and domestic violence. Religion is also a resource to deal with fear and losses. Healthcare access in Brazil is universal through the Brazilian Health System (SUS). Many factors interfere with adequate access to healthcare services: cultural and linguistic differences can be a source of stigmatization, and the social vulnerability derived from an indeterminate citizenship status act as a barrier. This research can contribute to identifying problems experienced by these people and provide a map of their social and health needs, enabling the formulation of subsidies for public policies that aim to eliminate inequalities in service access.

Surgical-reparative and psycho-social interventions in women with Female Genital Mutilation of III type (deinfibulation)

Sara Riefolo¹, Silvana Patricelli¹, Rossella Carnevali¹, Maria Guerra¹, Anna Simeone¹, Francesca Donadio², Marina Marceca², Giancarlo Santone³

¹ASL Roma 1 (Public Local Health Authority), SAMIFO Center, Rome, Italy,

²Department of Gynecology and Obstetrics San Filippo Neri Hospital, ASL Roma 1, Rome, Italy, ³SAMIFO Centre, ASL Roma 1, Rome, Italy

Background and Objective: Female Genital Mutilation (FGM) is a procedure involving the modification of the external genitalia, for cultural or other non-therapeutic reasons. In recent years, the SAMIFO Centre (Salute Migranti Forzati) has increasingly received requests from women with FGM, more specifically, with type III FGM (permanent infibulation). Based on this experience, it is therefore deemed necessary to start developing collaboration between public health actors. **Methods:** The verification and typology of FGM is carried out by the obstetric-gynaecological unit at SAMIFO which evaluates the necessary steps. The entire process is coordinated by a case manager. Three different pathways have been envisaged for: (i) pregnant women, (ii) non-pregnant women with physical problems and (iii) non-pregnant women with psycho-sexual problems. The pathway is organized as follows: 1. Identification and Classification of FGM, 2. Obstetrics Gynecological Counseling, 3. Followup meeting, 4. Psychological Counseling, 5. Prehospitalization, 6. Collaboration with S. Filippo Neri hospital for deinfibulation surgery (if patient under pregnancy, preferably in the second trimester of pregnancy), 7. Follow up (both gynaecological and psychological)

Results: Starting from 2021, out of a population of 137 women received, 3 have completed the process. 4 patients are at an advanced level of the process.

Conclusions: The multidisciplinary approach enabled the women who accepted the pathway to be able to fully recover on both gynaecological and psychological level. In addition, two of them were able to give birth physiologically with a good recovery of the sexual dimension. For all the patients received, it was possible to activate a dialogue on issues of femininity and sexuality during the consultation.

Immigration as a determinant of COVID-19 testing among children: a cohort study in Amadora, Lisbon Metropolitan area, Portugal

Iolanda Alves¹, Iolanda Alves², Maria Martins², Silvia Panunzi³

¹Global Health and Tropical Medicine (GHTM), Institute of Hygiene and

Tropical Medicine (IHMT), NOVA University of Lisbon (UNL), Lisbon, Portugal, ²Global Health and Tropical Medicine (GHTM), Institute of Hygiene and Tropical Medicine (IHMT), NOVA University of Lisbon (UNL), Portugal,

³Unit of Epidemiology and Medical Statistics, Department of Diagnostics and Public Health, University of Verona, Italy

Background and Objective: Vulnerable populations, such as adult immigrants, are proportionally over-represented in reported COVID-19 cases and underrepresented in COVID-19 testing rates. Worldwide, evidence is lacking on immigrant children's access to COVID-19 diagnostic tests. Immigrant children (i.e., those born outside or with at least one parent born outside the EU) are subject to adverse social determinants of health. As a result, they tend to use less primary care and more emergency services. This study aimed to analyse immigration as a determinant of COVID-19 testing among children living in Amadora, Lisbon Metropolitan Area, Portugal.

Methods: We link data from a prospective cohort study, conducted since 2019, on 420 native and immigrant children born in 2015 and living in Amadora, with administrative health records on COVID-19 tests. Testing data between March 2020 and October 2022 were used to estimate prevalence ratios for having ever done a test (yes/no), through Robust Poisson regression; to estimate determinants of the number of tests a Poisson regression model was used.

Results: The sample was balanced between immigrant (52%) and native (48%) children. Overall, 356 (85%) children were tested for COVID-19 during the period considered, among the non-tested group 84% were immigrants. The median number of tests undertaken was 3 tests per child (3 for natives and 2 for immigrants). Models adjusted for children's sex and birthweight, caregiver's sex, age, education level, employment status, and monthly household income, consistently showed higher prevalence ratios of ever being tested for COVID-19 in natives. Analogous results were obtained for the number of COVID-19 tests.

Conclusions: This study, the first in Portugal to provide evidence on children's access to COVID-19 diagnostic tests, suggested immigrant children face barriers to this service. Interventions in the large-scale forces that impact health are needed to reduce health inequalities in children.

The cedar project: indigenous experiences of connection and survival amidst conflicting colonial responses to the opioid, housing, and health crises of the COVID-19 pandemic

Chenoa Cassidy-Matthews¹, Chenoa Cassidy-Matthews¹, Jorden Hendry¹, Sherri Pooyak², Jeff Reading³, Patricia Spittal¹, Nadine Caron¹, Martin Schechter¹, Wayne Christian⁴

¹University of British Columbia, Canada, ²CAAN Canada, ³Simon Fraser University Canada, ⁴Splatsin First Nation Canada

Background and Objective: Connection is critical to the health and wellbeing of Indigenous Peoples who use drugs (IPWUD) - connection to family, cultural supports, and circles of care. During the COVID-19 pandemic, urban IPWUD are more likely to face multiple harms from ongoing opioid and housing crises in British Columbia, Canada. Despite early, effective Indigenous community-mobilized responses to protect against COVID-19 infection, many urban Indigenous Peoples were disconnected from that support as a result of blanket colonial responses. Indigenous Peoples have always found ways to survive through emergency situations, and this paper uplifts the experiences of urban IPWUD navigating respective colonial responses to COVID-19.

Methods: Nineteen semi-structured interviews were completed with Indigenous Peoples enrolled in the Cedar Project COVID-19 Study in Vancouver (n=9) and Prince George (n=10), Canada. Interpretive description was adapted to identify themes across participants' stories. Emerging themes were brought back to participants for member checking using iterative, arts-based techniques.

Results: Interviews were conducted in-person between March-May 2022. Median age of participants was 36, with 37% male and 63% female. Four broad themes were identified: 1) colonial responses to COVID-19 have not aligned with the needs of urban IPWUD, forcing people into crisis situations; 2) People in crisis frequently have no place to go: to eat, sleep, for ceremony, to live safely; 3) Connection is protection against the stresses of precarity and isolation; 4) Emotional responses to COVID-19 are rooted in intergenerational trauma, connected to the Indian Act and colonialism.

Conclusion: Urban IPWUD face emergencies that threaten daily security, safety, and health. This study amplifies that Indigenous Peoples are the experts in determining how to best survive and thrive through these health emergencies. Further research will inform Indigenous-specific and Indigenous-led responses, and incorporate these findings into quantitative analyses to better understand how to uplift urban IPWUD going forward.

The role of socioeconomic situation and social support on health perception among Ukrainian refugees in Czechia

Michala Lustigova¹, Dagmar Dzurova², Ivana Kulhanova³

¹Charles University, Czechia Faculty of Science, Charles University, Czechia Albertov 6, Prague 2 Czech Republic, ²Charles University, Czechia, ³Charles University Faculty of Science, Charles University, Czechia Albertov 6, Prague 2 Czech Republic

Background and Objective: Ukrainian refugees have experienced many stressful situations because of war, migration, and resettlement. Besides physical and mental health, social health is also very important in the case of refugees, as they are separated from family members and friends. The main goal of this study is to investigate the effect of socioeconomic situation (SES) and social support on health perception among Ukrainian refugees settled in Czechia after February 2022.

Methods: The study is based on the 3rd wave of online interview surveys among refugees from Ukraine. The survey took place in September 2022, and 1,347 respondents participated. Representativeness was ensured by a combination of random stratified sampling and subsequent data weighting. We used binary logistic regression to qualify the effect of several SES and social support characteristics on no-good health perception in an adult population below 65 years of age (N=1,331). All models were controlled for age, sex, education, physical and mental health.

Results: We found the effect on no-good health perception in case of low degree of concern by others (final model adjusted for all controlled and independent variables; OR=1.55, 95%CI 1.05-2.27), low ability to get help (OR=1.92, 95%CI 1.23-3.02) and high material deprivation (OR=1.64, 95%CI 1.03-2.59). On the other hand, the number of close persons, knowledge of the Czech language, amount of income and having a job were not found as significant predictors of health.

Conclusion: Not only providing material support for refugees is crucial, but also the development of interpersonal relationships based on trust and concern is

essential for improving the social health of refugees so that they receive social support from others in the host country.

Violence and depression among men who have sex with men in Tanzania

Lucy Mgopa¹, Lucy Mgopa¹, Jessie Mbwambo¹, Samuel Likindikoki¹, Pedro Pallangyo²

¹Muhimbili University of Health and Allied Sciences Dr P.O Box 65001, Dar es Salaam, Tanzania Tanzania, ²Jakaya Kikwete Cardiac Institute Dr P.O Box 65141 Tanzania

Background and objective: Men who have sex with men (msm) continue to be at an increased risk of violence, HIV Transmission and mental disorders, as a result of their sexual orientation. In this study, we aimed at determining the magnitude and source of violence, extent of depressive symptoms among MSM

Methods: We recruited 345 MSM using a respondent driven sampling Technique. Revised conflict tactic scale, PHQ-9 and questions adapted from the tdhs 2010 were used to assess for violence, depression and HIV-Risk behaviors respectively. Continuous and categorical variables were analyzed with student's T-Test and CHI-Square test respectively. Logistic regression analyses were performed to assess for predictors of depression and HIV-risk behaviors. All tests were two sided and p<0.05 was taken as significance level.

Results: Overall, 325 (94.2%) of participants experienced any form of violence, with emotional violence constituting the majority (90.1%), while physical and sexual violence were reported by 254 (73.6%) and 250 (72.5%) of participants respectively. Depressive symptoms were present in 245 (70.0%) and participants who experienced violence had a 3 times increased risk of depressive symptoms compared to their violence-free counterparts, p<0.001. On the other hand, participants who experienced any form of violence displayed an over 11 times increased rate of depressive symptoms compared to their counterparts who were violence free, p<0.001. Violence experience was found to be the strongest associated factor for depressive symptoms.

Conclusions: The rates of violence, depressive symptoms and HIV risk behaviors amongst MSM are astoundingly high thus necessitating extensive interventions. In view of this, deliberate measures to deal with the reported high rates necessitate joint intervention efforts from the policy makers, health providers and community at large.

Corpus delicti: the medico-legal evaluation of somatic outcomes in asylum seekers victims of torture and other inhuman and degrading treatments in the Metropolitan City of Rome, Italy

Erica Bacchio¹, Erica Bacchio¹, Martino Volpatti¹, Micol Maggio Tummiolo¹, Carlo Bracci¹, Giancarlo Santone¹

¹Samifo Centre, ASL Roma 1 (Public Local Health Authority), Via Luigi Luzzatti n°8,, 00185, Rome, Italy

Purpose

Migrants applicants for refugee status in Italy are examined through detailed interviews by the Territorial Commission to decide whether the asylum seeker meets the criteria to be granted international protection. Medical reports can decisively influence the result of the application, demonstrating the vulnerability of asylum seekers and assessing the credibility of their narratives when an asylum seeker claims to be a victim of torture or other severe forms of violence in their country of origin. Our goal was to describe the cases of asylum applicants who have suffered from physical violence who were examined in our Health Centre based in Rome (SAMIFO - Forced Migrants Health Centre).

Methods: We retrospectively analysed the data from 187 asylum seekers who were examined according to the Istanbul Protocol methods in our Centre during the period between July 2021 and July 2022.

Results: The study shows important differences among countries regarding circumstances, methods and sequel of torture. Their homeland is mainly the Sub-Saharan Africa (mostly Nigeria, Gambia and Senegal) while many others are from Middle East. Violence is often perpetrated in the country of origin and along the migratory route, mostly during detention in Libya, where they faced inhuman and degrading conditions and the risk of torture, sexual violence, extortion, and forced labour. Most of the wounds observed were related to blunt force injuries, followed by sharp force injuries, and thermal injuries. In the remaining cases, there were findings of explosion and chemical damage. 39 % of the subjects evaluated showed evident signs of mental distress.

Conclusion: This study focuses on our experience in Rome based Health Centre

and concern the medico-legal evaluation of scars and lesions in asylum applicants who have declared themselves to be victims of physical violence.

Migration as a health determinant for asthma symptoms in children born in 2015, Lisbon region

Regina Amado¹, Regina Amado¹, Cláudia Conceição¹, Jaime Sousa², Maria Martins¹

¹Institute of Hygiene and Tropical Medicine, NOVA University of Lisbon, Global Health and Tropical Medicine, Portugal, ²School of Medicine, Minho University, Portugal

Background and Objective: Asthma is the most common chronic disease affecting children. There is a lack of evidence on the prevalence of asthma symptoms in immigrant children in Europe and no studies exist for Portugal. Asthma prevalence is generally higher in high-income countries and immigrant children tend to have a lower prevalence of asthma symptoms when compared to natives, which increases with the length of stay in the country of origin. The objective of this study is to analyze immigration as a determinant for the development of asthma symptoms in children born in 2015 in Amadora, Lisbon Metropolitan Area.

Methods: We are conducting a cross-sectional study since august 2022 nested within a cohort of 420 native and immigrant children, 6 /7 years old, living in Amadora. We implemented the International Study of Asthma and Allergies in Childhood (ISAAC) questionnaire. The main outcome is the frequency of asthma symptoms. Descriptive statistics were used to describe sociodemographic variables and Exact Fisher Test to analyze associations.

Preliminary Results: So far, 208 caregivers have been contacted, with a response rate of 32.2% (n=67). From those who responded, 56 (83.6%) are natives, 11 (16.4%) are immigrant and 41 are boys (61.2%). "Ever had wheezing" is present in 26 natives (46%) and 4 (36%) immigrants (p=0.74). "Wheezing or whistling in the chest in the past 12 months" is present in 5 (8.9%) natives and 3 (27.3%) immigrants (p=.17) and asthma has been previously diagnosed in 6 (10.7%) natives and 2 (18.2%) immigrants (p=0.61).

Conclusion: So far, the proportion of children having asthma symptoms in the past 12 months and of children previously diagnosed with asthma is higher in immigrants than in natives. However, the sample size is still very low do inferences. More data is necessary to evaluate the real burden of asthma in this population.

DOI: 10.18332/popmed/163842

A qualitative approach for understanding the health perceptions in a group of women in situation of prostitution

Andres Agudelo-Suarez¹, Maria Figueroa-Ospina¹, Manuela Laverde-Zuleta¹, Maria Perdomo-Ochoa¹, Kelly Zea-Jimenez¹, Marta Martinez-Gomez¹

¹Universidad de Antioquia, Colombia

Background and Objective: Women and trans people who have engaged in sex work are triply vulnerable since they are victims of discrimination due to their employment status, their gender, and the risks that this work entails. This situation impacts their health situation. This study aimed to know the perceptions about health (physical, mental, and oral) of four women who work in prostitution in Medellín, based on their life experiences and those related to their social context. **Methods:** A qualitative research with an ethnographic approach was conducted to analyze the situations mentioned, with the participation of four women; two of Venezuelan nationality and two of Colombian nationality, and semi-structured interviews were carried out. Qualitative content analysis was performed, which allowed the generation of four categories (mental health, oral health, general health, and quality of life).

Results: Their speeches made it possible to elucidate the connection between living conditions and the health situation. The lack of job opportunities, a migratory process of profound economic and social changes, and a Colombia with inequities and barriers to access to health and social services are determining processes of a general, particular, and singular order of the precarious conditions of oral health and general.

Conclusions: The participating population is in a situation of social and health vulnerability, which shows the need for public policies and strategies based on the social reality that contribute to generating equity in health.

Cytology in Brazilian transgender men: reflection of the shortages of health care assistance

Ana Pinheiro¹, Livia Monteiro², Beatriz Souza³, Marcos Pereira², Arthur de

Lima², Silas Ferreira³, Camila Araujo², Maite de Lima³

¹Mauricio de Nassau University Center, Brazil, ²Catholic University of Pernambuco, Brazil, ³Faculdade Pernambucana de Saúde

Background and Objective: Brazil has been expanding the discussions about sexual diversity and gender over the years, but is still not fully inclusive, especially in health promotion for transgender people. The research aims to evaluate the situation of cervical cancer screening in Brazilian transgender men, since, according to the Ministry of Health, it is the third most prevalent type of cancer in the population.

Methods: This is a cross-sectional quantitative study. Data were collected regarding the notification of cervical cancer cases in trans men on the DATASUS platform, the official means of government notification, from 2020 to 2022.

Results: According to the Brazilian Institute of Geography and Statistics (IBGE), in 2020, the estimated number of trans men in the Brazilian population was 9,905,916, but only 0.0009% performed the cytological exam, about 10 times lower than expected when compared to cis women, according to DATASUS. However, in 2021 and 2022, the percentages reached 0.022% and 0.015%, an increase of 2.4 and 16.6 times, respectively, when compared to cis women. This is possibly due to the lower expected number of exams performed in the pandemic period, with a drop of almost half of the procedures, as well as to the increased registration of the trans population in the official notification systems.

Conclusion: Despite the increase of notifications in 2021 and 2022, health information about transgender people in Brazil is almost nonexistent, because even with the numbers presented, there is still a statistical lag in the population census and a lack of public policies, which ends up keeping individuals away from the system and makes health promotion excluding. Thus, more incentives are needed to thoroughly include this population, so that the numbers reflect the reality of the country and resolute measures can be planned to encourage health promotion and preventive care.

Introduction: In the context of remote work/classes in universities during the pandemic, the sexual division of workload intensified the "care crisis" experienced by women-professors, perpetuating mechanisms of exploitation.

Objective: To give insight into the care crisis experienced by women university professors during the pandemic from a gender perspective.

Methods: The following study consists of both a quantitative and qualitative analysis of 642 active professors at the Federal University of Espírito Santo, carried out from May to April 2021, and conducted by the Association of Teachers of the Federal University of Espírito Santo (Adufes). Thus, the data was analyzed from a gender perspective juxtaposed with the concept of differences and sought to question the work overload experienced by women-professors.

Results: The work overload women-professors face relates to a sexual disparity

in labor, which imposes on women jobs reproduction labor in household settings, carried out unpaid, devalued and unacknowledged. The idea that social norms are designated by biological sex has led to an overwhelming amount of work for women-professors whom, during the pandemic, had a regular workload of more than 8 hours. This care crisis has denied many women the right to self-protection, making them much more vulnerable in the context of the pandemic.

Conclusion: It is necessary to carry out an analysis considering the different intersections that cross the experience of women-professors from a perspective of differences, revealing the work overload experienced by women. Therefore, the public sphere - production/wage labor - and the private sphere - reproduction/unpaid labor are valued differently. Thus, to acquire equality, it is necessary to welcome the difference between men and women, between women and between the subject woman and her condition in society as a woman.

¹ASL Roma 4 Italy

Background e objective

The Local Health Authority (ASL) Rome 4 is characterized by the presence of the port of Civitavecchia, one of the largest in Italy, as well as centers for refugees and areas with a high concentration of immigrants. During COVID 19 vaccination campaign, there was a strong request for access by foreigners without health care who, for various reasons, were on Italian territory and were unable to book on the regional portal. The Vaccination Service has tried to make access as easy as possible and to offer the most complete prevention path possible.

Methods: The following actions were carried out:

- * Dedicate section on the ASL website with all the information
- * Dedicated email for information and appointments
- * Connection with port authorities, cruise companies and voluntary associations
- * Vaccination forms in English
- * In Hubs: record previous vaccinations done abroad, issue STP code (healthcare assistance to temporarily present foreigner), complete vaccination schedule, offer flu vaccination coadministration, send to vaccination centers for the other vaccinations required by age or health condition
- * Traveling vaccination campers

Results: Between April 2021 and October 2022, 8277 temporarily present foreigner were taken into care. Only 597 came from European countries. The age most represented was between 20 and 39 years (5758), followed by that between 40 and 59 years (2194), 161 were the under 20s, 158 were between 60 and 79 years and only 6 were over 80 years old. The first 3 doses were equally distributed, mainly linked to the green-pass, while the second booster dose was very little requested. The primary course was completed in 85% of cases. 562 subjects also carried out the other scheduled vaccinations.

Conclusions: To facilitate access to vaccination services for foreigners temporarily present, is required an integrated approach as well as the taking over of all the activities related to prevention.

Language barriers during covid-19 vaccination for ukrainian refugees - the perceptions of healthcare professionals

Alessandro Bianconi¹, Giorgia Zanutto¹, Gisele Castagna¹, Angela Coa¹, Esther De Gioia¹, Giulia Longo¹, Gaia Sicari¹, Giulia Tomaiuolo¹, Davide Gori¹

¹University of Bologna Department of Biomedical and Neuromotor Sciences Italy

Background: The Russian invasion of Ukraine in early 2022 caused a humanitarian crisis, displacing many individuals. COVID-19 vaccination was proposed to Ukrainian refugees arrived in the city of Bologna that had an incomplete vaccination course. To overcome language barriers-related problems, the Local Health Authority provided anamnestic forms in Russian/Ukrainian languages and assured the presence of interpreters at the vaccination centers. This study aims to investigate the perceptions of vaccinators about working with an interpreter in the context of the Ukrainian crisis.

Methods: The study consists of a descriptive analysis of the responses to a questionnaire administered to vaccinators involved in the medical history collection of Ukrainian users. The questionnaire collected data relating to personal perceptions on professionals' experience.

Results: Twenty-four healthcare professionals participated in the survey. 70.8%

(n=17) were female. The mean age was 39 (of=14). 91.7% (n=22) declared they spoke a good level of professional English. Only one participant had specific training in working with interpreters during his/her education. Twelve participants (50%) thought that specific training in working with an interpreter should be integrated into medical education. Difficulties noticed sometimes/often/always by the participants were the uncertainty that the user got all the information (79.2%), uncertainty that the interpreter translated the exact words (66.7%) or the correct medical terminology (75.0%). Only 3 (12.5%) respondents always ask the user if he/she has understood everything. Finally, 66.7% (n=16) very/fully agreed in defining the interventions used as adherence facilitators to other doses/vaccinations.

Conclusion: This study highlighted the quasi-total absence of training in working with an interpreter in the healthcare professionals' curricula. Vaccinators are shown to be unsure about the interpreters' translation during the medical history collection. The Ukrainian refugees' COVID-19 vaccination showed that an ad hoc intervention to overcome the language-related problems was perceived as impactful by the majority of the professionals involved.

Healthcare access in people with functional diversity: A comparative health study between Greece and Spain

Jeny Cruz¹

¹Maastricht University Governance and Leadership in European Public Health Master, Faculty of Health Medicine and Life Sciences, Maastricht University, Maastricht, the Netherlands Sorbonnelaan 178 C16, 2467 LK Maastricht Netherlands

Background: The Convention on the Rights of Persons with Disabilities was held more than 15 years ago. Contrary to Spain, equitable access to health services for people with functional diversity is still far from being a reality in Greece. The aim of this study is to identify the barriers and factors that influence the high Unmet Needs for Medical Examination or Treatment (UNME/T) among people with functional diversity in Greece and explore what can be learned from Spain.

Methods: In October 2022, a literature review was conducted in PubMed, Web of Science, Google Scholar, and grey literature using keywords such as "health services"; "healthcare"; "disability"; "access"; "policy"; "Spain"; and "Greece". Furthermore, the UNME/T indicator in people with functional diversity was compared between Spain and Greece from 2012 to 2021. The data was extracted from Eurostat and disaggregated by sex.

Results: The percentage of UNME/T reported in Greece exceeded by 7 times the UNME/T in Spain in 2021. The difference in UNME/T between men and women with functional diversity is significantly higher in the Greek population than in the Spanish (2.7 vs. 0.2). Both countries shared communicative barriers regarding access to health information by the government, health institutions, and medical professionals. However, Greece specifically faced access obstacles regarding infrastructure, financial support, and social stigma. In contrast, Spain showed barriers to the healthcare waiting list and stigma in decision-making. While the Spanish healthcare system has been characterized by high access to primary care, the Greek system is still developing. Additionally, healthcare access in Greece was affected by budget cuts.

Conclusion: Strengthening primary care through a budget increase for health is paramount to reduce the medical unmet needs in people with functional diversity in Greece. Furthermore, developing intersectoral interventions to attend the health necessities in women are crucial to close the gender gap.

Popul. Med. 2023;5(Supplement):A1414

DOI: 10.18332/popmed/164300

Mortality among guarani indigenous peoples in south and southeast Brazil over a 15-year period (2000 to 2015)

Felipe Tavares¹, Yasmin Farias², Carla Barreto¹, Lidia Pantoja³, Aline Caldas⁴, Marcia Duarte¹, Andrey Cardoso⁵

¹UFF Brazil, ²Municipal Health Foundation of Niterói, ³COVIG/Niterói Brazil, ⁴ENSP/Fiocruz, ⁵ENSP/Fiocruz Brazil

Objective: To analyze the causes of mortality and its trends among the Guarani from the South and Southeast of Brazil over a 15-year period (2000-2015).

Method: This is a descriptive study based on data on deaths that occurred among the Guarani from the South and Southeast of Brazil during the years 2000 and 2015 and notified to the Subsystem for Health Care of Indigenous Peoples. For this purpose, the frequencies of deaths were analyzed according to DSEI of residence, age groups, gender and causes of death. Trends in mortality rates were analyzed using health indicators calculated for the years included in the analysis period.

Results: 560 deaths were reported, with an increase in the number of deaths

reported each year. Annual standardized general mortality rates varied around 5 deaths/1000 inhabitants (1.8/1000 to 4.7/1000), being higher in the DSEI Litoral Sul (DSEI LS: 3.8/1000; DSEI IS: 2.7/1000). Most deaths occurred in the first years of life. Respiratory diseases and infectious and parasitic diseases were the main defined causes of mortality, especially in children under 5 years of age. The IMR showed higher values for the DSEI Litoral Sul, reaching 48.8/1000 live births, higher in the post-neonatal period. There was an upward trend in the IMR, ranging from 10.3/1000 live births to 72.7/1000 live births. The need for improvements in primary health care directed to indigenous peoples is evident, the strengthening of the Indigenous Health Care Subsystem and the increase in health promotion actions, in order to prevent avoidable deaths in the population, particularly in the child population, and contribute to overcome ethnic-racial inequalities in mortality in the country.

DOI: 10.18332/popmed/164602

Practices to enhance diversity, equity, and inclusion in the health services research workforce: An environmental scan of us veterans health administration research centers.

D. Keith McInnes¹, Angela Kyrish², C. Blessing Egbuogu², Sierra Ferris², Leah Cubanski², Lynn Garvin², Marva Foster², Emma Quach², Ida Griesemer², Sarah Cutrona²

¹U.S. Department of Veterans Affairs & Boston University School of Public Health 2745 Turk Blvd. San Francisco, California 94118 United States, ²US Department of Veterans Affairs United States

Background: Healthcare-related research institutions are working to increase diversity among their researchers and staff. However, data on effective practices to grow and support a diverse health services research (HSR) workforce is sparse. Our study objective was to identify, describe, and evaluate practices that enhance hiring, promotion, and retention of employees from underrepresented groups (URGs) (such as race/ethnicity, gender identity, disabilities) in the HSR workforce. **Methods:** US Veterans Health Administration (VHA) oversees hospitals, health care clinics, and research centers. We reviewed the websites of VHA Centers of Innovation (COIN) research centers and documented practices to increase the hiring, promotion, and/or retention of URG employees. Additionally, we conducted semi-structured interviews with research center representatives to gather information on diversity, equity, and inclusion (DEI) practices, outcome measures, and barriers and facilitators to implementation and sustainment.

Results: Several themes emerged. For hiring, funding fellows and scholars from URGs often led to the hiring of trainees from URGs.

In the area of retention, anti-racism/diversity trainings, mentoring programs, and DEI advisory groups contributed to a culture welcoming to URG researchers. Promotion often entailed mentoring initiatives to assist staff and investigators with career advancement.

Sustainment of DEI was supported by financial resources (e.g. providing attractive start-up packages to URG candidates), institutional leadership support, and sharing of DEI responsibilities among staff and investigators across the institution.

Barriers to sustainment included lack of financial resources, faculty/staff resistance to change, and burnout among individuals leading DEI initiatives. Measurement of DEI progress often involved surveys of research center employees to understand institutional climate and contributors to negative perceptions, such as micro-aggressions.

Conclusions: Initiatives to improve workforce diversity within VHA COIN research centers are common. However, hinderances include lack of staffing of DEI positions, insufficient financial resources, and inadequate leadership support. Additionally, much progress is needed in effective measurement of diversity activities.

Diversity, equity and inclusion in public health: a multidisciplinary analysis

Chiara Cadeddu¹

¹Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy

Public health crises like COVID-19 pandemic have demonstrated more than ever how different racial, ethnic, religious and cultural communities can be differently affected. All these determinants are proven to play an important role in relation to the susceptibility to certain illnesses or how people react in getting sick. For these reasons, it is particularly important to address issues related to diversity, equity and inclusion among different disciplines in order to find the best way to address the health needs of every individual. **Aims and Components:** The present

workshop is aimed at discussing among different perspectives the concepts of diversity, equity, and inclusion in Public Health, analysing which can be the multidisciplinary tools and approaches for analysis and successful interventions, with practical cases showed as examples. A first presentation will be focused on how the different stakeholders in public health could have a role in behavioural change towards more inclusive interventions to help people in need such as minorities, migrants, refugees, and how the different health systems answer to these needs, especially for prevention activities (speaker Dr. Chiara Cadeddu). The second presentation will deal with the contribution of digital technology, in terms of targeted solutions depending on sociodemographic factors, with a view to diversity and inclusion, and the new perception of reality, values, and relationships that it could generate (speaker Dr. Roberto Ascione). The third presentation is aimed at improving the health education and training of professionals in the matters related to diversity, equity and inclusion. Professionals include not only healthcare professionals, but also science journalists and administrative officers involved in the health sector and the private sector. Multidisciplinary team culture is a core competence for those involved in health promotion and educational paths must ensure the inclusion of this culture (speaker Prof. Marta Bertolaso). The final presentation will describe the role of communication in public health and how different approaches such as targeted communication campaigns, the use of diverse cognitive styles and digital tools could help in reaching the objective of contrasting infodemic and fake news and make that every individual feels as a part of an inclusive healthcare system (speaker Prof. Pierluigi Lopalco). **Key questions:** 1. Which multidisciplinary competencies in terms of stakeholders should be involved to develop the process of overcoming barriers and be more inclusive with minorities, hard-to-reach groups, marginalized identities, etc.? 2. Digital tools could really help to contrast obstacles in terms of diversity, equity and inclusion in health or could be a further obstacle in some populations? 3. How to improve cross fertilization in the different sectors of education in health and how to integrate diverse approaches used in academia or private companies or other areas? 4. A targeted communication in public health is an issue to be soon actualized and applied for the improvement of the access of every individual to health or are we still far from this goal?

Popul. Med. 2023;5(Supplement):A1417
DOI: 10.18332/popmed/165065

Queering global public places for health and wellbeing

Andrew Gorman-Murray¹, Evelyne Leeuw², Rebecca Cadorin³, Pippa Catterall⁴, Jason Prior⁵, Alice Vincent⁶, Arne Scheuermann⁷

¹Discipline of Geography, Western Sydney University, Australia, ²Healthy Urban Environments Collaboratory, Maridulu Budyari Gumal, Australia,

³Arup NSW Lighting, Australia, ⁴University of Westminster, United Kingdom,

⁵Institute of Sustainable Futures, University of Technology Sydney, Australia,

⁶ARUP Resilience Security and Risk, Australia, ⁷Swiss Centre for Design and Health, Bern University of Applied Sciences, Switzerland

The health and wellbeing of people with queer identities (more commonly designated as LGBTIQ, LGBTQ2S+ or LGBTIAQ+ communities) is increasingly becoming a spatially determined global health issue. This adds to a longer existing recognition of particular health care (access) needs of queer people. This workshop invites colleagues to engage with a growing and strengthening global research and practice agenda that represents a unique and powerful partnership between Arup (a multinational professional design and engineering services firm), universities, health services, and local governments. We draw on two recent reports. 'Queering Public Space' resulted from collaboration between Arup and the University of Westminster (UK), while the 'Queering Cities in Australia' report is the results of a collaborative research project between Arup, Maridulu Budyari Gumal Healthy Urban Environments Collaboratory, Western Sydney University, the University of Technology Sydney and the University of New South Wales. The two reports focus on London and on Sydney, Melbourne and Brisbane respectively, they examine how public spaces could be more inclusive for LGBTIAQ+ individuals, families and communities through better accommodation in design, policy and practice for local areas. Follow-up research is currently being developed and implemented. A third study will examine these factors from 2023 onwards, using three urban municipalities in Switzerland (Zurich, Bern, Basel) as an example. Both the British and Australian arms of the project also plan further detailed engagements. Research across various countries has identified how public spaces can be dangerous and exclusionary for LGBTIAQ+ individuals, families and communities. Less work has focused on how to make public spaces safe, welcoming and inclusive, or to 'usualise' queerness in the use and design of public spaces. This is important for secure access to public spaces, including: 1. A sense of self-security in public spaces, 2. Safe access to social networks and interaction, 3. Safe access to employment and education opportunities, and 4.

The use of open spaces (e.g. parks) for therapeutic and recreational purposes. In the next phase of this work – to commence in 2023 – we will see the report's recommendations framework taken to a series of workshops with LGBTIAQ+ communities, policymakers and public space planners to develop solutions that might be implemented by local councils to improve the inclusivity of local areas and public spaces. The Bern University of Applied Sciences is continuing this approach in a project together with the University of Bern to investigate design and architectural interventions in public spaces. These outcomes, it should be noted, will be important in improving access to and enjoyment of the public realm for all users. We hope to engage with the global public health and health promotion community and explore further iterations of this important research and development work.

Popul. Med. 2023;5(Supplement):A1418

DOI: 10.18332/popmed/165575

New methods and tools to monitor health outcomes among minorities and indigenous people

Natalia Skogberg¹, Nina Rehn-Mendoza², Leuconoe Grazia Sisti³

¹Finnish Institute for Health and Welfare Finland, ²Public Health Agency of Sweden Sweden, ³Italian National Institute for Health, Migration and Poverty Italy

Health inequalities are preventable disparities that affect the burden of disease and the opportunities to achieve optimal health. In many countries the COVID-19 pandemic demonstrated how the consequences of health inequalities affect our societies. Reducing inequalities is also central in the sustainable development goal framework.

Inequalities are observed both between countries and within countries. Population groups such as ethnic minorities and indigenous people, are reported to be at high risk to experience health inequalities. For some of these groups, research clearly indicates higher rates of poor health while for others there is insufficient evidence and data to scientifically track their health status. Reaching minorities and indigenous populations with traditional methods, for example with national health surveys, is usually limited at best. These population groups are generally hard to reach, both in terms of research and public health interventions. To further develop the capacity of public health and research institutions to systematically track the health status of hard-to-reach groups as well as to identify the health needs of people invisible to health services, new research methods and tools need to be identified and shared.

It is important to recognize that a further burden on the health of these population groups comes from the discrimination, violence and abuse (physical or psychological) to which they are often subjected. How to measure that impact on the health status of these hard-to-reach individuals is an additional part of the workshop.

The specific aim of this workshop is to explore new and innovative methods to measure and monitor the health status of hard-to-reach groups. Different methods to identify and define these groups, effective tools/methods to reach them, and to encourage their involvement and engagement in both research and health programmes are the main objectives of the workshop. In the discussions we will include how to also measure the impact of different types of discrimination.

Sharing among us studies and experiences with different methods will revitalize and push this area forward. This is especially welcome in an era with new digital tools such as smart phones and social media.

The workshop is organized jointly by Sweden, Finland and Italy (Public Health Agency of Sweden, Finnish Institute for Health and Welfare and Italian National Institute for Health, Migration and Poverty).

The presentations will be followed by small group discussions on the topic of the presentations and brainstorming around new ways or methods to systematically assess the health of the hard-to-reach-groups.

The focus is on transferring knowledge through intensive interaction with the audience.

Minority health data is vital for the identification and monitoring of health inequalities that stem from racism, bias and discrimination, and from other health determinants. Data on the hard-to-reach populations is also needed to inform interventions to improve equity in health-care access, quality, and outcomes. The workshops aim is to increase the capacity and knowledge of participants on the latest innovative methods to implement research to monitor the health status of minority and hard-to-reach groups.

DOI: 10.18332/popmed/163693

Health needs of newly arrived forced migrants: ethical, legal, and policy considerations

Nadav Davidovitch¹, Elena Petelos², Samia Latif³, Mathura Kugan⁴, Rosemary James⁴, Kerrie Stevenson⁵, Farhang Tahzib⁶, Bernadette Kumar⁷

¹Ben Gurion University, Israel, ²University of Crete, Greece, ³UK Health Security Agency, United Kingdom, ⁴Lancet Migration European Hub, United Kingdom, ⁵University College London, United Kingdom, ⁶UK Faculty of Public Health, United Kingdom, ⁷Norwegian Institute of Public Health, Norway

Outline

According to the UNHCR, there are 89 million forced migrants, of whom 36 million are displaced to other countries. Most are displaced to neighboring regions, but some make perilous journeys to distant countries in the hope of finding safety. Forced migration is recognised as a major global public health issue, particularly in relation to the care of newly arrived forced migrants. Forced migrants represent a heterogeneous group with a range of trajectories, stress exposures, and health needs, ultimately leading to highly divergent outcomes. Sadly, not all forced migrants are treated equally. For example, in the UK and other European countries Ukrainian refugees are offered a temporary protection directive giving them the ability to work whilst other forced migrants must enter a slow asylum process which can leave them in a state of limbo which further exacerbates previous trauma. In some countries newly arrived migrants face harmful and unethical detention with poor access to health care. They are met with hostility and suspicion, and in some cases moved to remote locations which can have long term impacts on their mental and physical health. This raises questions as to the public health impact of the handling of newly arrived migrants around the world. This is a joint roundtable workshop organized by the UK Faculty of Public Health, the EUPHA Migration and Health, and the EUPHA Ethics in Public Health Sections, including Lancet Migration. It brings together a multidisciplinary team of senior public health practitioners, ethicists, policymakers, and scholars working on migration, ethics, and public health.

Aims: The workshop will explore the ethical, legal, and health consequences of the handling of newly arrived forced migrants. It is hoped this will enable participants to apply the learning from these contexts to their settings to safeguard the wellbeing of newly arrived migrants across the world.

Component Parts

Summary of international best practice guidance and regulations for safeguarding the health and welfare of newly arrived forced migrants. Current barriers and facilitators to ensuring the welfare of newly arrived forced migrants through the presentation of results of a recent systematic review. Case studies from various countries responding to an influx of forced migrants. A panel discussion with questions from the audience to further explore the case studies and to consider the ethical, legal, and healthcare dimensions of these issues.

Key Questions: What are the legal and ethical considerations surrounding healthcare for newly arrived forced migrants, and how can an integrated approach be promoted? What are existing recommendations for ensuring access to primary care, public health services, routine health and social care for newly arrived migrants? How can health protection and infectious disease control be managed in an ethical and respectful manner for newly arrived migrants? How is mental health to be promoted and assessed for newly arrived migrants? How can human rights and the safeguarding of children and other groups with additional needs be upheld in initial accommodation centers?

Popul. Med. 2023;5(Supplement):A1420

Strengthening Pathways to High Quality Maternity Care for Migrant Women in Europe: Taking an Equity Lens

Kerrie Stevenson¹, Shuby Puthussery², Louise Teschemacher³, Martha Engelhardt⁴, Razan Al Munjid¹, Maria Marti Castaner⁵, Maria Marti castaner⁵, Theda Borde⁴

¹University College London, United Kingdom, ²University of Bedfordshire, United Kingdom, ³Charité Universitätsmedizin Berlin, Germany, ⁴Alice Salomon Hochschule Berlin, Charité Universitätsmedizin Berlin, Germany, ⁵Copenhagen University, Denmark

Outline of the overall workshop

Compared to non-migrants, migrant women are less likely to have adequate information about maternity care, experience suboptimal communication with care staff, and are less involved in decisions about their care due to difficulties in understanding information, socio-cultural beliefs, and experiencing racism. Some migrant groups (i.e. forced migrants) are also at particularly high risk of poor perinatal outcomes including mental illness, morbidity, and mortality due to larger contextual factors including poverty and poor access to host country healthcare services. In recent years, there have been increasing efforts to improve maternity care for migrant and refugee women across Europe. However, evidence is sparse and strategies to strengthen maternity care pathways are limited.

We will present research aimed at improving maternity care amongst migrant women across various European contexts, including Germany, the UK, and Denmark. We will consider how equity and co-production play an important role in improving these pathways. This will include a presentation from an Expert-by-Experience (a forced migrant mother), and a panel discussion with audience participation.

SPECIFIC AIMS AND COMPONENT PARTS: Based on recent empirical evidence, including new findings from a European-wide systematic review, this workshop aims to critically discuss the best approaches to improve maternity care pathways (including mental health care provision) for migrant women in Europe. We will take an equity lens by focusing on co-creation, holistic approaches, and the impact of wider socio-economic, political, and structural factors.

Component Parts: The Pregnancy and Obstetric Care for Refugees research team, led by Prof. Theda Borde, will present new insights on different maternity care pathways amongst forced migrants in Germany, and the role that institutional 'othering' and socio-political factors play in shaping women's experiences and mental health. Dr Kerrie Stevenson will present the preliminary results of a systematic review identifying effective interventions to improve maternity outcomes for migrant women in high-income countries. This review will also assess the use of co-production in intervention studies. Dr Shuby Puthussery will discuss the power of co-production in pathway development, based on findings from a community-based intervention to enhance antenatal care initiation and uptake in a low-income and ethnically diverse area in the UK. Dr Maria Marti Castaner will focus on the importance of holistic approaches to maternity care by presenting the qualitative findings of an evaluation of a nurse home visiting program for refugees in Denmark.

In the discussion, panellists and the audience will consider the most effective and equitable ways to strengthen maternity care pathways for migrant women by reflecting on the evidence presented and experiences from the field.

Key questions: How does 'othering' impact maternity care pathways for forced migrant mothers and how it can be tackled? Which maternity care interventions are most effective in improving maternal health outcomes and equity for migrant women? What role can Experts by Experience play in co-producing maternity care interventions and improving pathways to maternity care? How can maternity care pathways strengthen their focus on prevention of perinatal mental health problems by addressing wider socioeconomic factors?

Popul. Med. 2023;5(Supplement):A1421

DOI: 10.18332/popmed/164035

The way forward: strengthening health equity through social justice-based approaches in public health education

Diana Podar¹, Karl Conyard², Emma Schlegel², Mary Codd³, Yudit Namer¹, Lisa Wandschneider¹

¹School of Public Health, Bielefeld University Germany, ²Institute of Nursing Science, University of Cologne, Germany, ³School of Public Health Physiotherapy and Sports Science, University College Dublin Ireland

Brief outline of the overall workshop

While health inequities in minoritised groups are increasingly well conceptualised and documented in public health research, the translation into public health education practice is still evolving. By now, several approaches have been developed to overcome this gap in public health education. Prominent approaches include, but are not limited to Diversity, Equity and Inclusion (DEI), cultural competence programmes, intersectionality as an analytical framework and decolonisation based on scholarship activism. While these approaches differ in their theoretical underpinnings and address different levels of action needed, they ultimately aim to dismantle stigmatising practices and structures in public health institutions and promote health equity through social justice. Their implementation however comes with several challenges for public health professionals and academic institutions. In this workshop we propose to shed light on how such approaches can be implemented on a broader scale while remaining true to their underlying goal of promoting social justice.

Specific aims/objectives and component parts: Using a round table format, we present three exemplary projects with a focus to strengthen health equity through social justice-based approaches. Together, we aim to reflect on barriers as well as potential synergistic effects that help to move forward in a sustainable way. The three presentations aim to reflect voices at different stages of their career and the public health workforce.

First, Emma Schlegel presents results from an online survey among ASPHER (Association of Schools of Public Health in the European region) members on barriers and enablers in implementing diversity-driven and intersectional approaches in public health education. The perceived challenges included feeling overwhelmed by the range of topics, the lack of one's own competence and of

faculty expertise. As for enablers, participants reported that personal interest, interest from students on the topics and sufficient personal resources acted as enablers to implement these topics in teaching.

Second, Karl F. Conyard and Prof Dr Mary Codd give insights on how social justice-based approaches are represented in the 6th edition of the ASPHER Core Competencies (to be launched in 2023) and how they can be linked to existing as well as new elements. Additionally, they discuss the role of ASPHER in this endeavor and its role as an exemplary guiding institution for the European context. Third, Diana Podar discusses the challenges, opportunities and lessons learned in incorporating a decolonial lens in public health education and research within (European) schools of public health (SPHs) at the institutional level.

Based on these three inputs addressing multiple levels including perspectives from public health professionals, the Core Competencies as an organizational guideline and SPHs as institutional contexts, we conclude the session with an interactive discussion with the audience, creating a space for interdisciplinary exchange and reflections on international experiences.

The key questions that the workshop will address

* How can we ensure to implement social justice-based approaches promoting health equity sustainably in public health education?

* What kind of action is needed in our teaching practices, the institutional context and from associations like ASPHER?"

Development process of a clinical guideline to manage type 2 diabetes in adults by Ayurvedic practitioners

Kaushik Chattopadhyay¹, Michael Heinrich², Nitin Kapoor³, Achintya Mitra⁴, Madhukar Mittal⁵, Sarah Lewis¹, Sheila Greenfield⁶, Shyamalendu Mukherjee⁷, Ivo Pischel², Jeemon Panniyammakal⁸, Nikhil Tandon⁵, Sanjay Kinra⁹, Tuhin Biswas¹⁰, Jo Leonardi-Bee¹

¹University of Nottingham, United Kingdom, ²University College London, United Kingdom, ³Christian Medical College, India, ⁴Central Ayurveda Research Institute, India, ⁵All India Institute of Medical Sciences, India, ⁶University of Birmingham, United Kingdom, ⁷West Bengal State Medicinal Plants Board, India, ⁸Sree Chitra Tirunal Institute for Medical Sciences and Technology, India, ⁹London School of Hygiene and Tropical Medicine, United Kingdom, ¹⁰J B Roy State Ayurvedic Medical College and Hospital, India

Background and Objective: In the Indian subcontinent, Type 2 Diabetes Mellitus (T2DM) is a common disease for which people consult Ayurvedic (traditional medical system) practitioners and use Ayurvedic medicines. To date, a high-quality clinical guideline, based on the best available scientific evidence, to manage T2DM by Ayurvedic practitioners is not available. Therefore, the study aimed to systematically develop a clinical guideline for managing T2DM in adults by Ayurvedic practitioners.

Methods: The clinical guideline was developed guided by the Grading of Recommendations, Assessment, Development and Evaluation (GRADE) approach, the UK's National Institute for Health and Care Excellence manual for developing guidelines, and the Appraisal of Guidelines for Research and Evaluation II instrument. Initially, we conducted a comprehensive systematic review assessing the effectiveness and safety of Ayurvedic medicines for managing T2DM and the certainty of the Findings using the GRADE approach. Subsequently, based on the GRADE approach, we developed the Evidence-to-Decision framework, focusing on glycaemic control and adverse events. Based on the Evidence-to-Decision framework, a Guideline Development Group, comprising 17 international members, made recommendations on the effectiveness and safety of Ayurvedic medicines in T2DM. The recommendations formed the basis of a clinical guideline, with further generic content and recommendations being adapted from the T2DM Clinical Knowledge Summaries of the Clarity Informatics (UK). The Guideline Development Group gave feedback on the draft version, which was used to finalise the clinical guideline.

Results: The clinical guideline provides basic information on T2DM, how it should be diagnosed and managed through lifestyle changes like diet and physical activity and Ayurvedic medicines, how the acute and chronic complications of T2DM should be detected and managed (including referral to specialists), and advice on topics like driving, work, and fasting including during religious/socio-cultural festivals.

Conclusions: We systematically developed a clinical guideline for managing T2DM in adults by Ayurvedic practitioners.

DOI: 10.18332/popmed/164767

A qualitative meta-synthesis of women's critical experiences with

the Pap smear for the development of a novel cervical cancer screening device

Marcela Arrivillaga¹

¹Pontificia Universidad Javeriana Cali, Cali, Valle, Colombia

Objective: This qualitative study and systematic review examines women's critical experiences with the Pap smear in order to identify opportunities for the development and improvement of cervical cancer screening devices (e.g., Citobot, Pocket Colposcope, and others). **Methods:** Eighteen studies were assessed based on the Critical Appraisal Skills Program. Qualitative meta-synthesis was used to integrate the study Findings, and the experiences were classified into four categories: fear and embarrassment during the procedure, pain and discomfort from the speculum, distress about the Results, and barriers to health services. Critical experiences before, during, and after the test were analyzed.

Results: Previous experiences comprised a lack of instruction and misinformation, administrative barriers in health services, and behaviors and perceptions associated with gender roles. During the Pap smear, women experienced fear, embarrassment, and pain, associated in particular with the inappropriate use of the speculum. Experiences after the test included delays in the delivery of Results, anxiety associated with a lack of understanding of the Results, delays in treatment, and consequences affecting sexual relationships and life as a couple. **Conclusions:** Technologies with the potential to replace the traditional speculum and allow immediate delivery of both cervical imaging and HPV testing would benefit significantly from addressing these critical experiences to increase the acceptability of pap smears for women.

Health litigation and cancer survivorship in patients treated by the Brazilian public health system in a big Latin-American city

Rômulo Paes-Sousa¹, Monica Castro¹

¹Oswaldo Cruz Foundation, Belo Horizonte, Brazil

Introduction and Objectives: Litigation for health care, also known as health judicialization, is frequent in Brazil. It involves recourse to the court system to access health services. The study aimed to evaluate whether cancer patients in Belo Horizonte, Minas Gerais, Brazil, increased their overall survival by increasing access to certain drugs or treatments through litigation, controlling for the effect of demographic and disease-related variables. **Methods:** Patients with breast, prostate, brain, lung, or colon cancers from 2014 to 2019 were included. A retrospective cohort study was conducted. Survival analysis was performed using the Cox proportional hazards model.

Results: In the multivariate analysis, litigation was significantly associated with increased survival in cancers of breast (HR=0.51, 95%CI 0.33-0.80), prostate (HR=0.50, 95%CI 0.30-0.85), colon (HR=0.59, 95%CI 0.38-0.93), and lung (HR=0.36, 95%CI 0.22-0.60). Five-year survival rates of patients who sued for treatment were 97.8%, 88.7%, 59.3%, and 26.0%, compared to median survival of 95.7%, 78.7%, 41.2%, and 2.4%, respectively, among patients that did not resort to court action. The study suggests that litigation for access to cancer treatment may represent a step forward in obtaining more effective treatment. This study's main limitations are the lack of patient clinical information and data regarding the patients' quality of life. The study also found that many cases involved claims that could have been solved by administrative rather than legal action. Some claims thus reflect the lack of adequate administrative procedures. **Conclusions:** When based on scientific evidence, access to new therapies, combined with other technologies already available, can favor patient survival. Access to new therapies through litigation may increase health inequalities since low-income patients have limited access to legal recourse against the State to meet their needs. The timely approval of new effective therapies can mitigate the judicialization of cancer treatment.

Assessment of awareness about the impact of tobacco on head and neck cancers via mass media: a case-control study from India

Bhawna Gupta¹

¹Torrens University, Australia

Objective: Mass media channels like Television, cinema, radio and newspapers have been widely used to spread awareness amongst large populations about the tobacco consumption in any form causing head and neck cancers. In this study, it was aimed to measure the impact of mass media channels on this awareness among the people of Pune, India.

Methods: A frequency matched hospital-based case-control with face to face interviews for the purpose of data collection was conducted on 225 cases and 240 controls.

Results: Controls as compared to cases had good awareness scores for chewing (59.9%) and smoking tobacco (63.7%), P

What happens with cancer screening participants with a positive faecal test that do not complete colonoscopy?

Gonzalo Garcia¹, Maria Villares², Urko Aguirre³, Covadonga Audicana⁴, Juan Herrero⁵, Ainhoa Elosegui⁶

¹Medical Resident of Preventive Medicine and Public Health, Spain,

²Colorectal Cancer Screening Program, Osakidetza, Spain, ³Biostatistics, OSI Barrualde Galdakao, Osakidetza, Spain, ⁴Euskadi's Mortality Registry, Departamento de Salud, Spain, ⁵Bilbomatica SA, Spain, ⁶Preventive Medicine and Public Health, Osakidetza, Spain

Introduction: Colorectal cancer (CRC) was the second deadliest cancer for both sexes in 2020. The importance of having an effective CRC Screening Program is vital because it can reduce CRC's burden of disease by decreasing its incidence and mortality. In the Basque Country, everyone between 50 and 69 years old is biannually sent a Faecal Immunochemical Test (FIT) to their address and if it comes out positive is invited to book a colonoscopy. Colonoscopy is the gold standard test due to its capacity to be a diagnostic and therapeutic test able to remove pre-cancerous lesions. A problem we must face is what to do when an individual cannot undergo a colonoscopy after a positive FIT test.

Objective: Determine if there are differences in mortality rates between the different diagnostic pathways in Basque's Country CRC Screening Program. **Materials and methods:** The study is a retrospective cohort of participants in the Screening Program who have tested positive in FIT and after the have not completed a colonoscopy or have undergone another test. We received anonymized and untraceable data from 922 participants. We made a descriptive analysis of the data and then we used Cox's Regression and a Competitive risk's model to evaluate global mortality and CRC's specific mortality.

Results: After statistical analysis we found significant differences in three variables. The first one is that people who cannot undergo a colonoscopy have 3.47 times more risk of global mortality than people who underwent an incomplete colonoscopy. The second one is that men in our cohort have 2.31 times more increased risk of global mortality than women and finally that age, regardless of sex, increases a 5% the mortality risk per increase of age unit.

Deaths caused by non-communicable disease among people with a history of youth justice system contact

Lucas Ferreira¹, Stuart Kinner²

¹Melbourne School of Population and Global Health, The University of Melbourne, Melbourne, Australia, ²School of Population Health, Curtin University, Perth, Australia, Ireland

Background and Objective: Social determinants of health are strongly associated with an increased risk of contact with the criminal justice system, especially at a younger age. People who have had contact with the youth justice system are at increased risk of death from external causes such as homicide, suicide, and accidents, but their burden of non-communicable disease (NCD) mortality is still largely unknown. We aimed to characterise NCD mortality and identify its associated risk factors for NCD deaths in a large sample of young people with a history of youth justice contact.

Methods: This was a retrospective cohort of all young people charged with a criminal in Queensland, Australia, between June 1993 and July 2014 (N=49,011), aged 10-18 years at baseline and censored on 31 January 2017 or at death. Youth justice records were linked to adult correctional records and death records. We estimated crude mortality rates (CMRs) and standardised mortality ratios (SMRs) by age, sex, and Indigenous identification, and identified risk factors for NCD deaths using competing risk regression models.

Results: There were a total of 121 NCD deaths in the cohort, occurring at a median age of 26.8 years (interquartile range=22.7-31.8). The overall CMR from NCDs was 18.5 (95% Confidence Interval: 15.5-22.1) per 100,000 person-years, which was 67% (95%CI: 39-99) higher than in the general population of the same age and sex. Having two or more episodes of adult incarceration (compared to none) was a risk factor for NCD death (aHR=1.75, 95%CI: 1.15-2.64).

Conclusions: Youth justice contact might offer a window of opportunity to connect vulnerable young people – who may be less likely to engage with primary and preventative care due to the high prevalence of substance use disorders and unstable accommodation – with services, support and social networks that can facilitate timely access to health care.

Impact of oral diseases on oral health-related quality of life among Indians: a systematic review and meta-analysis

Anju James¹, Chandrashekar Janakiram², Vijay S.¹, B.Y. Yuvraj³, Meghana R.V.¹, Anitha Sagarkar⁴

¹Amrita School of Dentistry, Amrita Vishwa Vidyapeetham, Ernakulam, India,

²Amrita School of Dentistry, Amrita Vishwa Vidyapeetham, Kerala, India,

³Department of Public Health, Rajiv Gandhi University of Health Sciences,

Bangalore, India, ⁴Faculty of Dental Sciences, Ramaiah University of Applied Sciences, Bengaluru, India

Background: Oral Health-Related Quality of Life (OHRQoL) Results from the relationship between and among oral health problems, contextual and social factors, and the body as a whole. Several studies have been conducted to investigate the effect of oral conditions on OHRQoL in the Indian population, with inconclusive Findings.

Objective: This review will assess the impact of oral diseases on OHRQoL compared to individuals without oral disease among Indians.

Methods: PubMed and Scopus, CINAHL, Web of Science, and PsycInfo were systematically searched for english language studies conducted among Indians up to July 2022. Two independent reviewers performed the study search and screening through covidence software. The data extraction and quality assessment was facilitated using JBI SUMARI. PROSPERO registration Number: CRD42021277874.

Results: Fourty one publications were included in this review (N= 23,090). Studies include both cross-sectional studies and randomized controlled trials. Based on the JBI critical appraisal tools, the quality of the included studies was low to high. Most of the studies fail to address the confounding issues. Thirty-seven studies were considered for the meta-analysis. Dental caries have nearly four times the chances of having a poor OHRQoL compared to those without dental caries [OR: 3.54 (95% CI 2.24- 5.60), ten studies, 4945 participants]. Periodontal disease assessed by Loss of attachment affects OHRQoL [OR: 1.63 (95% CI 0.49, 5.51), three studies, 1364 participants]. Edentulism has 2.49 odds of having a poor OHRQoL compared to those without functional Edentulism [OR: 2.49 (95% CI 1.27, 4.90), two studies, 368 participants].

Conclusions: Despite the various definitions of the exposures and instruments used to assess OHRQoL, our review found that people with dental caries, periodontal disease, functional edentulism, and prosthetic needs have a significantly higher experience of poor quality of life.

Long-term consumption of ten food groups and cardiovascular mortality: a systematic review and dose response meta-analysis of prospective cohort studies

Buna Bhattarai¹, Zhixin Liu², Sophia Lin³, Rona Macniven³, Blessing Akombi-Inyang³, John Hall³, Xiaoqi Feng³, Aletta Schutte³, Xiaoyue Xu³

¹Central Department of Public Health, Tribhuvan University Institute of Medicine, Kathmandu, Nepal, ²Stats Central, University of New South Wales, Sydney, Australia, ³School of Population Health, University of New South Wales, Sydney, Australia

Background and objectives: A large body of evidence exist on diet and cardiovascular mortality, but limited studies have investigated the long-term intake of food groups, which may have cumulative effects on cardiovascular health. This review, therefore, evaluated the relationship between long-term consumption of food groups and cardiovascular mortality. **Methods:** We conducted a systematic search in Medline, Embase, Scopus, CINAHL and Web of Science up to January 2022. With a total of 5,318 studies identified from the initial search, 22 studies with a total of 70,273 participants with cardiovascular mortality were included. Summary Hazard Ratios (HR) and 95% CIs were estimated using a random effects model.

Results: We found that a long-term high intake of whole grains (HR: 0.87; 95% CI:0.80, 0.95), fruits and vegetables (HR: 0.72; 95% CI:0.61, 0.85) and nuts (HR: 0.73; 95% CI:0.66, 0.81) significantly reduced cardiovascular mortality. Each 10-gram increase in whole grain consumption per day was associated with a 4% reduction in the risk of cardiovascular mortality, whilst each 10-gram increase in red/processed meat consumption per day was associated with a 1.8% increase in the risk of cardiovascular mortality. Compared to the lowest intake category, red/processed meat consumption in the highest category was associated with an increased risk of cardiovascular mortality (HR: 1.23; 95% CI:1.09, 1.39). High intake of dairy products (HR: 1.11; 95% CI: 0.92, 1.34) and legumes (HR: 0.86;

95% CI:0.53, 1.38) were not associated with cardiovascular mortality, but in the dose-response analysis, each 10-gram increase in legume intake per week was associated with a 0.5% reduction in cardiovascular mortality. **Conclusions:** We conclude that the long-term high intake of whole grains, vegetables, fruits, and nuts and low intake of red/processed meat is associated with reduced cardiovascular mortality. More data on the long-term effects of legumes on cardiovascular mortality are encouraged. PROSPERO registration number: CRD42020214679

Multimorbidity and adverse longitudinal outcomes among patients attending chronic outpatient medical care in Bahir Dar, northwest Ethiopia

Fantu Eyowas¹, Fentie Ambaw¹

¹Bahir Dar University, Bahir Dar, Ethiopia

Background: Multimorbidity, the occurrence of two or more chronic conditions is becoming more prevalent in low-and middle-income countries (LMICs). However, the evidence base on the burden and trajectories of multimorbidity, and its longitudinal adverse outcomes are limited. This study aimed at understanding the development and progression of multimorbidity and associated adverse consequences among individuals living with chronic conditions in Bahir Dar, Ethiopia. **Methods:** A facility-based longitudinal study was conducted among 1123 participants aged 40+. Data were collected both at baseline and after one year through standardized interviews and record reviews. Data were analyzed using STATA V.16. Descriptive statistics and longitudinal panel data analyses were ran to describe independent variables and identify factors predicting outcomes. Statistical significance was considered at P-value <0.05.

Results: The magnitude of multimorbidity has increased from 54.8% at baseline to 56.8% by the end of the follow up. About four percent (n=44) of patients were diagnosed with one or more new NCDs and those having multimorbidity at baseline were more likely than those without multimorbidity to develop new NCDs. In addition, 106 (9.4%) and 22 (2%) individuals, respectively were hospitalized and died during the follow up period and living with multimorbidity was a risk factor for hospitalization and mortality. **Conclusions:** The prevalence of multimorbidity was high. Living with multimorbidity was associated with poor progress, hospitalization and mortality. If health systems are to meet the needs of the people with multimorbidity, it is essential to understand the impacts of multimorbidity and devise mechanisms to improve outcomes of patients over time.

Recommendations to guide implementation of palliative care services among patients with cervical cancer

Tolcha Motuma¹, Azwihangwisi Mavhandu-Mudzusi², Annah Mosalo²

¹University of South Africa (UNISA) - Ethiopia Regional Learning Center, Addis Ababa, Ethiopia, ²University of South Africa (UNISA), Pretoria, South Africa

Background and objectives: Due to increasing trends in non-communicable diseases and the aged population, our community has a high demand for palliative care. The World Health Organization (WHO) estimates that over 40 million people need palliative care, among which only 14% receive it. In this study, we studied the palliative care service provision for cervical cancer patients and provided pertinent recommendations on how best the service could be provided.

Methods: A cross-sectional study was conducted at a tertiary hospital in Addis Ababa, Ethiopia, in 2019 to evaluate the level of palliative care for patients with advanced cervical cancer. Using a pretested and structured questionnaire, a random sample of patients was interviewed by trained hospital nurses. A review of literature, including WHO guidelines, national palliative care strategies, and country-level guidelines, was also systematically conducted to identify critical areas recommended for implementation. Experts from the ministry of health, hospitals, and universities reviewed and provided comments on this study.

Results: A total of 385 patients were successfully interviewed for this study. Only about a quarter of the patients have adequate knowledge of comprehensive palliative care; however, over three-quarters reflected a positive attitude. The provision of comprehensive palliative care, including pain control, symptom management, and psychosocial, economic, and spiritual support, was poor. Triangulation of the research Findings with literature review and expert opinion identified critical areas for implementation. These include need-based planning, training of multi-disciplinary palliative care providers and recipients, strengthening advocacy and partnership, generating evidence for decision-making, and integrating palliative care at all levels of the healthcare system.

Conclusions: The knowledge and practice of comprehensive palliative care service delivery to patients with cervical cancer in Ethiopia were poor. This study has identified key areas for improvement to strengthen palliative care and improve the patients and their families quality of life.

Disability-adjusted life years (DALYs) avoided by quitting smoking after acute coronary syndrome

Wafa Dhouib¹, Hela Abroug¹, Manel Fredj¹, Imen Zemni¹, Cyrine Bennasrallah¹, Amel Gara¹, Amani Maatouk¹, Ines Bouanene¹, Asma Belguith¹
¹Department of Preventive Medicine, Monastir, Tunisia

Background: Smoking was the third largest contributors to the disability adjusted life years (dalys) attributable to Acute Coronary Syndrome (ACS) worldwide. The aim of this study was to assess the burden benefits from smoking cessation in patients with ACS. **Methods:** A longitudinal observational study among ACS inpatients attending the smoking cessation clinic between 2015 and 2018 at the university hospital of Monastir. Cox models were used to quantify the relation between smoking status and risk of recurrent Major Adverse Cardiac Events (MACES). DALYS were calculated by the Sum of Years of Life Lost (YLLS) and Years Lived with Disability (YLLDS).

Results: The quarter of 158 smokers stopped after their first ACS. Twelve died and 91 maces occurred. Compared to patients who continued to smoke, ex-smokers had a lower risk of recurrent maces (adjusted HR=0.56; 95%ci (0.32-0.98)). After the fifth year of follow up the adjusted HR was of 0.31; 95% ci (0.88-1.11). DALYS were greater in persistent smokers. **Conclusions:** Continuing smoking was associated with large numbers of DALYS after ACS. However, the success of smoking cessation remains minimal in these patients. Thus, our findings lend additional support to efforts that encourage smoking cessation in patients with or without cardiovascular events.

Polarization of body mass index among adults in Finland

Hanna Tolonen¹, Jaakko Reinikainen¹, Tiina Laatikainen²

¹Finnish Institute for Health and Welfare (THL), Finland, ²University of Eastern Finland, Finland

Background and Objectives: Obesity has become a global pandemic, affecting millions of people worldwide. It is a known risk factors for several non-communicable diseases and caused mainly by unhealthy diet and sedentary lifestyle. The risk of developing obesity has also changed over time. However, less is known how it affects men and women in different birth cohorts. This study estimated how body mass index (BMI) distribution has changed among adult Finnish population over the past 20 years.

Methods: Data from Finnish health examination surveys on adults was used. A series of cross-sectional surveys were conducted between 1997-2017 every 5-years among population living in mainland Finland covering age group 25-64 years. In all surveys, trained nurse measured height and weight using standardized protocol and calibrated measurement devices. The proportion of participants in different BMI categories was calculated by survey year, sex, age group, and birth cohort.

Results: The prevalence of obesity has increased in both men and women over the 20 years being 24% for men and 21% for women in 2017. Change has not happened uniformly in the distribution of BMI. We observed that the proportion of normal weight population has remained relatively unchanged over the years but the proportion of population with obesity has increased. The upward shift of the upper tail of the BMI distribution has been the greatest among the age groups under 45 years, but among older people there has also been polarization development to the opposite direction in normal weight persons. **Conclusions:** Increase in obesity and especially polarization of BMI at young age is of concern and has significant impact on incidence of non-communicable diseases such as diabetes, cardiovascular diseases, and several cancers. This will cause increased demand for healthcare services and increase both direct health care costs but also indirect cost of informal care.

Evaluation of the level of knowledge, attitudes, and behaviors about cancer screening tests in individuals over 30 years of living in the Aydınevler District

Şükran Peker¹, Ahmet Topuzoğlu², Cemre Kesen³, Elif Eyigün⁴, Zeynep Geldi⁵, Doğan Öksüz⁶, Enes Şaşkın⁵, Bartu Cansu⁵

¹Department of Public Health, Marmara University School of Medicine, Istanbul, Türkiye, ²Marmara University School of Medicine, Department of Public Health, Marmara Üniversitesi Tıp Fakültesi, Maltepe, Türkiye, ³Department of Public Health, School of Medicine, Marmara University, Türkiye, ⁴Marmara University School of Medicine, Istanbul, Türkiye, ⁵Marmara University School of Medicine, İstanbul, Türkiye

Background:and Objectives: Cervical, breast, and colon cancer screening programs are included in preventive health practices in Turkey. Cancer screening for the population in the risk group can contribute to the reduction of morbidity and mortality through early diagnosis. This study aimed to evaluate the knowledge, attitudes, and behaviors of individuals over 30 living in a district with a cancer screening center in Istanbul toward current cancer screening programs. **Methods:** The cross-sectional type of research was carried out between 05.04.2022 and 19.04.2022 by face-to-face survey method. The universe of the research was determined as 210 people selected from individuals aged 30 and over living in the chosen district using the World Health Organizations rapid assessment system, 30x7 clustering method.

Results: The research was carried out with a total of 159 (75.7%) volunteers. The mean age of the participants was 49.2±13.4%, and 50.9% (n=81) were women. 56% (n=89) of the participants stated that they knew that there was a cancer screening center in their district, and 10.7% (n=17) stated that they were informed about cancer screening methods by their family physicians.. 32.1% (n=51) of the participants had previously had any cancer screening. Among the individuals in the age group where screening is recommended; 23.5 % (n=16) of individuals had a colonoscopy, 21.2% (n=14) had stool occult blood test, 75.9 % (n=41) had a mammography examination for breast cancer, 67.9% (n=4) for cervical cancer 53) had smear test, 9.1% (n=7) had HPV DNA tests they had it done. **Conclusions:** This study showed that although access to the cancer screening center is easy and free in terms of physical conditions, the rates of colon and cervical cancer screening are low. Referring individuals at risk of colon, cervix, and breast cancer to cancer screening by family physicians may contribute to an increase in cancer screening rates.

Abdominal obesity according to the conicity index in a renal population on hemodialysis

Luciane Salarol¹, José Rocha², Cleodice Martins³, Monica Cattafesta⁴, Júlia Ferreira⁵, Camila Prado⁴, Edson Neto⁴

¹Graduate Program in Nutrition and Health, Health Sciences Center and Graduate Program in Collective Health, Health Sciences, Brazil, ²Program in Nutrition and Health, Universidade Federal do Espírito Santo, Brazil,

³Nutrition and Health, Health Sciences Center, Universidade Federal do Espírito Santo, Brazil, ⁴Graduate Program Collective Health, Universidade Federal do Espírito Santo, Brazil, ⁵Program in Collective Health, Universidade Federal do Espírito Santo, Brazil

Background and objective: The conicity index is indicated as a tool for assessing the nutritional status of renal individuals undergoing hemodialysis. The objective of the study was to estimate the prevalence of abdominal obesity using the conicity index in a renal population on hemodialysis to verify its association with sociodemographic and clinical factors and lifestyle habits. **Methods:** This a cross-sectional study with 941 individuals undergoing hemodialysis in a metropolitan region southeastern Brazil. The conicity index was calculated and cutoffs of 1.275 and 1.285 for men and women, respectively, were used. For the analysis of the results, binary logistic regression was performed and the odds ratio (OR) was calculated with their respective confidence intervals (95% CI).

Results: The conicity index was high in 56.54% (95% CI: 34.34-70.16) and 43,46% (95% CI: 38.45-55.20) of men and women, respectively. It was found that the adult age group in men (OR=3.71; p<0.001; 95% CI: 2.27-6.07) and women (OR=4.06; p<0.001; 95% CI: 2.41-6.84) were more likely to have abdominal obesity, as well as self-declared brown race (OR=1.74; p=0.046; 95% CI: 1.01-3.00) and being single (OR=1.64; p=0.047; 95% CI: 1.00-2.68) in males. **Conclusions:** The conicity index is an important anthropometric indicator to estimate the prevalence of abdominal obesity in individuals with chronic kidney disease on hemodialysis.

DOI: 10.18332/popmed/164971

Comparative analysis of knowledge, attitudes, behavior and practices of self breast examination in Mexico and Nicaragua

Thankam Sunil¹, Igor Ramos², Karen Castro³

¹Department of Public Health, University of Tennessee, Knoxville, United States, ²Department of Public Health, University of Guadalajara, Mexico,

³Quality Department, Hospital Military Escuela Dr. Alejandro Davila Bolaños, Nicaragua

Background: The importance of self-breast examination (SBE) to identify early signs of breast abnormality and as a significant preventative practice for early identification of breast cancer have been widely recognized among the scientific community. However, in many developing countries with varied health care practices, women's understanding about knowledge, attitudes, and practices (KAP) of SBE is still far from known. In the present study, we made a comparative analysis of KAP of SBE among women in Mexico and Nicaragua.

Methods: We conducted a cross-sectional survey of women aged 18 years and over living in selected urban and rural areas of the State of Jalisco, Mexico (n=547) and Nicaragua (n=500). Measures included in the survey reflected KAP related to SBE. We compared these measures between women living in urban and rural areas and women aged 18-39 years and 40+ years in both countries. Using t-tests, we evaluated the significance of these differentials. **Results:** Study results indicated widespread and significant differentials in basic knowledge and behaviors on SBE practices among women living in rural and urban locations both in Mexico and in Nicaragua. For example, while younger women reported significant and lower overall knowledge about breast cancer (BC), and purpose and reasons for SBE compared to women who were in the 40+ age group in Nicaragua, however, there is no significant difference in knowledge, attitudes, behavior, and practices regarding self-breast examination between women living in urban and in rural areas of Jalisco, Mexico. **Conclusions:** Study results call for location and population-specific programs and policies addressing disparities in breast cancer prevention and detection efforts in each country. While Jalisco has taken significant steps toward promoting cancer prevention, further attention to women in the older cohort is recommended, particularly for geographical relocation of mammography equipment and technicians.

Utilization of dental health services and its associated factors among adult population in Ernakulam district, Kerala, India: a mixed-method analysis

Venkitachalam Ramanarayanan¹, Saanu Sidharthan², Vineetha Karuveetil³

¹Amrita School of Dentistry, Amrita Vishwa Vidyapeetham, Kochi, India,

²Amrita Institute of Medical Sciences, Amrita Vishwa Vidyapeetham, Kochi, India, ³Amrita School of Dentistry, Amrita Vishwa Vidyapeetham, India

Background and Objective: Oral diseases are highly prevalent also there exists an inequality in dental healthcare utilization in India, further complexed by its excessive diverse population characteristics. Understanding patterns and why/why not individuals utilize dental healthcare resources is an essential requirement for effective public health-policy interventions for the equitable distribution of oral health outcomes. Our objective was to assess the utilization of dental health services and its associated factors along with barriers and facilitators among adults in a district in India using the Anderson healthcare model for healthcare utilization. **Methods:** A community-based mixed-method concurrent study was conducted among adults in selected urban and rural district wards using cluster sampling method. The quantitative part was carried out with a pre-validated questionnaire assessing the pre-disposing factors, enabling resources, need for care, health behaviors and oral health outcomes. Qualitative arm was based on in-depth interviews for assessing the barriers and facilitators for oral health utilization. Univariate and multivariate analysis were used for the former and thematic analysis for the latter, meta inferences followed.

Results: A total of 544 participants were included. The dental health utilization was found to be 15.4% among the participants. Age and education were significantly associated with dental healthcare utilization. The level of education, presence of pain and self-consciousness of oral diseases were independent predictors (p<0.05). In-depth interviews among 27 participants identified financial concerns and structural factors, dental service provider factors and individual factors as key themes. Financial restraints and access difficulties were some of the barriers and trust in service provider and availability were facilitators. **Conclusions:** There exists a gap between the perceived need and actual utilization of dental health care. To increase the utilization of dental health services it is necessary to improve the availability of public dental health care facilities and promote oral health awareness at all levels.

DOI: 10.18332/popmed/165021

Incidence of cerebrovascular accident (CVA) and its factors among hypertensive patients in a community hospital setting in Thailand: a retrospective cohort study from 2011 to 2022

Naruporn Krungkraipetch¹, Sidaporn Srirojanakul¹, Nachaok Sutthiopad¹, Kanlaya Jongcherdchootrakul¹

¹Phramongkutklao College of Medicine, Thailand

Background: Hypertension is a global concerned problem brings about a majority disability and mortality as well as in Thailand. Moreover, one of the sequelae among hypertensive patients is stroke or cerebrovascular accident (CVA) which an incidence rate is greater than the rate among general population. Nevertheless, there is lack of information indicating incidence rate and risk factors of CVA in Thai hypertensive patients.

Objective: To evaluate incidence and risk factors of cerebrovascular accident among hypertensive patients

Methodology: A retrospective cohort study was conducted in 2022 by recruiting 2578 hypertensive patients during 2011 – 2022 from Tha Wung hospital. Participants under 18 years old with previous CVA history before hypertension diagnosis were excluded from this study. The primary outcome of this research was the first CVA. For descriptive statistics, demographic data including the age of first hypertension diagnosis, gender, health insurance, and occupation were described in percent, mean and standard deviation. For analytic statistics, demographic data and predictive factors including BMI, uncontrolled hypertension, smoking status, alcohol consumption, diabetes mellitus, high cholesterol, and chronic kidney disease were calculated by a multivariate Cox Proportional Hazards regression model.

Results: There were 83 confirmed new CVA cases among 2578 eligible participants with follow-up. The incident rate of CVA was 8.05 per 1000 person-years [95% CI: 6.49–9.99]. Risk factors of CVA among hypertensive patients were being male with adjusted HR (95% CI) of 1.86(1.09 - 3.15), age at hypertension diagnosis above 80 years old, 4.39(1.79 - 10.74), and current smoking, 2.41(1.04 - 5.55). **Conclusions:** CVA incidence among Thai hypertensive patients is more considerable than the normal population. A smoking cessation program should be initially recommended to decrease the risk of CVA.

Decrease in oncological surgery activities during pandemic: a retrospective study from an Italian Southern Region

Giuseppe Di Martino¹, Fabrizio Cedrone², Pamela Giovanni³, Ferdinando Romano⁴, Tommaso Staniscia⁵

¹Department of Medicine and Ageing Sciences, G. d'Annunzio University of Chieti, Pescara, Italy, ²ASL Pescara, Italy, ³G. d'Annunzio University of Chieti-Pescara, Italy, ⁴"La Sapienza" University of Rome, Italy

Background: The pandemic had a strong impact on healthcare for other diseases, the so-called collateral damage. This situation heavily impacted the health care system, causing a deferment of surgical admissions. This situation had an immediate and long-term impact on millions of patients with surgical diseases all over the world. The objective of this study was to evaluate the incidence of hospitalizations for colorectal and breast cancers in an Italian region during 2020 and to compare it with years 2018–2019.

Methods: This retrospective study was performed in the Abruzzo region, Italy. All admissions occurred during years 2018–20 for colorectal and breast cancers were considered. Data were extracted from hospital discharge records. Monthly number of hospitalizations for both diseases in the year 2020 was compared with a control period consisting of the average of admissions that occurred in the years 2018–2019 using Poisson regression.

Results: In the Abruzzo region, during the year 2020, a total of 604 patients were admitted for colorectal cancer surgery, and 1012 patients were admitted for breast cancer surgery. A reduction in hospital admissions for all diseases considered was found. In particular, compared with years 2018–2019, admissions for colorectal cancer were 35.71% lower (HRR 0.915; 95% CI: 0.914–0.916; p < 0.001), and admissions for breast cancer were 10.36% lower (HRR 0.895; CI: 0.894–0.897; p < 0.001). Considering the monthly incidence of hospitalization, a significant reduction was observed particularly between March and June 2020, and during the last two months of the year 2020, for both cancers compared to previous years. **Conclusions:** The results of this study showed the impact of the COVID-19 pandemic on surgery volume for two common oncological surgeries. These results highlighted the need of strategic measures to deal with new cancer diagnoses and surgery overload during the coming years.

The burden of leading sites of cancer in India in terms of Disability-Adjusted Life Years (DALYs)

Koushik Pramanik¹

¹International Institute for Population Sciences (IIPS), India

Background and Objective: Cancer is a generic term for many diseases affecting any body part. Other terms used are malignant tumors and neoplasms. Disease elimination is an attempt to reduce the number of people who die from a particular cause. In practice, diseases like cancer can't be eliminated, and their effects will vary from person-years lived to the amount of money spent on managing them. Thus, in the study, we have estimated the burden of cancer in terms of DALYs.

Methods: To calculate YLL, we need the number of deaths due to cancers and standard life expectancy. Firstly, the age-sex-specific death rate (ASDR) from SRS was multiplied by the projected population, giving the age-sex-specific numbers of total deaths. Then, the number of cancer deaths was multiplied by standard life expectancy, giving YLL. To calculate YLD, we have multiplied the prevalence cases of cancer and the disability weights. Disability was estimated based on data for countries classified as Established Market Economies (EME) in the GBD study. Then the prevalence cases of cancer were multiplied by disability weights to obtain YLD. And lastly, DALYs were estimated by adding YLL and YLD.

Results: The total number of DALYs for three leading cancer sites was 5380.95 and 4735.57 per 100000 in males and females, respectively. Ranked by the age-standardized DALY rate, the top three cancers were lung (2500.58/100000 population), mouth (1430.83/100000 population), and stomach (1449.53/100000 population) in males and breast (2622.33/100000 population), cervical (1346.38/100000 population), and ovary cancer (766.86/100000 population) in females.

Conclusions: This disease burden estimate approach is incredibly beneficial for monitoring services and conducting health economic analyses such as cost-effectiveness studies. In addition, once results from DALY analyses are available in other developing countries, similarities and differences should be examined in more detail.

Economic burden for the Brazilian Health System attributable to excessive sodium consumption

Isis Machado¹, Aline Vegi², Larissa Guedes², Mariana Felisbino-Mendes³, Gabriel Vieira²

¹Institute for Collective Health, Universidade Federal de Ouro Preto, Brazil,

²Universidade Federal de Ouro Preto, Brazil, ³Universidade Federal de Minas Gerais, Brazil

Background and Objective: Excessive sodium consumption (ESC) is associated with increased blood pressure, the main risk factor for cardiovascular diseases, and predisposes to kidney disease and gastric cancer. We aimed to estimate the burden of non-communicable diseases attributed to ESC and costs to the Nacional Unified Health System (SUS), in Brazil and Federative Units (FU), in 2019. **Methodology:** Ecological study that used the population attributable fraction (PAF) of the ESC estimated by the Global Burden of Disease 2019, considering the theoretical minimum risk exposure level (intake of up to 3g of sodium/day); the average consumption in the population; and the relative risks of risk-outcome pairs. The PAFs were applied to the total costs of hospitalizations and procedures of medium and high complexities (MAC) for each outcome related to the ESC paid by SUS, obtained from databases of the Outpatient and Hospital Information Systems. The amounts were converted to international dollars (US\$).

Results: ESC was responsible for 30814 deaths, 699119 DALY (disability-adjusted life year) and US\$57,163,245 spent of which US\$52,275,994 in hospitalizations and US\$4,887,251 with MAC procedures in Brazil in 2019. Ischemic heart disease, stroke and chronic kidney disease represented more than 86% of this amount. The costs of hospitalizations and MAC procedures were higher for men, and almost 50% of the costs attributable to ESC were between 55-69 years. São Paulo and Minas Gerais were the FU's that spent the highest values for the treatment of diseases attributable to ESC, while Roraima and Acre the lowest. **Conclusions:** The ESC causes a significant burden to the SUS, mainly among men and in the Southeast region. Research using health and economic modeling approaches provides important evidence for the implementation of regional public policies and cost-effective strategies for ESC reduction favoring better allocation of public resources to SUS.

Differences in incidence trends (1987-2018) of cancers by sex in the Veneto Region, North-East Italy

Giuseppe Luca¹, Manuel Zorzi², Alessandra Buja³, Massimo Rugge⁴, Claudia Cozzolino⁵, Emanuela Bovo⁴, Stefano Guzzinati⁴, Vincenzo Baldo³

¹Department of Cardiological, Thoracic, Vascular Sciences and Public

Health, University of Padova, Padova, Italy, ²Azienda Zero, Registro Tumori Veneto, Italy, ³Department of Cardiological, Thoracic, Vascular Sciences and Public Health, University of Padua, Padua, Italy, ⁴Veneto Tumor Registry, Azienda Zero, Italy, ⁵University of Padua, Italy

Background: This is an observational study aimed at analysing the incidence trends of 18 different types of cancer, classified by site, in a population cohort of over 4 million residents in the Veneto region of north-eastern Italy over a period of almost 30 years.

Methods: This population-based observational study is based on epidemiological data on cancer incidence collected by the Veneto Regional Cancer Registry for the years 1987-2018. A joinpoint regression analysis was performed to identify significant changes in annual cancer incidence (Annual Percent Change - APC) by sex and tumour site. The average Annual Percent Change (APC) was also calculated for each trend.

Results: Overall, the APC of all cancers (excluding non-melanoma skin cancer) shows significant differences between the sexes (-1.7 males, -0.9 females). In addition, the APC of the incidence of tumours, classified by site, shows differences between males and females in 9 tumours (brain, larynx, lung, skin melanoma, oesophagus, colorectum, liver, bladder and oral cavity), while the remainder show similar trends (thyroid, stomach, pancreas, biliary tract, kidney and urinary tract, leukaemia, multiple myeloma non-Hodgkin lymphoma, Hodgkin lymphoma).

Conclusions: This study has shown that sex differences in cancer incidence trends still remain of concern for several malignancies. These observations should guide policy makers to adopt differentiated strategies to maximise the effectiveness of primary and secondary prevention.

of Oncology IOV-IRCCS, Padua, Italy, ⁴Veneto Institute of Oncology IOV-

IRCCS, Padua, Italy, ⁵Veneto Tumor Registry, Azienda Zero, Padova, Italy,

⁶Hygiene and Public Health Unit, Department of Cardiological, Vascular and Thoracic Sciences, and Public Health, University of Padua, Padua, Italy,

⁷Veneto Institute of Oncology IOV-IRCCS Padova, Padova, Italy

Background and Objective: Soft tissue sarcomas (STS) are rare malignancies. Their low incidence and the complexity of their management demand their treatment at high-volume multidisciplinary centers to ensure an adequate quality of care. This study aimed to assess the epidemiology, quality of care, and costs of care for cases of STS in the Veneto Region. **Methods:** This retrospective, population-based study included all incidental cases of STS recorded in the Veneto Region (northeast Italy) in 2017 and 2018. The 1990-2018 temporal trends in the age-standardized incidence of STS were also obtained by sex. Then significant changes in yearly rates for males and females were identified using a joinpoint regression. The quality of care in different phases of the STS clinical pathway was assessed by computing the real-practice values of a set of indicators established by a regional multidisciplinary working group. The average survival-weighted, real-world costs per patient at 2 years after their diagnosis were extracted from regional administrative databases and stratified by sex and TNM stage.

Results: The incidence of soft tissue sarcoma was generally higher in males than in females. The temporal trends were flat for women, and rose slightly trend for men (APC = 0.9, p-value = 0.001). The survival-weighted mean total cost per patient amounted to €22,183 (€40,042 for stage IV disease and €10,379 for stage I). Adherence to diagnostic procedures, such as the proportion of initial anatomopathological diagnoses supported by a second opinion, was poor. Indicators concerning the surgical treatment of intermediate/high-grade and retroperitoneal STS were still significantly lower than the thresholds as only 37% of the latter were treated with multivisceral surgery. **Conclusions:** The availability of a high-resolution registry enabled a population-based epidemiological investigations on the direct costs of illness for patients with STS, affording an overview of the quality of their clinical care pathways.

Sex-related difference in the risk of second primary cancers among cutaneous malignant melanoma survivors

Giulia Grotto¹, Alessandra Buja², Massimo Rugge³, Mariagiovanna Manfredi², Claudia Cozzolino⁴, Stefano Guzzinati³, Emanuela Bovo³, Manuel Zorzi³, Paolo Fiore⁴, Saveria Tropea⁴, Luigi Dall'Omo⁵, Carlo Rossi⁶, Simone Mocellin⁴

¹Department of Cardiology, Vascular and Thoracic Sciences and Public Health, University of Padova, Padova, Italy, ²Department of Cardiac, Thoracic and Vascular Sciences, and Public Health, University of Padova, Italy, ³Veneto Tumor Registry, Azienda Zero, Italy, ⁴Soft-Tissue, Peritoneum and Melanoma Surgical Oncology Unit, Veneto Institute of Oncology IOV-IRCCS, Italy, ⁵Faculty of Medicine and Surgery, Department of Surgical, Oncological and Gastroenterological Sciences, University of Padova, Italy, ⁶Faculty of Medicine and Surgery, Department of Surgical, Oncological and Gastroenterological Sciences, University of Padova, Padova, Italy

Background and Objective: Personalized precision preventive medicine is a new public health challenge that demands a definition of target populations at greater risk of disease from a gender-sensitive perspective. Cutaneous malignant melanoma (CMM) survivors are more likely to develop second primary cancers than the general population. This study aims to identify any sex-related difference in this risk of second primary cancers (other than CMM) in patients diagnosed with CMM.

Methods: A retrospective cohort study was conducted using data from a high-resolution, population-based cancer registry covering the Veneto Region (in Italy). The cohort included all CMM patients diagnosed between 1999 and 2018. All subsequent primary cancers occurring in this cohort, and the specific sites involved were considered. Cancer incidence rates were calculated stratifying the cohort by sex and tumor site, and standardizing patients by age and calendar-year group. Then the Standardized Incidence Ratio (SIR) was calculated as the ratio between the number of second cancers observed and the number that would be expected if CMM patients experienced the same cancer rates as the general reference population.

Results: Data for 9,726 CMM survivors were analyzed. Males were at higher risk of subsequent prostate, thyroid, kidney and urinary tract cancers, while the risk for females was significantly higher for second breast cancer, non-Hodgkin lymphoma, and kidney and urinary tract cancers.

Conclusions: Being diagnosed with CMM raises the risk of developing other subsequent primary cancers. Health care systems should offer patients who have been diagnosed with melanoma a tailored, specific cancer screening program and a generally greater commitment to proactive secondary prevention efforts to enable an early diagnosis of potentially gender-specific second primary tumors.

Association between body mass index and dental caries among adolescents

Manal Awad¹, Wegdan Issa², Hadia Radwan³, Randa Fakhry³, Nabeel Yateem³, Rachel Rossiter⁴

¹University of Sharjah, College of Dental Medicine, United Arab Emirates, ²College of Health Sciences, University of Sharjah, Sharjah, United Arab Emirates, ³College of Health Sciences, University of Sharjah, Sharjah, United Arab Emirates, ⁴Faculty of Science and Health, Charles Sturt University, Australia

Background: Body mass index (BMI) and dental caries among adolescents is a growing worldwide public health issue. They share some common and modifiable influences. The objective of this study was to evaluate the association between BMI and dental caries among adolescents in the United Arab Emirates (UAE).

Methods: This cross-sectional study enrolled 478 adolescents 13-19 years old from private and public schools in the UAE. Participants were classified as underweight, normal weight, overweight, and obese. Dental caries was diagnosed according to the criteria recommended by the World Health Organization (WHO). Independent t-tests were used to compare average number of decayed, filled and missing surfaces (DMFS) by age, sex, school type, mothers' employment, BMI categories, fruit and vegetable intake (F/V intake) and plaque index. Additionally, a multiple linear regression model was applied to analyze the association between BMI categories and dental caries, adjusted for confounding factors considered in this study.

Results: The average age of the participants was 16.2 ± 1.4. Prevalence of underweight, normal, overweight, and obesity was 14.6%, 46.4 %, 17.6%, and 21.4%, respectively. Overall, the average DMFS score was 4.35 ± 4.5, with lower dental caries rates among girls than boys. The linear regression model revealed that, being a male, attending a public school and being underweight were all positively and significantly associated with dental caries.

Conclusions: Underweight is associated with dental caries among adolescents

in the UAE. Further research is required to investigate the complex association between obesity and dental caries and how dietary habits, oral hygiene habits, and parental socioeconomic status mediate the association between BMI and dental caries.

DOI: 10.18332/popmed/165267

Adherence to Mediterranean diet and risk of pancreatic cancer: systematic review and meta-analysis

Vincenza Gianfredi¹, Andrea Cinnirella¹, Emanuela Campagnoli¹, Manuel Maffeo¹, Pier Perrone¹, Viiktorija Shishmintseva¹, Francesca Grosso¹, Ambra Castrofino¹, Silvana Castaldi¹, Luisa Romanò¹, Mariateresa Nardi², Daniele Nucci²

¹University of Milan, Italy, ²Nutritional Support Unit, Veneto Institute of Oncology IOV-IRCCS, Italy

Background and Objective: Pancreatic cancer (PC) still represents one of the gastrointestinal cancers with the highest burden both in terms of incidence, prevalence and mortality rate. However, despite efforts in deeply understanding the aetiology of PC, it still remains unclear, with several identified potential risk factors, among them diet. However, little is known about the association between Mediterranean Diet (MedDiet) and risk of PC. **Methods:** A systematic review with meta-analysis has been carried out according to The Preferred Reporting Items for Systematic Reviews and Meta-Analyses 2020 (PRISMA) guidelines, searching on three scientific databases (PubMed/MEDLINE, Scopus, and EMBASE). The protocol was registered in PROSPERO (ID number: CRD42022367497). Newcastle-Ottawa Scale was used to assess methodological quality. Both fixed and random effect models were performed. The effect size was reported as hazard ratio (HR) with a 95% Confidence Interval (CI). I² test was performed to measure the heterogeneity. Funnel plot and the Egger's regression asymmetry test (p < 0.10) were used to assess publication bias. Prometa3® software was used to perform the statistical analyses.

Results: A total of 8 articles were included. The methodological quality of the included meta-analyses was high. Our results show that higher adherence to MedDiet is associated with a lower risk of PC [HR:0.82 (0.76-0.88) p<0.001, based on 1,301,320 subjects]. Results were also confirmed in sensitivity and subgroups analyses (avoidance of potential overlapping effects, type of tools to assess dietary intake and the diagnosis of PC, prevalent and incident PC risk, country where the studies took place, sex and cancer site). **Conclusions:** Based on our results, and according to the NOURISHING framework developed by the World Cancer Research Fund, investing public money in educating about healthy food choices might maximize healthier food choices. In this case higher adherence to MedDiet reduces risk of PC.

Is reformulation capable of changing the nutritional quality of diets at population-level? A modeling study using real food market data

Barthélemy Sarda¹, Emmanuelle Kesse-Guyot^{2,3}, Morgane Fialon^{2,3}, Melanie Deschasaux^{2,3}, Bernard Srour^{2,3}, Pilar Galan⁴, Serge Hercberg⁴, Mathilde Touvier⁴, Chantal Julia⁴

¹Sorbonne Paris Cité Epidemiology and Statistics Research Center (CRESS), Inserm U1153, Inrae U1125, Cnam, Université Sorbonne Paris Nord University, Bobigny, France, ²Cité Epidemiology and Statistics Research Center (CRESS), Inserm U1153, Inrae U1125, Cnam, Université Sorbonne Paris Nord University, Bobigny, France, ³Nutritional Epidemiology Research Team (EREN), France, ⁴Nutritional Epidemiology Research Team (EREN), CRESS, Inserm U1153, Inrae U1125, Cnam, Paris 13 University, Bobigny, France

Background: Reformulation policies have been implemented to improve the nutritional quality of diets through the modification of the food offer. To assess the potential effects of reformulation policies, past research analyzed the impact of interventions in specific food sectors or for specific nutrients, using generally theoretical approaches. This study used branded food composition data to model potential effects on dietary intakes of widespread reformulation based on the composition of existing products.

Methods: Dietary data were retrieved from the Nutrinet-Santé cohort at inclusion (N=100,418), providing detailed information regarding participants' diet (N>3,000 unique generic food items). Each food consumed was matched with data from OpenFoodFacts, providing composition information from the French food market (N=119,060 products used) and products were classified as low, medium, or high quality for each generic food item according to FSAM-NPS. Three scenarios were

constructed: a baseline scenario in which products were selected from the entire range of food, two counterfactual scenarios with a food selection restricted only to products of higher nutritional quality, or poorer nutritional quality. For each scenario, a product of the corresponding selection was randomly attributed to each individual and dietary intakes were then assessed.

Results: We found that substitution from overall to products of higher nutritional quality led to improvement in diets for energy (-55 kcal/day, -2.9%), saturated fat (-2.4g/day, -7.6%), sugar (-4.8g/day, -5.3%) and salt (-0.54g/day, -8.3%) intakes. Improvements in diet quality were observed across all population strata. Food groups for which changes in composition contributed the most to improvements at the population level were: 1) sweets/confectionary, sweetened beverages, biscuits for sugars; 2) dairy desserts, processed meats, biscuits for saturated fat; 3) breads, cheeses, prepared dishes for salt.

Conclusions: Our study showed that replacing food consumed by similar one (intra-group substitutions) with different composition allows to substantially improve the overall quality of the diet.

COVID-19 diagnosis and mortality in patients with Acute Myocardial Infarction admitted in Italy during the National Outbreak

Paola D'Errigo¹, Stefano Rosato², Leonardo Luca^{3,4}, Barbara Giordani⁵, Marcello Cuomo⁵, Giorgia Duranti⁵, Gian Mureddu⁶, Andrea Tavilla^{7,8}, Gabriella Badoni², Fulvia Seccareccia², Giovanni Baglio⁵

¹National Centre for Global Health, Istituto Superiore di Sanità, Rome, Italy, ²National Center for Global Health, Istituto Superiore di Sanità, Italy, ³Department of Cardio-Thoracic and Vascular Medicine and Surgery, Division of Cardiology, A.O. San Camillo-Forlanini, Rome, Italy, ⁴UniCamillus-Saint Camillus International University of Health Sciences, Rome, Italy, ⁵Italian National Agency for Regional Healthcare Services, Italy, ⁶San Giovanni Addolorata Hospital, Italy, ⁷National Centre for Disease prevention and health promotion, Italy, ⁸Istituto Superiore di Sanità, Italy

Background and Objective: There are limited data on the clinical impact of COVID-19 in patients with acute myocardial infarction (AMI). Aim of this work is to assess the impact of COVID-19 infection on mortality in AMI patients admitted during the national outbreak in Italy. Methods: Retrospective nationwide cohort study enrolling consecutive AMI patients admitted between March, 11st and May 3rd, 2020 (national outbreak) and the equivalent periods of the previous 5 years in Italy. The main outcomes were 30-day and 6-month all-cause mortality.

Results: The actual number of AMI admission during the 2020 outbreak in Italy was significantly reduced as compared to that expected based on the trend of the previous 5 years (STEMI: 4048 vs 5523, $p < 0.0001$; NSTEMI: 4981 vs 8633, $p < 0.0001$). A COVID-19 diagnosis was reported in 4.2% of STEMI and 3.5% of NSTEMI patients. In STEMI patients the 2020 expected rate of 30-day and 6-month mortality was 9.2% and 12.6%, compared to observed rates of 10.8% ($p = 0.016$) and 14.4% ($p = 0.017$), respectively. In NSTEMI patients the 30-day and 6-month expected mortality rates in 2020 were 6.5% and 12.2%, compared to observed rates of 8.3% ($p = 0.001$) and 13.6% ($p = 0.041$), respectively. Excluding patients diagnosed with COVID-19, the mortality rates become consistent with the trend of the previous 5-year for STEMI, but remain higher for NSTEMI. After multivariate adjustment, diagnosis of COVID-19 resulted an independent predictor of both 30-day mortality (OR=4.7, $p < 0.0001$ for STEMI; OR=4.5, $p < 0.0001$ for NSTEMI) and 6-month mortality (OR=3.6, $p < 0.0001$ for STEMI; OR=3.8, $p < 0.0001$ for NSTEMI). Conclusions: During the 2020 national outbreak in Italy, a concomitant diagnosis of COVID-19 was associated with a significantly higher rate of mortality in both STEMI and NSTEMI patients. Excluding patients diagnosed with COVID-19, the mortality rates become consistent with the previous 5-year trend for STEMI, while they remain higher for NSTEMI.

Impact of national smoking bans on per-capita tobacco consumption, in Europe: a time trend analysis

Roberta Pastorino¹, Michele Sassano², Marco Mariani², Stefania Boccia²

¹Institute for Collective Health, Università Cattolica del Sacro Cuore, Italy,

²Università Cattolica del Sacro Cuore, Italy

Introduction: Tobacco is a major public health threaten and several policies and laws were enacted to reduce the burden of tobacco-related diseases and deaths. We aimed to assess the impact of national smoking bans on per-capita cigarette consumption and mortality of acute myocardial infarction (AMI) in the European Union (EU) and in the United Kingdom (UK) and to assess which factors influence

their effectiveness.

Methods: We carried out an interrupted time series analysis including data of 27 Member States of the EU and the UK on per-capita cigarette consumption and AMI mortality. A multivariate meta-regression was carried out to investigate whether some factors influenced the effectiveness of smoking bans in terms of level and slope changes following interventions.

Results: Around half of the interventions analyzed led to a level or slope change, or both, of per-capita cigarette consumption (17 out of 35) and AMI mortality (18 out of 36). As for cigarette consumption, the strongest level reduction was observed for the smoking ban issued in 2010 in Poland (rate ratio, RR: 0.47; 95% confidence interval, CI: 0.41, 0.53). Instead, the highest level reduction of AMI mortality was observed for the intervention introduced in 2012 in Bulgaria (RR: 0.38; 95% CI: 0.34, 0.42). Bans issued more recently or by countries with a lower human development index were found to be more effective at reducing per-capita cigarette consumption. In addition, smoking bans applying in bars were found to be associated with a higher effectiveness related to both cigarette consumption and AMI mortality.

Conclusions: The results of our study suggest that smoking bans are effective at reducing per-capita cigarette consumption and AMI mortality. It is of extreme importance to monitor and register data on tobacco, its prevalence and consumption in order to be able to tackle with concerted efforts its health effect.

The role of human rights law in preventing oral NCDs: states' imperative to regulate the cariogenic (living) environment

Dominique Mollet^{1,2}, Brigit Toebes³

¹Joint Research Center, European Commission, Italy, ²Rijksuniversiteit Groningen, ³Rijksuniversiteit Groningen, The Netherlands

Background and Objective: Protecting oral health is of increasing concern: 3.5 billion people worldwide suffer from oral non-communicable diseases (NCDs). Consensus has emerged that strategies must bypass individual responsibility and further systemic policies. The World Health Organization has recently adopted a Global Strategy on Oral Health, recognizing the fundamental right to oral health. Although previous research clarified the importance of human rights law in NCD prevention, the content of the right to oral health and the benefits of a rights-based approach for oral health remain unclarified.

Methods: Our methodology is firmly grounded in public health legal research. To identify the content of the right to oral health and the resulting State obligations, we conducted legal doctrinal research integrating dental sciences. First, we established the subject of regulation, namely behavioural risk factors of poor oral health. Subsequently, we signalled and interpreted relevant human rights law provisions. The Findings, namely the State obligations, were tested in light of available knowledge in the field of dentistry.

Results: Human rights treaties create legal obligations for States vis-à-vis individuals. The right to health is central and offers a framework for a comprehensive oral health strategy, covering both the underlying determinants of health and the healthcare system. The behavioural risk factors of poor oral health, including sugars ingestion, hygiene practices, fluoride exposure and dental attendance, have clear human rights dimensions: States must ensure access to essential medicines including fluoride, nudge individuals into healthy behaviour, and provide for an economically accessible healthcare system: omissions in these areas can amount to violations of human rights.

Conclusions: The right to oral health and the incorporation of human rights law in international and domestic strategies on oral health is a promising tool to further upstream policies, ensure equal oral health protection and hold governments accountable for lacking such strategies.

Associated factors to known but non-controlled high blood pressure in Senegal: a secondary analysis of the WHO STEPwise survey

Pengd-Wende Traore¹, Jean Tine¹, Adama Faye¹

¹Institute of Health and Development, Public Health Service, Faculty of Medicine, Pharmacy and Odontology, Cheikh Anta Diop University, Dakar, Senegal

Introduction: In Africa, in 2015, the prevalence of known hypertension under treatment but not controlled was 93%. The Objective of the study was to estimate its prevalence and identify its associated factors in Senegal.

Methodology: This secondary analysis of the WHO STEPwise survey was descriptive and analytical. Data were collected from August 1st to December 15th,

2015. All subjects between the ages of 18 and 70 and residents of the territory were included. Those in a state of pregnancy, incapacity (mental, physical), absence from the household, or non-consent were not included. The sample size had been calculated with the WHO formula. Sampling was done by stratification in three sampling stages. Data collection was done on the WHO STEPS form. The statistical analysis of the data was done on Rstudio 4.0.2. with descriptive, bivariate, and multivariate analyses by binary logistic regression.

Results: The prevalence of known but non-controlled hypertension was 56.9%. The associated factors were: The "Very important" degree of personal perception of the importance of reducing salt consumption (ORa = 21.7; 95% CI = [2.49; 601]); the advice received to reduce salt consumption (ORa = 12.1; 95% CI = [1.81; 144]); physical activity when moving only (ORa = 0.11; 95% CI = [0.02; 0.58]); limiting the consumption of savory cooked meals (ORa=0.04; 95% CI=[0.00; 0.57]).

Conclusions: We recommend that health practitioners go to populations to develop primordial and primary prevention of arterial hypertension, researchers conduct mixed studies on bad attitudes regarding salt consumption, administrative authorities develop cities where the practice of physical activity when moving is more easy and political authorities to issue mandatory warnings on the salt concentration of foods sold.

An e-learning course to support monitoring of food industry compliance with regulation to promote healthier diets in South-East Asia

Damian Maganja¹, Alexandra Jones¹, Angela Silva²

¹The George Institute for Global Health, Australia, ²South-East Asia Regional Office, World Health Organization, India

Background and Objective: The World Health Organization (WHO) recommends governments introduce regulations to support healthier food environments and address the growing burden of diet-related disease. Monitoring and enforcing food industry compliance with regulation is critical. However, guidance to support the development, implementation and improvement of monitoring systems is limited, particularly in low- and middle-income country (LMIC) settings. The George Institute for Global Health and WHO South-East Asia Regional Office collaborated to develop technical tools for countries across the region to support monitoring and enforcement efforts.

Methods: This work was undertaken in several phases. Firstly, relevant literature and frameworks for monitoring food regulation and other related areas such as alcohol control were reviewed. An initial set of monitoring methods was then developed, including consideration of relevant applications, authority and resources required, strengths and weaknesses, and potential barriers to implementation. The feasibility of application in LMICs was tested through targeted consultation with government and non-government stakeholders across the region. This informed a final, tailored set of recommendations for building monitoring systems. Materials were then translated into an e-learning course, further tested with stakeholders, to facilitate engagement with the policy recommendations.

Results: An e-learning course on monitoring food industry compliance with regulation is now available on the OpenWHO platform. This provides an overview of principles that support effective regulation, outlines a stepped set of recommendations for effective monitoring methods that can be adapted to country contexts, and discusses the need for effective enforcement and reporting systems. Case studies of regional and global practices are provided as examples. Conclusions: These practical and accessible materials will support governments across the South-East Asia region and elsewhere to strengthen monitoring and enforcement of regulations to address diet-related disease. Overall, we suggest a risk-based approach that considers country priorities and available resources is likely to be most effective.

Cervical cancer screening based on urine self-sampling to reach un(der)-screened women: study protocol of the ScreenUrSelf trial

Severien Keer¹, Eliane Kellen², Patrick Martens², Marc Arbyn³, Cindy Simoens³, Elke Smits⁴, Iris Verhaegen⁴, Joke Bilcke¹, Philippe Beutels¹, Annemie Smet¹, Pierre Damme¹, Alex Vorsters¹

¹University of Antwerp, Belgium, ²Centre for Cancer Detection, Belgium,

³Sciensano, Belgium, ⁴Antwerp University Hospital, Belgium

ScreenUrSelf aims to verify whether the offer of urine or vaginal self-sampling is more effective than an invitation letter to contact a physician for a Pap smear or no intervention, to generate participation in cervical screening without negatively impacting compliance to follow-up. Would home-collected urine sampling be more

preferred by un(der)-screened women than vaginal self-sampling? Could as such more women be reached that currently do not participate in organized screening? To define which intervention is most effective to reach un(der)-screened women, a trial will be embedded in the organized cervical screening program in Flanders (Belgium). 48000 women (30-64y) will be included, who are eligible for screening but were not screened for at least six years (two screening rounds). Women will be randomized in six arms each comprising 8000 women: two control (no intervention; recall letter) and four intervention arms. Interventions consist of receipt of a urine or vaginal self-sampling kit (opt-out) or receipt of a letter to order a urine or vaginal self-sampling kit (opt-in). The primary outcome will be the response rate: proportion of women that participate in each study arm within twelve months after initiation of the intervention. Response is defined as having a preventive cervical screen, by the self-sample or a Pap smear. Secondary study outcomes will include percentage of screened positive women with follow-up, percentage of women with a positive screen test, positive predictive value of a positive screen test, detection rate of high-grade cervical neoplasia, preference and attitudes of women, age- and socioeconomic status-related differences in response rates, and cost-effectiveness outcomes. Offering a cost-effective approach that reaches un(der)-screened women and assures compliance to follow-up should impact significantly on the burden of cervical cancer. If embedded in an organized screening program, this could positively impact both the patient's health and reduce costs for the healthcare system.

Sexually and non-sexually transmitted infections and the risk of Prostate Cancer: results from the EPICAP study

Melissa Sawaya¹, Emilie Cordivadverger^{2,3}, Pierre-Jean Lamy^{4,5,6}, Xavier Rebillard^{5,7}, Brigitte Tretarre⁸, Florence Menegaux²

¹Université Paris-Saclay, UVSQ, Exposome, Hérité, Cancer et Santé team, CESP (Center for Research in Epidemiology and Population Health), UMR 1018 Inserm, Villejuif, France., ²Université Paris-Saclay, UVSQ, Exposome, Hérité, Cancer et Santé team, CESP (Center for Research in Epidemiology and Population Health), UMR 1018 Inserm, Villejuif, France, ³Institut Gustave Roussy, Villejuif, France, ⁴Institut Médical d'Analyse Génomique-Imagename, Labosud, Montpellier, France, ⁵Service Urologie, Clinique Beau Soleil, Montpellier, France, ⁶Groupe INOVIE, France, ⁷IMM de la Clinique Beau Soleil, France, ⁸Cancéropôle Grand Sud-Ouest (GSO), Montpellier, France

Introduction: Prostate cancer (PCa) is by far the most common type of cancer among men in Western countries. However, relatively little is known about its etiology despite the high morbidity and mortality rates, where only advanced age, ethnicity, and family history of prostate cancer are well-established non-modifiable risk factors. It has been suggested that chronic inflammation may be involved in the development of prostate carcinogenesis. Therefore, our objective was to investigate the role of sexually and non-sexually transmitted infections in the occurrence of prostate cancer with a specific interest in the aggressive types based on data from EPICAP.

Methods: EPICAP is a population-based case-control study conducted in the département of Hérault, France, between 2012 and 2014. A total of 819 incident cases and 879 controls have been interviewed face-to-face using a standardized questionnaire gathering information on known or suspected risk factors of prostate cancer and personal history of specific sexually and non-sexually transmitted infections: Gonorrhea, Syphilis, Trichomonas, Herpes, Mononucleosis, Epstein Barr, Varicella-zoster, and Dengue. Odds Ratios (OR) and their 95% confidence interval were estimated using multivariate unconditional logistic regression.

Results: No association emerged for the history of sexually transmitted infections (OR 1.04, 95%CI: 0.84-1.25) and non-sexually transmitted infections (OR1.09, 95%CI: 0.89-1.34) and the risk of prostate cancer. Even for all the infections studied separately, there was no association with the risk of low-grade or high-grade prostate cancer.

Conclusions: Our results showed that sexually or non-sexually transmitted infections do not seem to be risk factors for prostate cancer in the EPICAP study. Therefore, further investigation is needed to help advance our understanding of the role of chronic inflammation in the etiology of prostate cancer, with a particular focus on its most aggressive types.

Capitalizing experiential knowledge from interventions promoting breast and cervical cancers screening to enhance uptake in France

Hélène Vandewalle¹, Sandrine Halphen¹, Béatrice Georgelin², Frédéric Bouhier², Timothée Delescluse², Samuel Gaspard², Benjamin Soudier²,

François Berdougo², Emmanuel Rush²

¹Institut National du Cancer, France, ²French Society for Public Health, France

Background: The latest French National Cancer Control Strategy makes improving access to Cancer Screening programs (CS) a public health priority, as inequalities regarding CS uptake persist. From 2020 to 2022, we carried a project to document Interventions Promoting CS Participation (IPCSP) for vulnerable groups, for both breast and cervical cancers. To build up experiential and practical evidence from IPCSP, we used an innovative approach in France called capitalization.

Methods: The project aimed at capitalizing, i.e. collecting, documenting and circulating, experiential knowledge from practitioners who implement IPCSP at a local level and followed 6 steps: 1/identify promising IPCSP nationwide; 2/ meet with IPCSP practitioners and users; 3/ document and analyze the key mechanisms impacting how IPCSP unfold; 4/ write a summary form for each IPCSP; 5/ publish them on a online portal; 6/ conduct a cross-case analysis to investigate key or recurring levers and barriers and design recommendations for public policy.

Results: 20 IPCSP were selected, including projects aimed at women in low-income neighborhoods, healthcare deserts' inhabitants, allophone women, handicapped women, etc. Most IPCSP targeted groups, not individuals. Strategies included: outreach strategies, peer prevention, training workshops, on-site screenings, etc. All IPCSP promoted informed choice. The analysis highlights issues regarding implementation design, partnerships, and evaluation. Most IPCSP had to adapt the tools of the national CS campaign. Most IPCSP reached out to women rather than remodel access to regular sites of prevention to facilitate CS uptake. Partnerships, between medical experts and professionals involved with targeted women, provided population-specific and context-specific levers. Fruitful partnerships dedicated time to co-construct interventions and to cross-train practitioners.

Conclusions: The selected IPCSP were small-scale programs showing positive results and offering insights for others to put into practice and disseminate strategies recommended in the National Strategy. New research is necessary to measure their cumulative impact on national uptake goals.

It takes two to tango: a couples-based lifestyle approach to reducing multigenerational risk of metabolic syndrome

Sundus Nizamani¹, Ro McFarlane², Cathy Knight-Agarwal³, Shawn Somerset¹

¹Health Research Institute, University of Canberra, Australia, ²Health Research Institute, University of Canberra, Bruce, Australia, ³Faculty of Health, University of Canberra, Bruce, Australia

Background and Objective: Metabolic Syndrome (MetS) is a major risk factor for non-communicable diseases, including type 2 diabetes mellitus, cardiovascular disease, and cancer. Although MetS risk is transferred via the epigenome from both biological parents, periconceptional lifestyle interventions are generally directed towards mothers. This study Aims to assess the feasibility of targeting both members of a couple in a periconceptional nutrition quality and physical activity intervention.

Methods: A non-randomised, non-blinded, single-arm couples-based nutrition quality and physical activity intervention was commenced in October 2022. Over a ten-week period, couples (n=10) will meet the study facilitator, via an online platform, for five healthy lifestyle sessions. Nutrition assessment will be undertaken using a combination of diet diaries, and 24-hour diet recalls. Physical activity will be measured with a Physical Activity Diary and the International Physical Activity Questionnaire. Individualised feedback will be given at each session. The primary outcome measure is changes in the quality of nutrition and physical activity levels and adherence to the study. Data will be analysed using a combination of qualitative and quantitative techniques.

Results: This pilot is currently underway. Preliminary results indicate that targeting both members of a couple simultaneously improves adherence to the program and encourages members of a couple to work together to potentially enhance post-intervention adherence to healthy habits.

Conclusions: To date, the results supporting targeting both members of a couple are at least as effective as targeting one member. Following the socio-ecological model of health, targeting both members of a couple would increase the post-intervention adherence to the newly learned healthy habits. Therefore, by targeting pre-conception couples, we have the potential to reduce the multigenerational risk of metabolic syndrome and in return the overall global burden of disease.

Policies to reduce tobacco availability through regulating retail environment: a scoping review

Raouf Alebshehy¹, Zara Asif², Melanie Boeckmann³

¹Bielefeld University, Germany, ²King's College London, United Kingdom, ³University of Bremen, Germany

Background: The World Health Organization Framework Convention on Tobacco Control (FCTC) includes measures to reduce demand for and supply of tobacco. The measures related to demand reduction include raising taxes, providing cessation services, promoting smokefree public places, banning advertising, and raising awareness. However, there are a limited number of measures for supply reduction, and these mainly include fighting illicit trade, banning sales to minors and providing alternatives to tobacco workers and growers. This scoping review Aims to identify additional potential measures of retail environment regulations to reducing tobacco supply and consequently reducing tobacco use.

Methods: This scoping review examines interventions, policies, and legislation to regulate the tobacco retail environment to reduce tobacco availability. FCTC and its Conference of Parties decisions, grey literature including tobacco control databases and the databases PubMed, EMBASE, Cochrane Library, Global Health, and Web of Science were systematically searched, complemented by a scoping communication with the focal points of the 182 FCTC Parties.

Results: Themes of potential measures to reduce tobacco availability by regulating retail environment were identified among both FCTC and non-FCTC measures. Studies show the effects of regulation of the retail environment in influencing overall tobacco purchases, and there is strong evidence that having fewer retail outlets reduces the level of impulse purchasing of cigarettes and tobacco goods. The measures covered by FCTC are more implemented than ones not covered by it. **Conclusions:** Further studies to assess effectiveness and implementation of such measures, and the adoption of the effective ones to be covered under FCTC decisions would probably increase their adoption globally and may reduce tobacco availability.

Depression increased the incident risk of obesity among a community population in southwest China

Tao Liu¹, Chaowei Fu², Bo Wu², Yun Chen²

¹Guizhou Province Center for Disease Control and Prevention, China, ²Fudan University, China

Background and Objective: The association between depression and obesity remains uncertain so far. This study aimed to investigate associations between depression and the risk of incident obesity among residents in Southwest China. **Methods:** A 10-year prospective cohort study of 4745 non-obese adults was conducted in Guizhou Province, southwest China from 2010 to 2020. Depression was assessed by the Patient Health Questionnaire-9 (PHQ-9) while the incident obesity was identified by waist circumference (WC) and/or body mass index (BMI). Cox proportional hazard models were used to estimate adjusted hazard ratios (aHR), and 95% confidence intervals (CIs) of depression and incident obesity.

Results: A total of 1115 incident obesity were identified over an average follow-up of 7.19 years, with an incidence of 32.66 per 1000 PYs for any obesity, 31.14 and 9.40 for abdominal and general obesity, respectively. After the adjustment for covariates, risks of incident abdominal obesity for subjects with minimal (aHR: 1.22, 95%CI: 1.05, 1.43), and mild or more advanced depression (aHR: 1.27, 95%CI: 1.01, 1.62) were statistically higher than those undepressed, while there was no significant association with incident general obesity. The risks of any incident obesity among subjects with minimal (aHR: 1.21, 95% CI: 1.04, 1.40), mild or more advanced depression (aHR: 1.30, 95% CI: 1.03, 1.64) were significantly higher than those undepressed and positive association was found for PHQ score per SD increase (aHR: 1.07, 95%CI:1.01, 1.13), too. The association was stronger significantly in Han Chinese (minimal: aHR: 1.27, 95%CI:1.05, 1.52; mild or more advanced: aHR: 1.70, 95%CI:1.30, 2.21) and farmers (minimal: aHR: 1.64, 95%CI:1.35, 2.01; mild or more advanced: aHR: 1.82, 95%CI: 1.32, 2.51). **Conclusions:** Depression increased the risk of incident obesity among adults in Southwest China, especially among Han Chinese and farmers. This finding suggests that preventing and controlling depression may benefit the control of incident obesity.

Validity of Finnish diabetes risk score in Turkish population and developing a predictive model for Type 2 diabetes mellitus

Neslişah Şiyev¹, Ahmet Emecen¹, Belgin Ünal²

¹Department of Public Health, Medical Faculty, Dokuz Eylül University, Türkiye, ²Department of Public Health, Medical Faculty, Dokuz Eylül University, Türkiye

Background and Objectives: Diabetes is a major health problem in Turkey as well as all over the world and its prevalence is increasing. The aim of this study is to evaluate the validity of the Finnish Diabetes Risk Score (FINDRISC) in Turkish population and develop a Turkish Diabetes Prediction (TDP) model.

Methods: The participants of the Turkey Chronic Diseases and Risk Factors study-2011 (TCDRF) were followed up through electronic health records until 2017 for incident type 2 diabetes (t2dm, ICD codes: E10, E11, E13, E14). After excluding 4997 people with a diabetes history and 1231 with missing data; a total of 12249 participants older than 14 years of age were included in the analysis. The performance of FINDRISC in predicting t2dm was evaluated according to c-index. We identified the final variables for the TDP model using backward stepwise logistic regression.

Results: Out of 12249 participants (mean age: 40±16.7, women: 53%); 505 developed t2dm within six years (cumulative incidence rate: 4.1%). The c-index of the FINDRISC was 0.75 (95% confidence interval: 0.73-0.77) with sensitivity and specificity of 78.4% and 59%. TDP model identified age (odds ratio: 1.02, 95% CI: 1.01-1.03), female gender (OR:1.48, 95% CI:1.17-1.86), university graduation (OR:1.91, 95% CI:1.24-2.94), BMI>30kg/m² (OR:1.89, 95% CI:1.33-2.70), waist circumference (OR:1.03, 95% CI:1.02-1.03), having hypertension (OR:1.70, 95% CI:1.34-2.15), impaired fasting glucose (OR:1.73, 95% CI:1.40-2.13) and family history of diabetes (OR:1.40, 95% CI:1.15-1.71) as significant predictors for t2dm. The c-index of TDP model was 0.77 (95% CI: 0.75 to 0.79) with sensitivity, specificity, positive and negative predictive values of 66.7%, 75.3%, 10.4% and 98.1%, respectively.

Conclusions: FINDRISC had good validity in Turkish population. Compared with FINDRISC, TDP model showed similar results in terms of model performance. TDP model had a good predictive ability for the population who had a low risk of developing t2dm.

¹Service Risk and Health Impact Assessment, Sciensano, Brussels, Belgium,

²Service Risk and Health Impact Assessment (Sciensano), Brussels,

Belgium, ³Department of Epidemiology and Public health, Sciensano,

Brussels, Belgium, ⁴Department of Epidemiology and public health,

Sciensano, Brussels, Belgium, ⁵Applied Mathematics, Computer Science and Statistics, Ghent University, Ghent, Belgium

Background: Overweight is the fourth most common risk factor for non-communicable diseases (NCDs) in Europe, affecting almost 60% of all adults. In Belgium, as in many high-income countries, average body mass index (BMI) has significantly increased over the past decades. Tackling obesity is therefore vital to reduce premature mortality from NCDs. This study aims to assess the relative contribution of overweight as a risk factor for NCDs and the potential health impact of four BMI reduction scenarios in the Belgian adult population.

Methods: Data from the Belgian health interview surveys 2013/2018 (n=18 212) were linked with objective environmental factors based on the residential address. Self-reported BMI and diabetes were corrected based on information from the 2018 Belgian health examination survey and a random-forest multiple imputation process. A G-computation approach was used to calculate the potential impact fractions of four BMI reduction scenarios on diabetes prevalence. The logistic regression model included several confounders related to socio-economic factors, lifestyle and environment. In the first scenario, the BMI distribution among people with overweight was shifted to the BMI distribution of people with "normal" BMI. In the second scenario, the BMI of people with overweight was reduced by one unit. In the third and fourth scenarios, the BMI of people with overweight was modified based on a weight loss of 5 and 10%, respectively.

Results: Under the four scenarios, the proportion of diabetes cases prevented would be respectively 29.9% (SE 4.7), 4.2% (SE 0.77), 6.43% (SE 1.48), and 12.5% (SE 2.2).

Conclusions: This study highlights the importance of overweight on the diabetes burden. Our results suggest that weight loss intervention programs among people with overweight could significantly reduce the prevalence of diabetes in the Belgian population. Further analyses will be performed for other NCDs and using a larger set of scenarios.

Assessing cervical precancer treatment rate among people utilising the Johannesburg public sector through record linkage of laboratory data

Amilcar Juggernath^{1,2}, Chodziwadziwa Kabudula³, Pamela Michelow^{4,5}, Leena Thomas^{1,6,7}, Mary Kawonga^{1,2}

¹Department of Community Health, Wits School of Public Health, University of the Witwatersrand, ²Charlotte Maxeke Johannesburg Academic Hospital, Gauteng Department of Health, ³Medical Research Council/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), Wits School of Public Health, University of the Witwatersrand, ⁴Department of Anatomical Pathology, School of Pathology, University of the Witwatersrand, ⁵Cytology Unit, National Health Laboratory Services, ⁶Public Health Unit, Ekurhuleni Health District, Gauteng Department of Health, ⁷School of Health Systems and Public Health, University of Pretoria

Background and Objectives: Cervical cancer, the commonest cause of cancer deaths in women in South Africa, is preventable through screening. Reductions in incidence are only possible if women who screen positive undergo precancer treatment. Routine monitoring of the screening cascade does not take place, presenting an opportunity to use sources outside the health information system to assist programme monitoring. This study analysed the follow-up, over two years, of people who screened positive in Johannesburg, 2017.

Methods: A retrospective cohort of 67208 people was performed using probabilistic record linkage of laboratory records – cytology with high-grade squamous intraepithelial lesions (HSIL) and histology results – as a proxy for follow-up. HSIL prevalence; follow-up, confirmation, and precancer treatment rates; and time between procedures were calculated. Variables were analysed for significant differences across age, HIV status, screening facility type and subdistrict, and through logistic regression for association.

Results: HSIL prevalence was 6.2% with greatest odds in people with HIV (OR:3.02; 95%CI:2.75-3.31). Of 4182 people who screened positive (HSIL), 26.6% underwent follow-up procedures. People had greatest odds of follow-up and treatment when screened at community health centres (CHCs) (follow-up OR:1.28, 95%CI:1.03-1.58; treatment OR:1.34, IQR:1.04-1.72) or hospitals (follow-up OR:1.61, 95%CI:1.26-1.90; treatment OR:1.63, IQR:1.28-2.09), or in subdistrict B (follow-up OR:2.68, 95%CI:2.02-3.45; treatment OR:2.47, IQR:1.70-3.58). Treatment at first follow-up was received by 475 (62.0%) people, and the remaining 38.0% had confirmatory tests, of which 49.5% subsequently received treatment. Precancer treatment rate overall was 16.1%. Median times from the screening test to any follow-up procedure was 131 days (IQR:80-189); to confirmatory test, 123 days (IQR:51-175); and overall time to precancer treatment was 151 days (IQR:101-246).

Conclusions: Precancer treatment rates are far below WHO's elimination target. Simpler screening cascades; benchmarking against high-performing subdistricts; and monitoring through record linkage may assist increase precancer treatment, reducing cervical cancer incidence.

Training Program (BFELTP), Nouakchott, Mauritanie, ³BFELTP, Burkina Faso,

⁴Faculté de Médecine, Université Joseph KI ZERBO, Burkina Faso

Introduction: En Mauritanie, le cancer du sein touche 44,9 femmes pour 100 000 habitants en 2020 et constitue le cancer le plus fréquent. Dans un contexte où deux tiers des femmes utilisent des contraceptifs oraux et près d'un tiers des mariages sont précoces, cette étude examine l'association entre l'âge de la première utilisation des contraceptifs oraux et le cancer du sein chez les femmes en Mauritanie. **Méthodes:** Une étude cas-témoins (192 cas pour 192 témoins) a été réalisée au centre d'oncologie de Nouakchott du 01 mai 2021 au 31 octobre 2021. Un cas était défini et un témoin aussi. Une régression logistique a été réalisée avec le logiciel SAS® 9.4 pour estimer l'odds ratio de cancer du sein associé à l'âge de la première utilisation des contraceptifs oraux indépendamment des autres caractéristiques. **Résultats:** La moitié des patientes étaient originaires de Nouakchott (50,5 %), 41,7 %, 57,8 % et 85,4 % étaient respectivement mariées, sans instruction et ménager. L'âge médian était similaire chez les cas et les témoins. Environ 11 % des cas et 18,7 % des témoins utilisaient des contraceptifs oraux pour la première fois avant l'âge de 24 ans, et plus de 64 % n'avaient jamais utilisé de contraceptifs oraux. Après ajustement pour ses facteurs de confusion possibles, l'âge à la première utilisation de contraceptifs oraux (<24 ans) était

significativement associé au cancer du sein (OR ajusté = 3,07, IC 95% 1,09-8,82; $p = 0,0372$) indépendamment des autres caractéristiques. Conclusions: L'étude montre que l'âge de la première utilisation des contraceptifs oraux, inférieur à 24 ans, est un facteur de risque de cancer du sein chez les femmes suivies au Centre d'Oncologie de Nouakchott. La sensibilisation des femmes aux méthodes contraceptives alternatives et au mariage précoce est recommandée.

Predictors of eating behaviour in patients with type 2 diabetes and/or coronary heart disease

Lisa Giesen¹, Larisa Pilic², Helene Könnecke¹, Lara Schneider¹, Jonas Werle¹, Marcus Redaelli¹, Stephanie Stock¹, Arim Shukri¹, Angeli Gawlik³, Nihal Ünlü⁴, Martina Heßbrügge⁴, Sibel Altin⁵

¹Cologne Institute for Health Economics and Clinical Epidemiology, The University Hospital of Cologne, Cologne, Germany, ²Institute of General Practice, Faculty of Medicine, University Hospital Cologne, University of Cologne, Cologne, Germany, ³Department of Health and Social Psychology, Institute of Psychology, German Sport University, Cologne, Germany, ⁴Institute of General Practice, Medical Faculty, University of Duisburg-Essen, Essen, Germany, ⁵AOK Rheinland/Hamburg, Düsseldorf, Germany

Background and Objective: The WHO points out the importance to reduce modifiable risk factors for non-communicable diseases (NCDs) and monitor the underlying trends and determinants. Since diet has been identified as one of the key modifiable behavioural risk factors, it is crucial to examine associated patient characteristics that increase adherence and create long-term behaviour change. Consequently, the following research investigates possible demographic and psychosocial predictors for dietary behaviour, particularly the Mediterranean diet, in patients with type 2 diabetes (T2D) and/or coronary heart disease (CHD). **Methods:** A cross-sectional analysis was conducted with 792 patients at baseline (2021) of a randomised controlled trial targeting the improvement of self-management through peer-support¹. Eating behaviour was analysed using an adapted adherence screener of the Mediterranean diet. Mediterranean dietary pattern score associations with sex, age, employment, migration status, education, BMI, health literacy, patient activation (level of engagement and participation in one's own care), self-efficacy, psychological well-being, quality of life, personality traits and loneliness were investigated using multiple regression analysis.

Results: Age ($\beta=0.234$, $p<0.001$), migration background ($\beta=0.180$, $p<0.001$), level of patient activation ($\beta=0.294$, $p<0.001$) and the personality trait openness ($\beta=0.234$, $p=0.004$), were predictors for Mediterranean dietary pattern score ($R^2=0.194$). Subgroup analyses resulted in the same predictors in the T2D group ($R^2=0.182$), whereas the CHD group showed additional significant positive associations with gender, education and the personality trait extraversion ($R^2=0.363$). **Conclusions:** Predictors for eating behaviour were identified. To maximise the success and adherence of dietary interventions, identification of predictors for eating behaviour and subsequent individualised adaptation, such as the application of an integrated approach to strengthen patient activation and self-management, could prove as a useful tool to create long-term and sustainable behaviour change and reduce the preventable burden of NCDs.

Individual, contextual, organisational and structural factors associated with the primary healthcare use of acute myocardial infarction patients in French region

Sandrine Domecq¹, Elodie Richard^{2,3}, Floriane Sevin⁴, Emilie Lesaine⁵, Mireille Plas⁶, Stéphanie Vandentorren⁷, Florence Saillour-Gléniisson⁸, Hasnae Ben-Roummâne⁹

¹Bordeaux Population Health, Centre Inserm U1219, Université de Bordeaux, Bordeaux, France, ²FNASAT, France, ³Bordeaux Population Health, Center Research U1219, France, ⁴Bordeaux Population Health - Center research U1219, University of Bordeaux - Centre Hospitalier Universitaire (CHU) de Bordeaux, France, ⁵Center research U1219, Bordeaux Population Health, CHU de Bordeaux, University of Bordeaux, France, ⁶CH Mont de Marsan, France, ⁷Center research U1219, Bordeaux Population Health, Santé Publique France, France, ⁸Center research U1219, Bordeaux Population Health, CHU de Bordeaux, France, ⁹Bordeaux Population Health, Center Research U1219, University of Bordeaux - CHU de Bordeaux, France

Background: Acute myocardial infarction (AMI) is a life-threatening and highly time-sensitive emergency. Management is initially based on the use of the emergency medical service (EMS) system by patients. We aimed to identify individual (sociodemographic and clinical), contextual (socio-economic level of

place of residence), organisational (healthcare services) and structural (hospital facilities) factors associated with the primary healthcare use for patients with AMI. **Methods:** The factors were identified in two steps: 1) construction of a healthcare utilization conceptual model focused on AMI using a scoping review; 2) assessment of the association between individual and collective factors and healthcare utilization of AMI patients included in a French regional registry between 1st January and 31st December 2019, before the COVID-19 pandemic. The statistical model was a multivariate logistic multinomial mixed model with a random effect on health territory. The variable to explain was the effective use of care in three modalities: mobile intensive care units (MICU) after EMS-calling (optimal pathway), direct arrival in the emergency unit after EMS-calling, direct arrival in the emergency unit without EMS-calling.

Results: Among the 1665 patients included, 54% were managed by MICU and 19% arrived at the emergency unit after EMS-calling. Factors associated with direct arrival at the emergency unit after EMS-calling were advanced age ($OR=1.15$ - $p=0.015$), being a woman ($OR=1.85$ - $p<0.001$), history of coronary heart disease ($OR=0.57$ - $p=0.006$) and presence of a cathlab in the hospital ($OR=1.44$ - $p=0.020$). Rurality of residence was associated with direct arrival at the emergency unit without EMS-calling (most rural level: $OR=3.43$ - $p=0.005$). **Conclusions:** This study has made it possible to identify AMI populations outside the optimal access to care pathway. Awareness-raising actions are needed in the general population and among emergency health professionals in order to reduce age or gender inequalities and territorial inequalities in care.

Evaluation of the impact of the COVID-19 pandemic on routine care of people with chronic disease: a qualitative study

İlknur Ayvaz¹, Zeynep Meva Altaş¹, Burak Tunahan Ekincikli², Hasan Orkun İpsalalı², Salim İdris Turan², Kezban Sila Kunt², Dilşad Save¹

¹Department of Public Health, Marmara University, School of Medicine, Istanbul, Turkey, ²School of Medicine, Marmara University, Istanbul, Turkey

Background and Objective: Restrictions in the COVID-19 pandemic have affected access to healthcare and caused delays in the routine care of people with chronic diseases. The aim of our study is to reveal the impact of the COVID-19 pandemic on routine care of people with chronic diseases.

Methods: Our qualitative study was carried out with 12 people who came to the Cardiology outpatient clinics of tertiary Training and Research Hospital in June 2022 for a routine care due to their chronic diseases. As a data collection tool, a semi-structured questionnaire was used. The data were collected through face-to-face interviews with the participants by taking the necessary protective measures. Thematic analysis method was used in the analysis of the data. After the interviews were transcribed, each transcript was coded using the ATLAS.ti program. The ethics committee approval of the study was obtained.

Results: The ages of participants were between 34-73, and 8 of them were male. Participant experiences were categorised into four themes: General Health Status, Routine Care during the Pandemic, Chronic Disease Management during the Pandemic and Patient Expectations of Healthcare. Most of the patients delayed their routine care during the pandemic and their chronic diseases worsened. Among the reasons for not going to the controls, the fear of contagion came to the fore, while some participants mentioned that they could not find an appointment. In terms of their expectations of healthcare, they stated that health institutions should give priority to those with chronic diseases and home health services and online services will provide convenience for them.

Conclusion: Delaying hospital admissions for routine care made the management of chronic diseases difficult and worsened the chronic diseases of patients in the long term. Implementation of online health services such as telemedicine can facilitate chronic disease management.

The potential impact of achieving Kenya's obesity reduction target on health outcomes, healthcare costs, and productivity: a modelling study

Mary Wanjau¹, Mary Wanjau², Leopold Aminde³, Lennert Veerman⁴

¹Griffith University Griffith University "401A/ 96 High Street 96 High Street" Australia, ²Griffith University Public Health & Economics Modelling Group, School of Medicine & Dentistry, Griffith University, Gold Coast, Queensland, Australia "401A/ 96 High Street 96 High Street" Australia, ³Griffith University, ⁴Griffith University Public Health & Economics Modelling Group, School of Medicine & Dentistry, Griffith University, Gold Coast, Queensland, Australia. Gold Coast campus, Parklands Drive, Southport, QLD, 4222 Australia

Background: Globally, the rising trend in mean body mass index has resulted in a substantial increase of the burden of non-communicable disease attributable to high BMI. Kenya has adopted the WHO target of halting the rise of overweight, including obesity, by 2025. This paper assesses the potential impact of achieving the set target on health, healthcare cost, and productivity.

Methods: We used a proportional multistate life table model to quantify health outcomes, healthcare costs and productivity. We modelled the 2019 population of Kenya over their lifetime, comparing a scenario in which BMI distributions stabilise in 2025, against one in which BMI distributions stabilise in 2044. We identified estimates of the total health expenditure and disease specific healthcare costs in Kenya from literature. We used the Human Capital Approach to estimate productivity gains.

Results: Halting the rise of overweight in the year 2025 is estimated to save 6.8 million HALYs (95% uncertainty interval [UI] 5.8- 7.9 million) over the lifetime of the 2019 Kenyan population (135 HALYs per 1,000 persons). Up to the year 2044, the leading contributors of the health gains were musculoskeletal diseases (537,052 new cases avoided; 95% UI 444,361- 639,460), followed by T2DM (466,030; 95% UI 360,103- 597,378) and cardiovascular diseases (301,729; 95% UI 248,559- 367,949). A total of US\$ 755 million in body mass-related healthcare costs could be saved by 2044 (US\$ 15 per capita) translating to 16% of Kenya's annual healthcare expenditure or 1% of gross domestic product. Over the lifetime, over US\$ 3 billion healthcare costs could be saved. In 2044, the total productivity gains resulting from a reduction in obesity-related mortality and morbidity (combined) could be as high as ~US\$ 5.8 billion.

Conclusion: Halting the rise of overweight and obesity not only improves health outcomes but also yields healthcare cost savings and productivity gains.

Preventing non-communicable diseases through the law: the role of civil society and academia. Experiences from East Africa and South Asia

Maria Campisi¹

¹International Development Law Organization Italy

Background: According to World Health Organization (WHO) figures, Noncommunicable diseases (NCDs) cause 17 million premature deaths each year among people between the ages of 30 and 69. The great majority of these deaths are preventable through cost-effective interventions that aim to address the main modifiable behavioural risk factors. Many of these interventions are implemented through legal measures.

Since 2019, the International Development Law Organization (IDLO) has undertaken a project, in collaboration with WHO and other partners, to enhance Low and Middle-Income Countries (LMICs) capacities to design, implement and monitor legal and policy measures to address two of the main NCD risk factors: unhealthy diets and insufficient physical activity.

This presentation will describe the approach, methodology and key results of the project implemented in East Africa and South-East Asia, with a specific focus on the role of civil society and academia in creating an enabling environment for regulatory and policy reforms for NCD prevention.

Methods and

Results: The methodology combines three complementary components: i) capacity building; ii) social mobilization; iii) evidence generation. The project has supported the engagement of civil society organizations (CSOs) in policy discussion to advocate for legal and policy reforms for NCD prevention. Six CSOs from five LMICs have been provided with technical and financial assistance, as well as with capacity building to call for action on NCD prevention measures. The project has also fostered collaboration between legal and public health scholars from local universities to promote research, publication and teaching on legal avenues for NCD prevention at local level. In East Africa, an academic working group has been created as the first of its kind to promote inter-disciplinary collaboration on Law and NCD issues in the Region.

Conclusions: The project has shown the critical role that civil society and academia play in addressing NCDs through legal avenues.

Improved self-care practices among people with type-2-diabetes following a low budget health literacy intervention; evidence from a before and after quasi experimental study

Stephen Kibusi¹, Zacharia Panga², Stella Mushy³

¹The University of Dodoma Department of Public Health Department of Public Health, The University of Dodoma, P.o.Box 259, Dodoma, Tanzania

Tanzania, ²The University of Dodoma Department of Nursing Management and Education Department of Nursing Management and Education, The University of Dodoma, P.O.Box 259, Dodoma, Tanzania Tanzania, ³The Muhimbili University of Health and Allied Sciences

Background: The role of health literacy based interventions have not been well documented in improving self-care practices among patients with type-2-diabetes. This study aimed at exploring the effectiveness of a low budget educational intervention on improving self-care knowledge, attitude, and practice (KAP) among people with type 2 diabetes mellitus in Tanzania.

Methods: A quasi-experimental study of 165 randomly selected participants with type 2 diabetes mellitus from different clinics in the Tabora region, Tanzania. A structured questionnaire collected data on knowledge, attitude and self-care practices at baseline and after the intervention. Paired t-test and linear regression were used to test the effect of the intervention on the outcome variables.

Results: The mean age was 55.5±13 years and the majority 55.8%, were women. Only 40% of the participants reported good level of knowledge at baseline compared to 87% after intervention. Participant's attitude towards self-care was overall negative at baseline (87%) and decreased to 33% after the intervention. Overall reported self-care practices increased from 9% to 48% after the intervention. Paired t-test and linear regression were used to test the effect of the intervention on the outcome variables.

Results: The mean age was 55.5±13 years and the majority 55.8%, were women. Only 40% of the participants reported good level of knowledge at baseline compared to 87% after intervention. Participant's attitude towards self-care was overall negative at baseline (87%) and decreased to 33% after the intervention. Overall reported self-care practices increased from 9% to 48% after the intervention. Paired t-test showed significant mean differences before and after the intervention; Knowledge score pre-intervention was (n=165, M=64.00, SD=10.92) and post-intervention was (n=165, M=76.21, SD=8.24), mean difference of (12.21, t (164) =15.60, p<0.001). Attitude, pre-intervention was (n=165, M=61.02, SD=9.10) and post-intervention was (n=165, M=71.74, SD=6.47) mean difference of (10.72, t (164) =16.27, p<0.001). Self-care practice, pre-intervention was (n=165, M=54.60, SD=9.66) post-intervention was (n= 165, M=68.02, SD=8.00) whereby, the mean differences was (13.42, t (164) =18.26, p<0.001) respectively. Furthermore, change in knowledge predicted the observed change in self-care practices after the intervention (p<.05).

Conclusion: The study demonstrated high potential of the intervention in improving self-care practices in a cohort of predominantly aged diabetic patients in a low resource setting. Effect of the intervention on self-care practice was positively moderated by the observed changes in knowledge.

Background: An alarming rise of poor control of non-communicable diseases (NCDs) calls for a comprehensive response of the health systems to strive towards universal health coverage. Better continuity of care (COC) is an important

benchmark for high-quality and efficient health systems. This study aimed to explore the COC for type 2 diabetes mellitus (T2DM) and hypertension across primary care and its association with health outcomes and disease control.

Methods: A total of 602 people with T2DM and/or hypertension managed in primary care were included. The Nijmegen continuity of care questionnaire (NCQ) valued from 1-5 was used to examine the relational continuity and team/cross-boundary continuity across care levels, the Bice - Boxerman continuity of care index (COCI) valued between 0-1 was used to measure the dispersion of health visits to different providers. Multivariate logistic regression analysis was performed to examine the predictors of COC.

Results: Mean values of COC indices were COCI 0.77 and NCQ 3.59. The NCQ showed higher relational continuity and team/cross-boundary continuity within primary care compared to specialist care. People with T2DM were more likely to have higher COC regarding specialist care than hypertension and both diseases. Gender, living areas, usual health facility, hospital and emergency department admission, frequency of health visits, disease duration, blood pressure and blood glucose levels, and disease control were demonstrated to be statistically associated with COC.

Conclusions: COC of Vietnam primary care is not sufficiently achieved for hypertension and diabetes. Strengthening robust primary care services is an essential strategy for chronic care. Our findings reflect that as a multi-dimensional construct, COC is needed to be measured using a robust and integrated assessment approach. More efforts are necessary to geographically align the imbalance of care delivery and increase the efficiency of virtual chronic services, and multidisciplinary and coordinated care for NCDs in primary care.

Early childhood caries: exploring the ethical implications for dental neglect in South Africa

Nashna Rampersad¹, Nadia Mohamed¹

¹University of the Western Cape "Tygerberg Oral Health Centre, Francie Van Zijl Drive, Parow, Cape Town, 7500", South Africa

Background: Child neglect is a significant public health issue. South Africa (SA) has a significant burden of early childhood caries (ECC). The ECC prevalence raises a concern. This presentation aims to explore if ECC constitutes as child neglect in SAs context?

Child neglect is an act of "deliberate neglect" of a child. Untreated caries is the most common type of dental neglect. Dental neglect is based on the root causes of the neglect and is an indication of broader child neglect. A high ECC prevalence and unmet treatment needs among SA children was reported. The lifetime prevalence of ECC was 44.94% in SA children below 6 years. A study on children of a low socio-economic area in SA reported that 67.5% of the children (> 6 months-<6 years old) had ECC.

Considering SA's socio-economic context, the public health problem of ECC is part of a broader social problem and has a degree of societal neglect as a result of the political, social, and economic forces which shape families' living conditions and the range of opportunities and services available. Thus, neglect shifts focus away from parents or guardians and toward the policies and actions of governments, service providers, and public utilities which harm children through the conditions and constraints imposed on families. The health promotion levy, integrated school health programmes, improving oral health services, targeted preventive programmes, early intervention and inter-professional screening can aid this problem.

Conclusion: As SA prepares for a health system overhaul through the National Health Insurance, child protection, care and the prevention of neglect should be at the forefront. A more workable, context-specific and integrated oral health policy could provide the appropriate resources and realise the implementation of a proper prevention programme against ECC, and prevent the prevalence of this passive form of child neglect in SA.

Introduction: A major driver of the rising childhood obesity in Uganda is an unhealthy food environment arising partially from an increase in advertising of unhealthy food. This project aims to examine the trends in the extent and nature of food and beverage advertisement to young children and adolescents (2- 18 years) in Uganda.

Materials and Methods: Mixed-methods study design involving a first secondary retrospective content analysis of national data from media monitoring (television, radio, and newspapers) from October 2018 to September 2019. Recorded data from 8 randomly selected days (four weekdays and four weekend days) in each of the four advertising seasons will be sampled from the top three national television and radio stations, plus the three most-read newspapers in the three study regions. Second, primary data is collected from 427 households with children (under 18 years) in 2022/3, using semi-structured questionnaires for self-reported consumption of the food items identified in the first phase and anthropometric measurements. Further, stakeholder attitudes, perceptions, and experiences with food advertising towards children will be captured using standardized International Network for Obesity Research Management and Action Support tools. The WHO Nutrient Profile model for the African region will be used to classify advertised foods into permitted/not permitted to marketing to children; and the NOVA system to classify foods into four groups: unprocessed/minimally processed foods, processed culinary ingredients, processed foods, and ultra-processed foods. Rates and trends of food advertising to children by type of food will be studied.

Makerere University School of Public Health Research and Ethics Committee and the National Council for Science and Technology approved this study.

Results (Anticipated Benefits)

The study findings will inform government policy priority actions to create healthy food environments that reduce childhood obesity risk.

Role of purchasing agreements for quality of chronic disease care: systematic scoping review

Jyoti Tyagi¹, Siyuan Wang², Samiksha Ingale², Manveen Kaur², Gill Schierhout², David Peiris³, Jaime Miranda³, Soumyadeep Bhaumik², Inke mathauer⁴, Megumi Rosenburg⁵, Lei Si³, Stephen Jan⁴

¹The George Institute for Global Health, "308, Third Floor, Elegance Tower Plot No. 8, Jasola District Centre, New Delhi", India, ²The George Institute for Global Health India, ³The George Institute for Global Health, Australia, ⁴World Health Organisation Switzerland, ⁵World Health Organization Japan

Background and Objective: Chronic disorders adversely affect the quality of life of patients living with illnesses and create a substantial financial burden. We aimed to assess how purchasing agreements have been used to promote quality in chronic disease care and understand its role in promoting quality of chronic disease care.

Methods: We searched for research studies published over the past 10 years in nine electronic databases in English, Chinese, French, and Spanish languages, supplement by grey literature searches and reviews of reference lists. We identified key characteristics of these arrangements and conducted narrative syntheses of the barriers and enablers to implementation.

Results: We retrieved 6486 records. Of them, 88 studies (80 quantitative and eight qualitative studies) met our eligibility criteria. They were predominantly from high income countries with the main payment method being pay for performance. The purchasing arrangements were generally set within national insurance or government funded programs. Quality of care was generally measured in terms of intermediate health outcomes, processes and efficiency. Adverse selection ('cherry-picking' of patients) was observed in some studies resulting in bias against socioeconomically disadvantaged and high-risk groups. The main barriers/enablers reported were the cultural shifts required to transition from a funding organisation into one with a purchasing role, added investment in infrastructure and training required to enable purchasing, and the need to engage patients and other stakeholders.

Conclusions: Evidence majorly from high income settings suggested pay for performance arrangement as one of the widely used strategic purchasing as a means of improving quality outcomes in chronic disease management. There is a need to address adverse selection and work towards improving the quality aspect.

Inequities in breast cancer screening utilisation in Spain - Using decision trees to identify intersections

Núria Pedrós Barnils¹, Núria Pedrós Barnils¹, Benjamin Schüz²

¹University of Bremen, Institute for Public Health and Nursing Research, University of Bremen; 2 Leibniz ScienceCampus Digital Public Health Bremen, Grazer Str. 4, 28359 Bremen, Germany, ²University of Bremen, Germany

Background and Objective: Organised breast cancer screening programmes can be effective in reducing incidence, mortality and illness burden. Currently in Spain, women between 50-69 are invited to attend screenings bi-annually. However, roughly 25% do not utilise this free service. Here, we take an intersectional perspective using machine learning techniques to identify social groups at risk of not utilising breast cancer screening.

Methods: Women were drawn from the 2020 European Health interview Survey in Spain, which targets the (young) adult population > 15 years old living in private households (N = 22,072; 59% response rate). Using available indicators of socioeconomic status based on the PROGRESS-Plus framework, we applied machine learning (Classification and Regression Trees (CART), Chi-square Automatic Interaction Detector (CHAID), and Conditional Inference Trees (CIT)) to data from the target population (women 50-69) to estimate models that disentangle existing social intersections. We then used accuracy, sensitivity and specificity indicators to identify the best-fitting tree.

Results: A non-parametric CHAID model suggests (overall accuracy of 75.07%) primary education or below to be the strongest discriminating factor for not attending screening (n=1,060 Pr=0.3448 vs n=2,790 Pr=0.2462). The second strongest factor was country of birth (lower education group, born in Spain: n=983 Pr=0.3313 vs born outside Spain n=77 Pr=0.5195; higher education group, born in Spain: n=2,596 Pr=0.2369 vs born outside Spain: n=194 Pr=0.3711). Finally, for those born in Spain with lower education, being married, widowed or divorced predicted attendance compared to being single or separated (n=869 Pr=0.3026 vs n=124 Pr=0.5081).

Conclusion: In order to reduce inequities in screening attendance, programs in Spain should particularly support women with lower education and migration background, and potentially focus on social support measures. CHAID is a useful tool to identify groups at higher risk of not utilising an organised public health program and inform tailored prevention programs.

⁴Avedis Donabedian Research Institute (FAD), Barcelona, ⁵Iberoamerican Cochrane Centre, Sant Pau Biomedical Research Institute (IIB-Sant Pau), Spain, ⁶Netherlands Institute for Health Services Research (Nivel), Utrecht

Background and Objective: Self-management interventions (SMI) are core components of high-quality care in type 2 diabetes mellitus (T2DM). T2DM patients experiences and perceptions of self-management and their disease can help to inform decision-making processes. We aimed to identify and summarise the perspectives of patients with T2DM and informal caregivers on SMI outcomes. This study is part of the COMPAR-EU project. This European initiative aims to identify, compare, and rank the most effective and cost-effective self-management interventions (SMIs) for adults in Europe living with type 2 diabetes, among other chronic conditions.

Methods: We searched MEDLINE, CINAHL and PsycINFO up to June 2021 for systematic reviews exploring the perspectives of adults with T2DM and their informal caregivers regarding self-management. Two reviewers independently conducted study selection, data extraction and quality assessment. We estimated the degree of overlap and used a thematic synthesis approach for the analysis.

Results: We identified 54 reviews, corresponding to 1,031 studies, with a slight overlap. Most reviews (48/54, 89%) were considered high quality. We developed summaries for 22 outcomes. The main themes were 1) the diabetic identity; 2) health literacy and access to care; 3) SMI requirements; 4) outcomes awareness and perceived risk; 5) challenges of adhering to SM, and 6) adequate support in

the SM process.

Conclusion: Our results represent what patients with T2DM and their caregivers perceive as most important when dealing with SMI. Our findings are informative for researchers developing and evaluating new SMI and for guideline developers and policy-makers formulating decisions, including recommendations.

⁴Dipartimento di Scienze Umane e di Promozione della Qualità della Vita, Università Telematica San Raffaele Roma Via di Val Cannuta, 247, 00166 Roma - Italy, 3. Human Functional Genomics Laboratory. IRCCS San Raffaele

Roma Via di Val Cannuta, 247 00166 Rom, Italy

Background: Inborn errors of metabolism (IEMs) are a heterogeneous group of monogenic disorders caused by defects in metabolic enzymes resulting in the accumulation of toxic substrates or a deficiency of essential metabolites.

Diet therapies aimed at removal of harmful substances is the main and crucial intervention in some IEMs, such as phenylketonuria (PKU). However, the IEM-induced metabolic dysfunction, as well as the dietary interventions, impact the gut microbiota resulting in exacerbation of the clinical phenotype.

Objectives: We aim to increase the knowledge of the structure of the microbiota in patients affected by PKU and of how the various therapeutic interventions modify its composition in order to define a personalized dietary interventions on a genetic and metagenetic basis.

Methods: We performed a systematic review and meta-analysis to examine gut microbiota in PKU patients with dietary treatment. The review was conducted according to the Meta-analysis of Observational Studies in Epidemiology (MOOSE) and Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) criteria.

Results: A significant reductions in several taxa at the phyla and genus levels were observed in patients with PKU compared to controls. The synthesis of the meta-analysis shows a difference in terms of biodiversity between PKU subjects respect the control population (SMD = -0,067; IC 95%, da -0,113 a .0,021) and performing a meta-regression starting from the data relating to the Firmicutes/Bacteroidetes ratio, it is possible to highlight a role for the type of diet followed by the patients (p = 0.050).

Conclusion: The increase in knowledge on the variations of the intestinal microbiota in response to treatments in subjects with PKU can be useful to improve therapies but, due to the limited number of studies, further researches are needed.

Prevalence and predictors of waterpipe/shisha use smoking among youths in Senegal: global youth tobacco survey, 2020

Bai Cham¹

¹Georgia State University, School of Public Health, 140 Decatur St, 30303

Atlanta GA, United States

Background and Objectives: Shisha smoking has become a global epidemic despite the declining trend of cigarette smoking. Despite the health risk associated with shisha smoking, there are few studies on shisha smoking in West Africa and none in Senegal. Our study assessed the prevalence and predictors of shisha smoking among youths aged 13-15 years in Senegal.

Methods: We use the 2020 Global Youth Tobacco Survey (GYTS) data of Senegal covering a sample of 4320 youths 11-17 years. However, we restricted our analysis to youths 13-15 years (n=2524) because GYTS is design to be representative of this age cohort. We calculated the weighted prevalence (with 95% confidence intervals) of ever and current smoking of shisha. We conducted multivariable logistic regression analysis to identify factors associated with ever current shisha use among youth.

Results: The prevalence of ever and current use of shisha were 9.8% (CI:7.7-12.3) and 2.2% (CI:1.5-3.1) respectively. More than half of current cigarette smokers ever tried or experimented with shisha smoking (50.5%, CI:36.9-63.9) and 26.6% (CI:15.4-42.0) were current users of shisha. In our fully adjusted models, higher grade (AOR=2.54, 1.25-5.15), gender (AOR=2.15, 95% CI:1.47-3.14), higher pocket

money (AOR= 2.92, CI:1.63-5.23), current cigarette smoking (AOR=8.36(3.97-17.65), close friends' smoking status (AOR= 2.61, CI:1.01-6.73), use of smokeless tobacco (AOR=9.52, CI:4.67-19.37) and exposure to second hand smoke (AOR=1.85, CI:1.22-2.83) were significantly associated with experimentation of shisha. Likewise, higher pocket money, current cigarette smoking, exposure to second and parents' smoking status were significantly associated with current use of shisha.

Conclusion: Our findings suggest shisha is being sold/served to youths in Senegal despite laws prohibiting the importation, distribution, and sale of shisha in the country. The Senegalese government should make more efforts in implementing tobacco control laws that protect them.

Profile of risk factors for Non-Communicable Diseases (NCDs) in a highly urbanized district of India: findings from Puducherry district-wide STEPS Survey, 2019-20

Parthibane Sivanantham¹, Jaya Sahoo¹, Subitha Lakshminarayanan¹, Zachariah Bobby¹, Sitanshu Kar¹

¹Jawaharlal Institute of Postgraduate Medical Education and Research (JIPMER), JIPMER, Puducherry-605009, India

Background and Aim: In India, the prevalence of various Non-Communicable Diseases (NCDs) and its risk factors shows wide variations across geographic regions necessitating region-specific evidence for population-based prevention and control of NCDs. Therefore, we undertook this study to estimate the prevalence of behavioral and biological risk factors of NCDs among adult population (18-69 years) in Puducherry district located in Southern part of India.

Methods: We surveyed adults using the World Health Organization (WHO) prescribed STEPwise approach to NCD surveillance (STEPS) during February 2019 to February 2020. A total of 2560 individuals were selected from urban and rural areas (50 clusters in each) through multi-stage cluster random sampling method. STEPS instrument was used to assess behavioral and physical measurements. Fasting blood sample and a spot urine sample were collected to estimate biochemical risk factors of NCDs. Categorical variables are summarized using proportions with 95% CI. P-value ≤ 0.05 was considered statistically significant.

Results: Among men, alcohol use 40.4% (95% CI: 37.4-43.4) was almost twice higher compared to tobacco use 24.4% (95% CI: 21.7-26.9). About half of the population was physically inactive 45.8% (95% CI:43.8-47.8) and obese 46.1% (95% CI: 44-48.1), nine out of ten people 86.8% (95% CI:85.5-88) were taking unhealthy diet and almost whole of the population 98.7% (95% CI:98-99.3) were taking salt more than the daily recommended levels. Hypertension and diabetes mellitus were present among one-third 33.6% (95% CI:31.6-35.5) and one-fourth 26.7% (95% CI: 24.1-29.1) of the population which were significantly higher among men (37.1% vs 30.8% and 31.6% vs 23.2% respectively). Physical inactivity and overweight/obesity increased with increasing education levels. Tobacco and alcohol use was more common among men, whereas physical inactivity with obesity and hypercholesterolemia was higher among women.

Conclusion: We found high prevalence of various NCDs and its risk factors among the adult population of Puducherry district

Effectiveness of individual compared to group dietary intervention in patients with type 2 diabetes: a systematic review and meta-analysis

Halimatou Alaofe¹, Waliou Amoussa Hounkpatin², Abidemi Okechukwu¹, Sarah Yeo¹, Carmelle Mizehoun², Jules Gninkoun², John Ehiri¹

¹University of Arizona, Drachman Hall A208, 1295 N. Martin Ave, P.O. Box 245209, United States, ²University of Abomey-Calavi, Benin

Background and Objective: With the rise of type 2 diabetes (T2D) worldwide, dietary interventions are becoming increasingly important for disease control. However, despite the differing potential advantages of individual and group dietary interventions, there is limited evidence regarding the effectiveness and cost-effectiveness of individual compared to group dietary interventions. The objective of this review is to compare the effectiveness of individual versus group dietary intervention for T2D adults on metabolic parameters and dietary adherence.

Methods: Cochrane CENTRAL, CINAHL, EMBASE, MEDLINE, and Psych INFO were searched for studies comparing the effects of individual versus group T2D dietary intervention. Our search focused on randomized controlled trials and controlled before-and-after studies of at least six months duration measuring glycemic control. Trials were included when diet modification was the main component, either through direct prescription of a diet or meal replacement or

nutrition education of T2D adults. Intervention assessed was individual dietary education, while the comparator was group-based dietary intervention, including family, peers, or laypeople (neighbors, friends, or coworkers). Data generated from the search were managed using Endnote Version 7. Quantitative data synthesis were performed where studies were homogenous in characteristics and provided adequate outcome data for meta-analysis. Otherwise, data were synthesized using the narrative synthesis approach. Trials were assessed for risk of bias (Cochrane Risk-of-Bias, version 2.0) and overall certainty of evidence (GRADE).

Discussion

Poor dietary adherence can severely affect a T2D patients health and well-being; therefore, the best method of delivering dietary education is a critical component of preventing and managing the disease. This review will provide a crucial summary of evidence regarding the effectiveness and/or cost-effectiveness of individual versus group delivery of patient dietary intervention. Implications for T2D prevention, policy, practice and future research will be discussed.

Association between screen time, weight trajectory, and perception of weight change during the COVID-19 pandemic

Sheila Alvim Matos¹, Maria Chagas de Almeida¹, Sandra Rego de Jesus¹, Maria Fonseca², Rosane Griep², Maria Molina³, José Mill³, Luana Giatti⁴, Sandhi Barreto⁴, Maria Schmidt⁵, Bruce Duncan⁵, Yukari Figueroa Mise¹, Ciro Queiroz⁶, Rogério Tosta⁷, Estela Aquino¹

¹Universidade Federal da Bahia-UFBA, Brazil, ²Fiocruz, Brazil, ³UFES, Brazil, ⁴UFMG, Brazil, ⁵UFRGS, Brazil, ⁶UESB, Brazil, ⁷UEFS, Brazil

Background: The prevalence of excess body weight in the Brazilian adult population has been increasing even before the restriction of social mobility due to the COVID-19 pandemic. In the period of social restriction, an increase in time in front of screens has been observed, whether for work or leisure, a practice that favors weight gain. The self-perception of greater weight gain in this period has been reported by adults as a consequence of social distancing. We aimed to estimate the association between screen time and perception of weight change, stratified according to gender and weight trajectory during the COVID-19 pandemic.

Methods: From the Brazilian Longitudinal Study of Adult Health (ELSA-Brasil), we included 5.080 participants aged 39–78 (2012–2014) who attended a follow-up visit (2017–2019) and ELSA-COVID wave in 2020. Standardized questionnaires were used to record sociodemographic data, perception of weight change, and screen time. Height and weight were measured on all participants during in-person visits at research centers. The weight trajectory was calculated by large annual weight gain since 20 years old at follow-up moments. We used Poisson regression with robust variance to estimate the association.

Results: Obesity rates were high in women (36.6%) and men (31.5%) and the weight trajectory increased 35% in women and 27.4% in men. During the social distancing period, perception of higher weight change was observed in 49% of women and 37.7% of men. Screen time increased in 53.7% of women and 41.7% of men who perceived higher weight change. The increase in screen time during this period was associated with a 21% (IC95%=1.09-1.35) perception of weight gain in women and 18% (IC95%=1.04-1.33) in men.

Conclusions: The higher screen time in the period of social restriction was associated with a perception of weight gain but no significant association was observed for weight trajectory.

The right to palliative care: the state of art in the Reggio Emilia province, Northern Italy

Camilla Lugli¹, Camilla Lugli¹, Federica Violi², Simone Storani², Maurizio Cocchi², Vittorio Foroni², Sonia Romani², Marco Vinceti¹, Marina Greci², Nicoletta Natalini²

¹University of Modena and Reggio Emilia, Residency Program in Hygiene and Preventive Medicine, Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Italy, ²Azienda USL - IRCCS di Reggio Emilia, Primary Care Department, Azienda USL - IRCCS di Reggio Emilia; Clinical and Experimental Medicine PhD Program, University of Modena and Reggio Emilia, Italy

Background and Objectives: In Italy, Palliative Care (PC) is included in the set of healthcare services guaranteed by the National Health Service (Law 38/2010). Local Health Authority can adapt the PC system according to Regional guidelines. In the Emilia-Romagna Region, the PC network (PCN) consist of 4 knots: hospital, medical office, hospice and homecare. In Reggio Emilia province, PC services are built on multidisciplinary teamwork since 1988.

Methods: All the patients with oncologic or non-oncologic disease and approaching end of life can enter the local PCN. The approach to care and its setting is evaluated by a multidisciplinary team, according to patient's wishes. The place of care can be one of the PCN knots. Specialists in PC (including trained general practitioners), psychologists and nurses teamwork in PCN. The Primary Care Department of the Local Health Authority collects data and evaluate process and outcome indicators of the quality of care provided.

Results: In 2021, 45 nurses and 33 PC specialists worked for the network, 70% and 50% part-time, respectively. In the same year, 2.017 patients were enrolled (+5% from 2020, +9% from 2019), 70% of them affected by cancer. Of all the oncologic patients died in 2021, 70% were taken care by PCN and 42% of them died at home. Patients that were taken care at home were followed for a median of 60 days.

Conclusion: PC system plays an important role in ensuring the best quality of life for patients approaching end of life. Moreover, PC allows patient to die at home surrounded by their loved ones. An efficient teamwork and strong relationships between hospital and territory is the keystone to its success and to guarantee uniformity to care access. Cultural interventions towards the acceptance of palliative care should be considered in order to reach patients not enrolled.

Reform of the health insurance funding model to improve the care of noncommunicable diseases patients in Saudi Arabia

Ahmed Hazazi¹

¹Saudi Electronic University, Department of Public Health, College of Health Sciences, Riyadh, Saudi Arabia, Saudi Arabia

Background and Objective: The funding model for a health system has significant impacts on how health care is delivered. Health insurance models are being considered as part of health system reforms in Saudi Arabia. This paper assesses the attributes of health funding models that support better control of Non-communicable Diseases (NCDs) and perspectives on health insurance as a model from the perspective of patients, clinicians, and managers.

Methods: The study employs a mixed-methods research design that included quantitative and qualitative data gathering and analysis. The study combined semi-structured interviews with health care professionals and managers as well as a cross-sectional survey of NCDs patients who received treatment at primary health care chronic disease clinics.

Results: Study findings indicated concerns that the current health funding mechanism is financially unsustainable and as a result there will be a greater reliance on personal health insurance to support government spending on healthcare. Essential elements of any health insurance model to support effective NCDs management identified from a review of the literature and interviews include: ensuring continuity of care and equity; funding chronic disease prevention interventions; prioritising primary health care; and maintaining the principle of community rating to prevent insurers from discriminating against members. Other desirable attributes for the funding model includes collaboration across primary, secondary, and tertiary care.

Conclusion: The health care financing system in Saudi Arabia faces many challenges and is thought to be unsustainable. Healthcare finance reform aimed at adopting and increasing personal health insurance coverage may play a critical role in extending access to health care, eliminating health inequities, enhancing population health, and reducing government spending on healthcare if appropriately considered. Managing the health needs and rising expenses associated with the increasing incidence of NCDs are major challenges for governments and health insurers.

Enhanced measurement of sugar sweetened beverages marketing in grocery store environments

Hadis Elyaderani¹, Rachael Dombrowski²

¹University of South Carolina, United States, ²California State University-San Marcos

Background and Objectives: Grocery stores are the primary venues that can have a vital role in overall health. This is especially true for immigrant families, who often have limited access to healthy foods and are burdened by many diet-related diseases. Sugar-Sweetened Beverages (SSB) marketing within grocers is an obesogenic environmental factor that negatively impacts childrens eating practices. Currently, little is known about different aspects of SSB marketing to young children that influence minority parents to purchase SSBs for their children. We aimed to assess community and consumer eating environments by 1) developing a methodology that describes the price, placement, and promotion

of SSBs 2) recognizing the differences in the landscape of SSB marketing within Metro Detroit grocers when compared across grocers in immigrant enclaves.

Methods: The original Nutrition Environment Measure Survey (NEMS) could not identify SSBs marketing aspects targeted young children. To enhance the NEMS, 1) organic, plant-based, unsweetened toddler and infant beverages and marketing questions to capture the SSBs promotion tactics were added; 2) enhanced NEMS was conducted in 78 grocers in immigrant enclaves (n=30) of Dearborn, Warren, Hamtramck, Detroit in Michigan and scores were compared with the scores of the grocers in Metro Detroit (comparison group (n=48)).

Results: One-way analysis of variance revealed that grocers in immigrant enclaves have a lower NEMS score (-2.38) compared to the comparison group (-0.52), which indicated significantly higher availability of cheaper SSBs. Availability of organic, plant-based, and unsweetened toddler and infant beverages was zero in all participating grocers. Signage of cartoon characters was the most frequent retail SSB marketing tactic.

Conclusions: Living in immigrant enclaves is linked with lower access to unsweetened and healthy beverages for toddlers, which could cause a high prevalence of early childhood obesity among this population. The findings can assist in developing and implementing healthy eating interventions in high-need areas.

An integrated healthy lifestyle toolkit for the Pacific Islands region

Judith McCool¹, Nuhifisa Williams², Leroy Tatui³, Chris Bullen¹, Vili Nosa¹, Troy Ruhe⁴, Sally Mackay¹, Amio Ikihele⁵, Maryann Heather¹

¹University of Auckland, 32 Cambourne Road, New Zealand, ²Te Marae Ora, Cook Islands, ³Ministry of Health Niue, ⁴University of Otago, ⁵Moana Connect, New Zealand

Background: Noncommunicable Diseases (NCDs) including cardiovascular diseases, cancer, diabetes, chronic respiratory diseases, and mental disorders are the leading causes of death in the Pacific Island Countries and Territories (PICTs). The PICTs are especially hard hit by the NCD crisis due to several factors, not the least being trade of unhealthy commodities.

A review of existing NCD resources for primary care providers was conducted to describe the resources available to support those working alongside families and individuals in the region to reduce NCD risk factors.

Aims:

To collate and critically appraise the NCD risk factors related resources for primary care providers to promote healthy lifestyles in the PICTs. To systematically appraise the content in respect to access, focus, cultural relevance, tone, practicality of advice and translation (for other countries) within each resource.

Method: Resources (guides, toolkits, advice kits) were collected through a search of all 14 PICTs Ministry of Health (MoH), NGO and primary care providers using predefined search terms. An Excel file was constructed by country and by category: healthy lifestyle guidelines, diabetes management (two of the most used general categories) physical activity, nutrition, alcohol, and tobacco. Resources relevant to all 22 PICTs including those prepared by the Intergovernmental and NGOs were included.

Results: Our review reveals the scope of existing materials including the gaps and potential opportunities for integration, alignment, and innovation available to primary care health workers. The review is testament to investment afforded to NCDs risk reductions via behaviour change techniques. The language and framing reflect a preference for individual choice and decision making in taking actions to live healthy lives.

Conclusions: Healthy lifestyle-related resources for primary care providers need to reflect cultural and practical realities for context and adapt to changing modalities to ensure resources are accessible and outcomes, equitable.

Performance of world health organization updated cardiovascular disease risk prediction charts in a low-resource setting - findings from a community-based survey in Puducherry, India

Sitanshu Kar¹, Parthibane Sivanantham¹, Subitha Lakshminarayanan¹, Jaya Sahoo¹, Zachariah Bobby¹, Cherian Varghese²

¹Jawahar Institute of Postgraduate Medical Education and Research (JIPMER), JIPMER, Puducherry-605009, India, ²World Health Organization | CH-1211 Geneva 27, Switzerland

Background and Aim: The World Health Organization revised the cardiovascular disease (CVD) risk prediction charts in 2019 for each of the 21 Global Burden of

Disease regions. These charts (non-lab and lab versions) estimate the total CVD risk in an individual, of which the non-lab is for low-resource settings. We aimed to estimate the burden of ten-year risk of fatal or non-fatal CVD event in the district of Puducherry in India using 'non-lab' and 'lab' versions of WHO CVD risk prediction charts, and to evaluate the agreement between them.

Methods: We included 710 individuals aged 40-69 years who participated in a district-wide non-communicable diseases survey conducted in Puducherry, India, during 2019-20. Both charts use information on age, gender, systolic blood pressure and smoking status. Additionally, lab-chart requires individual's status on diabetes mellitus and total cholesterol, while non-lab requires body mass index. Population in different CVD risk levels (<5%, 5%-9%, 10%-19%, 20%-29%, ≥30% risk) was presented using proportions with 95% confidence intervals. Agreement between lab and non-lab charts was evaluated using Cohen's Kappa (k).

Results: The mean (SD) age of study participants was 53.5 (8.4) years, and the majority (58%) were women. The lab and non-lab charts estimated 3% (95% CI: 1.7-4.2) and none in the population at ≥20% CVD risk, respectively. Both charts showed 89.4% (95% CI: 87.2%-91.7%) concordance in CVD risk prediction indicating a good level of agreement (k=0.653). One in five individuals identified to have 10%-19% CVD risk using non-lab chart were having ≥20% CVD risk when assessed using lab-chart.

Conclusion: WHO updated CVD risk prediction charts are feasible to apply when data is available, and we found a good level of agreement between non-lab and lab-based charts. We call for large-scale studies across geographic locations to verify the pattern

Descriptive epidemiology of gynaecologic cancers in southern Ethiopia: Retrospective cross-sectional review

Achamyelesh Tekle¹, Netsanet Bogale¹, Dubale Dula²

¹Hawassa University, Ethiopia, School of Medicine, College of Medicine and Health Sciences, Hawassa University, Hawassa, SNNPR, Ethiopia, ²Hawassa University, Ethiopia, Department of Midwifery, College of Medicine and Health Sciences, Hawassa University, Hawassa, SNNPR, Ethiopia

Objective: To determine the epidemiology of gynecological cancer among patients treated at Hawassa University Comprehensive and Specialized Hospital (HUCSH) from 2013 to 2019.

Design a retrospective cross-sectional review.

Setting, participants, and outcome measure a total of 3002 patients' cards with a diagnosis of cancer at a tertiary hospital named Hawassa University Comprehensive and Specialized Hospital were reviewed between February to May 2020. HUCSH is the only oncologic care center in the southern region of Ethiopia. Of this all-gynecologic cancer charts were extracted and descriptive and trend analyses were done. The review was conducted between February to May 2020.

Result: Out of all 3002 cancer cases, 522(17.4%) cases of gynecologic cancers were identified in seven years. Cervical cancer accounted for 385(73.8%) of all gynecologic cancers in this study, the next most common gynecologic cancers were ovarian cancer (55%) and endometrial cancer (51%) respectively. The mean [SD] age was 44.84[12.23]. Trends of all identified gynecological cancers showed continuous increments of caseload year to year. Since 2016 increment of cervical cancer is drastically vertical compared to others.

Conclusion: Despite the limited use of a registration and referral system in primary health institutions, the burden of gynecological cancers has increased over time. Treatment steps should be taken as soon as possible after a cancer diagnosis to prevent the disease from progressing.

Prevalence of Metabolic Syndrome According to ATP III, IDF and Harmonized Criteria Among Adults Aged 18-40 Years in the United Arab Emirates: The UAE Healthy Future Study

Shamma AlMuhairi¹, Aminu Abdullahi², Fatma AlMaskari¹, Javaid Nauman¹, Luai Ahmed², Raghib Ali³, Syed Shah¹

¹United Arab Emirates University, "UAE AlAin", United Arab Emirates, ²United Arab Emirates University, ³New York University Abu Dhabi "UAE Abu Dhabi" United Arab Emirates

Background & Objective: Metabolic syndrome (MetS) is a clustering of cardiometabolic risk factors and has many different definitions according to different international organizations. The presence of multiple risk factors simultaneously in Metabolic Syndrome has been shown to increase the risk for atherosclerosis development in young and middle-aged adults and the risk of cardiovascular disease in middle age.

This study aimed to estimate the prevalence of MetS using Adult Treatment Panel III (ATP III), International Diabetes Federation (IDF), and Harmonizing criteria of Joint Interim Statement (JIS) and to explore the level of agreement between them among young adults in the UAE.

Methods: Data were drawn from the UAE Healthy Future Study participants aged 18 to 40. Demographic and health information was collected through self-reported questionnaires. Anthropometric data and blood pressure were measured, and blood samples were also collected for biochemical parameters.

Results: The overall prevalence of metabolic syndrome was estimated at 14.7%, 19.5%, and 22.4% according to ATP III, IDF, and JIS respectively. The agreement between IDF and JIS was strong (Kappa: 0.89) and the agreement between ATP III and JIS (Kappa: 0.74) was considered moderate. Metabolic syndrome was more prevalent among men and older subjects. The significant risk factors of MetS in the studied cohort included male gender, older age group, being married, and a lower level of education.

Conclusion: In this young population, MetS is highly prevalent with about one in four young Emiratis being affected. JIS definition identified more Emirati adults with MetS, therefore, should be recommended as the preferred diagnostic criterion.

Study on Depletion of ovarian function and Late-life chronic diseases in India

Sampurna Kundu¹, Sanghmitra Sheel Acharya¹

¹Jawaharlal Nehru University, JNU Campus, New Mehrauli Road, New Delhi 110067, India

Background: Depletion of ovarian function which occurs due to menopause can affect multiple organs leading to multimorbidity. Women with extreme menopause ages (early or late) suffers from increased accumulated risk of multimorbidity than women who experience natural menopause. Hence, the study aims to understand the menopausal age in association which chronic conditions or multimorbidity.

Methods: The present study analyses the nationally representative data, Longitudinal Aging Study in India (LASI), 2017-2018, Wave 1. Bivariate analysis was carried out to examine the significant association between the covariates and the dependent variables which are the number of chronic diseases. Independent t-tests were used for continuous variables, and chi-square tests were used for categorical variables. Further regression analysis has been done to observe the effect of menopausal age on various chronic diseases, controlling the socio-economic and demographic variables, lifestyle and bio-physical factors.

Results: The results show that 15.8% of the women experienced premature menopause (50). Women with premature or early menopausal age are at higher risk of developing more chronic diseases such as heart diseases, whereas late menopausal age showed risk of high cholesterol. Women who had premature menopause, showed elevated risk of psychiatric disease.

Conclusion: The findings depict the relation of early or late depletion of ovarian function through menopause leads to chronic health conditions. A significant amount of risk of developing chronic diseases has been observed in the case of premature or early menopause. The loss of estrogen levels at an early age cause an alteration on the functioning of the organ systems that leads to chronic health conditions. Comprehensive strategies in the form of lifestyle changes may regulate the hormonal levels and allow body to reach menopause at the right age.

Epidemiology of Anaplastic Large Cell Lymphoma Associated with Breast Implants: a quantitative analysis

Santo Fruscione¹, Walter Mazzucco², Daniele De Bella³, Sergio Mazzola⁴, Claudio Costantino², Davide Costanza³, Nicole Bonaccorso², Miriam Belluzzo², Mariachiara Lo Porto², Arianna Di Napoli⁵, Francesco Vitale², Martina Vittorietti⁶

¹University of Palermo, Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties "G. D'Alessandro", Via Enrico Albanese, 31, Italy, ²University of Palermo, Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties "G. D'Alessandro", Italy, ³University of Palermo, "A.O.U.P. Paolo Giaccone, Italy, ⁴Sapienza University of Rome, Department of Clinical and Molecular Medicine, Italy, ⁵University of Palermo, Economics, Business and Statistics, Italy

Background and Objective: Breast implant-associated anaplastic large-cell lymphoma (BIA-ALCL) is a rare non-Hodgkin T-cell lymphoma arising in patients with breast reconstruction post-mastectomy or undergoing cosmetic-additive mammoplasty. Due to widespread use of implantations for cosmetic purposes,

BIA-ALCL cases are expected to increase. We aimed at investigating main characteristics of the disease and factors predicting BIA-ALCL onset in patients with and without implant replacement.

Method: A quantitative analysis was performed on cases extracted from primary studies published until April 2022 and searched in PubMed, Scopus and Google-Scholar databases, using "Breast-Implant" AND/OR "Associated" AND/OR "Anaplastic-Large-Cell-Lymphoma".

Statistical significance was verified by Student-T test for continuous variables, while Fisher's exact test was applied for qualitative variables. Cox model with time-dependent covariates was applied to estimate BIA-ALCL's onset time.

Results: 232 patients with BIA-ALCL (mean age at diagnosis: 55 years-old; mean time to disease onset from first implant: 10.3 years) were extracted from 52 selected studies. Patients with cosmetic implants were younger than patients with post-mastectomy implants but no difference was showed for median time to onset. Patients with implant replacement were significantly older than patients without previous replacement at the diagnosis, having a median time to diagnosis since first implant of 13 years (7 years in patients without replacement). Hazard of developing BIA-ALCL resulted significantly lower inpatients having a previous implant replacement as compared to patients who did not (HR= 0.03; 95%CI: 0.005-0.19; p-value= <0.01).

Conclusion: Exposure time to prosthesis, regardless of the age at implant and any possible condition associated with the disease, may play a role in BIA-ALCL induction. We provided evidence to be suggested for a proper information on breast implant use and for updating follow-up guidelines. Linkage between prosthetic implants registries and population-based cancer registries will help to better estimate the epidemiological impact over time of both BIA-ALCL and other lymphomas.

Background and objectives: High disease burden due to non-communicable diseases (NCDs) and the associated health inequalities are major problems in Europe. This study aimed to assess health inequalities in NCDs by Disability-Adjusted Life Years (DALYs) rates across 30 member states of the European Economic Area (EEA) between 1990 and 2019.

Methods: The Global Burden of Disease (GBD) 2019 estimates were used for a descriptive longitudinal systematic analysis. Age-standardized DALYs rates and 95% Uncertainty Interval (UI 95%) were used. For inequality analysis, we performed DALYs rate ratios between all countries in 2019 by sex, ratio between highest and lowest-ranking country by year, annual rate-of-change between 1990 and 2019 by sex, Gini Coefficient (GC), and Slope Index of Inequality (SII).

Results: In 2019, DALY rate of NCDs ranged from 24342 in Bulgaria (95%UI: 20406-

28775) to 14845 in Iceland (95%UI: 12379-17682). The ratio between highest and lowest-ranking country in terms of NCD DALY rates was higher for males (1.90: Bulgaria/Iceland) compared to females (1.49: Bulgaria/Slovenia). The annual rate-of-change indicated DALY rate decrease in all countries between 1990 and 2019. For females it ranged from -0.12 in the Netherlands to -0.28 in Slovenia, while for males from -0.10 in Bulgaria to -0.40 in the Czech Republic. NCDs with highest GCs and ratios over the studied period were cardiovascular diseases (GC: 0.283; ratio: 5.89), digestive diseases (GC: 0.244; ratio: 6.29), diabetes and kidney diseases (GC: 0.194; ratio: 4.97), substance use disorders (GC: 0.224; ratio: 5.10), and chronic respiratory diseases (GC: 0.160; ratio: 3.45). The SII was 0.85 in 1990 and 0.59 in 2019.

Conclusion: Although the DALY rate of NCDs decreased between 1990 and 2019 in all EEA countries, the level of inequality between countries is not decreasing. Targeted policies can help tackle NCDs with particularly high levels of inequality in EEA countries.

Genetic susceptibility to Insulin resistance and its association with estimated longevity in the hungarian general and roma populations

Peter Piko¹, Nardos Werissa², Roza Adany¹

¹University of Debrecen Hungary, ²University of Debrecen

Background and objective: Diabetes mellitus is a major public health problem with a wide range of prevalence among different ethnic groups. Early recognition of pre-diabetes is important to prevent the development of the disease, its complications, co-morbidities, and consequently early death. Insulin resistance (IR) is considered a condition that precedes type 2 diabetes (T2DM); thus, understanding its underlying causes will bring us closer to preventing it.

Methods: The present study aimed to investigate the genetic susceptibility to IR and its impact on longevity in populations with different origins using samples of 372 Hungarian general (HG) and 334 Roma participants. In the present study, we used the Homeostasis Model Assessment–Insulin Resistance (HOMA–IR) to identify people with IR (>3.63). To investigate the genetic predisposition to IR, 29 single nucleotide polymorphisms (SNPs) were selected and genotyped.

Results: Of these SNPs, the commutative effects of fifteen, showing the strongest association with HOMA–IR, were used to calculate an optimized genetic risk score (oGRS). The oGRS was found nominally significantly (p = 0.019) higher among Roma compared to HG, and it was strongly correlated with IR. Therefore, it can be considered as a stronger predictor of the presence of IR among the Roma (AUCRoma = 0.673 vs. AUCHG = 0.528). Furthermore, oGRS also showed a significant correlation with reduced estimated longevity in the Roma population (β = -0.724; p = 0.005), but not in the HG one (β = 0.065; p = 0.779). Overall, IR shows a strong correlation with a genetic predisposition among Roma, but not in the HG population. Furthermore, the increased genetic risk of Roma is associated with shorter longevity.

Conclusion: Increased genetic susceptibility to IR should be considered in preventive programs targeting the development of T2DM, which may also reduce the risk of preventable premature death among them.

Flash glucose monitoring for indigenous Australians with type 2 diabetes: a randomised pilot and feasibility study

Digsu Koye¹, Elif Ekinici¹, Audrey Eer², Mariam Hachem¹, Tracey Hearn³, Sharon Atkinson-Briggs⁴, Jessica Jones¹, Sandra Eades¹, Sabine Braat¹, Stephen Twigg⁵, Ashim Sinha⁶, Anna McLean⁶, Richard O'Brien¹, Phillip Clarke¹, David O'Neal¹, David Story¹, Jeffrey Zajac¹, Megan Freund⁷, Ray Kelly¹, Luke Burchill¹

¹The University of Melbourne Australia, ²The University of Melbourne,

³Rumbalara Aboriginal Co-operative Australia, ⁴Rumbalara Aboriginal Co-operative, ⁵Royal Prince Alfred Hospital Sydney Australia, ⁶Cairns Hospital Australia, ⁷The University of Newcastle Australia

Background and objective: In non-Indigenous populations with diabetes, knowledge gained from continuously monitoring of blood glucose levels has led to behavioural change and a reduction in blood glucose levels. However, this has never been studied in Indigenous Australians. We therefore conducted a pilot and feasibility study aimed to assess the feasibility of performing a larger multicentre trial using flash glucose monitoring (FGM) compared to standard care in Indigenous Australians with type 2 diabetes on injectable therapies.

Methods: In this non-masked, individually randomised controlled pilot and feasibility study, Indigenous people with type 2 diabetes were randomised to FGM

or standard care for 6 months. Eligible participants were Indigenous Australians aged ≥ 18 years with type 2 diabetes, have high blood glucose (defined as HbA1c of $\geq 7.0\%$) and on diabetes treatment that included injectable therapies. Primary effectiveness outcome was change in HbA1c from baseline to 6 months.

Results: We randomly assigned 40 participants, with 20 allocated to the intervention device (FGM) and 20 to the control arm, and 39 completed the study. Participants' baseline characteristics were similar between groups except for sex and body mass index. The primary outcome, mean difference in HbA1c at 6 months was 0.19% (95% confidence interval -1.20 to 0.81). No participants experienced a severe hypoglycaemic event during the study period.

Conclusions: This is the first randomised controlled pilot and feasibility study comparing FGM to standard care in Indigenous Australians with type 2 diabetes. The high recruitment and retention rates show promise for a larger multicentre randomised controlled trial which is currently in progress. REGISTRATION Registered at the Australian and New Zealand Clinical Trials Registry (ACTRN12621000021875).

Vegetable and high sodium food intake, nutritional status and metabolic syndrome among adolescents in makassar, Sulawesi Selatan, Indonesia

Suryani Tawali¹, Suryani Tawali¹, Irene Leonardy², Ari Junaedi¹, Nurul Qalby¹

¹Department of Public Health and Preventive Medicine, Faculty of Medicine Hasanuddin University, Makassar Indonesia Faculty Of Medicine, Hasanuddin University, Makassar Indonesia Jl.Perintis Kemerdekaan Km. 10, Makassar Indonesia, ²Bachelor of Medicine Study Program

Background and Objective: Noncommunicable diseases (NCDs) account for 74% of total deaths in the world. Around 77% NCDs death occurred in low- and middle-income countries including Indonesia. Adolescents are among those who are at risk to develop NCD due to unhealthy diet and lack of physical activity. These may lead to obesity, a rise in blood pressure, and increased of blood glucose and blood lipids levels, which are known as metabolic syndrome. This study aimed to determine the vegetable dan high sodium food, nutritional status and metabolic syndrome among high school adolescents in Makassar

Methods: This cross-sectional observational study was conducted in August to October 2022 in an urban public high school in Makassar, Indonesia. Vegetable and high sodium food intake were measured through questionnaire. Anthropometric measurement (weight and height) was performed to obtain the nutritional status of the students. Metabolic syndrome were characterized through measurement body mass index (BMI), blood pressure, and blood glucose level.

Results: Among 390 high school children, 11.8% were overweight and 10% were obese. On the other hand, 16% students were underweight. Further analysis among 104 students showed that the majority of students had inadequate intake of vegetable (84.6%). For high sodium food, more than 50% students consumed at least three kinds of high sodium food and 58.7% students consumed more than 5 g salt per day. In term of the risk of metabolic syndrome. 48 (46.2%) students had one risk of metabolic syndrome, either of obesity and hypertension, and 3 students (2.9%) had two risks of metabolic syndrome

Conclusion: In view of the fact that vegetable consumption as the protective factor for developing metabolic syndrome were severely inadequate and the intake of high sodium food were above the normal, therefore, multisectoral intervention are urgently needed to prevent the development of metabolic disease among adolescents.

Assessing the predictive performance of published polygenic scores for prevalent and incident coronary artery disease in multiple genetic ancestries

Luca Regazzi¹, Chiara Cadeddu¹, Stefania Boccia¹, George Busby², Alessandro Bolli³

¹Università Cattolica del Sacro Cuore "1) Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy" Italy, ²Allelica, Inc. Allelica, New York, NY, USA United Kingdom, ³Allelica, Inc.

Background and Objective: Polygenic scores (PGS) for coronary artery disease (CAD) measure an individual's genetic liability for CAD. Multiple PGSs for CAD have been published and whilst they are generally considered predictive in individuals of European ancestry, performance is attenuated in non-European ancestry groups (AG). Here we collate publicly available CAD PGS and benchmark their performance across several AGs to evaluate their utility for personalized

prevention.

Methods: We queried the "PGS Catalog" to extract standardized odds/hazard ratios (OR/HR) for published CAD PGSs across multiple AGs (European, African, Hispanic, South-Asian, East-Asian, Greater-Middle-Eastern). We restricted our analysis to PGSs specifically developed for prevalent and/or incident CAD and analyzed AG-specific PGS performance to identify the five best-performing PGSs in each AG to include in a comparative analysis.

Results: In general, PGS applied to the European AG had the highest OR/HRs per standard deviation of the PGS (min: 1.74[1.61-1.89]; max: 1.89[1.75-2.03]), while the African AG had the lowest performances overall (min: 1.05[0.94-1.17]; max: 1.40[1.30-1.52]). PGSs applied to Hispanic, East-Asian and Greater-Middle-Eastern AGs exhibited highly heterogeneous performance overall, although their absolute best performance was comparable to those in Europeans with OR/HRs of 1.93[1.67-2.22], 1.84[1.74-1.94] and 1.81[1.66-1.98] respectively. PGS000018 demonstrated the best performance in both Africans (1.40[1.03-1.52]) and Hispanics (1.93[1.67-2.22]), while PGS000013 was the best performing PGS in Europeans (1.89[1.75-2.03]) and ranked second in Hispanics (1.52[1.43-1.62]), East-Asians (1.66[1.47-1.86]) and South-Asians (1.58[1.42-1.76]). Furthermore, PGS000337 was best in East-Asian (1.84[1.74-1.94]) and Greater-Middle-Eastern AGs (1.81[1.66-1.98]), while PGS000296 performed best in South-Asians (1.66[1.53-1.81]).

Conclusion: There is currently no gold-standard CAD PGS that can be applied with equal predictive performance across all AGs. However, performance of CAD PGS in different AGs can be optimized by applying different ancestry-specific CAD PGSs to achieve the best possible predictive performance in every individual, an essential prerequisite towards implementing PGSs in CAD personalized prevention protocols.

Lunch dietary pattern in association with overweight in Brazilian adults

Valéria Baltar¹, Ana Lima Ferreira², Bruna Hassan¹

¹Universidade Federal Fluminense Brazil, ²Universidade Federal do Rio de Janeiro Brazil

Background and Objective: In Brazil, lunch is the most consumed meal and it is the meal with the highest energy intake of the day. The combination of food items in this meal, provides the main nutrients among Brazilian adults. We aimed to investigate the relationship between lunch dietary patterns and overweight among Brazilian Adults.

Methods: We used 28,191 individuals aged 19-59 years (excluding pregnant and breastfeeding) from the National Dietary Survey (2017-2018). We included the food items consumed at lunch in 14 food groups. Lunch dietary patterns were derived by principal component factor analysis (Varimax rotation). The patterns scores were classified accordingly to terciles (lower, median, and higher adherence to the pattern). To access the association between overweight (BMI ≥ 25 kg/m²) and the dietary patterns we applied logistic regression adjusted by age, schooling, sex, region and total energy intake. All analysis were made considering the study design.

Results: Only 3.27% of the adults did not mention having lunch. Among the those that consumed lunch we found three patterns: Traditional Brazilian (rice, beans and red meat), Vegetable and Salads (vegetable, salads, oils, red meat, and processed meat) and protein dish with side dishes (white meat, juices and sweets). We found that adults with higher adherence to the Vegetable and Salads lunch patterns are associated to 18% higher chance of overweight in comparison to the lower adherence (OR=1.18 [1.08; 1.30]).

Conclusions: Despite that the Vegetable and Salad lunch pattern includes health food, it also contains fat and oil and red meat/processed meat, and is directly associated to overweight in Brazilian adults.

Law and Policy Gap Analysis to promote physical activities in Bangladesh Context

Syed Alam¹, Syed Alam¹

¹Center for Law and Policy Affairs-CLPA Secretary Center for Law and Policy Affairs-CLPA Flat-A3, House-49, Road-13, Block-D, Banani-1213, Dhaka Bangladesh

Background: Bangladesh is one of the leading vegetables and fruit-producing countries in the globe,[1] [2] being now the world's third-largest producer of vegetables.[2] [3] Although Bangladesh has entered the list of top 10 countries in the production of seasonal fruits,[3] [4] Bangladeshi people tend to consume very

little fruits and vegetables. Given this evidence, it is important to understand the reasons behind the population's low consumption of nutritious food, vegetables, and fruits despite the country's adequate supply. However, it will be impossible to effectively promote healthy diets unless a set of different laws and policies that govern the healthy food supply chain is implemented simultaneously.

Intervention Method: This policy briefing grounds on law and policy analysis, review of existing research and publications, and consultations with a variety of stakeholders. We are exploring the policy situation and analyzing thirty two (32) policies related to food from eleven (11) different ministries so far. During the policy analysis, it was determined whether any form of subsidy or assistance was provided to improve production, storage, transportation, marketing, and distribution of food. Six laws have been identified that regulate the promotion, advertising, and sale of unhealthy foods.

Results/Impact: CLPA developed this policy brief to inform country stakeholders on the legal basis for the promotion of healthy diets as a policy tool to prevent NCDs in Bangladesh.

Conclusions: The law, through the adoption of regulation and fiscal policies, is a crucial part in this effort to transform food consumption patterns to promote healthy diets.

Acute myocardial infarction in a decade in Italy: Impact of age, gender and heart failure

Stefano Rosato¹, Stefano Rosato¹, Leonardo De Luca², Gian Mureddu³, Stefano Cicala⁴, Barbara Giordani⁵, Giorgia Duranti⁴, Gabriella Badoni¹, Alice Maraschini¹, Fulvia Seccareccia¹, Paola D'Errigo¹, Giovanni Baglio⁴

¹Italian National Institute of Health Italy, ²A.O. San Camillo-Forlanini, Rome,

³San Giovanni Hospital, Rome Italy, ⁴Italian National Agency for Regional

Healthcare Services Italy, ⁵Italian National Agency for Regional Healthcare Services

Background and Objective: The outcome of patients with acute myocardial infarction (AMI) may vary substantially based on baseline risk. This work aims to analyse the impact of gender, age and heart failure (HF) on mortality trends, based on a nationwide, comprehensive and universal administrative database of AMI.

Methods: This is a nationwide cohort study enrolling patients admitted with AMI from 2009 to 2018 in all Italian hospitals. The main outcomes were in-hospital mortality rate (I-MR) and 1-year post-discharge mortality rate (1-Y-MR).

Results: Among the 1,000,965 AMI events included in the analysis, 43.6% occurred in patients aged ≥ 75 years, 34.7% in females and 21.8% in AMI complicated by HF at the index hospitalization. Both I-MR and 1-Y-MR significantly decreased over time (from 8.87% to 6.72%; mean annual change - 0.23%; confidence intervals (CI): - 0.26% to - 0.20% and from 12.24% to 10.59%; mean annual change - 0.18%; CI: - 0.24% to - 0.13%, respectively). This trend was confirmed in younger and elderly AMI patients, in both sexes. Since I-MR has decreased more than 1-Y-MR, the ratio between 1y PD-MR and I-MR increased over time.

In AMI patients complicated by HF, both I-MR and 1-Y-MR were markedly high, regardless of age and gender.

Conclusions: This contemporary, nationwide study suggests that I-MR and 1-Y-MR are still elevated, albeit decreasing over time. Elderly patients and those with HF at the time of index admission, present a particularly high risk of fatal events, regardless of gender.

Does the healthcare system sufficiently promote cancer screening among those in its care?

Allegra Ferrari¹, Thuy Tran², Sarah Hoeck³, Marc Peeters⁴, Mathieu Goossens², Guido Van Hal⁵

¹University of Antwerp Social Epidemiology and Health Policy, Family Medicine and Population Health (FAMPOP), University of Antwerp, 2610 Antwerp, Belgium; Department of Health Sciences (DISSAL), University of Genoa, 16123 Genoa, Italy, ²Centre for Cancer Detection, ³Centre for Cancer Detection Social Epidemiology and Health Policy, Family Medicine and Population Health (FAMPOP), University of Antwerp, 2610 Antwerp, Belgium; Centre for Cancer Detection, 8000 Bruges, Belgium, ⁴Antwerp University Hospital (UZA) Department of Oncology, Antwerp University Hospital,

2650 Antwerp, Belgium; Integrated Personalized & Precision Oncology Network (IPPON), University of Antwerp, 2610 Antwerp, Belgium, ⁵University of Antwerp Social Epidemiology and Health Policy, Family Medicine and Population Health (FAMPOP), University of Antwerp, 2610 Antwerp, Belgium; Centre for Cancer Detection, 8000 Bruges, Belgium

Despite the recognized benefits of organized cancer screening programs, tests outside screening programs are common. Downsides to this practice include the lack of quality control and disparities in participation patterns based on one's perception of risk and willingness/ability to pay. While comprehensive reports on outside program screening in Europe are lacking, the Flemish breast (BC) and colorectal cancer (CRC) screening programs monitor data on non-organized tests prescribed by GPs and specialists. Using multivariate logistic regression, we examined the relationship between health care utilization and BC and CRC screening coverage in 308 Flemish municipalities between 2015–2018. With regards to BC, municipalities with a higher rate of visits with gynecologists have a lower coverage inside (-8%) and higher coverage outside (+17%) the program. By contrast, municipalities with a higher rate of GP visits, have a higher coverage inside (6%) and a lower coverage outside (-7%) the program. As for CRC, municipalities with a higher rate of visits with gastroenterologists have a lower coverage inside the program (-3%). Instead, municipalities with a higher rate of GP visits, have a higher coverage both inside (+2%) and outside (+5%) the program. Municipalities with a higher percentage of people with chronic conditions have a higher coverage within both the BC and CRC programs (+5% and +3%), and lower rates of outside screening (-7% and -6%). Municipalities with a higher percentage of people 65+ affected by dementia, partially overlapping with the target population, have higher inside coverage in both the BC and CRC screening (+13% and +5%, respectively). Finally, a higher percentage of people with mood disorders was associated with lower inside coverage of BC and CRC screening (-3% and -4%). Providers should remain aware of their role in facilitating patients' decision-making process, especially among vulnerable groups, and attempt to increase participation in the organized programs.

Madodiet: Comparison of dietary habits and lifestyles between residents of madonie mountain area and those of the metropolitan area of palermo

Martina Sciortino¹, Claudio Costantino¹, Nicole Bonaccorso¹, Livia Cimino¹, Arianna Conforto¹, Daniele De Bella¹, Santo Fruscione¹, Walter Mazzucco¹, Francesco Vitale¹

¹University of Palermo Department of Health Promotion, Maternal and Infant Care, Internal Medicine and Excellence Specialties (PROMISE), University of Palermo, Palermo, Italy

Background: We compared dietary and lifestyle habits in a sample population living in the small cities of the Madonie Mountains (MM), Palermo's Province, an Italian area characterized by one of the highest prevalence of centenarians and in a sample of residents living in the Metropolitan Area of Palermo (PA) to highlight any difference of public health interest.

Methods: A cross sectional study was conducted administering an anonymous questionnaire in digital format since August 2022 and still ongoing.

The questionnaire includes items which explore socio-demographic features, lifestyle, eating habits and supplement use. A MD adherence score was calculated based on fruit, vegetable, red meat intake, and walking habit.

Results: Overall, 749 subjects were enrolled (RR 74%), with an average age of 38.6 years: 526 living in MM and 223 in PA.

Only 21% of sample showed good adherence to MD, with young individuals having a statistically significant lower adherence to MD.

Wholegrain flours consumption was found to be significantly associated with greater adherence to MD (Adj-OR: 2.04; CI95%:1.41-2.96)

Residents in MM showed a significantly higher consumption of fruits (61.2% vs 52% - Adj-OR:1.45; CI95%:1.06-2.00) and vegetables (80.7%vs.50.9% - Adj-OR:4.02; CI95%:2.86-5.65), mainly coming from local or homegrown production.

Lastly, MM subjects were found to eat red meat mainly from local or household production as comparison with urban residents (Adj-OR:4.77; CI95%:3.32-6.85).

Conclusion: Our findings confirmed the central role played in dietary habits by local and household production.

Because of important role played by seasonality of fruits and vegetables and local production on MD food pyramid, data collected should encourage public health Authorities to promote proper lifestyle and nutrition also in Metropolitan Areas.

Mapping of the state-of-the-art and bottlenecks for the adoption of personalised preventive approaches in health systems

Sara Farina¹, Nicolò Scarsi², Tommaso Osti¹, Cosimo Savoia¹, Leonardo Villani², Martina Porcelli², Luigi Russo², Roberta Pastorino², Stefania Boccia²

¹Università Cattolica del Sacro Cuore Section of Hygiene, University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²Università Cattolica del Sacro Cuore

Background: Personalised medicine, especially in the field of prevention, is one of the priorities on the research agenda of the European Commission, which has funded the project "a Personalised Prevention roadmap for the future HEalThcare" (PROPHET), a Coordination and Support Action of the International Consortium for Personalised Medicine (ICPerMed). This project has the objective to support health systems in the implementation of innovative, sustainable, and high-quality personalised strategies for preventing chronic diseases. In the PROPHET context, a scoping review was performed to map the state-of-the-art and bottlenecks for the adoption of these approaches in health systems.

Methods: The search, which followed the latest PRISMA-ScR checklist, was conducted until November 2022 on Pubmed, Web of Science, Scopus, Google Scholar databases and national and international official repositories. All documents published in the last five years, concerning personalised prevention approaches for common chronic diseases were included.

Results: Of the 8990 results obtained, 18 articles were included. Among these, 30% concerned primary prevention, including genomic screening approaches for cardiovascular or cancer risk prediction; 55.5% were related to secondary prevention, i.e. cancer screening with omic biomarkers; 14.5% focused on tertiary prevention, encompassing pharmacogenomics and nutrigenomics. The main bottlenecks were data analysis and management, high costs of technology, education of healthcare workforce in omics science and public health literacy. However, limited examples of personalised prevention were in place in high developed countries, mainly limited to international-funded research projects.

Conclusions: Personalised prevention has great potential, both for improving the health of population and reducing the burden of chronic diseases on health systems. Several bottlenecks currently limit full implementation, but some approaches, especially including genomics, have been deployed in clinical practice. Therefore, it is necessary to ensure that personalised prevention is consistently adopted and becomes a priority on the health agendas of all countries in Europe and beyond.

Health seeking behaviour among cancer patients using Geographic Information System: A Mixed-Methods study from Western India

Garima Singh¹, Pankaja Raghav², Neeti Rustagi¹

¹Lady Hardinge Medical College, New Delhi India, ²All India Institute of Medical Sciences, Jodhpur

Background and objective: Cancer prognosis is dependent on early diagnosis and treatment as well as on awareness, beliefs, accessibility, and affordability of the health services. Delay in seeking health care by patients increases mortality risk. This study has been undertaken in rural Jodhpur (Rajasthan, Western India) to determine health-seeking behavior related to common cancers and the factors affecting them.

Methods: A community-based mixed-methods study was conducted in randomly chosen one-third villages (37 villages out of total 113 villages were included in the study) of Mandore block of Jodhpur. Data was collected from individuals diagnosed with cancer/their relatives. In-Depth Interviews (IDI) were conducted with frontline workers, cancer survivors, and their caregivers. A geographic information system (GIS) was also used to depict health care facilities accessed by cancer patients.

Results: A total 82983 population was covered in 37 villages. Among the population covered, 146 participants were diagnosed cancer cases. About one-third (34.2%) preferred alternative medicine along with allopathic medicine. The behavior of changing hospitals frequently was depicted maximum by patients suffering from primary brain tumors (62.5%, 5). Forty-five (31%) participants did not continue their treatment after initiation. From the content analysis of IDI, major factors for delays in health-seeking were misconceptions, superstitions, stigmatization, financial burden, miscommunication from doctors, no proper referral mechanism, unfelt need to visit healthcare. Awareness of risk factors was limited to tobacco and alcohol. None of the participants were aware of screening services provided and the benefits of screening services. Availability of initial treatment at peripheral centers, and training activities for frontline workers and teachers were the major recommendations to improve cancer prevention and control.

Conclusions: Alternative medicine usage was common among cancer patients.

Leaving treatment in-between was also observed among one-third of participants. Misconceptions, superstitions, stigmatization, financial burden were major factors enlisted for health-seeking delays.

Introduction: Patients with haematological diseases, commonly have lasting immunodeficiency due to their disease or related treatments. Research suggests that COVID-19 positive patients with haematological diseases have worse outcomes than non-haematological patients however, there is limited data from Africa and South Africa.

Methods: A retrospective review of all COVID-19 positive patients with an existing Haematology diagnosis from January 2020 to April 2021 (encompassing two waves of COVID-19), at Groote Schuur Hospital. Descriptive and inferential statistics to evaluate data.

Results: A total of 53 patients with the haematological disease were identified (35 infected in the first wave and 18 in the second wave). Of these participants, 51% were male with a median age of 47.5 years (IQR:35.6-60.3); half were because of severe COVID-19 illness (47%), 28% were diagnosed during non-covid admission and 25% were outpatients. Lymphoma was the most common haematological diagnosis (45%), followed by those with cytopenias or myeloma/plasma cell disorders (each 13%). The majority of cases had more than one comorbidity (62%), were HIV negative (81%), were non-smokers (77%) and had an ECOG (Eastern Cooperative Oncology Group) score of 0 (40%). The most commonly reported symptoms were shortness of breath (53%), cough (51%) and fever (38%) while 17% of patients reported no symptoms. Prior to COVID-19 infection, 40 patients (75%) had a survival prognosis of >12 months of whom 13% succumbed to COVID-19. Of the 13 patients (25%) with a survival prognosis of

Challenges in access to care among diabetes patients during COVID-19 pandemic: A hospital based mixed method study

Namuna Shrestha¹, KC Dirghayu², Ingrid Miljeteig³, Krishna Aryal⁴

¹Public Health Promotion and Development Organization Nepal, ²Public Health Promotion and Development Organization, ³Bergen Centre for Ethics and Priority Setting in Health, Department of Global Public Health and Primary Care, University of Bergen Norway, ⁴Bergen Centre for Ethics and Priority Setting in Health, Department of Global Public Health and Primary Care, University of Bergen Nepal

Background: The COVID-19 pandemic challenged the capacity of health system to deliver essential health services worldwide, including Nepal. Hindrances in access to care had substantial impact on people suffering from chronic non-communicable diseases (NCDs), and the most critical cases of COVID-19 were found among those with co-morbid. We aimed to identify challenges of diabetes mellitus (DM) patients in accessing health care during COVID-19 pandemic.

Methods: We conducted a hospital-based cross-sectional study using a mixed-method approach in two hospitals in Kathmandu, Nepal and interviewed 134 participants employing structured questionnaire in August - September 2021. Further, we conducted in-depth interview with patients (10) and key informant interview with service providers (5). Study received ethical approval from the national Ethical Review Board at Nepal Health Research Council. Quantitative data was analyzed using descriptive statistics. The audio records of qualitative interviews were transcribed, translated, and analyzed using thematic analysis.

Results: Many DM-patients struggled to access care, and 14% participants reported they were unable to get healthcare needed in previous two months. Among them, nearly 60% reported COVID-19 pandemic to be the cause. People from low socio-economic background, with chronic diseases, particularly elderly, and from rural areas were the ones most affected. Hindrance on follow up visits, delay in seeking care, fear of COVID-19 transmission and shortage of medications

were reported as main challenges. With fear of COVID-19 transmission many regular follow-up was missed; some reported later with very low sugar level and some with very high endangering them of severe complications.

Conclusion: Access to care for people with DM was affected due to COVID-19 pandemic with the effects mostly noticed among people from low-socioeconomic background. Distance modalities such as telemedicine and mHealth would help maintain the required access to care for patients with chronic NCDs such as DM during such emergencies.

Transforming multiple sclerosis care in Italy through Integrated Care Pathways and local networks of service providers. A survey on clinical centres

Tommaso Manacorda¹, Michela Ponzio¹, Federica Terzuoli², Piero Lamendola², Daiana Bezzini³, Mario Battaglia¹

¹FISM - Italian MS Foundation Italy, ²AIISM - Italian MS Society Italy,

³University of Siena

Background and Objective: 240 specialised clinical centres (CCs) provide diagnosis and treatment of multiple sclerosis (MS) within the Italian National Health System (SSN). Mostly based in neurology departments, CCs were authorised in the mid '90s by SSN to administer the first Disease Modifying Treatments (DMTs). Increasingly widespread Integrated Care Pathways (ICPs) require CCs to coordinate multidisciplinary care and to ensure collaboration across hospital, community and social care for people with MS (PwMS). Understanding whether CC led local networks of services exist and what factors hinder of facilitate establishing them is key to design policies aimed at support transformation of MS care.

Methods: The Italian MS Society (AIISM) carried out a survey in early 2022 inviting all Italian CCs. The questionnaire was designed in collaboration with an advisory board including representatives from the Ministry of Health, relevant professional bodies, academics and researchers.

Results: 70% of Italian CCs (n=169) completed the questionnaire and reported to follow 102,246 PwMS overall (77% of the estimated prevalent cases in Italy). 25% of participating CCs provide care based on a local ICP while 44%, 11% and 20% respectively mentioned a regional, an informal or no ICP. Presence of a local ICP was significantly associated with more collaboration with community and social care services and with reported existence of a local network of providers, compared both to no ICP and to regional ICP. Staff shortage and suboptimal IT infrastructure are reportedly the main factors hindering transformation.

Conclusion: Most CCs struggle to build relationship with other providers, especially with those farther from the hospital setting and the healthcare domain. A minority of CCs reports the existence of networks in MS services. Local ICPs are effective vehicles to formalize collaboration across hospital, community and social care providers, and to facilitate the leading role of CCs' in transforming MS care.

Neuromed, Pozzilli Italy

Background and objective: Bile acids (BAs) are synthesized in the liver as primary BAs, to facilitate absorption of dietary fat. In the intestinal lumen, primary BAs are partially converted by gut microbiota in secondary BAs, then excreted to feces or reabsorbed in blood. Literature suggests that circulating BA levels could have effects on metabolic health and could be modulated by diet. We investigated the association between habitual diet and fasting levels of circulating BAs in Italian adults.

Methods: A subsample of 1080 subjects was randomly selected from the RoCAV

population-based study (men and women 60-75 years, recruitment period 2013-2016). Dietary habits (previous year) were collected using the EPIC questionnaire. BAs were measured from frozen plasma samples, collected after overnight fasting, using HPLC MS/MS. Cross-sectional association analyses between dietary data (dietary patterns and total food, macronutrient and food group intakes) and BA levels were performed using multivariable regression models.

Results: In the age- and sex-adjusted model, we found a negative association between total food intake and secondary BAs (for increase of 1 SD of edible part: Est=-0.14 SDs of BAs, p=0.0004) or specific BA (DCA, secondary: -0.14, p=0.0002; CDCA, primary: -0.13, p=0.0005). When total food intake was added as covariate, chronic alcohol consumption was associated with primary BAs (0.17, p=0.0002; wine: 0.13, p=0.0006), while not with secondary BAs, despite the dependence of secondary BAs on their substrates, the primary BAs.

Conclusion: These results showed associations between total food intake and fasting circulating BAs. Moreover, wine consumption was associated with selected BA groups, independently on total food intake. Further prospective studies should be designed to investigate the cause-effect relationship between diet and BAs, to establish circulating BA profiles as potential mediators of the effect of diet on health.

Public health interventions to promote oral health and well-being in patients with type 2 diabetes: a systematic review

Jacopo Garlasco¹, Maanasa Koripalli², Gemma Bridge³

¹Department of Public Health Sciences and Paediatrics, University of Turin 5/bis, Via Santena, I-10126 Turin Italy, ²Department of Epidemiology, Biostatistics and Occupational Health, McGill University, Montréal, Quebec,

³York St John University Lord Mayor's Walk, York, YO31 7PJ United Kingdom

Background and objective: Poor oral health and type 2 diabetes mellitus (T2DM) are chronic conditions affecting a wide proportion of the population. Both conditions share many risk factors and are linked by a chronic inflammation state. This review aimed at identifying public health interventions that could promote oral health and diabetes control in patients with poor oral health and T2DM.

Methods: The systematic review was performed according to the PRISMA Statement and registered in the International Prospective Register of Systematic Reviews (PROSPERO registration: CRD42022310974). Seven electronic databases were searched (PubMed, Scopus, Embase, Web of Science, CINAHL, PsycInfo, Cochrane Library) from inception to 21 January 2022, and additional hand searching was performed across reviews' references. A qualitative analysis was conducted, including all primary studies on diabetic patients, about interventions whose effectiveness and/or feasibility was measured for at least one outcome related to oral health or T2DM.

Results: Of the 3153 records obtained after deduplication, 89 studies were considered eligible for inclusion. The most frequently evaluated outcomes were HbA1c and fasting glucose for T2DM, and parameters such as probing depth, bleeding on probing and clinical attachment loss for periodontitis. Most studies assessed the use of non-surgical periodontal treatment (especially scaling and root planing, sometimes corroborated by antibiotics): evidence confirmed effectiveness on periodontal parameters, but was more contrasting regarding T2DM outcomes. Three studies evaluated interventions involving group education for lifestyle modification, which showed to be effective on both outcomes. Also, community-based oral hygiene interventions and glycaemic control appeared to improve T2DM and periodontal outcomes.

Conclusions: A variety of interventions are described in the literature. Of those included in this review, many indicated that there is a potential opportunity to promote good oral health alongside T2DM. An integrated approach involving health education, oral hygiene and glycaemic control may offer synergic improvement of both conditions.

Risk stratification of non-communicable diseases with sars-cov-2 virus disease severity in Dubai, United Arab Emirates

Najwa Bastaki¹, Basema Saddiq², Mohamud Hussein³

¹Dubai Health Authority Dubai Government Al-Jaddaf, AlNawras Road, Dubai, UAE United Arab Emirates, ²University of Sharjah United Arab Emirates,

³United Arab Emirates University

Background: During the COVID-19 pandemic, emphasis was placed on morbidity and mortality due to COVID-19 infections, with less emphasis on COVID-19 patients with comorbid non-communicable diseases (NCDs). The high rate of

people of underlying condition NCDs in the United Arab Emirates places the country at higher risk of disease infection and worse clinical outcomes. Objective: This study aimed at determining the prevalence of non-communicable diseases among SARS-CoV-2 infected patients in Dubai, United Arab Emirates to identify predictors for COVID-19 disease severity and clinical outcomes.

Methods: A retrospective observational study was conducted on patients admitted to Dubai hospitals between January 28, and September 30, 2020. The clinical and demographic data for 34,687 hospital records were analyzed. Bivariate analysis determined associations between comorbidities and COVID-19 severity and multivariable logistic regression analysis identified predictors of COVID-19 severity.

Results: All co-morbidities were significantly associated with COVID-19 severity in the bivariate analysis ($p < 0.05$) except for vitamin-D deficiency and chronic lower respiratory diseases. Patients with ischemic heart diseases (AOR: 2.08; 95% CI: 1.37, 3.15), pulmonary and other heart diseases (AOR: 2.13; 95% CI: 1.36, 3.32), and chronic kidney diseases (AOR: 1.81; 95% CI: 1.01, 3.25), had higher odds of severe COVID-19 symptoms. Suffering from multiple co-morbidities increased the odds of developing severe COVID-19 symptoms substantially in comparison to having only one co-morbidity, (AOR: 2.33; 95% CI: 1.37, 3.97) and (AOR: 1.52; 95% CI: 1.76–2.60) respectively.

Conclusion: This study demonstrates that COVID-19 patients with pre-existing comorbidities require continuous monitoring. The identification of risk factors associated with SARS-CoV-2 infection will facilitate the early identification of high-risk populations and ensure the most appropriate preventive measures and medical management for these patients.

Residential segregation, breast cancer mortality and the effect of a conditional cash transfer (bolsa família) programme: Results from the 100 million Brazilian cohort

Joanna Guimarães¹, Julia Pescarini², J Filho³, Andréa Ferreira³, Gervasio Santos³, M de Almeida⁴, Ligia Gabrielli⁵, Emanuelle Goes², Dandara Ramos⁶, Mauricio Barreto², Estela Aquino⁶

¹Cidacs - Fiocruz, Salvador, Brazil, ²Faculty of Epidemiology and Population Health, London School of Hygiene & Tropical Medicine, London, UK, ³Cidacs - Fiocruz, Salvador, Brazil, ⁴Gonçalo Muniz Institute - Fiocruz, Salvador, Brazil, ⁵Secretaria de Saúde do Estado da Bahia - Centro de Diabetes e Endocrinologia do Estado da Bahia, Salvador, Brazil, ⁶Instituto de Saúde Coletiva - Universidade Federal da Bahia, Salvador, Brazil

Background and objective: Women living in economically segregated areas are less likely to receive adequate breast cancer care and access community resources, which may heighten breast cancer mortality risk. We investigated whether the conditional cash transfer programme Bolsa Família (BFP) could mitigate the detrimental effects of living in segregated areas on breast cancer mortality.

Methods: We analysed data on 20,680,930 adult women from the 100 Million Brazilian cohort, linked to nationwide mortality registries (2004-2015). The association between women's residential segregation at the municipality level (using the dissimilarity index in tertiles: low/medium/high) and breast cancer mortality was analysed using Poisson regression adjusted for age, race/ethnicity, education, area of residence (rural/urban), municipality's area size and population density. Multiplicative interactions between residential segregation and BFP receipt (yes/no) were assessed.

Results: Breast cancer mortality rates were greater among women living in high (adjusted Mortality rate ratio=1.18, 95%CI 1.12-1.23) and medium (1.07, 1.03-1.12) vs low segregated municipalities. Women not receiving BFP had higher breast cancer mortality rates (1.12, 1.08-1.17) than BFP recipients. Stratified analysis by BFP receipt showed that among BFP recipients, women living in high vs low segregated municipalities had a 12% (1.12, 1.06-1.19) greater risk of dying from breast cancer; among non-recipients of BFP, the risk of dying for women living in high vs low segregated municipalities was 23% higher (1.23, 1.14-1.33) (P for interaction=0.008). When stratifying by the time in years receiving the benefit, associations between segregation and mortality were stronger for women receiving BFP benefit for less time (<4 years:1.10, 1.01-1.20; 4-7 years: 0.97, 0.89-1.07; 8-11 years:1.09, 0.95-1.25) (P for interaction<0.001).

Conclusion: Place-based inequities in breast cancer mortality due to residential segregation might be attenuated through the BFP, possibly by improving women's familial income and access to preventive cancer care services, leading to early detection and treatment and ultimately reducing mortality.

University of Ibadan and University College Hospital, Ibadan, Nigeria ⁵Department of Periodontology and Community Dentistry, University of Ibadan and University College Hospital, Ibadan, Nigeria, ⁶University of Ibadan University of Ibadan and University College Hospital, Ibadan, Nigeria

Background and objectives: SUSTAINABLE DEVELOPMENT GOAL 3 (healthy life and general well-being for all) cannot be accomplished without focus on oral health of adolescents, a major segment of the population and transition to adulthood. Oral health is often neglected in developing countries despite being integral to general well-being. The objective of this study was to determine the unmet dental needs and evaluate the impact on oral health related quality of life (OHRQoL) of adolescents in Ibadan, Nigeria.

Methods: This cross-sectional study was conducted among 700 randomly selected adolescents attending 14 secondary schools in Ibadan. Data were obtained using pretested self-administered structured questionnaire and by oral examination. The Oral Health Impact Profile 5 (OHIP-5) was used to assess the OHRQoL of the adolescents. Oral examination included assessment of oral hygiene using the Simplified-Oral Hygiene Index (OHI-S), dental caries using the Decayed, Missing and Filled Teeth (DMFT) index, gingival bleeding, pathologic periodontal pocketing and traumatic dental injuries. Data was analysed with SPSS and p value was

Non-communicable disease risk factors and mental health status among school students in Nepal: a mixed-method study

Pratik Khanal¹, Kiran Paudel², Arpana Adhikari³

¹Nepal Public Health Association Lalitpur, Nepal, ²Institute of Medicine, Tribhuvan University Nepal, ³Nobel College, Pokhara University, Nepal

Background and objective: This study aimed to determine the prevalence of behavioral risk factors of non-communicable diseases (NCDs) and mental health problems among school students. Perception of stakeholders regarding contributing factors and strategies to reduce the burden of NCDs and mental health problems was also explored.

Method: This study used explanatory sequential research method which included school-based survey with 415 higher secondary school students, four focus group discussions with students, and seven in-depth interviews with community stakeholders. The study was conducted in Kathmandu, the capital city of Nepal in between February-April 2021. Data collection tools included the WHO STEPS survey, Hospital Anxiety and Depression Scale, Insomnia Severity and Young's Internet Addiction Test. Both descriptive and inferential analysis was conducted for quantitative data while thematic analysis using deductive approach was done for qualitative data.

Result: The proportion of current alcohol users and tobacco users was 8% (10.8%-male and 4.7%-female) and 7.2% (11.7%-male and 2.1%-female) respectively. Fifty-seven percent students consumed fruits and vegetables less than five servings per day and 32.5% were physically active. Overall, 41%, 62.7%, 47.5%, and 48.2% had symptoms of depression, anxiety, insomnia, and internet addiction, respectively.

The stakeholders suggested strict implementation of tobacco and alcohol control regulations, subsidy on the price of fruits and vegetables, restricting junk foods, and establishment of parks and open spaces for promoting the physical activity to curb NCD risk factors. Similarly, interventions focusing on creating a safe space for sharing mental problems and ensuring the availability of mental health services at the community level was also sought.

Conclusion: This study found a considerable proportion of students with NCD risk factors and mental health problems. Policy makers and programmatic managers need to focus on both behavioral and environmental interventions for promoting physical and mental health of young people in Nepal.

Oral contraceptive use and breast cancer risk: A link beyond hormones

Sanne van Weers¹

¹Maastricht University Netherlands

Background: Breast cancer is a heterogeneous disease with distinct molecular signatures of disease aetiology, evidenced by the joint expression of molecular tumour markers. Differential effects of oral contraceptive (OC) use on breast cancer risk by molecular subtypes have been reported. This is the first meta-analysis to investigate the associations between OC use and subsequent breast cancer risk stratified by combined estrogen receptor (ER) and progesterone receptor (PR) status alongside the Luminal A and B subtypes, which additionally consider the human epidermal growth factor receptor 2 (HER2) status.

Methods: A systematic review and meta-analysis of case-control and cohort studies was conducted in PubMed and Web of Science. The odds ratios (ORs) were summarized using a random-effects model.

Results: Eleven studies were analysed. Random-effects meta-analyses revealed significant increasing effects for ever-users of OCs on ER-PR- breast cancer compared to never-users (OR = 1.30, 95% CI: 1.07 -1.56, p 4 years compared to never-users (OR = 1.74, 95% CI: 1.15-2.63, p 4 years is associated with an increased breast cancer risk, pertaining to the estrogen and progesterone double negative breast cancer subtype. Large-scale prospective observational studies comprising more comprehensive molecular signatures of breast cancer aetiology, including HER2 status, are needed.

DOI: 10.18332/popmed/164498

The use of mobile app survey data to examine compliance with occupational smoking bans: A case study of seven countries

Gabriela Gil¹, Louisa Johnson², Emmanuela Gakidou¹, Luisa Flor¹

¹Institute for Health Metrics and Evaluation (IHME) Institute for Health Metrics and Evaluation (IHME), University of Washington, Seattle, WA United States, ²Institute for Health Metrics and Evaluation (IHME)

Background and Objective: Secondhand smoke (SHS) endangers the health of individuals who do not smoke and poses a significant public health risk. Protecting individuals from SHS through smoking bans is a key tobacco control measure, but timely data on the degree of compliance is needed. We used a mobile app-based survey platform, Premise, to assess compliance with smoking bans in workplaces in Brazil, Indonesia, Mexico, the Philippines, South Africa, Turkey, and Venezuela. Methods: Data were collected through Premise between April and June 2022 for a minimum of 900 adult respondents meeting age and sex quotas. Countries represent diverse levels of tobacco control and smoking prevalence. In this descriptive analysis, we included only respondents who reported working outside their homes. Respondents were asked whether their workplace allowed smoking everywhere inside and how often and where they saw folks smoking at their workplace.

Results: Analysis samples ranged from 373 (South Africa) to 604 (Brazil). Respondents in Venezuela and South Africa reported the greatest proportion of workplaces with indoor smoking restrictions (97%), followed by Brazil, Mexico, and the Philippines (96%). 98% (Venezuela and South Africa) and 97% (Brazil) reported compliance with these restrictions. Reported compliance rates in Mexico and the Philippines were lower (94% and 96%, respectively). Indonesia (86%) and Turkey (93%) had the lowest rates of reported workplace indoor smoking bans, with compliance rates at 91% and 85%, respectively.

Conclusion: Our findings suggest that there are high levels of workplace smoking restrictions overall. However, even with high levels of tobacco control, lapses in compliance may still result in exposure to SHS in occupational settings, particularly in contexts with higher smoking prevalence. Despite the limitations of mobile app-based data collection, this study highlights the potential usefulness of such innovative approaches to capture real-time compliance to tobacco control measures in different contexts.

Public health and clinical utility of "dica" classification, " coda" score and fecal calprotectin in the management of patients with diverticular disease

Gabriella Nasi¹, Frank Lambert², Francesco Di Mario³, Tomas Poskus⁴, Matthias Reichert⁵, Jaroslaw Regula⁶, Stefanos Bonovas⁷, Martina Sapienza⁸, Giovanni Brandimarte⁹, Antonio Tursi¹⁰

¹Cristo Re Hospital - Rome Direction of Health Management Cristo Re Hospital - Rome Via delle Calasanziane 25 - 00167 Rome Italy, ²Department of Medicine II Saarland University Medical Center Homburg Germany,

³Gastroenterology Maggiore Hospital - Parma Italy, ⁴Institute of Clinical Medicine Vilnius University Hospital Vilnius Lithuania, ⁵Gastroenterology Medical Centre for Postgraduate Education Warsaw Poland,

⁶Gastroenterology Maria Skłodowska-Curie Memorial Cancer Centre Warsaw Poland, ⁷Department of Biomedical Sciences Humanitas University Rozzano Italy, ⁸Department of Life Sciences and Public Health Catholic University Rome Italy, ⁹Internal Medicine and Gastroenterology Cristo Re Hospital - Rome Italy, ¹⁰Territorial Gastroenterology Service ASL BAT - Andria Italy

Background and objective: The Diverticular Inflammation and Complication Assessment (DICA) classification and the Combined Overview on Diverticular Assessment (CODA) score are valuable prognostic tools for diverticulitis, providing new risk stratification tools useful for everyday clinical practice and also with a significant public health impact in terms of treatment effectiveness and decision making. Our aim was to assess the net benefit of management strategies based on DICA and CODA and to see whether fecal calprotectin (FC) can further aid improving risk stratification.

Methods: 871 participants with diverticular disease who underwent FC dosing were included in this international, multicentre, prospective cohort study. Survival methods for censored observations were used to estimate the 3-year risk of diverticulitis according to basal FC, DICA and CODA. The net benefit of management strategies based on DICA, CODA, and FC in addition to CODA, was assessed with decision curve analysis.

Results: FC was associated with the risk of diverticulitis at 3 years (HR per each base 10 logarithm increase: 3.29; 95% CI, 2.13-5.10) and showed moderate discrimination (c-statistic: 0.685; 0.614-0.756). DICA and CODA were more accurate predictors of diverticulitis than FC. However, FC showed high discrimination capacity to predict acute diverticulitis at 3 months, which was not maintained at longer follow-up times. A decision curve analysis, which incorporates the harms and benefits of using a prognostic model for clinical decisions, comparing the combination of FC and CODA with CODA alone did not clearly indicate a larger net benefit of one strategy over the other.

Conclusion: CF could be useful as a complementary tool to evaluate the early risk of diverticulitis in patients with long-standing diverticular disease in whom performing further colonoscopy is considered inconvenient or not feasible. In all other cases, management strategies based on the CODA score alone should be suggested.

Improving access and information with and for people with inflammatory bowel disease: co-design using the Ophelia (Optimising Health Literacy and Access) process

Melanie Hawkins¹, Wayne Massuger², Hailey Fisher², Christina Cheng¹, Sanne Elbrink¹, Ranjit Nadarajah¹, Leanne Raven², Richard Osborne¹

¹Swinburne University of Technology Australia, ²Crohn's & Colitis Australia

Background and objective: The quality of care and information for people living with inflammatory bowel disease (IBD) in Australia is inconsistent, often sub-optimal, and does not meet the prevailing Australian IBD Standards. Crohn's and Colitis Australia (CCA), using the Ophelia (Optimising Health Literacy and Access) process, aims to co-design improvements to the delivery of information, services and resources with and for people with IBD and their carers.

Methods: Vignettes were developed from interviews (n=17) and cluster analysis outcomes of health literacy data from surveys (n=868). Using the vignettes in participatory co-design (online workshops and an online activity) with consumers (n=38) and health professionals (n=38), the Ophelia process facilitated the generation of ideas to improve access to IBD information and services. These ideas were collated and coded into specific activities then prioritised for implementation.

Results: Ideas generation with consumers and health professionals led to 883 ideas that were collated and coded (removing duplicates and grouping similar ideas) to 70 ideas. Of these, 29 were deemed within the scope of this CCA project, with 11 ideas already part of daily CCA business and 30 ideas allocated to other CCA projects or to future projects. Grouping of the 29 ideas into prioritised activities for implementation resulted in 13 activities in 3 categories: 1) National leadership (n=2 activities); 2) Improvement of services and access (n=1 activity); and 3) Improvement of information, tools, and processes for consumers (n=10 activities).

Conclusion: The ideas for improvement were derived from data generated by the intended recipients of the project activities and were grouped and prioritised for implementation by CCA. The program of work will forge pathways for health literacy development for CCA, its members, and the wider IBD community.

Forecasting smoking deaths to 2050: a forecasting analysis for

the global burden of disease study

Dana Bryazka¹, Marissa Reitsma², Stein Vollset¹, Emmanuela Gakidou¹

¹Institute for Health Metrics and Evaluation United States, ²Stanford University United States

Background and objective: Smoking caused 8.96 million deaths in 2022 worldwide, representing the second largest modifiable risk factor. Although global smoking prevalence declined by 34.8% since 1990, it remains high in many countries. The objective of our study is to forecast cause-specific smoking attributable deaths, under reference and alternative scenarios.
