Methods: Our forecasts of cause-specific mortality to 2050 for 204 countries by age and sex are based on past trends in risk factors and other drivers of health from the Global Burden of Disease Study. Estimates of smoking attributable deaths use dose-response relative risk curves and continuous exposure distributions among both current and former smokers. In the reference scenario, we forecasted current and former smoking prevalence given past trends. To estimate avoidable deaths, we implemented a scenario eliminating smoking immediately. In this scenario, forecasted smoking attributable deaths are entirely due to past smoking exposure; the difference in deaths compared to the reference are deaths avoidable through tobacco control. Finally, we model an accelerated progress scenario that simulates linear elimination of smoking prevalence by 2050.

Results: If past trends persist, we estimate 12.2 million deaths due to smoking in 2050, with a cumulative 310 million deaths over the next 28 years. Of these, 162 million deaths are potentially avoidable. We estimate 84.0 million lives could be saved by 2050 with accelerated progress, 66.7% of which would be in lower- and middle-income countries. In this scenario, deaths due to cardiovascular disease and lung cancer will be reduced by 25.9% and 23.0%, respectively.

Conclusion: Smoking will continue to cause enormous health burden in the coming decade. Accelerated progress in tobacco control is necessary to maximize prevention of smoking deaths.

The effect of spirituality and health perception on screening behavior of people with and without a family history of cancer

Ali Özer¹, Pinar Soylar², Ali Özer¹

¹İnönü University Turkey, ²Firat university Turkey

Background: Family cancer history increases the chance of developing cancer and contributes to all other risk factors. Our research question was: Do health perceptions and spiritual beliefs affect the participation of individuals with and without first degree relatives (FDR) in cancer screening?

Methods: A cross-sectional study was conducted in Elazığ, Turkey with 150 individuals (75 individuals without a family history of cancer and 75 individuals with a family history of cancer). Demographic characteristics, cancer screening behaviours, spiritual wellbeing and health perception of participants were measured through survey in in Firat University Hospital. Univariate analysis (independent t-test/chi-square test) was applied first to identify the candidate independent variables. Then, multivariate logistic regression was used to examine the association between independent variables and participation in cancer screenings.

Results: People with cancer in FDR participated more cancer screening such as mammography and colonoscopy than those without FDR ($p=0.002$ and $p=0.001$, respectively). People with cancer in FDR participated have a better health perception of than without FDR ($p=0.001$). Women (OR, 3.694; 95% CI, 1.207-11.301; $p=0.022$), perceived health (OR, 1.480; 95% CI, 1.290-1.697; $p=0.001$), and spiritual beliefs (OR, 1.074; 95% CI, 1.028-1.122; $p=0.001$), were positively associated with the likelihood participating cancer screening.

Conclusions: Being a woman, spiritual beliefs and health perception are the main factors associated with screening participation. Future studies with large sample size are suggested to examine on cancer screening behaviours for Turkish at-risk populations due to family history.

DOI: 10.18332/popmed/164606

Prediabetes in Delaware: a snapshot and a wake-up call

Sangeeta Gupta¹

¹Delaware State University, Dover, United States

Background and Objective: Prediabetes implies blood glucose levels being higher than normal—but not high enough to be diagnosed as diabetes. 1 in 3 American adults have pre-diabetes and more than 8 in 10 of them are unaware of their condition. Prediabetes can lead to heart disease, stroke, and type 2 diabetes. If detected early, prediabetes can often be reversed. Without aggressive lifestyle changes, 15 percent to 30 percent of people with prediabetes will develop type

2 diabetes within five years. The Objective of this study was to investigate the sociodemographic, behavioral, and comorbid chronic conditions in Delaware adults diagnosed with prediabetes.

Methods: We used Delaware Behavioral Risk Factor Surveillance System (BRFSS) data from 2018 through 2021 ($N=17,180$). Descriptive statistics explored sociodemographic characteristics and comorbid chronic conditions in Delawareans with prediabetes. Data were weighted on the basis of Delaware population estimates accounting for the complex sampling BRFSS Methodology. **Results:** Overall, 10.5% (CI: 9.6–11.4) of Delaware adults reported prediabetes. Delawareans with prediabetes were more likely to be females; predominantly White; less educated, with low income, and less than 65 years of age. Prevalence of comorbid chronic conditions (angina, heart attack, stroke, arthritis, cancer chronic obstructive pulmonary disease and depression) was significantly higher as was the prevalence of obesity, tobacco smoking and lack of exercise among Delawareans with prediabetes. **Conclusions:** Results from this study puts a spotlight on a greater need for a rigorous diagnosis and screening for prediabetes in Delaware. Of great concern is the significantly higher prevalence of comorbid chronic conditions that can further complicate the management of prediabetes. This snapshot could serve as the driver of targeted public health programs to not only prevent but reverse prediabetes thus improving the overall health of Delawareans.

Road traffic injuries in the National Capital Region, Philippines (2011-2020)

Jonathan Guevarra¹

¹College of Public Health, University of the Philippines Manila, Manila, Philippines

Introduction: The burden of injuries due to road traffic is a major development and health issue in the Philippines, in general, and the National Capital Region (NCR), in particular. This current study is being conducted in order to describe the most recent trend (2011-2020) in road traffic injuries in the National Capital Region as well as to uncover information on why road traffic injuries continue to persist in spite of the fact that the national government has enacted statutes addressing road traffic injuries and road safety and crafted a national road safety plan

Objective: Describe the trend (2011-2020) and risk factors in road traffic injuries in the National Capital Region, Philippines

Methods: Using secondary data obtained from a government agency from 2011-2020, proportion of yearly road traffic injuries were calculated. Key informant interviews shed light on risk factors contributing to road traffic injuries in the Metropolitan Manila, Philippines.

Results: The Results show that Quezon City had the highest road traffic fatality followed by Manila for the period under consideration. Motorcycle road crashes consistently topped the number of cases for fatal and nonfatal road collisions closely followed by incidents involving cars. Risk factors identified were mainly related to road safety behaviors, road infrastructures, vehicle conditions.

Conclusions: The trend in road traffic injuries continues to increase in the National Capital Region in the last decade with the exception of the year 2020 when the COVID 19 pandemic began. Motorcycle is the type of motor vehicle that is most commonly involved in road traffic injuries in the National Capital Region. Human, vehicular, and tenvironmental factors were contributors to road traffic mortality in the study site. A comprehensive road safety program needs to be put in place in order to address road traffic injuries in the National Capital Region, Philippines.

Perceptions of barriers towards dental appointment keeping among patients of a tertiary care setting: a mixed method exploration

Vineetha Karuveettil¹

¹Department of Public Health Dentistry, Amrita School of Dentistry, Amrita Vishwa Vidyapeetham, Kochi, India

Background and objectives: Dental appointment keeping is an important aspect of patient care, influencing the effectiveness of health care delivery. Since this behavior is setting-specific, a gap in knowledge is observed on the barriers to appointment keeping in a dental tertiary care center. Therefore, a sequential mixed method study was adopted to explore the barriers governing dental appointment keeping among patients reporting to a tertiary care setting and to assess the prevalence of missed dental appointments in a tertiary care center. **Methodology:** Quantitative data recorded six months of retrospective data on missed appointments in the center. Prevalence was estimated in percentages, and

descriptive statistics were used to summarize data. The Chi-square test was used to determine the association between categorical variables. For the qualitative arm, focus group Discussions and in-depth interviews were conducted among dental health professionals and patients. Data were transcribed, and thematic content analysis was performed using NVivo software.

Results: The prevalence of missed appointments in the tertiary care center was reported to be 8.4%. Education was negatively correlated with missed appointment rates. Barriers identified for appointment keeping include personal/health issues, socioeconomic status, health system, communication, and accessibility barriers. Qualitative data revealed information on the appointment systems, experiences, consequences, responsible factors, management, and prevention of missed appointments in a tertiary care dental center. Conclusions: and recommendations: Multiple barriers to dental appointment keeping in the tertiary care center are identified. Missed appointments are prevalent in the study setting, as dental treatments require multiple sittings to complete. Tailor-made interventions are suggested for tertiary care settings to manage and prevent missed appointments, thereby paving the way for successful health care delivery.

How does sugar-sweetened beverages consumption impact health costs in Brazil?

Mariana Menezes¹, Joice Leal², Aline Vegi³, Adriana Meireles³, Ísis Machado³

¹Universidade Federal e Ouro Preto (UFOP), Ouro Preto, Minas Gerais, Brazil, ²Universidade Federal de Ouro Preto (UFOP), Ouro Preto, Brazil,

³Universidade Federal e Ouro Preto (UFOP), Ouro Preto, Brazil

Background and Objective: Scientific evidence suggests a relationship between regular consumption of sugar-sweetened beverages (SSB) and the increased prevalence of type 2 diabetes mellitus (DM2) and ischemic heart disease (IHD). Although this association has been well reported in the scientific literature, there are few studies that estimate the impact of this risk factor on the costs of health services, which subsidize the treatment of these diseases. Thus, this study Aims to estimate the financial costs for the treatment of DM2 e IHD attributed to the consumption of SSB in the Brazilian Unified Health System (SUS) in 2019. Methods: This is a descriptive ecological study using secondary and public domain data. The costs of DM2 e IHD attributable to the consumption of SSBs were estimated from the Population Attributable Fraction (PAF), extracted from the Global Burden of Disease (GBD) 2019 study, whose parameters are the prevalence estimates of SSB consumption in the population, the relative risks related to the risk-outcome pairs, and the minimum risk exposure level. The FAP was multiplied to the total spent for treatment of DM2 and IHD in secondary and tertiary health care according to the Brazilian ambulatory and hospital healthcare information systems. The analysis were stratified by sex, age groups.

Results: In 2019, in Brazil, the treatment of attributed to the consumption of sugar-sweetened beverages costed US\$14,116,240.55. These costs were higher in males (US\$8,469,265.14) compared to females (US\$5,646,975.42) and greater for older age groups (over 60 years). Conclusions: This study revealed the high economic impact of high and medium complexity treatment of DM2 e IHD attributed to the consumption of SSBs in Brazil. The results demonstrated the urgency and the need for the expansion of public policies to reduce the consumption of SSBs in Brazil.

DOI: 10.18332/popmed/164892

Prevalence and associated clinical factors of GERD (Gastro-esophageal Reflux Disease) in Filipino hemodialysis patients: a cross sectional study

Kento Takahashi¹

¹Philippine College of Physicians, Tarlac City, Philippines

Objectives: This study aimed to determine the prevalence of GERD in Filipino patients on maintenance hemodialysis (HD) and to investigate demographic, clinical, and renal profiles of HD patients with and without GERD. Methods: This was a cross-sectional, multicenter study using a validated GERDQ questionnaire with a Filipino translation. Patients above 18 years-old undergoing hemodialysis as outpatients were included. A GERDQ score of ≥ 8 was regarded having GERD. Logistic regression analysis was conducted using variables which exhibited a significant correlation coefficient on two group comparison as factors, with the presence or absence of GERD as the dependent variable.

Results: Included in our analysis are 264 patients, from which 36 had GERDQ score of ≥ 8 (13.64% 95%CI 9.98-18.35). Factors associated with having score of ≥ 8 includes the following: (1) having CHD (COR 4.041, 95%CI 1.89-8.64, $p < 0.001$), (2) being on insulin (COR 2.599, 95%CI 1.25-5.42, $p = 0.011$), (3) anemia (COR 4.508, 95%CI 1.91-10.64, $p = 0.001$) (4) diagnosis of both HTN and DKD (COR 3.853,

95%CI 1.15-12.96, $p = 0.029$), (5) previous diagnosis of GERD (COR 6.655, 95%CI 3.18-13.91, $p < 0.001$), (6) previous intake of antacids (COR 2.622, 95%CI 1.17-5.89, $p = 0.020$), (7) those employed (COR 2.332, 95%CI 1.15-4.75, $p = 0.020$) (8) alcohol consumption (COR 2.477, 95%CI 1.23-5.01, $p = 0.012$), and (9) smoking (COR 2.405, 95%CI 1.19-4.86, $p = 0.014$). Conclusions: The prevalence of GERD in Filipino HD patients from three centers in Tarlac City is 13.64% and may be associated with several clinical factors such as heart disease, insulin use, anemia, hypertensive and diabetic kidney disease, previous diagnosis of GERD, use of antacids, with employment, smoking, and alcohol use. A comprehensive understanding of relationship between these clinical factors awaits further studies in a larger number of patients. Keywords: prevalence, GERD, GERDQ, Filipino, Chronic Kidney Disease, hemodialysis

Prevalence and associated factors of hypertension among women in Southern Ghana: evidence from 2014 GDHS

Ahlem Silini¹, Salsabil Rejaibi^{1,2,3}, Majdi Zid¹, Sarra Ben Youssef¹, Nada Zoghalmi¹, Rym Mallekh¹, Ibrahim Ben Slema¹, Nabil Ben Salah^{3,4}, Hajer Aounallah-Skhiri^{1,2,3}

¹National Institute of Health, Epidemiology Department, Tunisia, ²SURVEN, Research Laboratory, Nutrition Surveillance and Epidemiology, Tunisia,

³Medical Faculty of Medicine Tunis El Manar University, Tunisia, ⁴Intensive Care Unit department, Center for Urgent Medical Assistance, Tunis, Tunisia

Background and Objective: Hypertension, coupled with prehypertension and other hazards such as high blood pressure, is responsible for 8.5 million death from stroke, ischemic heart disease, other vascular diseases and renal diseases worldwide. Hypertension is the fifth commonest cause of outpatient morbidity in Ghana. Some evidence has illustrated geographical variation in hypertension and it seems to have a heavy toll on women in southern Ghana compared to the north. This study seeks to determine the prevalence and associated factors of hypertension among women in southern Ghana using the most recent demographic and health survey (DHS) data set. Materials and Methods: This study used data of 5662 women from the current DHS data from Ghana that was conducted in 2014. Data were extracted from the women's file of the 2014 Ghana DHS. The outcome variable of this current study was hypertension and it was measured by blood pressure, according to guidelines of the Joint National Committee Seven (JNC7). Multivariable binary logistic regression analyses were performed to establish the factors associated with hypertension at the individual and community levels. Results: Prevalence of hypertension among women in southern Ghana was 16%. Women aged 40–44 years (aOR=8.04, CI=4.88–13.25) and 45–49 years (aOR=13.20, CI=7.96–21.89) had the highest odds of hypertension relative to women aged 15–19 years. Women with two births (aOR=1.45, CI=1.01–2.07) and those with three births (aOR=1.47, CI=1.01–2.15) had a higher likelihood of being hypertensive. Greater Accra women had higher odds (aOR=1.35, CI=1.02–1.79) of being hypertensive relative to the reference category, women from the Western region. Conclusions: This study has revealed the prevalence of hypertension among women in southern Ghana. The associated factors include age, parity, region, and occupation.

The feasibility of applying individual patient data to assess inequity in cancer treatment retention in Northern Ghana - early results

Chloe Tuck¹, Abubakari Baba², Richard Cooper¹, Laura Gray¹, Robert Akparibo¹, Richmond Aryeetey³, Abdul Timoni⁴, Tampuri Rahman⁴

¹School of Health and Related Research, University of Sheffield, United Kingdom, ²Ghana Regional Health Directorate, Ghana, ³School of Public Health, University of Ghana, Ghana, ⁴Tamale Teaching Hospital, Ghana

Background: Cancer poses an increasing burden in the Africa, associated with an epidemiological transition. Despite the high contribution of preventable cancers, survival rates are low, reflecting limitations in screening, diagnosis, resources and treatment access. One reason for poor cancer outcomes in the Ghana is poor engagement with treatment. We previously conducted a critical interpretive synthesis of literature on access to cancer treatment in Ghana and found barriers across the social ecological system (Tuck et al., BMJ Open 2022). However, there was a gap in understanding what influenced treatment completion in the northern region. Objectives: 1. To assess the feasibility of using digital patient records to assess cancer treatment completion in Northern Ghana. 2. To apply the data to understand social, economic and demographic characteristics influencing completion of cancer treatment.

Methods: Secondary data analysis of routinely collected cancer treatment data, retrieved from the cancer registry of the Oncology Department of Tamale Teaching Hospital (TTH) (the largest referral hospital in the northern Ghana) will be undertaken. Variables required to perform analysis to address the study objectives include outcome variables: completion of chemotherapy and radiotherapy and explanatory variable: demographics and social economic status. These variables are currently being extracted from anonymised medical records of patients with cancer. Data will be cleaned and sorted in R. Descriptive analysis will estimate the proportions of patients completing chemotherapy and radiotherapy and logit regression conducted to identify characteristics associated with incompleteness. Finally, the feasibility of applying multi-level modelling approaches for the intersectionality of social characteristics will be assessed.

Results: The results will be presented as summary statistics for the single level and multiple level logit regression models to assess the discriminatory accuracy and intersectionality of characteristics on treatment completion.

Conclusions: The key findings and feasibility of using the clinical dataset in future equity research will be discussed.

Prevalence, awareness, treatment and control of diabetes among Iranian population: results of the national cross-sectional STEPwise approach to surveillance survey

Zhaleh Abdi¹

¹National Institute of Health Research, Tehran University of Medical Sciences, Tehran, Iran

Background: Diabetes as a leading cause of death imposes a heavy burden on health systems worldwide. This study investigated the prevalence, awareness, treatment and control of diabetes among Iranian population aged 25 to 65 years at the national level in 2021. **Methods:** Secondary data analysis was performed using data from a national population-based survey, STEPwise approach to surveillance (STEPS) for non-communicable diseases performed in across the country in both rural and urban areas. The survey had a sample size of 27874 individuals and performed by Iran's National Institute of Health Research (NIHR). Data were analyzed using descriptive statistics and a logistic regression model with odds ratio at a significance level ≤ 0.05 . Logistic regression was used to identify socio-demographic factors (i.e. gender, age, place of residence, wealth quintile and having health insurance) associated with the levels of diabetes mellitus control. **Results:** The prevalence of diabetes was 14.2% among people with diabetes, 73.2% were aware of their condition and 68.1% were treated for this condition. Almost 27.4% of all diabetic patients had adequate glycemic control. In the multivariable logistic regression analysis, there was a significant relationship between female gender, older age, and living in urban areas with controlled diabetes ($p < 0.001$). **Conclusions:** The prevalence of diabetes in Iran has increased over recent years, which is currently higher than the estimated prevalence of raised blood glucose worldwide. Despite the great awareness of the disease, receiving treatment and effective control of the disease are suboptimal. While several national policies to improve diabetes screening and care have been passed in recent years, it seems large gaps remain in disease detection and treatment. It is suggested that more attention be paid to the treatment and control of diabetes by NCDs national policies to prevent the growing burden associated with the disease.

DOI: 10.18332/popmed/165042

Multilingual campaign encourages smoking cessation in Arabic.

Anette Jansson¹

¹Swedish Heart Lung Foundation, Stockholm, Sweden

Background and objectives: The COVID Pandemic had caused concern among many smokers after reports that smoking may be a risk factor for more severe disease with covid-19. To reach the general health benefits of smoking cessation, Sluta-Röka-Linjen (Quit smoking telephone line) and the Swedish Heart Lung foundation developed a joint campaign in Arabic. Statistics from the Public Health Authority show that foreign-born Swedes are over-represented among those infected by the coronavirus. Smoking is also more common among foreign-born, especially men.

Methods: The campaign reaches out to those who wanted to quit, both during and after the pandemic. Smoking contributes to unequal health. The campaign, which had by the name "Smoking cessation improves your health directly", highlighted the positive health benefits a smoking cessation entail. The campaign was run in social media such as Facebook, Instagram and Alkompis.se from May to September 2020. The message was focused on improvements a smoking cessation makes in the short and long term.

Results: The campaign has had a major effect on the number of new clients on the Stop Smoking line, especially in the Arabic-speaking. The Arabic-speaking clients increased by 1486. Compared with the same period last year, this is an increase of 754 percent. **Conclusions:** There seems to be a great potential to reach and a great willingness among the Arabic-speaking population to get help by telephone to quit smoking.

DOI: 10.18332/popmed/165069

Content and quality of clinical practice guidelines for managing type 2 diabetes in India: a systematic review

Kaushik Chattopadhyay¹, Oluwasegun Olujide¹, Mariama Olujide², Jo Leonardi-Bee¹

¹University of Nottingham, United Kingdom, ²Waziri Shehu Gidado General Hospital, Nigeria

Background and Objective: Over the last few decades, India has witnessed an increase in the number of people with type 2 diabetes mellitus (T2DM). Consequently, several clinical practice guidelines (CPGs) have been developed to assist Western and traditional Indian medicine practitioners in managing this disease. This systematic review aimed to evaluate and synthesise the content and quality of these CPGs.

Methods: Several databases and sources were searched from inception to 20th May 2022, to identify CPGs for managing adults with T2DM in India. The screening of titles and abstracts and full texts, data extraction and quality assessment were conducted by two independent reviewers. Any disagreements were resolved through discussion or by involving a third reviewer. A data extraction tool from a previous study was adapted to extract the content of the included CPGs, and the Appraisal of Guidelines for Research and Evaluation II (AGREE II) tool was used to assess the quality of the included CPGs. A narrative synthesis was conducted. **Results:** Of 3350 records identified, 11 were retrieved for full-text screening and five CPGs were included in this systematic review - three focused on traditional Indian medicine (Ayurveda) and two focused on Western medicine. These two Western medicine CPGs contained comprehensive recommendations for managing T2DM but only one of these, the Research Society for the Study of Diabetes in India/Endocrine Society of India (RSSDI/ESI) CPG, was of high quality.

Conclusions: Only one CPG can be recommended for managing T2DM by Western medicine practitioners in India. Future CPGs, especially for traditional Indian medicine practitioners, should be developed and updated using the standard CPG manuals and quality appraisal tools.

Assessment of the Israeli healthcare system's functionality among Ultra-Orthodox Jews and Non-Ultra-Orthodox Jews

Anat Romem¹, Ronit Pinchas-Mizrachi², Beth Zalcman¹, Zvika Orr¹

¹Jerusalem College of Technology, Israel, ²Global Public Health Department, Jerusalem College of Technology, Israel

Background: Ultra-Orthodox Jews constitute approximately 13% of the Israeli population. A previous study based on the 2017 Central Bureau of Statistics (CBS) Social Survey found a lower level of trust in the Israeli healthcare system among ultra-Orthodox Jews compared to non-ultra-Orthodox Jews. During the COVID-19 pandemic, compliance rates with health regulations were relatively low among ultra-Orthodox Jews; numerous interventions were introduced to increase compliance. This study aimed to evaluate ultra-Orthodox Jews' and non-ultra-Orthodox Jews' assessment of the Israeli healthcare system's functionality based on data from the 2021 Social Survey.

Methods: Data collected from the 2021 CBS Social Survey examined the associations between sociodemographic variables and assessment of the healthcare system's functionality.

Results: 5995 Israeli Jews participated in the study, of which 81% were non-ultra-Orthodox Jews and 9% were ultra-Orthodox Jews. Associations between age, income, education, religious level, self-reported health status, feelings of discrimination in the previous year, and trust in the healthcare system and assessment of healthcare system functionality were found. 16.2% of non-ultra-Orthodox Jews and 27.4% of ultra-Orthodox Jews gave high scores to the functionality of the healthcare system. Multivariate regression showed higher scores of functionality among ultra-Orthodox Jews compared to non-ultra-Orthodox Jews (OR=1.89, 95%CI=1.87,1.91), even after adjusting for sex, age, income, education, self-reported health status, use of healthcare services, trust in the healthcare system, and feelings of discrimination in the previous year. Differences were found between the groups in relation to the position of the sociodemographic variables in predicting higher assessment of healthcare

system functionality.

Conclusions: Further research is required to investigate the changes that occurred in the level of trust in the healthcare system among different groups following the pandemic. These must also account for population-based interventions introduced by the healthcare system.

Assessment of women's autonomy towards oral care utilization and its association with cognizance, attitude, and oral hygiene practices in Sri Ganganagar, India

Manu Batra¹

¹Surendera Dental College & Research Institute, India

Background and Objective: Oral health, though an integral part of general health, yet it is accorded low priority and remains an issue of neglect. Gender disparity in Oral health-seeking behaviour and utilization of dental services have been observed, therefore understanding factors affecting among females is necessary. Women's autonomy which suggests the power to alter one's fate and environment, among other things may have a role in their dental health-care utilization in India. The objective of the study was to assess women's autonomy towards oral care utilization and its association with cognizance, attitude, and oral hygiene practices in Sri Ganganagar, India.

Methods: A cross-sectional study was conducted among 387 women aged 18 years or older who in Sri Ganganagar city, Rajasthan. Structured, pre-validated, and interviewer-guided questionnaires were used to assess women's autonomy, knowledge, attitude, oral hygiene practices, and dental care service utilization. Descriptive and inferential statistics were carried out.

Results: Out of total, 58.4 % of the women reported high level of autonomy, with more of urban than rural women. Out of these, 57.2% had high decision-making power at the household level and 51.4% had a high financial control and regular access to money. Women with a high level of autonomy had more cognizance, a more positive attitude, and better dental hygiene habits. Findings of logistic regression analysis revealed that women with high autonomy were 1.89 times more likely to utilize oral health services, whereas women with high knowledge were 1.17 times more likely and women with a positive attitude were 1.76 times more likely than those with a negative attitude to use oral health services.

Conclusions: Women's autonomy was found to influence along with knowledge, attitude, and oral hygiene practices the oral health-care service utilization.

Hysterectomy and thyroid cancer risk: a systematic review and meta-analysis

Irene Giacchetta¹, Roberto Fabiani², Patrizia Rosignoli², Manuela Chiavarini³

¹School of Specialization in Hygiene and Preventive Medicine, University of Perugia, Perugia, Italy, ²Department of Chemistry, Biology and Biotechnology, University of Perugia, Perugia, Italy, ³Department of Medicine and Surgery, University of Perugia, Perugia, Italy

Background: Incidence rates of thyroid cancer have increased considerably during the last two decades. Recent studies findings suggest that women who underwent a hysterectomy have an elevated relative risk of thyroid cancer. The aim of our review and meta-analysis is to summarize the evidence about the association between hysterectomy with or without oophorectomy and thyroid cancer risk.

Methods: PubMed, Web of Science, and Scopus database were searched for studies published up to May 2022. The PRISMA statement and MOOSE guidelines were followed. Data derived from selected studies were pooled using a random effects model. Heterogeneity was explored with chi-square-based Cochran's Q statistic and the I² statistic. Publication bias was assessed with Begg's and Egger's tests.

Results: Sixteen studies met the eligibility criteria. The pooled analysis showed a significantly 64% increment of thyroid cancer risk in association with any hysterectomy (OR 1.64, 95% CI 1.48–1.81; I² = 28.68%, p = 0.156). Hysterectomy without oophorectomy was a stronger predictor of risk than hysterectomy with oophorectomy. The pooled analysis of data regarding hysterectomy without oophorectomy showed a statistically significant increment of thyroid cancer risk by 59% (OR 1.59, 95% CI 1.43–1.77; I² = 31.32%, p = 0.178). Hysterectomy with oophorectomy was associated with an increase of thyroid cancer risk of 39% (OR 1.39, 95% CI 1.16–1.67; I² = 42.10%, p = 0.049). Significant publication bias was not detected.

Conclusions: Our findings might help with decision making around these surgeries. Additional research is needed to elucidate the biological mechanisms underlying this association.

Effectiveness and safety of self-management interventions among adults with type 2 diabetes mellitus in sub-Saharan Africa: a systematic review and meta-analysis

Naomi Carter¹, Gamze Nalbant¹, Prit Chahal², Kaushik Chattopadhyay¹

¹Lifespan and Population Health, School of Medicine, University of Nottingham, United Kingdom, ²Health Education East Midlands, United Kingdom

Background and Objective: There has been a rapid increase in the prevalence of type 2 diabetes (T2DM) in sub-Saharan Africa (SSA). Association with lifestyle factors make self-management strategies an integral part of managing T2DM, and these must be tailored to context. Several randomised controlled trials (RCTs) evaluating T2DM self-management interventions in SSA have been conducted. This systematic review therefore aimed to assess and synthesize evidence on the effectiveness and safety of self-management interventions among adults with T2DM in SSA.

Methods: The JBI systematic review methodology was followed. Several databases were searched for published and unpublished RCTs until 31st May 2021. The screening of titles and abstracts and full texts, data extraction and critical appraisal were conducted by two independent reviewers. Disagreements were resolved through Discussion or with a third reviewer. Data synthesis was conducted using narrative synthesis, followed by meta-analysis where feasible.

Results: Out of 1452 records identified, 16 and 12 studies were included in the systematic review and meta-analysis, respectively. Only 4 studies were assigned a 'yes' for more than half of the criteria in the standardised JBI critical appraisal tool for RCTs. Compared to usual care, self-management interventions did not reduce glycated haemoglobin (HbA1c) at 3 months. HbA1c was reduced at 6 months (490 participants, mean difference -6.45mmol/mol, 95% confidence intervals -9.98, -2.92), but not at 12 months. Three studies assessed health-related quality of life and one demonstrated an improvement (2762 participants). Three studies specifically reported no adverse events in relation to the trial interventions (1230 participants), whilst in the remainder this was not reported.

Conclusions: Self-management interventions for adults with T2DM in SSA appear to produce a clinically significant improvement in glycaemic control in the medium-term. Given the limitations of the available evidence and to strengthen the evidence base, high-quality RCTs should be conducted and reported.

Dental care during the COVID-19 pandemic at the São Gonçalo Unit of the Social Service of Commerce, Rio de Janeiro (Sesc-RJ)

Patrícia Neves¹, Leila Franca¹, Lígia Bragança¹, Cláudia Coscarelli¹

¹Social Service of Commerce, Rio de Janeiro, Brazil

Background and Objective: The pandemic caused by the new coronavirus was decreed by the World Health Organization (WHO) on March 11, 2020. The Ministry of Health recommended maintaining only emergency dental care. In October 2020, a new ordinance guided the resumption of elective care. Dentistry at Sesc - RJ resumed services at the São Gonçalo Unit in July 2021. To report the experience of adapting the environment and training the oral health team at Sesc São Gonçalo - RJ, to carry out care safely for patients and professionals.

Methods: Biosafety training courses were held for the team and specific protocols were established for assistance during the pandemic.

Results: The care protocols were modified and, consequently, the number of patients was reduced. We have incorporated into our routine the measurement of the temperature of the team and patients, hand disinfection and the placement of a sanitizing mat at the entrance to the clinic. In addition to the PPE (personal protective equipment) already in use, such as a disposable cap, safety goggles, fabric lab coat and special shoes, we now use face shields, PFF2 or N95 masks, disposable lab coats and shoe covers, in the offices, the air conditioning remained off and the windows half-open. After the consultations, the surfaces were cleaned with quaternary ammonia.

Conclusions: Biosafety training and protocols established during the COVID-19 pandemic contributed to the safe resumption of care. Some changes proved to be positive and were maintained, such as extending the duration of consultations (which before the pandemic were 30 minutes, now to 1 hour) and the use of the N95 mask and face shield.

Consumption of energy drinks among Italian university students: a

Cross-sectional multicenter study

Francesca Gallè¹

¹University of Naples Parthenope, Italy

Background and Objective: Energy drinks (EDs) use is very popular, especially among youths. They usually contain caffeine, sugar, various additives and legal stimulants which can cause adverse effects. The aim of the study was to evaluate the prevalence of caffeinated EDs' consumption in a large sample of Italian undergraduates and its association with some of lifestyle-related risk factors. **Methods:** Students attending twelve public Italian universities were involved. Information on socio-demographic characteristics, EDs use and on health-related behaviors of participants were collected by the use of a web-based questionnaire. **Results:** A total of 2,165 students (median age 22, 69.6% F) participated to the study and 15.2% of them reported the use of caffeinated EDs in the last six months. ED users showed a higher proportion of males (47.4 vs 27.4, $p<0.001$) and a higher father's educational level (36.2 vs 27.0 graduated, $p=0.003$), came mainly from Northern universities (56.2 vs 46.3, $p=0.004$) and from degree courses in the life sciences area (76.9 vs 74.7, $p<0.001$), and lived in the university area. Besides, ED users reported higher median Body Mass Index values (22.1 vs 21.5, $p=0.003$), less particular dietary regimens (58.7% vs 59.6%), higher levels of weekly moderate-vigorous physical activity (180 vs 120 min/week, $p<0.001$) and participation in sport (52.6 vs 50.4, $p<0.001$) and in team sports (25.7 vs 16.7, $p=0.003$), and higher proportion of smokers (43.5 vs 30.1, $p<0.001$) and alcohol drinkers (90.2 vs 84.0, $p=0.005$). In the regression analysis male gender, diet, geographical area, tobacco smoke and type of sport were found to be associated with ED consumption. **Conclusions:** These findings highlight the need for increasing the awareness about the negative consequences of an excessive use of EDs among university students', especially in the most interested subgroups.

Combined association between physical inactivity and non-white skin color exacerbates the chance of diabetes during the COVID-19 pandemic: a population-based study in Brazil

Adriana Meireles¹, Samara Moura², Luiz Menezes-Júnior³, Júlia Carraro¹, George Machado-Coelho², Aline Batista², Ana Sampaio²

¹Department of Clinical and Social Nutrition, Federal University of Ouro Preto, Brazil, ²Federal University of Ouro Preto, Brazil, ³Graduate Program in Health and Nutrition, Federal University of Ouro Preto, Brazil

Introduction: The covid-19 pandemic has drastically impacted the daily lives of the population and changes in lifestyle patterns, such as reduced physical activity (PA). These new patterns may lead to changes in glycated hemoglobin (HbA1c) levels. Further, a racial-ethnic disparity of the pandemic's impacts is perceived, both with overall health care along with limited opportunities to be physically active. We assessed the association between HbA1c and physical inactivity (PI), stratified by skin color during social restriction. **Methods:** A population-based household seroepidemiological survey was conducted in two Brazilian cities. A face-to-face interview was conducted using a structured questionnaire in electronic format; sociodemographic questions, lifestyle habits, and health conditions were assessed. Blood draws were conducted to evaluate HbA1c levels. The practice of PA during leisure time was assessed categorically (active and inactive), according to the recommendations of the WHO. HbA1c was categorized into normal ($\leq 6.4\%$) and diabetes mellitus ($\geq 6.5\%$). The skin color was self-reported (white; non-white). The association between PI and HbA1c was performed by multivariate logistic regression stratified by skin color, and adjusted for age, sex, income and presence of comorbidities. The p values <0.05 were considered significant. **Results:** 1685 individuals were analyzed, being the majority female (52.4%) and aged between 35-59 years (45.8%). About 73.9% of the study population was non-white, 69.1% had education less than 9 years and 41.2% of individuals had monthly income ≤ 2 minimum wages. In addition, during leisure time, 69.7% were physically inactive, 9.3% had diabetes mellitus. When performing the combined analysis between these two factors, we found that inactive and non-white individuals were 4.03 times more likely to be diabetic (OR=4.03; 95% CI: 1.57-10.2). **Conclusions:** In a combined analysis, non-white individuals and PI during social restriction were associated with altered HbA1c levels when compared to physically active white individuals.

Body Mass Index and physical activity habits: an observational study on modifiable risk factors for Noncommunicable diseases on students and employees of the University of L'Aquila

Annalucia Moretti¹, Mario Muselli², Giada Mastrangeli², Giulia Battista²,

Francesca Galassi², Leila Fabiani²

¹Department of Life, Health and Environmental Sciences, University of L'Aquila, Italy, ²Department of Life, Health and Environmental Sciences, University of L'Aquila, L'Aquila, Italy

Background and Objective: Noncommunicable diseases (NCDs) are responsible for 74% of all deaths globally. These statistics will worsen in the next years for many reasons, including an increase in physical inactivity and a rise in overweight and obesity. Promotion of healthy lifestyles and prevention are powerful valuable tools to face chronic diseases. They can significantly reduce the risk of developing NCDs by adopting healthy habits, such as a healthy diet and regular physical activity. **Methods:** We selected a sample of 290 employees and 374 students at the University of L'Aquila who were examined for professional risks at the occupational medicine clinic. Data collected included age, sex, regular physical activity (Yes/No), and Body Mass Index (BMI). BMI was categorized into 4 groups: underweight (<18.5), normal weight (18.5-24.9), overweight (25-29.9), and obesity (>29.9).

Results: The average age was 25.0 years for students (male: female ratio 1:1) and 54.6 years for employees (male: female 2:1). In both categories the percentage of those who claimed to perform regular physical activity was similar (students: 63.5%, employees: 60.2%); males did more physical activity than females (68.3% vs 56.9%, $p=0.003$). 15.0% of students and 42.6% of employees were overweight/obese, and there was a significant difference in the categories of BMI regarding age ($p<0.0001$). In the whole sample, obesity prevalence was 4.4% in those claiming to perform regular physical activity, and 7.9% in those claiming not to perform regular physical activity ($p<0.0001$). Moreover, males were more often overweight/obese (40.4%) than females (17.7%) ($p<0.0001$). According to multinomial logistic regression, being male and older exposes to a greater risk of higher BMI. **Conclusions:** Promoting healthy lifestyles needs to cover all the modifiable behavioural risk factors to act effectively on intermediate risk factors, such as being overweight, for NCDs. Physicians should use all medical examinations to give education on healthy lifestyles.

Availability of B-type natriuretic peptide testing in Brazilian public health system

Ione Oliveira¹, Andressa Braga², Marisa Santos³, Bernardo Tura³

¹Novartis Biociencias, Brazil, ²Núcleo de Avaliação de Tecnologias em Saúde do Instituto Nacional de Cardiologia, Brazil, ³Núcleo de Avaliação de Tecnologias em Saúde do Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil

Background and Objective: Early detection of heart failure allows an evaluation of risk factors and adequate pharmacotherapy in order to postpone or reversing cardiac remodeling. The diagnosis of heart failure can be supported by B-type Natriuretic Peptide measures (BNP or NTproBNP). These test should be performed before the patient can have free access to sacubitril valsartan. Despite the important role in diagnosis of heart failure and access to specific treatment, a small number of tests were recorded in Brazil between 2020 and 2021. This study aims to assess the availability of B-type Natriuretic Peptide testing in primary health care in Brazil.

Methods: A cross-sectional study utilizing a telephone survey with 255 health departments among the 2849 counties available with primary health care units of medium complexity. Three telephone contact attempts were conducted with each municipality on alternating days, throughout the months of June and July 2022. After the unsuccessful attempts, the next county selected in the same region was contacted, and so on, until the necessary number of municipalities was attained. **Results:** The availability to perform these exams were recorded at 20.78% (53/255) of the municipalities and only 16.86% (43/255) the testing was carried out inside the county. These exams were unavailable in 78.03% (199/255).

Conclusions: there are more municipalities without access to the test than those who have perform it (16,86% (43/255) x 4,63% (132/2849)). It suggests that this exam is not solicited by physicians despite being offered in some counties. which could indicate that these professionals are unaware of its availability or about the Heart Failure diagnostic flow in Primary Care. The inability to perform these exams limits and delays Heart Failure's diagnosis and proper care. Furthermore, it increases inequities of the Brazilian Health System, posing questions concerning the plan for conditional drug reimbursement based on test results.

Sinonasal intestinal type adenocarcinoma: increased incidence in Portuguese woodworkers

Lara Guedes¹, Francisco Marques², Clara Mota², Roberto Estêvão², Nuno Lousan²

¹Public Health Resident at Baixo Tâmega Public Health Unit, Portugal,

²Tâmega e Sousa Hospital Center, Portugal

Background and Objective: Sinonasal carcinomas are rare, having an estimated world incidence of 0.5-1/100.000 individuals per year. Intestinal type adenocarcinoma (ITAC) account for 6-13% of these, but its incidence is around 1000 times higher among woodworkers, being recognized as an occupational disease. Our hospital serves a population of approximately 550.000 individuals, many of which are woodworkers. We aim to estimate the incidence of sinonasal ITAC in our area and to characterize the affected population.

Methods: We did a retrospective cohort study of all the patients diagnosed with sinonasal ITAC, in the otorhinolaryngology department of a Portuguese tertiary level hospital, between January 2018 and December 2022, and performed a descriptive analysis.

Results: In 5 years, 27 cases were diagnosed, 25 (93%) of which were or had been woodworkers. The median of ages was 64 years and 26 (96%) were men. In one of the two patients not exposed in the workplace, we could not find any link to wood dust, the other one had an husband that had a woodshop in their home. Nasal obstruction was the main cause of admission. The mean time between the first symptom and the diagnosis was 6 months, with 11 (41%) patients in stage T4.

Conclusions: Based on the global incidence of sinonasal ITAC, our hospital should have less than 1 case per year. However, in 5 years we diagnosed 27 patients, most of which in advanced stage (T3 or T4). With that in mind, we are planning a collaborative public health intervention in the most affected cities and wood companies to build community resilience through health promotion, empowerment and literacy.

Factors associated with muscle pain in university students during the online class period

Alberto Barrios¹, Melissa Fernandez², Irving Jarvio¹, Josue Villegas-Dominguez¹

¹Universidad Veracruzana, Mexico, ²Mexico

Background: During the COVID-19 pandemic, the world found it necessary to adapt its activities to reduce the risk of contagion, so many schools took their classes online, having the freedom to choose their position and place to take the classes. **Objective:** To determine the factors associated with musculoskeletal pain in university students during the online class stage.

Methods: a cross-sectional, prospective, observational, analytical study was carried out. University students from Veracruz, Mexico, between the ages of 18 and 35, who were in online classes, were included. Those who did not agree to participate were excluded. The main variables were the place where you take the class, the hours you spend sitting per day, the physical activity you practice, the presence of muscle pain and its characteristics.

Results: 1284 students from the main universities of the place participated, 60% indicated having some muscle pain, mainly in the lower back (47%) and neck (46.8%); 37% of the students with pain tried to correct their posture, 15.3% went to the doctor and 47.7% tried to solve the pain in an alternative way. The factors associated (OR/CI95%) with the prevention of muscle pain were being male (0.5/0.4-0.6), not working in addition to school (0.7/0.6-0.9), taking classes in a chair with a backrest in front of a table (0.7/0.5-0.9), spending a maximum of 5 to 6 hours sitting (0.7/0.5-0.9), while the risk factors for pain are taking classes sitting in bed (1.5/1.05-2.1), sitting 7 hours or more (1.4/1.1-1.8) and not doing physical activity (1.5/1.2-1.9).

Conclusions: Posture, physical activity and sitting hours are determining factors for presenting muscle pain, so education towards university students on postural hygiene and protective factors for pain should be taken into account, in order to reduce the prevalence of this pathology in similar academic situations.

Polychlorinated biphenyls in meat products and its effects on human health

Gholamreza Khaniki^{1,2}, Nabi Shariatifar¹, Parisa Sadighara³, Maral Neyestani¹, Mahla Bayat¹, Masoomeh Chooapan⁴

¹Division of Food Safety and Hygiene, Department of Environmental Health Engineering, School of Public Health, Tehran University of Medical Sciences, Tehran, Iran, ²Iran National Science Foundation (INSF), Tehran, Iran,

³Division of Food Safety and Hygiene, Department of Environmental Health Engineering, School of Public Health, Tehran University of Medical Sciences,

Tehran, Iran, ⁴Tehran H, Tehran, Iran

Background and Objectives: Polychlorinated biphenyls (PCBs) are a group of environmental chemical contaminants which is classified as a probable human carcinogen by the International Agency for research on cancer and the environmental protection agency. Studies of PCBs in humans have found increased rates of melanomas and cancer in liver, gall bladder, biliary tract, gastrointestinal tract, and brain, and may be linked to breast cancer. PCBs tend to be absorbed into the fat tissue and remain it for over years. The food products with high fat content such as meat products are one of the most important foods in the transfer of PCBs from environment to the human body which can cause a variety of diseases such as cancer, kidney disorders, neurobehavioral disorders, etc. The aim of this study is to measure the level of polychlorinated biphenyls (PCBs) in sausage meat products and its health effects. **Methods:** Thirty-two sausage meat products samples were collected from food stores and were sent to the laboratory for PCBs analysis by GC-MS Apparatus. Then, the statistical analysis was done on the data using excel and SPSS Software.

Results: The results showed that the average concentration of PCB28, PCB101, PCB52, PCB138, and PCB153 is 0.206, 0.708, 0.629, 0.562 and 0.600 Ppb, respectively. According to international standards, the maximum allowable level of PCBs in meat products is 40 Ppb, and the level of PCBs in all samples was lower than the allowable limit. **Conclusions:** It can be stated that the consumption of examined sausage is safe, but the continuous consumption of these meat products can introduce some of these compounds into the body over time. Therefore, it is recommended to carry out a risk assessment for children, adults and vulnerable people. Also, the monitoring program of PCBs in meat and meat products is periodically suggested.

Determinants of cardiovascular diseases among Indian expatriates residing in Ajman, UAE-A Pilot study

Akshay Ahuja¹

¹College of Medicine, Gulf Medical University, Ajman, United Arab Emirates

Background and Objective: UAE observes overweight/obesity, physical inactivity, high stress levels, smokers and unhealthy dietary practices are major determinants that influence the prevalence of heart diseases and comorbidities. Hence, this research assessed the determinants of cardiovascular diseases (CVDs) among Indian expatriates residing in Ajman, UAE.

Materials and Methods: This cross-sectional study was conducted among 279 Indian expatriates using self-administered questionnaire. The participants were recruited after obtaining consent from them. The SPSS version 27 was used for analysis. Chi square test was used to assess the association between dependent and independent variables.

Results: Among the respondents 54 (19.4%) had CVDs. Males reported having CVDs at a rate of 30 (24.6%) over the age of 40, compared to females at a rate of 24 (15.3%) over the same age. This correlation demonstrates that men are more prone to CVDs than women. This includes South Indians, 44 (33.1%); Other States, 10(6.8%); married people, 45 (35.2%); single people 9 (6%); family history of CVD (first-degree relatives); insufficient sleep: frequency of sleep: those who do not adhere to a regular sleep pattern; and those who don't exercise showed a statistically significant correlation.

Conclusions: The determinants such as age, gender, topography, family history of CVDs, regular sleep pattern, stress, energy drinks, red meat, alcoholism and physical exercise dispose adult Indians residing in Ajman, UAE to various CVDs. Age above 40 years, male gender, hailing from South Indian states, married, family history (first degree relatives), inadequate sleep, frequency of sleep, who don't follow a regular sleep pattern, and those who don't exercise showed a statistically significant association.

Assessment of pain/discomfort and their associated factors among cancer patients with chemotherapy in Bangladesh

Marufur Roshid¹, Moshir Rahman¹, Mohammad Sarker², Jiaur Rahman¹, Junaidi Prihanto³, Kaniz Eity⁴, Mehedee Masud⁴, Hitoshi Okamura¹

¹Graduate School of Biomedical and Health Sciences, Hiroshima University, Hiroshima, Japan, ²International Centre for Diarrhoeal Disease Research, Bangladesh, Dhaka, Bangladesh, ³Health Education, Health and Recreation, Sport Science Faculty, Universitas Negeri Surabaya, Indonesia, ⁴Oncology department, Khwaja Yunus Ali Medical College and Hospital, Sirajgonj, Bangladesh

Background and Objective: Cancer-related pain/discomfort might be a potential

cause of persistent symptoms that have negative impacts or alter patients' quality of life (QOL). The aim of this study was to assess the pain/discomfort among cancer patients undergoing chemotherapy in Bangladesh. Methods: A hospital-based cross-sectional study was conducted on 415 cancer patients using a convenient sampling technique. Adult cancer patients' socioeconomic and self-reported EuroQol 5-Dimension 5-Level (EQ-5D-5L) data were collected between January 2022 and April 2022. Frequency and percentages were used to represent descriptive analysis, and Chi-Square test was performed to assess possible influencing factors with pain/discomfort.

Results: Among our respondent participants, 258 (68%) patients were in the age groups of 30-59 years, and most of them 272 (66%) were males. The majority 113 (27%) of the subjects was lung cancer, 169 (41%) had stage IV cancer, and 175 (42%) completed 3-4 chemotherapy cycles. In total, 131 (32%), 141 (34%), 85 (20%), and 47 (11%) patients reported slight, moderate, severe, and extreme pain/discomfort, respectively. The results showed significant associations of pain/discomfort with cancer stage ($p<0.001$), smokeless tobacco use ($p<0.001$), chemo cycle number ($p=0.001$), and work status ($p=0.001$). Conclusions: The majority of patients experienced pain or discomfort, which was associated with cancer stages, smokeless tobacco use, chemotherapy cycle number, and work status, resulting in a poor quality of life. We need to take the initiative in pain/discomfort management or health education interventions to reduce cancer survivors' pain or discomfort, which might enhance cancer survivors' QoL in the future.

Metal exposure and obesity in Chile: a cross-sectional analysis of the National Health Survey 2017

Alejandro Sepúlveda-Peñaloza¹, Patricia Matus², Cinthya Urquidí²

¹Departamento de epidemiología y estudios en salud, Universidad de los Andes, Santiago, Chile, ²Departamento de Epidemiología y Estudios en Salud, Universidad de los Andes, Santiago, Chile

Background and Objective: Chile is a low-middle-income mining country with an epidemiological transition. The prevalence of overweight/obesity reached 78%, and a small area analysis revealed a heterogeneous geographic distribution. These findings lead us to consider the population exposed to metals and their role in developing the disease.

Methods: From National Health Survey 2017 (NHS-2017), we characterized metal concentrations as measured in spot urine (arsenic, cadmium, and mercury) and blood (lead) samples in 15 administrative regions of Chile. The criterion for the detection of metals used by the NSH-17 was a minimum quantification of 5 µg/L for arsenic, 1 µg/dL lead, 1 µg/L cadmium, and 2 µg/L for mercury. We defined metal exposure according to its 50th percentile distributions over the minimum value recordable. Obesity was a body mass index >30 kg/m². Analyses accounted for the complex sampling design; obesity association was estimated through quasi-binomial models. We report prevalences (%), Odds ratios (OR) with 95% Confidence Intervals.

Results: Of 6233 subjects, 3847 (61.7%) had blood/urine samples. Four regions had the highest prevalences of exposure to any of the metals analyzed: Arica (63%, 52-74%) and Atacama (53%, 45-61%) from the north zones; Bio Bio (60%, 49-70%) from the central, and Magallanes (57%, 49-65%) from the south zone. Only a northern region of Chile had the highest prevalence of multiexposure to metals (Tarapacá 25%, 14-35%). OR for lead and obesity was 3.6 (1.18-11.12) in the Valparaíso region and 1.99 (1.04-3.83) in the Tarapacá region. Arsenic was associated with obesity in the Bio Bio (2.41, 1.11-5.94) and the Maule regions (2.51, 1.03-6.11).

Conclusions: This study reveals high-risk areas exposed to metal toxicity in Chile, with different patterns along the territory. This study also explores the external exposome theory in obesity origin, specifically in metal toxicity exposure, proposing the trade-off from curing to preventing obesity.

DOI: 10.18332/popmed/165615

Serum selenium concentrations and adherence to the MIND diet in a Northern Italian population: a cross sectional study

Tommaso Filippini¹, Teresa Urbano¹, Marcella Malavolti¹, Sara Grioni², Claudia Agnoli², Sabina Sieri², Bernhard Michalke³, Marco Vinceti¹

¹University of Modena and Reggio Emilia, Italy, ²Epidemiology and Prevention Unit, Fondazione IRCCS Istituto Nazionale dei Tumori, Italy, ³Research Unit Analytical BioGeoChemistry, Helmholtz Center Munich, German Research Center for Environmental Health, Germany

Background and Objective: The Mediterranean-dietary approach to stop

hypertension (DASH) Intervention for Neurodegenerative Delay (MIND) is a healthy dietary plan which showed protective effects on cognitive decline, cognitive performance, and dementia risk. Selenium is an element with nutritional and toxicological properties, whose role in neurological diseases is greatly debated. We aimed to perform individual-level selenium speciation analyses to understand the association of different selenium compounds (organic and inorganic) with MIND diet adherence.

Methods: We recruited healthy and non-smoking blood donors from Northern Italy referred to the Transfusion Medicine Unit of Reggio Emilia Hospital in 2017-2019 period. We assessed adherence to MIND diet using the semi-quantitative EPIC-food frequency questionnaire, and total selenium and its species in serum. We used cubic spline regression analysis to investigate the association between selenium compounds and adherence to the MIND diet.

Results: Out of 148 subjects, we performed serum speciation analyses 104 (males/females: 50/54), with median age 48.5 years. Median score of adherence to the MIND diet was 7.5 (interquartile range (IQR) 6.5-8.5), while median levels of total selenium were 116.5 µg/L (IQR 106.0-128.0 µg/L). Overall, we found that total selenium was negatively and linearly correlated with adherence to MIND diet, as in the case of organic selenium and the organic form selenoprotein P. Glutathione peroxidase-bound selenium and selenocysteine were U-shaped associated with MIND, with positive associations above 8-score. For inorganic selenium and specifically the selenate compound, an inverted U-shaped relation emerged with MIND diet, with negative relation above median level of adherence. **Conclusions:** Our results support the hypothesis that higher adherence to MIND corresponds to lower levels of selenium in serum, specifically selenoprotein P and selenate. Hence, these two compounds may have adverse effects on cognitive decline and dementia risk as suggested in recent studies.

DOI: 10.18332/popmed/165651

Alcohol intake and risk of hypertension: a systematic review and dose-response meta-analysis of cohort studies

Marta Cecchini¹, Silvia Federico¹, Inga Iamandii¹, Tommaso Filippini¹, Marco Vinceti¹

¹University of Modena and Reggio Emilia, Italy

Background and Objective: Alcohol consumption is responsible of the global burden of disease and contributes to a number of diseases and deaths each year globally. Among the established adverse health effects of alcohol consumption there is hypertension. Our purpose is to assess the association between chronic alcohol exposure and incidence and mortality from hypertension in cohort studies, by carrying out a dose-response meta-analysis.

Methods: After performing a comprehensive literature search in PubMed and Embase through December 2, 2022, we retrieved 17 eligible cohort studies. We assessed the risk of bias of the studies and we used a restricted cubic spline model with three knots to model the prospective association between alcohol consumption and incidence of hypertension.

Results: We observed a linear positive association between alcohol exposure and hypertension risk, which in sex-specific analysis was confirmed only in males. Conversely, in females an increased risk emerged only above 12 g of daily alcohol intake.

Conclusions: Our results support a causal association between alcohol intake and the risk of hypertension, thus adding to the evidence recommending to decrease any amount of alcohol consumption in order to improve cardiovascular health. While any amount of alcohol use appeared to be detrimental in males, this may not be the case for females in case of low amounts of consumption.

DOI: 10.18332/popmed/165695

Tea and coffee consumption and risk of dementia: a systematic review and dose-response meta-analysis

Elena Mazzoleni¹, Andrea Rossetti^{2,3}, Tommaso Filippini^{2,3}, Marco Vinceti^{2,3}

¹Environmental, Genetic and Nutritional Epidemiology Research Center (CREAGEN), Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, ²CREAGEN - Environmental, Genetic and Nutritional Epidemiology Research Center, Italy, ³Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy

Background and Objective: Dementia is a chronic progressive disease characterized by multifactorial aetiology. Among the factors of greatest interest for prevention is lifestyle, including dietary habits. In particular, tea and coffee are still a matter of debate, being associated both with protective and detrimental effects. The aim of our study is to assess the relation between tea and coffee

intake and risk of developing dementia through a dose-response meta-analysis based on cohort studies.

Methods: We performed a literature search in PubMed and EMBASE databases up to 28 November 2022. Inclusion criteria were: population without chronic diseases or previous dementia diagnosis, cohort study design, assessment of tea or coffee intake by increasing categories of exposure, assessment of incident dementia risk. Exclusion criteria were: type of study (non-cohort), type of publication (letters, commentaries and systematic reviews), missing information about exposure level for tea and coffee in each category. For statistical analysis, we used cubic splines through a non-linear random-effects regression model (drmeta routine in Stata/SE 17.0).

Results: We identified 9 articles published between 2009-2021, 1 assessing tea consumption, 6 coffee and 2 both. As the amount of tea consumed increases, risk of dementia decreases progressively. Conversely, we found a U-shaped association between coffee intake and dementia risk: as the number of cups of coffee consumed increases, the risk of dementia decreases progressively up to two cups of coffee (approx. 300 mL) per day, whereas as the daily amount increases, there is a reversal up to five cups (approx. 750 mL) per day.

Conclusions: Moderate coffee intake appears to have a protective effect, while intake in higher amounts seems to increase the risk of dementia. Concerning tea, the relation is almost linear in a protective way.

The role of health literacy as a factor associated with tooth loss

Marília Batista^{1,2}, Carla Tenani³, Manoelito Silva-Junior⁴, Carolina Lino⁵, Maria Sousa⁵

¹Department of Community Health, Jundiai Medical School, São Paulo, Brazil,

²Department of Health Sciences and Child Dentistry, Piracicaba Dental School, University of Campinas (UNICAMP), São Paulo, Brazil,

³Faculdade de Odontologia de Piracicaba, Universidade Estadual de Campinas, Brazil, ⁴Department of Healthy, State University of Southwest Bahia (UESB), Brazil, ⁵Department of Health Sciences and Pediatric Dentistry of the Piracicaba Dental School, State University of Campinas, Brazil

Objective: The objective was to analyze the role of Health Literacy (HL) as a factor associated with tooth loss among users of the Brazilian Health System with chronic non-communicable diseases. **Methods:** The cross-sectional study was conducted with adult and elderly users at ten Family Health Clinics in the town of Piracicaba, São Paulo State, Brazil. A questionnaire was applied with sociodemographic (sex, age, skin color and education), behavioral (brushing and flossing), health determinants (dental health services) and clinical data (pain). Mouth conditions were collected by intraoral examination of visible dental biofilm and community Periodontal Index. The systemic clinical conditions (blood glucose, glycated hemoglobin and blood pressure) were extracted from the medical records. The explanatory variable was HL (low, medium and high), measured with the Health Literacy Scale (HLS-14).

Results: The outcome was tooth loss measured by the index of decayed, missing and filled teeth. Logistic regression was performed using a conceptual model for HL ($p < 0.05$). For the 238 subjects, the mean age was 62.7 years (± 10.55). Tooth loss was associated with HL in regression models adjusted by type of dental service, dental frequency, and dental floss. In the final model, the factors associated with tooth loss are older age (OR=1.12; 95%CI=1.07–1.17), a lower education (OR=3.43; 95%CI=1.17–10.10), irregular use of dental floss (OR=4.58; 95%CI=1.75–7.31), irregular use of dental services (OR=2.60; 95%CI=1.32–5.12), periodontal pocket (OR = 0.31; 95% CI 0.01–0.08), having visible dental biofilm (OR=7.23; 95%CI=3.19–16.41) and a higher level of blood sugar (OR=1.98; 95%CI=1.00–3.92). **Conclusions:** Tooth loss was associated with HL when adjusted by health behaviors; when sociodemographic variables and clinical conditions were included, it was less significant. In the final model, behaviors, determinants in health and clinical conditions were risk indicators of tooth loss, showing the multifactorial nature of this phenomenon.

Body shape trajectories are associated with birth weight, current body mass index and sociodemographic conditions in participants of the Brazilian Longitudinal Study of Adult Health (ELSA-Brasil): a multiple correspondence analysis

Isiyara Pimenta¹, Maria Fonseca¹, Maria Fonseca¹, Rosane Griep², Sheila Matos³, Maria Diniz⁴, Arlinda Moreno¹

¹National School of Public Health, Oswaldo Cruz Foundation, Brazil,

²Laboratory of Health and Environmental Education, Oswaldo Cruz Institute,

Oswaldo Cruz Foundation, Brazil, ³Institute of Collective Health, Federal University of Bahia, Brazil, ⁴Federal University of Minas Gerais, Brazil

Depending on body shape trajectory, individuals may be more prone to develop chronic diseases in adulthood or older age, so the identification of factors associated with this is essential for encouraging the development of preventive public health strategies. This study was conducted among 14,014 participants in the first follow-up wave (2012-2014) of the Longitudinal Study of Adult Health (ELSA-Brasil). Participants were asked to identify their body shapes at 5, 10, 20, 30 and 40 years of age by choosing one of the nine silhouettes developed by Stunkard (1983) and we applied a clustering method to longitudinal data (kmlShape) to identify body shape trajectories from 5 to 40 years of age and assessed the associations between these and sociodemographic (self-reported race/skin colour, education, maternal education and monthly per capita family income) and health-related factors (body mass index and birth weight) using multiple correspondence analysis. Low birth weight was associated with a slight to moderate increase in shape between 5 and 40 years of age. High birth weight was associated with maintaining large body size in both sexes and markedly increased body shape from age 5 to 40 years in women. Higher sociodemographic status and white self-reported race/skin colour were associated with marked increases in body shape in men and maintenance of medium body shape in women. As far we know, this is the first study to verify the relationship between sociodemographic and health-related variables and body shape trajectories evaluated by silhouette scales. The study shows that variables related to worse lifetime weight status (evaluated by anthropometry), such as presence of obesity, are also associated with worse body shape trajectories, as assessed with silhouette scales. The results thus indicate that body shape trajectories are a good indicator of body weight trajectories and may be used when cohort studies are not possible.

Cycling in Czechia: associations with cardiometabolic and mental health

Elena Vitteková¹, Geraldo Neto², Juan Rivas¹

¹Faculty of Medicine, Masaryk University, Brno, Czech Republic Kamenice

5, 625 00 Bohunice Czech Republic, ²International Clinical Research Center (ICRC) of St Anne's University Hospital (FNUSA) Pekařská 53, 602 00 Brno Czech Republic

Background and Objective: Insufficient physical activity is one of the leading risk factors for mortality in Czechia. Cycling is one of the most popular physical activities worldwide. Despite its repeated health-related benefits, there is a lack of evidence about the prevalence, cardiometabolic, and mental components associated with this activity in the Central European region. This study aims to determine the prevalence of cycling regularly (150 min/week) in a population-based survey of Czech adults and its association with cardiometabolic and mental health factors.

Methods: Data are from the KardioVize project, a population-based cross-sectional study with a random sample of 1% of the adult population (25-64 years) from Brno, Czech Republic. The multiple linear regression was applied to assess the association of cycling with different health outcomes. The fully adjusted model included age, sex, educational level, income, body fat percentage, relationship status, alcohol consumption, smoking, specific medication use, the season of assessment and non-cycling physical activity.

Results: In total 2,109 subjects were included. The prevalence of cycling 150 min/week was 8.2% (n=174) and was higher in men. Regular cycling was significantly

Mortality trends in cardiovascular diseases in belgrade and perspective

Gordana Tamburkovski¹, Svetlana Mladenovic Jankovic², Svetlana Miltenovic³, Aleksandra Andric³

¹Institute for public health of Belgrade Public Health Association of Serbia

"Vladimira Čopića 51 Belgrade" Serbia, ²Institute for public health of

Belgrade, ³Institute for public health of Belgrade, Bulevar despota Stefana 54a, Serbia

Background & Objectives: Cardiovascular diseases (CVDs) are one of the global leading causes of concern due to rising prevalence and mortality. The objective was to assess structure and trends in CVDs mortality in Belgrade over last 10 years. Examining these trends is part of broader analysis, important for planning local interventions for prevention of noncommunicable diseases.

Methods: CVDs mortality rates were calculated based on data from Population Register for diseases of major public health importance, maintained by Informatics

Unit in Institute for Public Health of Belgrade. Trends were analyzed by age, sex and type of CVD, for the period 2012-2021. Retrospective analysis was performed. Results: CVDs were the most common causes of death in Belgrade, with 37,6% in total mortality in 2021. The highest share of mortality is in population aged 65 and over (89,5%). Death rates per 100.000 population were higher in women, increased in both sexes during 10-year period, more pronounced in male. Cerebrovascular diseases and ischemic heart diseases (IHD) make almost one third in total CVD mortality (29,1%), predominantly in age group of 65 and over (88,4%, 86,8% respectively). Mortality rates from cerebrovascular diseases decreased by 44,0% among females and by 37,1% among males. Acute coronary syndrome (ACS) accounts for 68,6% of all IHD deaths, downward trend of mortality was more pronounced in man, by 22,9%, compared to 2,8% in women. Remaining 70,9% of CVDs deaths, includes high blood pressure diseases, cardiomyopathies, heart rhythm disorders, insufficiency and cardiac arrest, recorded an increase in mortality rates in both sexes.

Conclusion: Increase in overall mortality in Belgrade from CVDs was noted. Mortality rates from IHD and cerebrovascular diseases declined, but are still high in age group 65 years and older. Special attention should be paid to risk factors for CVDs, such as overweight and obesity, smoking, sedentary habits and unhealthy diet.

Factors influencing shisha smoking among youths 15-35 years in Juba city council, South Sudan

Rhoda Elia¹, Nancy Pon²

¹UNICEF, Nutritionist, Nyarkuron West Residential area, Sudan, ²WFP, Public Health Practitioner, "Munuki Block C, Mia Saba Road - Juba South Sudan, N/A", Sudan

Background: Shisha smoking is one of the major preventable causes of premature death in the world and recent trends indicate raising smoking prevalence rates among children and adolescents and earlier ages of initiation, if these patterns continue, tobacco use will result in deaths of 250 million children and adolescents alive today, many of them in developing countries (WHO 2013).

The Objective Of The Study

The main objective of the study was to determine the factors influencing shisha smoking among youths 15-35 years in the period of October to November 2022. The specific objectives were to determine the prevalence of shisha smoking, to identify the socio-demographic, socio-economic, and environmental factors influencing shisha smoking among youths in Juba City Council.

Methodology: A cross-sectional study used convenience sampling to obtain 110 respondents in the 3 payams of Juba City Council from July to August 2016. Both Quantitative and Qualitative data collection were used with a key informant guide. Pearson Chi-square and Multiple logistic regression models were used to strengthen the association respectively at a 95' confidence interval between shisha smoking and the independent variables.

Results: The prevalence of shisha smoking among youths 15-35 years was 30.9%. The socio-demographic factors; gender ($X^2=3.553$, $P\text{-Value}=0.031$) residence ($X^2=5.069$, $P\text{-value}=0.036$), socioeconomic factors; level of education ($X^2=33.835$, $p\text{-value}<0.001$) and employment status ($X^2=20.965$, $P\text{-value}<0.001$), environmental factors; shisha advertisement ($X^2=9.339$, $P\text{-value} 0.002$), relatives who smoke ($X^2=14.611$, $P\text{-value}= 0.000$), family support for shisha smoking ($X^2=20.790$, $P\text{-value}=0.000$) and friends who smoke shisha ($X^2=9.384$, $P\text{-value} 0.001$). Influenced shisha smoking among youths in Juba.

Conclusion: The prevalence of shisha smoking among youths in Juba City Council is high. Socio-demographic, socio-economic and environmental factors, gender and residence, level of education, employment status, shisha advertisement, relatives and friends who smoke shisha, and family support for shisha smoking were the factors that influenced shisha smoking.

Prevalence and determinants of musculoskeletal problems among university students in Ajman UAE

Jayakumary Muttappallymyalil¹, Smirit Tribhuvan¹, Savitran Eshwar¹

¹HDPSC Program, Faculty College of Medicine, Gulf Medical University, Ajman, UAE

Background: Musculoskeletal disorders is a major public health issue. Musculoskeletal pain is one of the major reasons for decrease in the attendance in the class.

Objective: To determine the prevalence and factors of musculoskeletal pain among university students in Ajman UAE.

Materials and Methods: This research was conducted among medical university students from year one to five. A total of 1008 students participated. An online self-administered questionnaire was used. In addition to socio-demographic details and factors, the Nordic questionnaire was used to obtain information to achieve the objectives. SPSS version 27 was used for analysis. Association between dependent and independent variables were assessed using Chi-square test. Statistical significance was set at $p<0.05$.

Results: The sample size of this research was a total of 1009 students. Out of which 978 students had responded with issues with one of the listed common sites.

All the participants were of age group 18-30. Most students had a issue in their neck-978 (97%), Upper back- 396 (39.3%), Lower back- 976 (96.8%), Hips/thighs-518(51.4%), Knee-431(42.8%), ankle/feet-342(33.9%) .

The socio-demographics table shows that 97.5% of male and 99.45 female are effected with musculoskeletal disorders in the last 12 months. With a 99% of the students from EMRO region. Most of the students from other courses have a 100% response as YES, with a exception to college of medicine 97% students effected. It is determined that the ergonomics of students is mostly neglected which leads to musculoskeletal problems among students.

Conclusion : The objective to determine the prevalence of musculoskeletal pain among University students is proved and the data obtained is indicating the same.

The effect of visual-based health education on the Perception and Willingness To Pay (WTP) on Human Papillomavirus (HPV) Vaccination among Male Chinese University Students in Hong Kong SAR: a pre-post interventional survey

Eliza Wong¹, Clement Ng¹, Annie Cheung¹, Paul Chan²

¹The Chinese University of Hong Kong, Jockey Club School of Public Health and Primary Care, Hong Kong, ²The Chinese University of Hong Kong, Department of Microbiology, Hong Kong

Background: Despite Human Papillomavirus (HPV) vaccine being recommended to both genders, vaccine resources and financial subsidies in Hong Kong had been mainly utilized on females and little was invested in promoting vaccine uptake in men. Studies had reported a low HPV vaccination uptake rate in Hong Kong male students, who often demonstrated misconceptions about HPV and perceived low benefits in receiving HPV vaccinations. This study explored the perception and willingness-to-pay (WTP) of the HPV vaccine among male university students in Hong Kong, and further assessed if visual-based education would impact their HPV vaccine uptake intentions.

Methods: An interventional online survey was conducted in April 2021. Perception and WTP were measured with Likert scales and bidding games respectively pre and post the visual-based knowledge dissemination section. Visual-based HPV fact sheet was prepared to highlight male HPV-related diseases such as genital warts, papilloma, and oropharyngeal cancer. Symptoms of the captioned diseases were illustrated with clinical pictures and the section ended by stating HPV vaccine was regarded as an effective measure to prevent the HPV-related diseases mentioned.

Results: Of the 105 cases recruited, the mean age of the sample and their first sexual activity were 21 and 18 respectively. Forty-four participants (41.9%) did not know the male HPV vaccine was available. After visual-based education, the participants recorded a change of +0.35 in the need for HPV vaccine ($p\text{-value}<0.01$) and +0.54 in HPV vaccine uptake intention in the future 6 months ($p\text{-value}<0.01$) on a 5-point Likert scale, while an increase of HKD\$1240 (~USD160) was observed in WTP for each dose but the difference was yet to reach appropriate statistical significance ($p\text{-value}:0.19$).

Conclusion: The findings hinted that many male Chinese university students still held an unclear understanding of HPV and HPV vaccines. Visual-based education materials could be an effective aid to boost their vaccine uptake intentions.

Consumption of processed meat increases the incidence of hypertension: ELSA-Brazil cohort

Maria del Carmen Bisi Molina¹, Raquel de Deus Mendonça¹, Maria del Carmen Bisi Molina¹

¹Federal University of Ouro Preto, Brazil

Background and Objective: Hypertension is a public health problem that increases morbidity and mortality and reduces quality of life. There is evidence of an association between hypertension and consumption of red and processed meat. The objective of this study was to investigate the association between

the consumption of red and processed meat and the occurrence of new cases of hypertension in participants of the Longitudinal Study of Adult Health (ELSA-Brazil).

Methods: Cohort study with 15 105 civil servants (age: 35 to 74 years). Biochemical, anthropometric, socioeconomic, and lifestyle data were collected at baseline (2008–2010) and second wave (2012–2014). Meat consumption (g/day) was estimated using a food frequency questionnaire. To categorize low, medium and high consumption, the independent variables (red meat and processed meat) were divided into tertiles. Hypertension was defined as systolic BP ≥ 140 mmHg and/or diastolic BP ≥ 90 mmHg. Stata software was used and a $P < 0.05$ was adopted. Cox proportional hazards models were used to estimate adjusted HRs and 95% CIs for the incidence of hypertension.

Results: Participants with medium and high consumption of red and processed meat had a lower mean age, lower education level and lower per capita income. We identified 1189 new cases of hypertension, corresponding to an overall incidence rate of 38.2 per 1000 person-years. Medium and high consumption of processed meat increases the risk of developing high blood pressure by 1.3 times (95% CI: 1.11–1.53).

Conclusion: The consumption of red meat did not have a negative impact on the health of the participants, however the consumption of processed meat at a moderate and high level increases the risk of hypertension and should be discouraged.

Malaria endemicity in sub-Saharan Africa: Past and present issues in public health

Kolawole Eniola¹, Bartholomew Okolo², Eunice Ayeni², Sodi Abolade², Stephen Ugwu², Temitope Awoyinka², Augustine Ofeh², Bartholomew Okolo²

¹Department of Microbiology, Ahmadu Bello University, Zaria, Nigeria,

²Infectious Disease Research Group, Nigeria

The World Health Organization (WHO) reported an estimated 241 million malaria cases with nearly half of the world's population at risk in 2020. Since time immemorial, malaria has been one of the most endemic parasitic diseases, which has caused a great menace to public health. This infectious disease has spread worldwide, with a cumulative mortality rate. Despite the significant developments in the healthcare sector, parasitic infectious diseases still exist, causing life-threatening diseases and leading to high mortality and morbidity rates worldwide. This review article discussed malaria as a public health endemic infection in general while exposing the associated past and present issues. This is done using articles published in peer-reviewed journals. The endemic nature of malaria was investigated through the past and present issues in its prevalence, multiple causative agents and epidemiological survey. Its morbidity and mortality rate, especially in Africa, where poverty and many other favorable conditions have proven it life-threatening and a serious public health concern. Investigation on the report of various drug resistance to malaria treatment, wide association with other infectious diseases which could aggravate malaria pathogenicity and pose a threat on diagnosis; culminate into a more threat. However, the investigation into various management, prevention and control practices in many African countries has given a glimpse of hope in mitigating endemic malaria.

Chronic kidney disease in Slovakia - the key role of general practitioners in prevention and screening

Mária Bartušová¹, Katarína Gazdíková², Katarína Dostálová¹, Mário Dvoržák³, Martina Slováčiková², Štefánia Moricová¹

¹Faculty of Public Health, Slovak Medical University in Bratislava, Bratislava, Slovakia Faculty of Public Health, Slovak Medical University in Bratislava, Bratislava, Slovakia Slovakia (Slovak Rep), ²Faculty of Medicine, Slovak Medical University, Bratislava, Slovakia, ³General Practitioner's Office, Trnava, Slovakia General Practitioner's Office, Trnava, Slovakia Slovakia (Slovak Rep)

Chronic kidney disease (CKD) is defined as kidney damage or glomerular filtration rate (GFR) < 60 mL/min/1.73 m² for 3 months or more, irrespective of cause. CKD is classified based on GF and albuminuria and affects approximately one in ten people.

The three most common causes of CKD in the world are diabetes mellitus (DM), hypertension (AH) and glomerulonephritis (GNF). About one of five adults with AH and one of three adults with DM suffers from CKD.

In the Slovakia (5 441 991 inhabitants) at the end of the year 2021 were followed 159,882 patients suffering from CKD. Adult patients, aged 19 and over, were

most often diagnosed with glomerular disease in diabetes mellitus (DM) – diabetic nephropathy (DN), followed by arterial hypertension (AH) with vascular nephrosclerosis (VN) and tubulointerstitial nephritis (TIN). 730 patients with kidneys diseases were included in the regular dialysis treatment (RDT). More than 1/3 of patients had dialysis therapy indicated on the basis of chronic kidney damage caused by DM, followed TIN and AH with VN. 343 persons were placed on the transplant waiting list by the end of 2021 and kidney transplants were performed on 105 patients. In the year 2021 dialysis centers registered 855 deaths of people undergoing RDT.

The ideal place for recognizing the risk persons is preventive examinations, which are covered by health insurance for every adult citizen in Slovakia once every 2 years. They are focused on the most important risk factors of CKD – DM, cardiovascular diseases as well as the recognition of early stages of CKD (assessment of creatinine, GFR, exam of urine).

Prevention of CKD should be aimed at finding people at risk (DM, AH, taking drugs, infections, etc.), quitting smoking, achieving and maintaining an ideal weight, treating comorbidities. Any visit to the doctor should serve this purpose.

Designing a Communication Strategy Toward the Promotion of Children's Oral Health Among Parents/Caretakers in Calamba City, Laguna, Philippines: An Action Research

Jelaine Bagos¹, Aldo Lim²

¹University of the Philippines Open University UP Open University, Brgy.

Maahas, Los Banos, Laguna Philippines, ²University of the Philippines Los Banos

The core objective of the study was to determine the antecedent conditions to be considered in devising communication strategies to promote good oral health among preschool children in Calamba City, Laguna, Philippines. Survey research design was primarily used to gather data on communication factors and knowledge, attitudes, and practices (KAP) from 177 parents/caretakers from 22 barangays in the city. Meanwhile, interviews with key informants were done to find out the city's existing policies and programs. Data were analyzed using descriptive and inferential statistics. Overall gaps in KAP were: 1) lack of knowledge on the ways to prevent or treat oral diseases; 2) negative attitude toward children's oral health; and 3) unfavorable practices regarding children's oral hygiene, dental visits, and diet. Thus, the communication objectives and core content of a prospective communication strategy must focus on the importance of taking care of children's oral health and positive oral healthcare behaviors. The following communication approaches are proposed: awareness raising; information and knowledge sharing; community communication; and networking/linkaging and alliance building. Both interpersonal and media-based methods of communication are apt to be used. Oral health lectures/seminars will serve as the locomotive medium. Meanwhile, brochures, e-modules, posters/banners/stickers, and a Facebook page will serve as supporting materials. Dentists will also be tapped as resource persons seeing as they are not only subject matter experts; they are also parents/caretakers' most preferred information source. These channels of information were found to have moderate to strong association with parents/caretakers KAP. Moreover, parents/caretakers who acquire information from the said channels were found to get higher mean scores in the knowledge test. Lastly, results suggest prioritizing less educated parents/caretakers, those who reside in rural barangays, and those who do not have enough financial capability. Based on statistical analysis, these parents/caretakers had significantly lower KAP levels.

Smokeless tobacco cessation support in dental hospitals in Pakistan: Dentists and dental patients' perspectives on current practices, support needed and opportunities available

Shaista Rasool¹, Fiona Dobbie², Linda Bauld²

¹University Of Edinburgh House 156, street 5 sector k 1 phase 3 hayatabad peshawar Pakistan, ²University Of Edinburgh United Kingdom

Background: Despite evidence on the effectiveness of tobacco cessation interventions in dental settings, the implementation remains low in most regions. This lack of implementation and scale up of tobacco cessation interventions, which have been found effective in dental settings, requires an understanding of the influences that drive effective implementation. The purpose of this study, was to explore the influences governing ST cessation support in dental hospitals. **Methods:** A multi-centre exploratory qualitative study was conducted at two tertiary-care dental hospitals, in Pakistan. Semi-structured interview guides; containing open ended questions guided by the Capability-Opportunity-Motivation-

Behaviour (COM-B) model were used, to capture the views of dental patients (n=12) and dentists (n=12) regarding behavioural interventions for ST cessation in dental hospitals. Framework approach was used to thematically analyse the data. Results: Screening of ST users in routine dental practice was seldom practiced and the cessation support offered was brief advice. Common barriers identified by dentists included: fear of offending patients; stereotyping patients; lack of knowledge and skills; lack of privacy; lack of belief in the effectiveness of behavioural support; lack of time and workload pressure; ST use amongst dentists; lack of referral systems and the absence of a mandatory requirement of offering ST cessation support. Facilitators included: delivering support through junior dentists and the length of interaction between the dentist and the patient. Naswar was the most common ST product used by dental patients. Previous cessation attempts were unassisted, with patients reporting receiving negligible cessation support from any healthcare providers. Patients overwhelmingly expressed the need for cessation support.

Conclusions: A range of influences that hinder and facilitate the implementation of behavioural support for ST cessation in dental hospitals were identified. These findings can inform the implementation of behavioural interventions for ST cessation in dental and other clinical settings in low and middle income countries.

Inequalities in the use of dental care among the elderly in 14 European countries

Nóra Kovács¹, Orsolya Varga²

¹Department of Public Health and Epidemiology, Faculty of Medicine, University of Debrecen Hungary, ²Department of Public Health and Epidemiology, Faculty of Medicine, University of Debrecen

Background And Objective: Regular use of dental care among older people is low, even though healthy ageing can be achieved through better access to health services, including dental care. There is little evidence on the extent to which socioeconomic status and welfare systems influence access to dental care among older people. This study was to describe trends in the uptake of dental care and to compare the uptake of dental care with other types of health services among the elderly, taking into account different socioeconomic factors and welfare systems in European countries.

Methods: A multilevel logistic regression analysis was performed using longitudinal data from four waves of the European Health, Ageing and Retirement Survey database (between waves 5 and 8). Absolute and relative inequalities in the use of dental care and healthcare services were measured. The study sample consists of 20,803 respondents aged 50 years and older from 14 European countries.

Results: The dental care attendance was the highest in Scandinavian countries, although, improving trends of dental attendance was recognized in Southern and Bismarckian countries ($p < 0.001$). The absolute and relative income inequalities in the use of dental care increased over the study period ($p < 0.001$). The educational and income inequalities were higher for dental care attendance compared to other forms of healthcare. Income level and unemployed status had significant effect on forgoing dental care due to cost and unavailability.

Conclusion: The observed differences between socioeconomic groups regarding dental care utilization highlight the health consequences of the different organization and financing of dental care. Adopting policies to reduce financial barriers to dental care may benefit the elderly population. Furthermore, quality of life gains and reduction in overall cost of care is also expected by ensuring access to dental health care due to the correlation between chronic disease and oral health.

Introduction: Children are susceptible to unhealthy lifestyle and have been shown to have various risk factors that may predispose them to development of non-communicable diseases (NCDs). The objective of our study was to assess NCDs risk factors among pre-school children in Sousse, Tunisia.

Methods: We carried out a cross-sectional study in 2016-2017 among pre-school children enrolled in the level 3 to 5 of kindergartens in the region of Sousse. Weight and height were measured for the children. Parents filled in a questionnaire about their characteristics and those of their children. Overweight and obesity were defined according to the age and sex specific body mass index cutoff points of the International Obesity Task Force. Data were analyzed using the Software SPSS 20.0.

Results: A total of 364 participants were included in the analysis. The mean age of participants was 4.5 ± 0.97 years, the sex ratio was 1.05. Of these, 31.3% were classified as overweight/obese. Only 20.4% of children practice regular physical activity (five days per week or more), whereas the quarter of children (22.7%) did not practice any physical activity per week. Moreover, the mean daily sedentary time was $1,83 \pm 1,21$ hours, whereas it reached 2.88 ± 1.9 hours daily during the weekend. Thirty nine percent (39,5%) of overweight/obese children and 36% of normal weight children eat their food in front of TV or computer. More than Half (56.2%) of children consume unhealthy snack in the morning. This rate was significantly higher among Overweight/Obese children than normal weight children ($p = 0.024$).

Conclusion: The findings suggest that the healthy lifestyle behaviors were not yet incorporated in our culture. The NCDs risk factors set in at a very early age. Hence, identifying them early and trying to modify them would help in combating NCDs."

Epidemiological survey of oral health in an adult population in São Tomé and Príncipe

Marta de Oliveira Pinto¹, Marta Pinto², Inês Fronteira³, Leonor Marinho⁴

¹Mundo a Sorrir (MAS) Instituto de Higiene e Medicina Tropical (IHMT) R. da Junqueira 100, 1349-008 Lisboa, Portugal, ²Mundo a Sorrir (MAS) Instituto de Higiene e Medicina Tropical (IHMT) Portugal, ³IHMT, ⁴MAS- Mundo a sorrir FMDUL - Faculdade de Medicina Dentária da Universidade de Lisboa Portugal

Background and objective: Pathologies of the oral cavity are great burden globally and one of the most expensive health treatments. In low and middle-income countries, such as São Tomé and Príncipe (STP), they have an even greater impact. Objective: To describe the prevalence of dental caries of caries, dental trauma, erosion and oral lesions and behaviors related to oral health in adults (≥ 18 years) in STP.

Methods: Cross-sectional study. Convenience sample of 241 adults (≥ 18 years). Data collected through the clinical oral health assessment form based on the WHO Oral Health Surveys and extra and intraoral observations by a Dentist. The DMFT index was computed to determine the prevalence of dental caries. Descriptive statistical analysis of data.

Results: Participants were frequently females (67.2%), 5.4% had no education and the mean age was 36.6 years. The prevalence of decayed, missing and filled teeth was respectively 84.6%, 78.0% and 9.1%. 0.4% of erosion lesions with pulp involvement and 0.8% of teeth lost by trauma. More than half of the individuals had no lesions of the oral mucosa (LOM) abnormal condition. The most frequent location of LOM was the gingiva and/or alveolar ridge (17.4%). Only 0.4% did not brush their teeth. 75.5% used fluoride toothpaste and more than half washed their teeth twice a day (90.0%). 66.0% had felt pain or discomfort in a tooth in the last year. However, 30.7% never received dental treatment.

Conclusions: The prevalence of dental caries in the studied sample is high, with a low DMFT index, despite being higher compared to young age groups. The prevalence of dental trauma is below average for African countries. The prevalence of dental erosion was low. This study contributed to the description of oral health in adult age groups in STP, which had never been done before."

Pediatric dental healthcare in serbia before and during COVID-19 pandemic

Milena Vasic¹, Biljana Kilibarda², Jelena Brčanski¹, Verica Jovanovic¹, Vesna Korac³

¹Institute of Public Health of Serbia Dr Subotica 5 Serbia, ²Institute of Public Health of Serbia, ³Ministry of Health of Serbia

Background and Aim: Despite high prevalence of oral diseases, oral health is still neglected public health domain.

Regular check-ups and other preventive measures can significantly reduce the burden of oral diseases and children are important population group for implementation of these measures.

COVID-19 pandemic had influence on oral health care utilization globally, depending on the organization of health service. The aim of this study is to explore the changes in indicators of oral health care for children.

Methods: For this analysis we used data from routine statistics collected regularly from all 158 primary health care centers in Serbia. We compared trends in pediatric dental health care indicators for the period 2001-2020.

Results: The average number of visits to dentist per one preschool child was the lowest in COVID-19 pandemic 2020 (0.7). This number is for 40% lower than in 2019 (1.1) and almost double lower than in period from 2011 to 2013 (1.3). The results are similar for school aged children. One child of this age visited dentist 1.4 time in average in 2020 which is significantly lower than 2.4 visits registered in 2019. Coverage of children with dental check-ups decreased from 85% in 2014 to 59.6% in 2020 for children 7 years old, and from 79.9% in 2014 to 47.3% in 2020 for 12 years old. Conclusion:

COVID-19 pandemic led to changes in pediatric dental healthcare utilization and impact on the children oral health can be expected. The intervention to minimize this effect should be developed and recommendation should be made for the event of further pandemic situation.

Screening for risk factors of big four diseases-social accountability research from Ajman UAE

Anusha Sreejith¹, Jayakumary Muttappallymyali²

¹Gulf Medical University, Ajman Department of Community Medicine, College of Medicine "Al Jurf Ajman United Arab Emirates P.O Box: 4184" United Arab Emirates, ²Gulf Medical University Department of Community Medicine, College of Medicine "Al Jurf Ajman United Arab Emirates P.O Box 4184" United Arab Emirates

Background & Objectives: Non-communicable diseases accounts for more than 70% of all causes of mortality in the UAE. Leading five risk factors of NCDs are elevated cholesterol, elevated blood pressure, increased blood sugar level, increased body mass index level, and nutritional factors. This research was conducted from the data bank of community engagement as part of social accountability to assess the risk factors of non-communicable diseases among the marginalised population in Ajman.

Material and Methods: Data collected during community engagement was analysed. It had the following variables: Demographic, lifestyle, screening of diabetes, obesity and hypertension. Approval from IRB was obtained. Risk factors screening for marginalised population was part of the social accountability of university. Chi-square test was used to find the association between variables.

Results: Majority of the participants (68.8%) were below the age of 40 years. Male comprises of 93.3% of the total sample. Indians were more with 63.4% when compared to the rest of the nationalities. Prevalence of over-weight and obesity among the expatriates was 57%, while 7.4% were found be diabetic and 26.5% were found to have either grade1 and grade 2 hypertension. Obesity, random blood sugar and hypertension was significantly higher among participants of older ages (14.1%, 27.9% and 39% respectively).

Conclusion: A significantly higher percentage of diabetic, hypertensive and obese respondents were found above the age of 40 years among the expatriate population in Ajman. Educating people to follow health lifestyles can reduce the risk of many life style diseases.

Personalized cancer cellular therapies: a socio-economical impact of a therapeutic modality on the rise for mass-adoption

Inês Subtil¹, Manuela Garcia¹, Edgar Simões², Bragança Pereira¹

¹Public Health Unit of Loures-Odivelas Portugal, ²Public Health Unit of Loures-Odivelas Manuel

Background and Objective: In 2019 neoplasms rose to be the second global cause of DALYs. The social and economic burden of cancer impacts patients, healthcare systems and countries' health expenditures. While prevention and early detection should be at the forefront of public health action, effective treatment could reduce both the social and economic burden of cancer. Cellular therapies for cancer have recently advanced to a new stage of success with chimeric antigen receptor (CAR) T cell therapy for the treatment of acute lymphoblastic leukemia. The unrivaled response rates this therapy achieved opened the floodgates for research investment and strides into the translation of these results to other malignancies.

It also becomes clear that most health care systems are not prepared for the high costs associated with the presently near to prohibitive high cost of personalized cellular therapies.

Methods: We systematically reviewed all current clinical trials in the field and broke these results down in patient individual therapy versus off-the-shelf approaches, as well as targeted tumors and patient populations that can benefit from these therapies. We will also go over technological breakthroughs that can lead to mass production and the ethical implications of failing to implement such cost-lowering technologies.

Results: Currently there are 6 clinically approved CAR T products for hematological malignancies and more than 1000 clinical trials ongoing, more than 500 of these currently recruiting. CAR T cell therapy products currently in the market have an approximate cost of \$370.000 for the payer - a cost significantly higher than that of targeted therapies. Furthermore, we highlight efforts in the field of gene and cell engineering to optimize production and scalability.

Conclusion: Personalized cancer therapy heralds both the potential to enable the treatment of malignancies that are currently palliative and to be the straw that breaks traditional public health care systems.

Countermeasure policy for chronic noncommunicable diseases in Ukraine

Tetiana Yurochko¹, Viktoriia Kondratiuk²

¹School of Public Health of National University "Kyiv-Mohyla Academy" National University "Kyiv-Mohyla Academy" Ukraine, ²School of Public Health of National University "Kyiv-Mohyla Academy"

Background: Noncommunicable diseases (NCD) are main reason for disability and precocious mortality rate in Ukraine. They are determining main socio-economic consequences for country's development and need urgent intervention in political decisions and coordinated actions on all levels.

Objective: Comprehensively assess situation of countermeasures, consolidate data from pre-war period about NCD preventive conditions in strategy development of post-war health care system restoration in Ukraine.

Methods: The assessment was done accordingly to WHO methodology "effective treatment of non-communicable diseases: challenges and solutions for the healthcare systems" within the Ukrainian-Switzerland project "Act for Health".

Results: The major NCDs are not only part of irreversible losses because of mortality but factors in reducing life expectancy. Contribution of NCDs is significant, mainly cardiovascular disease, as Ukraine's overall disease burden (DALYs) which were 8/9 of total years of life lost for women and - for men. There are gaps in primary care in prevention and control of NCDs, despite its importance and work done by the system to overcome the epidemic of cardiovascular disease (CVD), diabetes, and oncology diseases in Ukraine. Nevertheless, mortality rate from these pathologies remains high, showing a systemic fracture in patient group management system and lack of attention to prevention and financial support. As a result, unhealthy lifestyle practices lead to a high level of CVD spread. The number of neglected cases of diabetes and their complications caused by uncontrolled disease courses remains high. Oncology treatment spending from the government and patient budget remains an acute problem.

Conclusions: Results of research show gaps in the pre-war periods activities, which significantly increased due to the destructive impact of war that system passes. Health care system post-war restoration plan development should be based on challenges and barriers depending on populations health condition analysis and pre-war system work.

Compliance with the cervical cancer screening program among women living in low-income settings in Cali, Colombia

Paula Jaramillo¹, Kirvis Torres², Diana Liberos³, Lorena Castillo⁴, Daniela Neira⁵, Daniel Arroyabe⁶

¹Pontificia Universidad Javeriana Cali Departamento de Salud Pública y Epidemiología Pontificia Universidad Javeriana Cali Pontificia Universidad Javeriana Cali Calle 18 No. 118-250. Código Postal: 760031 Edificio Raúl Posada 3° piso Cali, Colombia. Colombia, ²Instituto Nacional de Salud Pública, ³Hospital de Siloé Siglo XXI. Red de Salud Ladera Empresa Social del Estado. Colombia, ⁴Instituto de la Mujer Cuernavaca Mexico, ⁵Hospital de Siloé Siglo XXI. Red de Salud Ladera Empresa Social del Estado., ⁶Escuela de Salud Pública, Universidad del Valle, Cali, Colombia.

Background: The global strategy towards the elimination of cervical cancer (WHO), proposes to achieve screening coverage in two rounds higher than

70%, therefore it is important to establish the compliance of women to cervical cytology. **OBJECTIVE:** To determine the relationship between patient compliance with cervical cytology screening and the factors associated with primary health care services.

Method: Through a cross-sectional, observational, and analytical study, we analyzed 32001 records of women affiliated to the subsidized health insurance from 2014 to 2018. We classified women according to compliance with cytology rounds into three groups: i. women not attending the program (NAP), ii. women who did not return to the next round (WNR) iii. women up to date in screening (WUD). A multinomial logistic regression model was used to identify the behavior of associated factors in each group: distance in kilometers from the patient's home to the health care center (DIST) and the average number of annual medical consultations made by women in primary health care services (MCPHC).

Results: No significant relations were identified in the groups when there was a change in DIST. While MCPHC showed statistically significant relationships in the NAP and WNR groups. In the WNR group the probability of being up to date with the screening increased as the frequency of MCPHC increased as follows: 1-3 times OR=720.2688; IC95%=380.11-1364.82; 4-10 times OR=1329.3304; IC95%=707.10-2499.08; 11-20 times OR 1892.36 IC95%=1008.68-3550.22; In the WUD group, the same tendency was observed: 1-3 times OR=8.93 IC95%=7.89-10.11; 4-10 times OR=21.34 IC 95%=19.27-23.64; 11-20 times OR=41.13 IC95%=37.39-45.26.

Conclusions: Inducing attendance to primary health care services for any reason is useful to prevent cervical cancer. There was no relation between distance from patient's home to health care center and adherence to cytology; other approaches should be integrated for a better understanding of the proximity phenomena.

Physical activity of patients with colorectal cancer, according to sociodemographic factors, in mato grosso, Brazil, 2019-2021: A Descriptive Study

Gustavo da Silva¹, Rita de Souza¹, Noemi Galvão¹

¹Federal University of Mato Grosso Brazil

Background objective: Colorectal cancer (CRC), which occupies the second position in percentage terms among the types of cancer in Brazil, has been considered one of the clearest markers of epidemiological and nutritional transitions, and associated with an unhealthy lifestyle, among them physical inactivity. The aim of this study was to describe the physical activity of patients with CRC, according to sociodemographic factors, in Mato Grosso, Brazil, from 2019 to 2021.

Methods: This is a descriptive study. The study population comprised patients assisted at the Hospital de Câncer and Hospital Universitário Júlio Muller, in the state of Mato Grosso, aged 18 years or older and with a cytopathological or histopathological diagnosis of CRC. Sociodemographic and physical activity information was collected through a questionnaire, in a face-to-face interview, from November 2019 to April 2021.

Results: 105 patients diagnosed with CRC were identified, with a mean age of 55.4 years and 50.5% female. Most reported not having practiced physical activity or sport in the last 3 months (71.6%) and not doing physical activity that involves walking or cycling in their usual activities (52.6%). Among the patients who reported not having practiced physical activity or sports in the last 3 months, most were brown (47.0%), married or in a stable relationship (69.1%), with incomplete elementary schooling (48.5%) and economic class C (50.0%). Among the patients who reported having practiced physical activity or sports in the last 3 months (N=27), all practiced at least once a week, with a minimum duration of 50 minutes (N=17).

Conclusion: High physical inactivity was identified among patients diagnosed with CRC, especially among brown, married or in a stable union, low level of education and lower purchasing power.

Socio-demographic determinants of obesity in adults: findings from the IAN-AF survey in Portugal

Sara Travassos¹, Júlia Martinho², Inês Subtil², Maria Santos²

¹Escola Nacional de Saúde Pública Av. Padre Cruz, 1600-560 Lisboa

Portugal, ²Escola Nacional de Saúde Pública Portugal

Materials and methods: Public available data on socioeconomic determinants and anthropometric measurements was retrieved from the Portuguese National Food, Nutrition, and Physical Activity Survey (IAN-AF 2015-2016), a cross-sectional study. A total of 4339 observations were included, through multistep sampling. Body mass index (BMI) has been used to assess obesity (BMI>30kg/m²). Sampling weights were used for a complex samples statistical analysis, to

obtain population estimates. Bivariate analysis was performed, and associations with p<0,2 were included in the logistic regression model.

Results: Sex, educational level, marital status, income, employment status, household dimension and age were associated with obesity (p<0,05). Marital status and household dimension were excluded from the multivariate analysis model (p<0,05). Female sex (OR=1.38, CI 95% 1.07-1.77), having completed less than middle school (OR=2.23, CI 95% 1.55-3.19) and each additional year of age (OR=1.03, CI 95% 1.02-1.04) were associated with higher odds of obesity.

Conclusion: This study identifies socio-demographic characteristics that are determinants of obesity. Policies to promote healthier behaviors targeted to towards these populations groups are needed to better control the increasing prevalence of obesity-related morbidities and healthcare costs.

DOI: 10.18332/popmed/164632

Health of mothers: integration of oral health and tobacco control into antenatal care

Hyewon Lee¹, John Gannon^{2,3}, Sarah Forberger⁴, Sophia Thomas^{5,6}, Neetu Sinha^{7,8}

¹School of Dentistry and Dental Research Institute, Seoul National University, Republic of Korea, ²Department of Paediatrics, Galway University Hospital, Ireland, ³World Federation of Public Health, Ireland, ⁴Department Prevention and Evaluation, Leibniz Institute for Prevention Research and Evaluation, Germany, ⁵Ramalingaswami Centre on Equity and Social Determinants of Health, Public Health Foundation of India, India, ⁶World Federation of Public Health, ⁷National Health Mission, Karkinos Healthcare, India, ⁸World Federation of Public Health, India

This workshop aims to showcase how two WFPHA workgroups (oral health and tobacco control) collaborate to improve the health of mothers by integrating oral health and tobacco prevention/cessation into primary and antenatal care systems. Oral health is a neglected public health topic globally. The WHO recently reported that global case numbers of oral diseases have increased by 1 billion over the last 30 years, which is higher than cases of all five main non-communicable diseases combined. Women are the key change agents to secure and promote the oral health of communities and families. Mothers' oral health, knowledge, and behaviors can influence children's oral health. Therefore, pregnancy is a window of opportunity to intervene in tobacco prevention and cessation. There is no safe level of fetal tobacco exposure. Research showed that maternal tobacco use during pregnancy approximately doubled the risk of stillbirth and congenital defects and increased the incidence of prematurity and low-birth-weight infants. There is expert consensus that pregnant women who use tobacco should be counseled about cessation from the first trimester. Concern for the fetus combined with regular clinician interaction results in a greater efficacy of tobacco cessation interventions during pregnancy compared to other times. In this workshop, an analysis of the integrative approach for maternal oral health and tobacco cessation will be demonstrated in the India context. About two-thirds of pregnant women have active dental caries, and almost 90% of adults have periodontitis. Tobacco use among women, especially pregnant women, is a significant public health problem in India, with 7.5% of pregnant women being tobacco users. The Indian national oral health strategy will be published next year with a heavy emphasis on tobacco cessation, and the Indian government has rolled out the Ayushman Bharat (health and wellness centres) initiative, with oral health highlighted throughout the plan. However, there is room for improvement in emphasizing how oral health and tobacco control can be integrated into existing ANC systems, focusing on implementation and evaluation. WFPHA collaborated with the public health foundation of India to support the effective integration of oral health and tobacco control programs into ANC, and the workshop will demonstrate the analysis process. WFPHA aims to perform a scoping review to identify existing national and international maternal tobacco prevention and cessation frameworks and/or recommendations to analyze them concerning the following points: (a) common core elements in those frameworks (scientific evidence, addressed workforce, best practices, etc.), (b) differences based on contextual variation, (c) jurisdiction and legal quality. Not all maternal health and oral health strategies and clinical guidelines include straightforward tobacco prevention and cessation strategies specific for women of childbearing age for primary care and dental providers to adapt in clinical practice. Furthermore, national maternal tobacco control strategies are highly diverse between countries in terms of context, practice, and targeted healthcare workforce. This scoping review and analysis aim to understand the core elements of maternal tobacco control frameworks, which can be used for the future development of maternal tobacco control frameworks and mutual learning between countries.

DOI: 10.18332/popmed/165234

The evolving chronic disease landscape: lessons for the post-pandemic world

Tatjana Makovski¹, Shehzad Ali², Kathryn Nicholson², Saverio Stranges²¹French National Public Health Agency, France, ²Western University, Canada

Background: The COVID-19 pandemic has had a major impact on people living with multiple chronic disease (multimorbidity), has reduced the ability to prevent disease via screening, has disrupted disease management, and has exacerbated health inequities. We propose a workshop to discuss the evolving chronic disease landscape, by providing three case-studies from diverse geographic locations, with a focus on multimorbidity, avoidable hospitalizations from chronic disease, and the role of social determinants of health. Objectives and key questions: Our objective is to discuss major public health challenges in chronic disease and lessons for the post-pandemic transition. Specifically, the workshop will address the following key questions: 1) what is the potential long-term impact of the pandemic among people living with multimorbidity? 2) what is the role of social determinants of health in avoidable hospitalizations from chronic disease? 3) how can we improve surveillance of multimorbidity using multiple data sources? Case study 1: multimorbidity and the risk of sars-cov-2 infection and post-covid-19 condition in France. Population data on SARS-COV-2 infection and its prolonged symptoms is limited among multimorbid patients. Here, we present the risks of SARS-COV-2 infection and post-COVID-19 condition, among individuals living with multimorbidity, using data from a large, randomly selected, representative sample of the adult French population. The interaction between multimorbidity and COVID-19 will be discussed. Case study 2: millions of hospital admissions are avoidable: the role of chronic conditions and social determinants of health in the United States. The rate of avoidable hospitalizations, for conditions that can be treated in primary care, is an important indicator of health system performance. We use the US National Inpatient Sample (2015-2020), to investigate the association between avoidable hospitalizations and chronic conditions, income, race and hospital region. Findings of this study can help develop targeted policies to improve primary care supply and quality to reduce avoidable hospitalizations from chronic conditions. Case study 3: surveillance of multimorbidity using multiple data sources: a Canadian perspective. Multimorbidity has been acknowledged as a burden for health care systems for many years, but the COVID-19 pandemic highlighted the fact that multimorbidity can result in a vulnerable general population. This study will present the epidemiology and surveillance of multimorbidity through the use of common operational definitions, a national health survey dataset (Canadian Longitudinal Study on Aging) and a national electronic medical record dataset (Canadian Primary Care Sentinel Surveillance Network). These findings will be compared to international literature and approaches to supporting individuals living with multimorbidity will be highlighted.

DOI: 10.18332/popmed/165746

The role of law and human rights in promoting healthy diets to prevent NCDs: the experience of East Africa

J. Mwangi¹, Brigit Toebes², Maria Campisi³, Florence Tushemerirwe⁴, David Patterson⁵, Brigit Toebes²¹Jomo Kenyatta University of Agriculture & Technology - Karen Campus, School of Law Kenya, ²Aletta Jacobs School of Public Health, The Netherlands, ³International Development Law Organization (IDLO), Italy, ⁴Makerere University Uganda, ⁵Groningen Centre for Health Law Netherlands

Outline: Despite its adoption by the World Health Assembly in 2010, no country has comprehensively implemented the WHO set of Recommendations on the Marketing of Foods and Non-Alcoholic Beverages to Children. Furthermore, although some 50 countries apply fiscal policies to reduce consumption of sugar-sweetened beverages (SSBs), the measures are sometimes formulated in ways that some products with high sugar content are not covered by the regulations. Nutrition labelling is implemented by many countries in all regions, however not all have mandatory nutrient declarations in line with Codex guidelines, and national food labelling standards. Moreover, few countries have embarked on front-of-pack labelling. Reformulation of food products to contain less salt, salt and oil is becoming increasingly common, but most often it is voluntary rather than mandatory. Many countries lack the technical capacity and political will to introduce appropriate regulatory and fiscal measures to address NCD risk factors. Objectives: This workshop will examine the role of the law in promoting healthy diets from three perspectives. First, state obligations under international law will be examined. Second, the experience of a legal and public health capacity-building project in three countries in East Africa (Kenya, Tanzania, Uganda) will be presented. Third, the recent experience of one country (Uganda) will be discussed.

Key Questions

What is the role of international law in addressing the risk factors for noncommunicable diseases, notably unhealthy diets? How is law relevant to advancing the right to health in low and middle-income countries? How can civil society organizations participate in developing policies to address NCDs? How can human rights-based approaches be applied in practice to NCD prevention?

Popul. Med. 2023;5(Supplement):A1571

DOI: 10.18332/popmed/163662

The integration of occupational medicine and public health to improve cardiovascular health in the workplace and community

Saverio Stranges¹, Nicola Magnavita², Giuseppina Affinito³, Veruscka Leso⁴, Franca Barbic⁵¹Department of Epidemiology and Biostatistics, Schulich School of Medicine & Dentistry, Western University, Canada, ²Department of Science of Woman/Child & Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ³Department of Public Health, University "Federico II" of Naples, Italy, ⁴Department of Public Health, University Federico II, Naples, Italy., ⁵Humanitas University, Pieve Emanuele, Milan Italy, Humanitas University, Department of Biomedical Sciences, Via Rita Levi Montalcini 4, Pieve Emanuele, Milan, Italy

Background: Occupational Medicine is an integral component of Public Health aimed at preventing mortality, morbidity, and disability burden attributable to occupational risk factors. Minimizing exposure to cardiovascular risk factors in the workplace, in line with the recent model of "Total Worker Health", may improve health and safety of workers, their families and community. The workplace represents an extraordinary powerful "milieu" for creating and developing health promotion programs in keeping with Public Health policies.

Objectives and Key Questions

To evaluate how the control of cardiovascular risk factors in workplaces may reduce morbidity and mortality in the community. To evaluate how the integration of Occupational Medicine and Public Health may improve cardiovascular prevention in the population at large.

INTRODUCTION (Stranges and Barbic) (5 minutes).

Assessment of Cardiovascular Risk in Workplace and Community: Role of New Risk Algorithms and Artificial Intelligence (Giuseppina Affinito).

Cardiovascular disease (CVD) is one of the most prevalent causes of long-term sickness and absenteeism in the workplace. The working environment can expose workers to elevated physical and psychological work stress, which is related to an elevated risk of CVD and consequent working disability. Therefore, to quantify the interplay between the workplace and health, a new algorithm was developed to estimate the risk of a diagnosis of unsuitability for work due to CVD.

Sleep, Violence, Stress, and Cardiovascular Risk Prevention in the Workplace. (Nicola Magnavita)

Workers' health surveillance offers the opportunity to conduct health promotion interventions in the workplace which, with low-level resources, can achieve significant improvements in health. This study presents some experiences conducted in the last 10 years by our occupational health unit which demonstrate the effectiveness of workplace health interventions. Sleep health promotion, prevention of workplace violence, and reduction of work-related stress are associated with low levels of cardiovascular risk factors and metabolic syndrome. Public Health Approaches to Prevent Cardiovascular Disease in the Workplace (Saverio Stranges)

Evidence suggests that health interventions in the workplace may generate wide-ranging benefits by improving cardiovascular risk factor profiles and preventing cardiovascular disease among workers. This presentation will discuss current evidence from randomised controlled trials, cluster randomised trials, quasi-experimental and observational studies of workplace interventions to assess their effectiveness and feasibility to improve cardiovascular risk factors among workers and prevent cardiovascular disease in the population at large.

Occupational Medicine and the Total Worker Health®: From Workplace Risk Assessment and Management to Workers' Well-Being Promotion (Veruscka Leso) The National Institute of Occupational Safety and Health developed the Total Worker Health® (TWH), defined "as policies, programs, and practices that integrate protection from work-related safety and health hazards with promotion of injury and illness-prevention efforts to advance worker well-being". The TWH model will be presented and the role of occupational physicians in preventing cardiovascular diseases that have a significant impact on Public Health will be discussed. Indeed, addressing modifiable CVD risk factors by structured health promotion interventions in workplaces represent a powerful opportunity to obtain benefits in terms of both occupational and public health.

INTERACTIVE DISCUSSION (15 minutes)

Holding us back? tackling inequalities in the detection and treatment of structural heart disease in Europe

Arunima Himawan¹, Lily Parsey²

¹International Longevity Centre UK Fulltime staff member "International Longevity Centre UK Vintage House 36-37 Albert Embankment London SE1 7TL" United Kingdom, ²International Longevity Centre UK, United Kingdom Workshop Outline

Across many European countries, inequalities in the detection and treatment of Structural Heart Disease (SHD), such as geographic and gender inequalities exist. And there is also evidence of widespread ageism. Such inequalities are hampering progress and holding us back. Indeed, across 11 European countries, a study found that SHD occurs more frequently in women than in men, yet women are less likely to regularly receive a heart check with a stethoscope by their GP, (24.1% vs 31.3% respectively). Despite this, there is very little policy focus on tackling inequalities in the detection and treatment of SHD. With the Healthier Together EU Initiative on Non-communicable diseases, and the forthcoming EU Joint Action on Cardiovascular disease and Diabetes as part of the EU4Health programme, there is an important opportunity to raise the profile of SHD and reduce its growing burden in an ageing society. In this workshop, we will present the findings and policy recommendations of our publication: Holding us back? Tackling inequalities in the detection and treatment of structural heart disease in Europe, supported by Edwards Lifesciences. Following the presentation, we will then open the floor to the audience (which will be moderated by the Chair) to engage in a meaningful dialogue on the barriers and opportunities to reducing the SHD burden.

Specific Aims/Objectives: While most types of SHD can be successfully treated, it receives very little policy attention. The key aim of the workshop is to engage with key stakeholders at the forefront of academia, global health policy, and science and medicine, to identify what still needs to happen to reduce inequities in the detection and treatment of SHD across Europe. Our objectives include: 1. Raising the profile and shining a light on the growing burden that SHD places on our society and especially, the heavy toll it places on certain marginalised and underserved populations. 2. Engaging with a diverse group of stakeholders on the barriers and opportunities to reducing inequities in the detection and treatment of SHD and identifying how we can engage world leaders and leading public health policy makers on the importance of tackling SHD in an ageing society. 3. Take the key lessons learned from the workshop to enhance our engagement activities and develop a targeted dissemination plan to ensure we are influencing the right people and engaging in the right conversations.

Key Questions

1. What are the barriers and opportunities to reducing inequities in the detection and treatment of SHD? 2. What needs to happen to engage world leaders and leading public health policy makers on the importance of tackling SHD in an ageing society? 3. What examples of good practice can you share that you think would help shrink inequalities in the detection and treatment of SHD that should be adopted in other countries? As part of the SHD Coalition, ILC-UK will leverage its expertise to ask the audience the right questions to ensure we are identifying the gaps in our knowledge and understanding and looking for robust solutions.

Workshop on the sustainability of chronic care programmes with a focus on providers' acceptance during programme development and implementation

Larisa Pilic¹, Dr. Redaélli², Lisa Giesen³, Larisa Pilic⁴

¹Institut of General Medicine, University Hospital of Cologne "Kerpener Str. 6250937 Cologne Germany, ²Institute of Health Economics and Clinical Epidemiology, University Hospital of Cologne, Cologne, Germany, ³Institute of Health Economics and Clinical Epidemiology, University Hospital of Cologne, ⁴Institut of General Medicine, University Hospital of Cologne Kerpener Str. 6250937 Cologne Germany

Brief outline of the overall workshop: This workshop will provide a status-quo of German chronic care programmes (CCP) and interactively address their challenges, focussing on providers acceptance, as well as on options to ensure the sustainability of CCP. In Germany, the first CCP (referred to as "disease management programmes (DMP)") were implemented more than 20 years ago, culminating in currently six ongoing DMP for diabetes type 1 and type 2 (T2D), coronary heart disease (CHD), chronic obstructive pulmonary disease, bronchial asthma and breast cancer. Among these, the DMP T2D has the highest number

of enrolled patients, followed by the DMP CHD. The enrollment and treatment of patients in the DMP in Germany are mainly carried out by family doctors, which are supported by health assistants. Currently, it is planned to extend the existing DMP for T2D and CHD by self-management interventions, based on internationally deployed chronic care models. Furthermore, additional DMP for other chronic conditions are planned to be implemented. Within a regional innovation project we are conducting an exploratory mixed-method-study, which identifies positive and negative aspects, impacting the sustainability of the current DMP for T2D and CHD from a family doctor's perspective. The findings of the initial qualitative study show differing perceptions regarding individual DMP. While family doctors evaluate the DMP T2D positively, the DMP CHD is considered less effective. As a result, some of the respondents tend to enroll less patients into the CHD programme, or consider to stop its provision. These results will be presented in the workshop and discussed in an international context. The target group of the workshop are international experts with experience in the implementation and/or provision of CCP.

Specific aims/objectives and component parts

This workshop will start with a keynote speech on the actual status of CCP for T2D and CHD in Germany, setting them into the international context of CCP and the latest research on their challenges. Furthermore, it will share knowledge on various factors affecting provider's acceptance of DMP, such as family doctors and paramedical health workers, which is relevant for the overall sustainability of such programs. After the keynote speech, participants will discuss key questions in small groups and present their discussion outcome in plenary. Further Information of the workshop schedule and component parts are found in table 1. Table 1: Workshop Schedule

Workshop content additional information duration

Keynote speech Status-quo of CCP 10 min Introduction to group discussions and formation of groups Provision of handout with key questions 5 min Group discussions Maximal 5 participants per group 20 min Group presentations Presentation of discussion outcomes for 3-5 minutes per group 20 min Closing of the workshop Feedback 5 min

Key questions that the workshop will address

1) What are international experiences of factors increasing or decreasing the sustainability of individual CCP, with a special focus on providers acceptance? 2) How are the reported findings from Germany comparable with international experiences? 3) How can CCP be improved in order to ensure providers' acceptance and sustainability of such programmes?

Workshop on estimating burden of disease metrics - experiences from the German Burden of Disease Study

Annelene Wengler¹, Elena von der Lippe¹, Alexander Rommel¹, Michael Porst¹, Aline Anton¹, Annelene Wengler¹

¹Robert Koch Institute Germany

Summary measures of population health have become key metrics for quantifying the burden of disease (BoD). These include the BoD metrics YLL (years of life lost due to mortality), YLD (years lived with disability) and their total the DALY (disability-adjusted life years). They can be used to identify the importance of specific diseases and injuries with regard to population health. DALY combine information on mortality (YLL) and morbidity (YLD) by quantifying the deviance between the actual health of the population compared to an ideal health state, allowing population health to be assessed in a consistent and comparable manner. As BoD estimates become more popular in Europe and Germany in particular, methodological questions arise and first results become available. BoD metrics can be used to identify the sex and age specific leading causes of disease or injury and the contribution of mortality and morbidity to the disease specific burden. Moreover, the relative importance of specific risk factors can be quantified, as each metric can be linked to metabolic, behavioral, and environmental risk factors. This demonstrates the great importance of BoD estimates for national and local policy decision making, especially when it comes to the planning and monitoring of prevention programs. Nevertheless, the BoD methodology is complex and highly data intensive, particularly regarding the requirements for data on deaths (mortality) as well as prevalence, severity, and duration (morbidity) by disease. Each estimation process requires several small-scale decisions regarding data handling, operationalization, and statistical analysis. Hence, this workshop will focus on the different methodological challenges when calculating both the fatal (YLL), the non-fatal (YLD) as well as the attributable burden due to risk factors. On the one hand, the workshop will foster exchange on methodological questions and challenges related to calculating the BoD. On the other hand, we will discuss results on YLL, YLD, and DALY that have been obtained so far. As an

example, we want to discuss results that have already become available through the German BoD study BURDEN 2020 and through the work of other researchers in the field. The workshop shall be a platform for BoD researchers, including those just starting off and those who are already experienced.

The compliance status of tobacco control law (TCL) in Bangladesh: approach in a private university setting

Nasrin Akter¹, Bilkis Banu¹, Sujana Chowdhury², Tahsin Tabassum³, Sarder Hossain²

¹Northern University Bangladesh, Dhaka, Bangladesh, ²Northern University Bangladesh, Bangladesh, ³East-West Medical College, Bangladesh

Implementation of national tobacco control law (NTCL) in the university settings was found very poor in Bangladesh. This study aimed to depict the compliance status of the tobacco control law (TCL) of Bangladesh following the university setting approach. This cross-sectional study was carried out based on descriptive including a mixed method approach, among the 385 students (quantitative method), 10 teachers, and 10 administrative staff (qualitative method) of Northern University Bangladesh. Quantitative and qualitative data were collected through face-to-face and In-Depth Interviews (IDI) Methods. The ethical issue of the study was conformed according to the Declaration of Helsinki. Data analysis was done through both descriptive and inferential statistics. Logistic regression analysis was performed followed by a modeling procedure to find out the determinants for the non-satisfactory compliance on TCL. The study revealed non-satisfactory compliance with TCL among 56.4% of subjects who were strongly supported by the outcomes from the qualitative approach. Predominant non-satisfactory compliance was found to explore the conditions of buying and selling tobacco (78.4%), pasting no-smoking signage (3.2%), anti-tobacco advertisement within the university (34.8%), and specific university policy to implement NTCL. Poor compliance was found significant among the younger aged (≤ 21 years: COR/p=2.74/0.01; 95% CI: 1.27-5.92) 1st-year group (AOR/P=2.28/0.02; 95% CI: 1.15-4.49) who had moderate nicotine dependency (AOR/P=4.04/0.01; 95% CI: 1.28-12.74) and poor knowledge on TCL (AOR/P=3.57/0.02; 95% CI: 1.28-9.95). As a predictor, a significant influential group suggested family guidance (AOR/P=1.77/0.06; 95% CI: 0.97-3.22) as a sustainable way to minimize tobacco consumption and improve compliance status among university students. This study revealed a depressive scenario on the compliance status of TCL in all tiers of the selected university setting. As it is a unique exploration of individual institutional compliance it might provide guidance to plan for sustainable intervention programs in order to improve compliance with TCL in university settings.

Access, affordability and barriers to cancer care in India: stories of patient journeys

Soumita Ghose¹, Soumitra Datta^{2,3}

¹MPH Global Health, Tata Medical Center, India, ²MRC Clinical Trials Unit, Institute of Clinical Trials and Methodology, University College London, United Kingdom, ³Tata Medical Center, India

Background and objective: Cancer burden versus resources are inequitably distributed in low and middle income countries. Access and affordability to oncology services are limited for the majority of rural and semi urban India. This contributes to late presentation and poor outcome. The present qualitative study aimed at gaining a deeper understanding of patient experiences, social barriers and facilitators of care seeking in Indian cancer patients. The study attempted to identify treatment-seeking pathways of patients and explore reasons for delays and roadblocks. **Methods:** In this is a cross sectional qualitative study, using in-depth interviews, purposive sampling was used with proportionate representation of all common cancer types. The interviewers had access to an interview guide that acted as an aide-memoire to help the interview process but we progressively enquired newer areas brought up in earlier interviews till data saturation was reached. Data was analyzed using the qualitative content analysis frame work. **Results:** Cancer patients (n = 100) and caregivers (n = 48) were interviewed. In depth interviews generated data covering patient's perspectives about healthcare facilities, views on quality of care received, perception related to direct and indirect costs of care and overall impact of cancer on the broader lives. Major themes emerging were related to a) journey of patients to access care, b) psychological trajectory of patients, c) stigma d) decision making and adherence to treatment, e) economic costs and its impact and f) modifiers to accessing cancer care. Barriers and enablers of access to cancer care were identified.

Conclusions: Planning and policymaking in the future of cancer care delivery need to consider the views expressed by the cancer patients and their caregivers as regards to access, adherence and disruptions to cancer care in India. Future policies will hopefully address some of the difficulties faced by patients.

Assessment of surgical, anaesthesia and obstetric workforce providers in Somalia

Mohamed Omar¹

¹University of Somalia, Somalia

Aims: To determine the number and distribution of surgical anaesthesia and obstetric (SAO) care providers (both qualified and practitioners); and to establish the patient SAO care provider ratio in Somalia. **Methods:** Cross-sectional study design using quantitative data. The study was conducted in health facilities of 2 Administrative zones of Somalia (Northeast known as Puntland and South/central). The Surgical Assessment Tool (SAT).

Results: 55 health facilities participated. The results indicate that most of the SAO providers were in the Benadir state (57%) (Puntland (13%), Southwest (10%), Galmudug (8%), Jubaland (7%), and Hirshabelle(5%)). Most SAO providers were midwives (309) (MBBS providing surgery 127, nurse anaesthesia 89, foreign provider 82, consultant surgeon 67, O&G consultant 54, MBBS providing anaesthesia 49, biomedical 34, orthopaedic consultant 26). Other SAO providers were consultants from the following specialities: radiology, ENT, anaesthesia, and ophthalmology, urology, pathology, neurosurgery, cardiothoracic, cardiology and paediatric surgery. Finally, there was no consultant SAO providers from the following specialities: oncology, gastroenterology, or paediatric anaesthesia. The highest number of SAO providers worked in urban areas (874), whilst rural SAO providers numbered 75. All the states in Somalia had a lower SAO provider: population than the goal of 20 SAO providers for every 100,000 persons set by the Lancet Commission on Global Surgery. Benadir had the highest SAO provider: population (16:100000) followed by Puntland (7:100000), Jubaland (5:100000), Hirshabelle, and Galmudug (3:100000) and South West (2:100000). It is worth noting that the Benadir region is a capital, Mogadishu. The national average was 6:100000. The actual number of health employees (of all types) in Somalia is unknown. **Conclusions:** This study demonstrates that there is a deficiency in Somalias SAO workforce and that it is still a neglected topic. Currently, the workforce required to meet the needs of the population is not present.

A systematic review on frugal tele-otoscopy for low resource settings

Christoph Buhr^{1,2}, Andrew Blaikie³, Katharina Bahr-Hamm¹

¹Department of Otorhinolaryngology, Johannes Gutenberg University, Mainz, Germany, ²School of Interdisciplinary Studies, University of St Andrews, St Andrews, Scotland, ³School of Medicine, University of St Andrews, St Andrews, Scotland, United Kingdom

The implementation of telemedicine disrupts medical care and provides great opportunities for low resource settings. However, expensive diagnostic equipment is hampering the adoption of telemedicine on a larger scale. Frugal innovations achieving cost reduction while maintaining functionality with a high-performance level might solve this issue. This study provides a review on frugal tele-otoscopy suitable for low- and middle-income countries. A systematic review was conducted on basis of the PRISMA 2020 flow diagram for new systematic reviews. The National Library of Medicine (NLM), the Web of Science Core Collection (WoS), Scopus (Scopus) and the Cochrane Library (CochraneLibrary) were scanned for different terms including "tele-otoscopy" and "telemedicine". After removing duplicates, the articles were scanned for Keywords like "cut-rate", "low price", "low resource", "low- and middle-income countries" or "reverse innovation" using Rayyan. The remaining abstracts were screened, case reports as well as studies evaluating tele-otoscopy as study purpose and published after the year 2012 were included. None of the reviewed studies assessed a device meeting the criteria of a frugal innovation. Moreover, the term "frugal" does not seem to be established in the field of tele-otoscopy yet. However, versatile publications stated the potential of low cost tele-otoscopes for "at-home", rural and low resource settings. Despite the great potential for "at-home", rural and low resource settings, studies evaluating frugal otoscopy devices are lacking. This study provides the first systematic review on frugal tele-otoscopy. This study is part of Dr Buhr's Masterthesis (MSc Digital Health St Andrews).

Strengthening the public health partnership and telehealth infrastructure to reduce health care disparities

Jie Chen¹, Merianne Spencer², Portia Buchongo²

¹School of Public Health, University of Maryland, United States, ²University of Maryland, United States

Background and Objective: The COVID-19 pandemic has underscored the urgency to focus on the essential value of public health systems (PHS) in fostering health equity across the U.S. healthcare delivery system. PHS integration and care coordination can be successfully achieved through Health information technologies (HIT) systems, while the impact of HIT on racial and ethnic health disparities is unclear. The objective of the study was to examine the association between PHS partnerships, telehealth-post discharge services, and racial and ethnic disparities in health care. **Methods:** The analysis used 2017 Centers for Medicare and Medicaid Services Medicare 100% inpatient claims data, the Medicare Beneficiary Summary File, the American Hospital Annual survey, and the American Community Survey. Our final sample size was 2,142,486, including 1,990,781 White, 151,705 Black, and 74,998 Hispanic community-dwelling Medicare fee-for-service beneficiaries aged 65 years and up who had at least one hospital visit in 2017. Outcomes of interest were total Medicare payments, the 30-day all-cause readmission rate, and the number of inpatient visits.

Results: Compared to those treated in hospitals with neither PHS partnerships nor telehealth-post discharge services, beneficiaries treated in hospitals with PHS partnerships encountered significantly lower Medicare payments and inpatient and readmission rates. Blacks encountered significantly lower cost, inpatient visits, and readmission rates when treated hospitals with PHS partnership and telehealth-post discharge services (coef=-0.051, p<0.001; IRR=0.982, p=0.007; IRR=0.891, p=0.003). **Conclusions:** Results demonstrated the importance of combining PHS partnership and telehealth-post discharge services to improve the efficiency of the healthcare delivery system and health equity. It is urgent to ensure that PHS has adequate funding and telehealth support, given the encouraging findings of our study.

Attitude and practice of medical students in Khartoum state toward advocacy as a core component of medical professionalism 2022

Fatima Mohammed¹, Abdelgadir Bashir¹, Tagreed Mohammed²

¹Faculty of Medicine, Khartoum University, Sudan, ²Faculty of Medicine, Ibn Sinna University, Sudan

Background and Objectives: Advocacy is a strategic, evidence-based process to promote human health by addressing social, economic, environmental and political determinants of health. Many medical organizations have declared advocacy as a core component of medical professionalism. The study aimed to determine the attitude and the practice of medical students in Khartoum state toward advocacy.

Methods: This study was a descriptive cross-sectional study at Khartoum State. Clustered sampling was used to select six universities, and stratified sampling was used to select an equal number of participants per batch. A simple random technique was used to determine study participants per university. We collected the data through a self-administered online questionnaire with six sections. The Statistical Package of Social Science (SPSS) 29 was used to analyze the data. We measured frequencies, percentages and univariate associations between demographics, attitude and practice scores, Kruskal Wallis H, Mann-Whitney U and Chi square tests to measure the associations between the different variables.

Results: We received a total of 473 responses. The median attitude score of health advocacy was 48.00, determinants of health advocacy were 35.00, advocacy inclusion in medical education was 22.00, and of practice was 2.00. Moreover, 42.9% of the participants agreed and 40.8% strongly agreed on including health policy in medical curriculum. Approximately 51% agreed and 52.4% strongly agreed that they should be engaged meaningfully in health policy development. Only 28.3% agreed and 12.7% strongly agreed on considering health advocacy as a future line. The most common advocacy barrier among medical students was lack of Knowledge, with 267 (56.4%) responses.

Conclusions: Medical students need to be well-empowered to excel as an advocate from the early stages of their medical studies. Medical schools and health policymakers should promote more for the importance of advocacy among medical students more and engage them meaningfully in their advocacy actions.

Exploring interventions to address unhealthy commodity industry

influence on policy

Adam Bertscher¹, Britta Matthes¹, Anna Gilmore¹, Krista Bondy¹, Michael Bloomfield¹, James Nobles², Amber Akker¹, Sarah Dance¹, Mateusz Zatoński¹
¹University of Bath, United Kingdom, ²Leeds Beckett University, United Kingdom

Background and Objective: Interventions are needed to prevent and mitigate unhealthy commodity industry (UCI) influence on policy, which poses a significant barrier to advancing effective policy. Whilst literature on interventions to address such influence is beginning to emerge, current conceptualisations may be incomplete as they fail to consider the wider systemic complexities surrounding UCI influence, such as industry adaptivity or its enabling factors. This study aims to apply a systems thinking lens to explore possible interventions that could help address UCIs influence on policy. **Methods:** A series of workshops were conducted between November 2021 and February 2022 with stakeholders from academia, industry monitoring groups, civil society, government, and intergovernmental organisations with expertise in UCIs. Stakeholders identified and discussed possible interventions to effectively address UCI influence on policy. Workshop data were coded and analysed using NVivo.

Results: A total of fifty-two stakeholders participated in twenty-three online workshops. Preliminary results collated 43 groups of interventions that aim to decrease: direct access to public sector decisionmakers; confusion and doubt about policy decisions; industry's ability to prioritise their growth and profits; industry's ability to leverage legal and dispute settlement processes; and industry's ability to leverage policymaking, norms, rules, and laws in their favour. In addition, stakeholders suggested leadership, and coordination and cooperation between stakeholders as key actions to achieve interventions. **Conclusions:** Workshops identified a disparate and heterogeneous range of interventions. The complexities surrounding UCIs influence suggest that interventions need to: work in concurrently in different parts of the system; apply to broad policymaking processes, not just particular industries; strengthen intermediary actions to achieve change; and target system structures, such as sources of corporate power beyond policymaking processes, which may be overlooked without a systems lens. Government, public health, and civil society actors could consider investing time and resources to support or advance these interventions.

Improving adolescents' cooking skills and food literacy in Portugal: a youth-led policy idea as a lifelong health-promoting strategy. The CO-CREATE European Project

Sofia Mendes¹, Ana Rito², Inês Figueira¹

¹Centre for Studies and Research in Social Dynamics and Health (CEIDSS), Portugal, ²National Institute of Health Dr Ricardo Jorge, Portugal

Background/Objective: Although young people are an important target group for health policies, there are few examples of adolescents themselves being included as active agents in formulating such policies. The engagement of adolescents in the EU CO-CREATE (CC) project was based on Youth-led Participatory Action Research with strong focus on the development of their own Policy ideas. We present one of the policy ideas developed by the adolescents and its relevance within the Portuguese context. **Methods:** Three Portuguese CC Youth Alliances (YA) were established with a total of 41 adolescents (15-18 yo) and activities included system mapping, data collection methods, advocacy training and photo-voice for the development of policy-ideas which were then discussed with relevant stakeholders in online or face-to-face Dialog forums.

Results: From the YA activities, the youth identified several challenges: 1) lack knowledge about food and nutrition as well as cooking skills 2) dislike for unattractive school meals 3) preference for unhealthy cheap food outside the school premises 4) need of nutrition training and education provided since early ages, at school setting. "To include nutrition and cooking contents in the curriculum of the Citizenship/ Civic Education subject in schools". From this main policy-idea an implementation and evaluation plan was built as a theoretical exercise that potentially could be used in a real-life context and applied in Portugal.

Conclusions: As the next generation of adults and decision makers, youth must be involved in shaping the current and future policies. As in Portugal Food and Nutrition Education in schools relies on voluntary guidelines and occasional school-based programs, the importance of integrating nutrition and food related contents in the school curriculum to promote healthier and sustained eating habits, as recognized and proposed by CC Youth, should be acknowledged and an opportunity to turn the youth-led policy-ideas into feasible and applicable action to effectively prevent obesity.

DOI: 10.18332/popmed/165202

Let's Control Flu: the use of gamification in health decision-making for flu vaccination. Application to new countries

Henrique Lopes¹

¹Catholic University of Portugal, Portugal

Background and Objective: The "Let's Control Flu" (LCF) is an interactive digital tool designed to simulate the impact of public health policies (PHP) on influenza vaccination coverage rates (VCR). It adopts a gamification approach to support decision-making processes on influenza vaccination by testing the relative effects of PHP in specific population segments and providing clues for the optimization of policy decision-making. It, therefore, helps to support the World Health Organization's milestone of having 75% of European target populations vaccinated against influenza by 2030. The application to the pilot country and the project's methodology were presented at the European Health Forum Gastein and World Health Summit conferences in 2022.

Methods: The LCF tool is the first quantitative research to apply Kassianos' model, utilizing 13 of the originally proposed 42 PHP while maintaining the 5-pillar structure. The tool creates scenarios within a 10-year time horizon demonstrating what could be averted in seven pre-determined outputs (influenza infections, hospitalizations, flu-related GP visits, workdays/productivity loss, flu-related deaths, hospitalizations due to cardiovascular diseases, and deaths due to cardiovascular diseases) in five key-target groups: children, elderly, pregnant women, healthcare workers, and high-risk populations.

Results: The tool was successfully applied to Sweden (<https://letscontrolflu.com> [1]). It is currently in expansion to regions in Italy and Germany, as well as to the Czech Republic, with the results of this phase being presented for the first time, if approved, at the 17th World Congress on Public Health.

Conclusions: Gamification is a useful approach to bridging the gap between science, policy-makers, and patient advocacy organizations, merging epidemiology and health policies in a single and democratic solution. Through digitalization, the LCF tool enables quicker and more secure decision-making in health policies and helps promote health education among populations, paving the way for a safer and healthier future for all (<https://vimeo.com/user129422763/review/751589991/dff2ecd410> [2]). Links:-----[1] <https://letscontrolflu.com/>[2] <https://vimeo.com/user129422763/review/751589991/dff2ecd410>

Food classification guidelines across Australia - concordance and implications of differences

Miranda Blake¹, Bettina Backman¹, Meg Adam², Jasmine Chan³, Josephine Marshall³, Emalie Rosewarne⁴, Gary Sacks⁵, Adrian Cameron⁵

¹Global Centre for Preventive Health and Nutrition (GLOBE), Institute for Health Transformation, Deakin University, Burwood, Australia, ²Institute for Physical Activity and Nutrition, Deakin University, Burwood, Australia, ³Institute for Health Transformation, Global Centre for Preventive Health and Nutrition (GLOBE), Deakin University, Australia, ⁴The George Institute for Global Health, The University of New South Wales, Australia, ⁵Global Centre for Preventive Health and Nutrition (GLOBE), Institute for Health Transformation, Deakin University, Australia

Background: Each Australian jurisdiction produces separate food and drink classification guidelines for different institutional settings (e.g., schools) to guide food service providers on what constitutes a nutritious offering. Australian food manufacturers, suppliers and retailers frequently report that it is challenging to align their product range with a multitude of different classification systems. This study aimed to investigate the concordance between guidelines from all Australian jurisdictions across various settings, based on their application to a range of packaged food and drink products.

Methods: Products from top selling brands in Australian food service settings across 10 product categories (e.g., sweet snacks) were classified according to each of the 20 state and territory food classification guidelines applying to schools, workplaces, and healthcare settings (primarily 'traffic light' classification systems). Product nutrition information was retrieved from manufacturer, supplier, or retailer websites. The level of concordance between each combination of two guidelines using a traffic light' based classification system was determined by the proportion of products rated as 'amber' across both guidelines.

Results: 747 food and drink products were assessed. 88% products were classified at the same level of healthiness across all 'traffic light'-based systems. Concordance in 'amber' food classifications ranged between 63% and 96% across guidelines for different jurisdictions. For school guidelines, 'ice creams and frozen desserts' had the highest concordance across guidelines (97%); 'meat and seafood products' had the lowest concordance (80%). Discrepancies mainly arose from differences in food categories included in guidelines, e.g., the 'ready-to-eat

meals' category was absent from some guidelines.

Conclusions: There is a need for national coordination and greater evidence-based consistency in food classification guidelines across Australian jurisdictions. This will help ensure clarity for businesses on how to better support community health, including food manufacturer product development and reformulation, and food outlets offerings.

Generating political priority for domestic alcohol policy reform: a framework to guide advocacy and research

Louise Signal¹, Ryan Gage¹

¹University of Otago, New Zealand

Background and Objective: Effective policies to reduce harm from alcohol include restricting its marketing and availability and increasing its price. However, political will to enact these policies is low in many jurisdictions. Advocacy and research at global, national and local levels are crucial to progress alcohol policy change. Yet, the challenges and levers for influencing political will remain poorly understood. We aimed to identify the key barriers and strategies to enhance political priority for domestic alcohol policy reform using a mixed method approach.

Methods: Data came from a scoping review and 37 key informant interviews. Thematic analysis was used to identify the key barriers and strategies to generate political priority for alcohol policy.

Results: 52 articles met the inclusion criteria. Study authors and interviewees described the drivers of political will as complex, interrelated and context-dependent. Nonetheless, several strategies were viewed as important for influencing alcohol policy. Key challenges included the lack of an internationally binding treaty to support domestic policymaking, industry actions (e.g. lobbying), limited capacity of alcohol policy advocates and limited civil society involvement. Key strategies included working towards an internationally binding treaty, similar to the Framework Convention on Tobacco Control, framing around the public health harms of alcohol consumption, network building and exposing industry tactics. Several promising strategies were unspecific to alcohol, e.g. combined action to tackle the involvement of unhealthy commodity industries in policymaking. **Discussion:** The findings reveal a set of strategies that could assist advocates and researchers in influencing political will for alcohol policy reform. Two different types of strategies were identified: i) those targeting upstream policy changes to level the playing field between industry and alcohol policy advocates, and b) those seeking to enhance the effectiveness of advocates themselves.

Popul. Med. 2023;5(Supplement):A1586

DOI: 10.18332/popmed/165421

Immunisation: Time to consider new preventative solutions beyond vaccines

Catherine Weil-Olivier¹, Catherine Weil-Olivier¹, David Salisbury², José Navarro-Alonso³, Chrysoula Tziaila⁴, Yan Zhang⁵, Tobias Tenenbaum⁶, Susanna Esposito⁷, Fabio Midulla⁸

¹Paris VII University, France, ²Programme for Global Health, Royal Institute International Affairs, Chatham House, United Kingdom, ³Ministry of Health, Spain, ⁴Paediatrics and Nursery Department, Voghera Civil Hospital, Italy, ⁵National Institute for Viral Disease Control and Prevention, Chinese Centers for Diseases Control and Prevention, China, ⁶Clinic for Child and Adolescent Medicine, Sana Hospital Lichtenberg, Germany, ⁷Department of Medicine and Surgery, Pediatric Clinic, Pietro Barilla Children's Hospital, Italy, ⁸Department of Pediatrics and Pediatric Neuropsychiatry, Sapienza University of Rome, Italy

Background and Objective: The pace of innovation is accelerating and new preventative technologies for infectious diseases are emerging to address unmet medical needs. Most imminent is the use of long-acting monoclonal antibodies (mAb) to prevent Respiratory Syncytial Virus (RSV) lower respiratory tract infection in infants during their first RSV season. Innovative products, such as prophylactic mAbs may challenge existing legislative and regulatory immunisation categorization schemes. Indeed, due to the lack of precedent mAbs for prevention of broad populations, uncertainty remains in the assessment of upcoming prophylactic RSV mAbs, which, in some countries, are categorized neither as a treatment nor as a vaccine, with associated consequences in terms of registration, recommendation, funding, and implementation.

Methods: These findings are based on views and insights gathered from 9 global experts (EU, Japan, China, UK) during an advisory board held in July 2022 to discuss RSV prevention strategies, completed by a desk research.

Results: Beneath the umbrella of immunization, active and passive immunization exist, which differ in mechanism of action but serve the same public health

purpose. As such, the legislative and regulatory categorization of preventative solutions should not be dictated by what the product is, in terms of technology or mechanism of action, but rather by what the product does, in terms of impact on healthcare systems and population. By terminology, prophylactic mAbs work as passive immunisation and should fall under the remit of National Immunisation Technical Advisory Groups or other relevant recommendation bodies for inclusion into National Immunisation Programs, to facilitate equitable access and maximize the public health impact through high uptake.

Conclusions: Current regulations, policy and legislative frameworks need to evolve to embrace innovative preventative technologies to allow their inclusion into routine immunization programs and recognize them as immunisation tools in our regulatory and access pathways.

How is the EU implementing the tobacco products directive ban on characterising flavours in cigarettes and roll-your-own tobacco?

Constantine Vardavas¹, Zinovia Plyta¹, Alexander Vardavas¹, Ioanna Lagou¹, Anastasia Manta¹

¹School of Medicine, University of Crete, Heraklion, Greece

Objectives: The European Union (EU) Tobacco Product Directive (TPD) prohibits the sale of boxed cigarettes and roll-your-own (RYO) tobacco products with characterising flavors (Directive 2014/40/EU, Article 7). The EUREST-FLAVOURS projects goal is to provide the European Commission (EC) with scientific and technical expertise to assist in the methodology specifications on whether tobacco products impart a clearly noticeable flavor other than tobacco.

Methods: Regulatory implementation strategies for fully implementing Article 7 of the TPD include the entry into force of two Commission Implementing Acts, the formation of an Independent Advisory Panel, the formation of a Technical Group of Sensory and Chemical Assessors, and, finally, the establishment of uniform rules and Methodology to support whether or not a tobacco product has a characterising flavor-the latter two processes facilitated by the EUREST-F.

Results: The methodology for determining whether a tobacco product has a distinguishing flavor other than tobacco that is "clearly noticeable" is based on a comparison of sensory profiles of test products through descriptive profiling and rank rating and that of reference products, and is supplemented, as needed, by a chemical assessment of the product composition properties. In 2023 a similar methodological approach will be applied by EUREST-FLAVOURS to support the regulatory decisions for Heated Tobacco Products.

Conclusions: The EU TPD Article 7 is among very few policies regulating tobacco product flavours globally to have banned characterising flavours. An understanding of the policy implementation strategies and methodology for determining whether a product possesses a characterising flavour has significant public health policy implications in the EU and beyond.

Impact of advocacy towards integrating nursing into National Surgical Obstetric Anesthesia Policy in LMICs: Nigeria perception

Olubunmi Lawal-Aiyedun¹, Hayat Goma², Ifeoma Okoro³, Njoku Prisca⁴

¹Lifebox Foundation, Nigeria, ²Nursing Sciences Department, Faculty of Allied Health Sciences, College of Medical Sciences, Ahmedu Bello University, Nigeria, ³March Health Care Initiative, Bwari General Hospital, Abuja, Nigeria, ⁴National Hospital Abuja, Nigeria

The Lancet Commission (2015) revealed that 5 billion people and 1.7 billion children below the age of 15 years worldwide do not have access to safe, affordable surgical obstetric, trauma, and anesthesia services when needed, a major public challenge. Most of these people and children live in Low and Middle-Income Countries (LMICs) as such there was the launch of the National Surgical Obstetric Anesthesia Plan aimed at promoting and supporting quality, safe and timely surgical healthcare strengthening in LMICs. However, all the countries that have the plan either at the planning or implementation stage do not have nursing integrated into the nomenclature except for Nigeria.

Methods: The Nigerian National Surgical Obstetric Anesthesia and Nursing (NSOANP) plan (2019 - 2023) included nursing from the inception at all levels of the policy in the spirit of leaving no one behind.

Results: Nigerias surgical plan included nursing and children's surgery: the two key elements that have been neglected in the LMICs national surgical plan, making Nigeria the first and the only country that integrated nursing into their surgical plan driven by the power of consistent and well-structured advocacy. The pilot implementation started in 2020, supported by a Non-Governmental Organization driving the essence of galvanizing synergy for public health interest. Now, Nurses

have been trained in safe operative care, and research and are also involved in the electronic registry for orofacial cleft.

Conclusions: Advocacy is the actual process of supporting a cause. It is the nub of healthcare system transformation, which seems to be neglected in the clinical space but serves as a critical and effective tool to create change. To achieve the goal of prioritization of nursing and children's surgical care, Advocacy is a core driver and key element to bring to bear a change in the surgical ecosystem.

Evaluation of the Philippine National Unified Health Research Agenda 2017-2022

Reneepal Sales¹, Krizelle Fowler¹, Joseph Oraño¹, Juan Camacho¹, Kathryn Burgonio¹, Allen Gonzales¹, Lynnell Ong¹, Krizell Ngipol¹, Kevin Cavan¹, Kristine Alvina¹, Miguel Dorotan¹

¹Alliance for Improving Health Outcomes, Quezon City, Philippines

Background: The 58th world health assembly in 2004 and the 2008 Bamako call to action emphasized the use of evidence as an essential priority to achieve health equity. The attainment of high-quality research begins with a strong national health research system that generates, disseminates, and uses evidence. Research agendas have been shown to maximize the efficiency and effectiveness of research investments, strengthen health research systems, and harmonize research priorities across stakeholders. Despite recognition of research agendas as an important tool for health improvement and resource optimization, most of these do not include an evaluation plan. First published in 2006, the Philippine national unified health research agenda (NUHRA) is intended to guide national health research activity, generate research support, and promote the translation of research into practice. The NUHRA 2017-2022 was informed by international, national, and regional research priorities. This evaluation aimed to provide data for its implementers for decision-making, implementation improvement, and subsequent research agenda formulation.

Methods: The evaluation applied a mixed method approach with a triangulation convergence model. An evaluation plan was developed based on a literature review of global research agenda evaluation literature and policy review of NUHRA implementation. Secondary quantitative data collection focused on research output metrics from all regions of the Philippines. Primary data was collected through 40 key informant interviews of national and regional health research council members, NUHRA implementers, and researchers. Data will be analyzed through descriptive and thematic analysis using an abductive approach. Results and Discussion: This project evaluated the NUHRA 2017-2022 using secondary data from regions and interviews with research stakeholders across regions and members/nonmembers of research consortiums. The findings emphasize the importance of mobilizing resources for research, a robust monitoring system to maintain relevance of research priorities, and improving the relationship between researchers and policymakers to facilitate evidence-based decision making.

Rewriting/Re-Righting first nations, métis, and inuit public health research in Canada: a commentary of the public health agency of Canada's maternity experiences survey

Isabelle Choon-Kon-Yune¹, Arielle Perrotta², Jennifer Leason², Erin Davis²

¹Western University Canada, ²University of Calgary, Canada

The Public Health Agency of Canada (PHAC) population health research frameworks rely on aggregated statistics, which perpetuates generalized stigma and fails to address differences and disparities within racial/ethnic groups. In particular, Indigenous peoples in Canada disproportionately experience poorer health outcomes in comparison to the general population, with health disparities such as cardiovascular disease, substance abuse, mental health, and reduced life expectancy being attributed to the lasting effects of colonialism. In addition to young and growing Indigenous demographics, there is a need to address Indigenous maternal-child health disparities. In 2009, the PHAC released the Canadian Maternity Experiences Survey to provide evidence-based recommendations for improvements in maternity care, and maternal and infant health. In alignment with Truth and Reconciliation Commission's Calls to Action, proposed efforts to focus on indicators such as infant mortality, maternal health, mental health, and availability of appropriate health services are essential. Moving forward, perinatal health research should thus consider engaging directly with Indigenous communities and other stakeholders such as birth partners, Elders, and health care workers to develop a more robust understanding of the current state of Indigenous health. The presentation analyzes PHAC's models for public health engagement to identify gaps in both understanding and creating effective

strategies to improve the overall health outcomes in Indigenous communities. The incorporation of Indigenous epistemologies and ontologies recognizes that Indigenous peoples have the knowledge best suited to address the concerns of their communities and is therefore integral in producing research that is culturally relevant and representative of their needs. Although the credibility of Indigenous methodologies are continuously scrutinized against Western methodological standards, the presentation challenges frameworks rooted within quantitative, epidemiological, and economic research methods that fail to address health disparities between Indigenous and non-Indigenous communities in Canada.

Birth and death registration: qualitative exploration of barriers and gender differences in selected locations in Bangladesh

Mrittika Barua¹, Avijit Saha², Muhammad Mannan³, Jahedul Islam³, Shahrear Alam², Protyasha Ghosh³, Saima Mehjabeen⁴, Syeda Ahmed⁴, Sayema Akter⁵, Moyeen Uddin⁶, Nazrul Islam⁷, Anushka Mangharam⁸

¹BRAC James P. Grant School of Public Health, BRAC University Assistant Professor Bangladesh, ²BRAC James P. Grant School of Public Health, BRAC University, ³BRAC James P. Grant School of Public Health, BRAC University Research Assistant Bangladesh, ⁴BRAC James P. Grant School of Public Health, BRAC University Senior Research Associate Bangladesh, ⁵BRAC James P. Grant School of Public Health, BRAC University Lecturer Bangladesh, ⁶Data for Health Initiative, Cabinet Division CRVS Country Coordinator Bangladesh, ⁷Vital Strategies Bangladesh, ⁸Vital Strategies Technical Advisor Singapore

Background and Objective: For effective resource allocation and planning and implementation of public health strategies, registration of births and deaths is important. Despite Bangladesh having laws mandating birth and death registration, in practice, women and girls are often excluded from their births and deaths being registered. The current research explores the barriers to birth and death registration in Bangladesh and the contributing factors that lead to lower registration among women.

Methods: This qualitative study was conducted in selected urban and rural locations covering both low and high sex disparities in births and deaths (Dhaka, Dhaka North City Corporation, Thakurgaon, Gaibandha, Satkhira, Kutubdia and Sunamganj) between October and November of 2022. Total 33 Key informant interviews with implementers and 13 FGDs with male and female adult populations were held. The data was analysed using the content analysis method, and patterns and themes were identified.

Results: Poor awareness, perceived unnecessary, complex, tedious administrative approval process, accumulated financial burden, social and religious norms and practices, and poor technological and human resources' support delay and discourage both birth and death registrations. Child marriage causes lower birth registrations among women. Men being socially and legally expected inheritor demotivates and leads to lower death registrations among women.

Conclusion: Barriers contributed by both implementers and beneficiaries must be addressed to improve birth and death registration in Bangladesh, particularly among women. More awareness about death registrations needs to be made. Interventions and policies need to be gender sensitive and strengthened to increase the number of registrations, especially death.

Evaluating a peer-led intervention to support clients to vacate warrants following release from prison: a case study from British Columbia, Canada

Mo Korchinski¹, Pamela Young¹, Cheri McBride¹, Nelson Luk², Heather Palis², Amanda Slaunwhite²

¹Unlocking the Gates Services Society, Canada, ²University of British Columbia, Canada

Background and Objective: The process of vacating warrants can be difficult to navigate. Having a warrant affects well-being by limiting access to housing, eligibility for income assistance, and engagement in treatment and recovery programs, overall producing adverse health outcomes; therefore, support for navigating the warrant resolution process is needed. This study outlines a peer-led warrant program that supports clients to vacate their warrants. The program also supports clients to connect with social services such as legal aid, income assistance, safe supply, treatment, food and housing in order to meet their survival needs and improve health outcomes.

Methods: Surveys were conducted at two time points (intake and follow-up) to monitor progress and determine warrant impact and health outcomes of people

seeking to vacate warrants. Two Peer Mentor staff were trained in the specifics of vacating active warrants. Unlocking the Gates Services Society (UTGSS) also established a relationship with a municipal organization providing social services, to promote their services in the community.

Results: The UTGSS warrant program has successfully provided warrant resolution for 77 people, exceeding their target of 50 clients. Of the 77 clients with the assistance of UTGSS, 41 connected with a lawyer, 22 accessed treatment, and 17 found safe temporary housing upon warrant resolution, thus meeting their basic needs and improving health outcomes.

Conclusions: Peer-led interventions can play a critical role in supporting clients to navigate the criminal legal system, including the process of vacating warrants. The positive reception of this peer-led warrant program has led to increasing demands to provide this warrant program to the surrounding communities.

Popul. Med. 2023;5(Supplement):A1593

DOI: 10.18332/popmed/163840

Guiding principles of a peer-led intervention to support the transition to community among people released from prison in British Columbia, Canada

Pamela Young¹, Nelson Luk², Mo Korchinski¹, Heather Palis², Simrat Mahil², Jessica Xavier², Amanda Slaunwhite²

¹Unlocking the Gates Services Society, Canada, ²University of British Columbia

Background: People who are released from prison face significant challenges in their transition back into community. Unlocking the Gates Services Society (UTGSS) is a peer-led organization comprised of people with shared lived experience that supports this population by connecting them with health and social services in British Columbia, Canada. The objective of this study was to identify the guiding principles of UTGSS program in their peer-to-peer work with people released from prisons.

Methods: Focus groups (N=2 groups; 11 participants) and one-on-one interviews (N=3) were conducted with UTGSS staff. Focus groups and interviews were audio recorded and transcribed. Thematic analysis was conducted with an iterative approach, moving between data collection, analysis, and discussion with participants to identify patterns across the transcripts.

Results: Four themes were identified in relation to the guiding principles of UTGSS staff in their peer-to-peer work: 1) Offering hope; 2) Meeting clients where they are; 3) Building respectful relationships; 4) Providing consistent support.

Conclusions: The identified UTGSS peer-to-peer program themes enable staff with shared lived experiences to develop rapport with clients via robust and proven guidelines, thereby creating opportunities for connections to health and social services and overall improving the transition of recently released people back into community. The guiding principles reported in this study may serve as a model for engagement with people released from prison in other peer-led programs seeking to support this population in their transition to community post-release.

DOI: 10.18332/popmed/163859

The health halo effect of 'better for you' alcohol products on women

Simone McCarthy¹, Hannah Pitt¹, Samantha Thomas¹, Grace Arnot¹, Sarah Marko¹, Florentine Martino¹, Julia Stafford, Danica Keric

¹Deakin University Australia

Background and Objective: Alcohol is a significant public health problem, with the alcohol industry increasingly targeting women with a range of sophisticated marketing strategies. This has included a range of 'better for you' products, including low calorie/sugar and zero alcohol products. While research suggests that these products may have particular appeal for women, there has been limited systematic investigation into women's attitudes towards, and reasons for, consuming these products, and whether women perceive that these products are appealing for women.

Methods: An online panel survey was conducted with 497 Australian women aged 18 and over who had consumed alcohol in the past year. Participants were asked about their own consumption of low calorie/low sugar or zero alcohol products and were asked questions to whether they thought these products would particularly appeal to women and the reasons for this. Reflexive thematic analysis was used to analyse the qualitative data.

Results: Women perceived low calorie/sugar and zero alcohol products as an appealing option for women who were health conscious or worried about their weight. These products were identified as having health benefits and described as tools to assist with weight loss or to "stay skinny". Some participants recognised that zero alcohol products gave the illusion that they were healthier since they

did not contain alcohol. Participants thought these would increase the number of drinks that a woman might consume in the one session because women could drink without worrying about calories or weight gain.

Conclusion: 'Better for you' alcohol products were perceived as being for women who were health and weight conscious. Marketing for these products promotes an illusion of healthiness which does not consider the health impact of the alcohol itself. Controls on alcohol marketing should be expanded to limit the use of health and nutrient claims.

Strategies to engage young people in climate decision-making: Perspectives from young Australians

Grace Arnot¹, Samantha Thomas², Hannah Pitt¹, Elyse Warner¹

¹Deakin University, Institute for Health Transformation, Deakin University, Australia, ²Deakin University

Background and Objective: Public health and health promotion communities globally are calling for young people to participate in decision-making that impacts their futures, particularly in relation to the climate crisis. Young people understand how political and commercial determinants influence climate action, and can provide recommendations for systemic and policy-based changes to enforce stronger climate responses. There is a need for strategies to strengthen young people's engagement in climate discussions and decision-making, however there is little research to guide the development of this engagement.

Methods: Photo-Elicitation Interviewing was conducted with n=28 young Australians (aged 12-16 years) to explore young peoples perspectives of current influences on climate action, their ability to influence climate action, and suggestions for increasing their influence. Interview data were analysed using a reflexive approach to thematic analysis. Participant images were analysed for content and ascribed meanings.

Results: Participants expressed the need for young people to have increased influence over responses to the climate crisis, particularly those by decision-makers. Participants highlighted the importance of developing interesting and practical advocacy engagement initiatives that balance information about the realities of the climate crisis with hope, and follow up with strategies to create action. They also described strategies and mechanisms to increase young peoples influence. This included being involved in research, collaborating with youth organisations, providing feedback to decision-makers, and higher level involvement such as engaging in parliamentary sittings. Finally, participants noted that due to their age, young people were reliant on "adults" and those with power to facilitate this engagement.

Conclusion: Young people are intelligent and compassionate, and recognise the importance of urging decision-makers to enact climate responses that prioritise health and wellbeing. Public health and health promotion must collaborate with young people to champion their voices, and develop strategies and mechanisms to embed their perspectives into climate discussions and decision-making.

Perceptions and experiences of women about their help seeking behavior for domestic violence in Chitral, Pakistan

Nigar Ali¹

¹AKSP, Project Manager, 29 united plaza block 7 Ayesha manzil, Pakistan

Domestic violence against women (DV) is a widely prevalent public health issue that affects all social classes but most significantly low socioeconomic strata in the world. WHO 2013 reports, the prevalence of DV is 30% in the world, 37.7% in South East Asia, and 30-35% in Pakistan. Electronic media reported a 67% prevalence of DV against women in the remote district of Chitral, Pakistan [24]. Help-seeking in DV has important relations with effective handling; preventing and eradicating the issue because it enhances womens autonomy, increases access to support services and visibility of the issue.

The qualitative exploratory case study design was used taking DV survivors as a case and formal and informal help-seeking as the unit of analysis. Through purposive sampling, women were selected from the data registry of the legal and humanitarian institutions. The non-help seekers were identified through social networks by snowball sampling. Data were analyzed through thematic and content analysis by manual coding and through Nvivo software.

This was the first study of its kind in the context of Chitral that has explored that contextual dynamics are the influence of joint family, normalcy of DV after marriage, transmission of social norms, gender inequalities, drug addiction, and lack of awareness about womans right. reason of not help-seeking Stigmatization, female powerlessness, dependency on others, fear of worsening the situation,

fear of losing children custody and safeguarding family honor and hassles of formal procedures. The parental family found to be most trusted, accessible and frequently sought informal support system followed by community-based organizations like Jirga and arbitration board.

Based on the findings of the study we recommend the relevant organizations integrate DV screening, management, and referral facilities in the existing structure of their service provision. The study has implications for the local administrators and policy personnel to strengthen services.

Taxation on sugar-sweetened beverages: a systematic review and time series analysis

Leonardo Villani¹, Michele Sassano², Carolina Castagna³, Gianluigi

Quaranta¹, Roberta Pastorino¹, Walter Ricciardi³, Stefania Boccia¹

¹Università Cattolica del Sacro Cuore Section of Hygiene, Department of Health Science and Public Health Largo Francesco Vito 1 Italy, ²Università di Bologna Department of Medical and Surgical Sciences Italy, ³Università Cattolica del Sacro Cuore

Background and Objectives: Consumption of sugar sweetened beverages (SSBs) has been linked to a number of adverse health outcomes. Many countries introduced taxation to face this Public Health issue. Thus, we aimed to summarize national taxation laws on SSBs and to assess their impact on population's health. **Methods:** We conducted a systematic review up to May 2021. Time series analysis included Hungary, France, Fiji, Samoa, Nauru, Guatemala, Latvia, Norway, Palau, Panama, Tonga, and Finland. We used ordinary least square regression to evaluate modifications in the rate of change of standardized prevalence rates of obesity, overweight, and diabetes. A random-effects meta-regression was used to assess whether year of entry into force of the law, Human Development Index (HDI), and tax design affected the effectiveness of the intervention.

Results: We included 60 tax laws issued between 1979 and 2020 by 43 countries. Results show a deceleration of the increasing prevalence rates of overweight among children in Hungary ($\beta = -0.101$, 95% CI: -0.217, 0.015), Samoa ($\beta = -0.148$, 95% CI: -0.243, -0.052), Palau ($\beta = -0.161$, 95% CI: -0.310, -0.012), Panama ($\beta = -0.068$, 95% CI: -0.091, -0.045), Tonga ($\beta = -0.492$, 95% CI: -0.630, -0.354), Guatemala ($\beta = -0.043$, 95% CI: -0.104, 0.018). The same holds for obesity in Hungary ($\beta = -0.096$, 95% CI: -0.236, 0.044), Samoa ($\beta = -0.117$, 95% CI: -0.254, 0.021), Nauru ($\beta = -0.116$, 95% CI: -0.170, -0.061), Guatemala ($\beta = -0.038$, 95% CI: -0.098, 0.021), Palau ($\beta = -0.145$, 95% CI: -0.269, -0.021), Tonga ($\beta = -0.283$, 95% CI: -0.341, -0.224), Fiji ($\beta = 0.021$, 95% CI: -0.145, 0.188). Eventually, the year of entry into force of the law, the HDI, and the tax design have a significant effect on post-intervention coefficients for obesity.

Conclusions: Taxation is highly heterogeneous across countries in term of products and design. In some countries taxation led to a deceleration of the increasing prevalence rates of overweight and obesity among children.

A joint action task to assess and strengthening of IHR core capacities among ten countries in Europe

Sara Bengtsson¹, Anders Wallensten², Andreas Bråve³, Nuška Čakš Jager⁴,

Indra Linina⁵, Janusz Janiec⁶

¹Public Health Agency of Sweden Presenter to be confirmed later. Sweden,

²Public Health Agency of Sweden Sweden, ³Public Health Agency of Sweden

Departement of Microbiology Sweden, ⁴National Institute of Public Health

Slovenia, ⁵State Emergency Medical service of Latvia Latvia, ⁶National

Institute of Public Health NIH Poland

Background and Objective: The objective of the Joint Action task was to Strengthening IHR Core Capacities in 10 focus countries over a 3-year project period.

Methods: The task commenced with a strengths and gaps baseline analysis among 10 countries. Data from were derived from IHR core capacities as reported in the WHO-IHR-State Party Annual Reports (SPAR), Joint External Evaluations and a summary of reporting among EU Member States. These were complemented with structured interviews with representatives from each country. Two follow-up interviews and an analysis of subsequent country SPAR reports occurred. The findings from the baseline analysis of preparedness gaps determined four core capacities which merited additional IHR strengthening activities: Biosafety and Biosecurity, Chemicals, Antimicrobial Resistance and Risk Communication. This analysis was presented to the members to finalise the focus of the IHR areas for further work in order to improve public health preparedness. The first of three workshops with the themes took place in January 2020. A second workshop with

a focus on only Risk Communication took place after a second interviews. A third and final interview took place to decide the focus for the final workshop which analysed the core capacities strengthened over the joint action.

Results: The core capacities that improved over the joint action included surveillance, biosafety and biosecurity including lab capacity and risk communication. The underlying factors to strengthen these core capacity included additional financing, national political commitment, training and acquirement of additional qualified human resources. By bringing together representatives from different countries to share examples of best practice knowledge was transferred and communication channels opened for further collaboration.

Conclusion: The rigorous selection process ensured that the project focused on relevant gaps and through workshops strengthened important core preparedness capacities core capacities forward coincided with responding to the covid-19 pandemic in the 10 countries.

²All India Institute of Medical Sciences, New Delhi, India Professor, Centre for Community Medicine, All India Institute of Medical Sciences, New Delhi, India Centre for Community Medicine, Old OT-Block, AIIMS, Ansari Nagar, New Delhi (Pin Code-110029), India India, ³ESIC Medical College and Hospital, Faridabad, Haryana, India, ⁴All India Institute of Medical Sciences, New Delhi, India India, ⁵All India Institute of Medical Sciences, New Delhi, India India, ⁶All India Institute of Medical Sciences, New Delhi, India

Background and objectives: Anemia control program in India have seen mixed experiences from initial progress to later stagnation of effect on anemia control. Poor program implementation, and lack of research to identify solutions for these implementation bottlenecks being key reasons for stagnation. Anemia Mukh Bharat (AMB) was launched in 2018 to intensify, strengthen, and accelerate efforts to reduce anemia burden in India. Present abstract outline various implementation research agenda identified in first-four years of launch of AMB.

Methods: AMB strategy embarks service delivery through 6x6x6 strategy. Progress of AMB had led to identification of bottlenecks at various levels through stakeholder meetings/high-level-expert-meetings/real-time problem faced during implementation of the program. Low coverage/consumption of IFA among beneficiaries, difficulties in procurement of point-of-care devices for haemoglobin estimation, and lack of effective strategies for control of non-nutritional causes of anemia were few known implementation challenges. Various issues identified at different levels from AMB program were utilized as implementation research exercises to further improve its effectiveness.

Results: The various implementation researches agendas identified were proof of concept for 6x6x6 strategy, effectiveness of food fortification (rice, salt, and wheat flour), and feasibility of food fortification through multiple food vehicles. Multi-micronutrient deficiency as adjunct cause of anemia also necessitates research on effectiveness multi-micronutrient supplements in tackling anemia. Ferrous carboxy maltose as one-shot therapy for anemia in pregnancy was also explored. We also have to focus on anemia literacy, and studies on non-responders for anemia treatment. Other areas to further explore under implementation research are supervised supplementary feeding programme-ready-to-use-therapeutic food, non-invasive haemoglobin measuring devices and many more.

Conclusions: AMB program in India has successfully incorporated implementation research as key strategy for strengthening program implementation. The learning's achieved from these implementation research will prove valuable for success of AMB program and control of anemia in India.

Global Rise of India: Evidence from Millennium Development Goals to Sustainable Development Goals

Ramesh Sethi¹

¹Kalinga Institute of Industrial Technology (KIIT), Deemed to be University, Bhubaneswar, India Kalinga Institute of Industrial Technology (KIIT) Dr. Ramesh Chandra Sethi Assistant Professor Department of Social Sciences and Humanities School of Law Kalinga Institute of Industrial Technology

(KIIT) Deemed to be University Bhubaneswar-751024, Odisha, India India

Background: India is recognized as the world's largest democracy and second most populous country in the globe. In recent times, India has become the centre of attention for its development in the field of science, technology and in medicines specifically in developing indigenous coronavirus disease (COVID-19) vaccines. The World Health Organization has appreciated India's strategy for COVID-19 management. At the same time, diplomatic engagements with other global leaders and government's commitment: to eradicate extreme poverty and hunger, to promote gender equality and empowerment of women, to reduce inequality through social welfare policies, to provide good health and well-being, global partnership for development and attempt to restore global peace, justice and setting up strong institutions for the welfare of citizens indicate remarkable achievements and global rise of incredible India in the 21st century.

Objectives: The present study attempts to evaluate the significant development in the field of public health that has accelerated India's position globally through the implementation of global agenda policies like MDGs and SDGs since 2000.

Methods: This study is based on critical analysis of secondary sources data available and accessible in the form of official documents and reports published by the Government of India as well as by national and international institutions/ organizations. It uses both qualitative and quantitative research methods.

Results: The findings of the study reveal that various interventions made by India paved the way towards achieving the targets of global goals. It also focuses on strengthening institutional capacities to deliver public policies that ultimately promote welfare of the people.

Conclusion: This study reflects the policy implications of MDGs and SDGs and also helps the policy makers to understand various nuances of legislating, various innovative policies for welfare of people in a democratic country which enhances India's position as a global leader in the contemporary world order.

The agenda of civil society organizations in global health: weaving networks of social engagement and participation

Marcigley Moraes¹, Laurence Pires², Renan Oliveira¹, Patrícia Carpio³, Diana Zeballos Rivas⁴, Luis de Souza³

¹Federal University of Bahia (UFBA) Brazilian Association of Public Health/ Scholarship by Coordination for the Improvement of Higher Education Personnel (CAPES) Brazil, ²Public Health School/Fiocruz, ³Federal University of Bahia (UFBA) Brazilian Association of Public Health Brazil, ⁴Federal University of Bahia (UFBA)

Background: The study highlights the performance of Civil Society Organizations (CSOs) in the context of global health by monitoring their public manifestations in the Observatory of Global Health and Health Diplomacy of the Center for International Relations and Health at Fiocruz - Brazil (CRIS/Fiocruz), in 2022.

Methods: With a qualitative, analytical, and reflexive approach, it discusses the data obtained in the monitoring of 50 CSOs, through visits to their official websites and social networks, systematized in bi-weekly publications in 2022 that constituted 23 documents for the study. The data were submitted to the content analysis technique, organized by grouping the CSOs into two analytical groups and categories: the public interest CSOs and the private interest CSOs.

Results: CSOs work for human rights, peace, equity, economic and environmental sustainability, and global responses based on cooperation and solidarity. Public interest CSOs focus on exposing health inequities and global inaction and call for the achievement of the Sustainable Development Goals, including strengthening health systems and intersectoral collaboration. On the other hand, the Private interest CSOs highlight their initiatives to financially support research and public health programs in low-income countries, prioritizing actions related to artificial intelligence, digital technologies and to stand up to the neglected tropical diseases.

Conclusions: Repeatedly the manifestations emphasize the relevance of the ethical principle of equity, attention to vulnerable groups, and the need to implement policies, agreements, cooperation, and treaties that preserve the people and the planets health. The persistence of this agenda makes it evident that the search for equity has not gone beyond the rhetorical sphere, remaining distant from concrete actions. Behind this persistence, there is a clear insinuation of the global power asymmetries and the dispute between conceptions of health as a human right or as a commodity.

Effects of rate of use of aphrodisiac drinks on some health parameters of commercial bus drivers in Ife-Central local

government and inadequacy of information on the packs of many sampled aphrodisiac drinks

Samuel Olaniran¹

¹Department of Pharmacology, Faculty of Pharmacy, Obafemi Awolowo University, Ile-Ife, Osun State, Nigeria

Background and objectives: The influx of herbal drinks acclaimed to have aphrodisiac activities into the Nigerian society is rising daily but there is dearth of scientific information on the beneficial and adverse effects of these drinks in their consumers. This study examined the usage and effects of aphrodisiac drinks on some human health parameters among commercial bus drivers in Ife-Central Local Government, Osun State, Nigeria.

Methods: Two hundred commercial bus drivers were used for the study, selected through random sampling method. The drivers' Body-Mass Indices (BMI), Blood Pressure (BP) and Random Blood Sugar (RBS) were measured through direct observation. Fifty samples of aphrodisiac drinks were purchased from a source in the open market.

Results: From the data collected, 87.5% have used aphrodisiac drinks before (treatment group) while 12.5% have not used it before (control group). 44% use these drinks every day; 26.9% use every other day, 21.1% use occasionally, 4.0% use once a week, 1.7% use on weekend while 2.3% use the drinks rarely. The rate of consumption of the aphrodisiac drinks in simple mean scores (14.14) was above the average (high). Rate of use had no significant effect on the drivers' BMI ($t = -1.97$, $p > 0.05$) but had significant effects on BP ($t = 3.562$, $p < 0.05$) and on RBS ($t = 7.631$, $p < 0.05$) respectively. The constituents of 30% of the sampled drinks were not written on the pack, while 80% do not have expiry dates. Drinks with percentage alcohol between 30% v/v and 42% v/v of alcohol amounts to 54%.

Conclusions: Consumption rate of aphrodisiac drinks by the commercial bus drivers in Ile-Ife, Nigeria is high and the rate has significant effects on the drivers' BP and RBS. The information on the packages of most of the sampled drinks are inadequate.

Advancing rare disease policy in Latin America: a call to action

Daniel Wainstock¹, Amiel Katz²

¹Pontifícia Universidade Católica do Rio de Janeiro - PUC-Rio, Brazil,

²Harvard University, United States

People living with a rare disease are amongst the most vulnerable groups in society. They have been historically marginalized and systematically stigmatized. It is estimated that 300 million people worldwide live with a rare disease. Despite that, many countries today, especially in Latin America, still lack consideration of rare diseases in public policies and national laws. Based on interviews with patient advocacy groups in Latin America, we aim to provide recommendations for lawmakers and policymakers in Brazil, Peru, and Colombia on how to improve public policies and national legislation for persons living with rare diseases in these three countries.

Benchmarking local government policies for creating healthy, equitable and environmentally sustainable food systems

Miranda Blake¹, Oriana Ruffini¹

¹Global Centre for Preventive Health and Nutrition, School of Health and Social Development, Institute for Health Transformation, Faculty of Health, Deakin University, Burwood, Australia

Background and Objective: A transformation to healthy, equitable and environmentally sustainable food systems is required as part of efforts to improve human and planetary health. Local governments in Australia vary widely in the extent to which they are addressing this issue, with a lack of comprehensive and cohesive action. This study aimed to develop and apply a tool for local governments to benchmark their policies for creating healthy, environmentally sustainable and equitable food systems against global and local best practice.

Methods: The Local Food Environment Policy Index (Local Food-EPI) tool and application processes were developed in collaboration with local government policy makers. We used existing accountability tools, refined through an extensive literature review and detailed input from an international and local expert advisory panel. In 2022, the tool was piloted in one Victorian local government to test its feasibility, usability, reliability, and the perceived value of the tool from a local government perspective. In 2023, the tool will be applied in 10 Victorian local governments, informing refinement of the tool for broader uptake. The tool consists of 61 indicator statements across 25 policy areas spread across 10 food policy domains. Pilot implementation of the tool identified the assessment

process as reliable, feasible and helpful in guiding policy development at the local government level. Local government stakeholders perceived the tool and processes as beneficial in: building knowledge and staff capacity in this area; developing networks; assessing local strengths and weaknesses; and advocating for change.

Conclusions: The Local Food-EPI tool is a comprehensive method to assist local governments in benchmarking their actions to improve food systems, and prioritising areas for action. Further assessment of local governments using the tool will identify and share knowledge of best practice, monitor policy progress, build capacity and collaborations, and strengthen efforts to increase accountability for change.

Popul. Med. 2023;5(Supplement):A1605

DOI: 10.18332/popmed/164909

Unhelmeted riding, drunk riding, and unlicensed riding among motorcyclists: a population study in Taiwan during 2011-2016

Cheng-Wei Chan¹, Chih-Wei Pai²

¹Department of Emergency Medicine, New Taipei City Hospital, New Taipei City, Taiwan, ²Graduate Institute of Injury Prevention and Control, College of Public Health, Taipei Medical University, Taipei, Taiwan

Prior studies have explored the individual effect of drunk riding on a variety of risky riding behaviours, whereas the effects of unhelmeted riding or unlicensed riding and their association with running-off-road (ROR) crashes have been rarely examined. This study investigated the relationship among drunk riding, unhelmeted riding, unlicensed riding, and ROR crashes. By analysing data from the National Taiwan Traffic Crash Dataset from 2011 to 2016, this study focused on motorcycle crashes involving drunk riding, unhelmeted riding, unlicensed riding, and ROR crashes. The multiple logistic regression models were estimated to calculate the adjusted odds ratio (AOR). The model Results revealed that unhelmeted riding increased the risk of drunk riding and unlicensed riding by 138% (AOR = 2.38; CI [confidence interval] = 2.34–2.42) and 47% (AOR = 1.47; CI = 1.45–1.49), respectively. The risk of unhelmeted riding increased with increasing BACs, and riders with the minimum BAC (0.031%–0.05%) had nearly 5 times (AOR = 4.99; CI = 4.74–5.26) higher odds of unlicensed riding compared with those of riders with a negative BAC. Unhelmeted riding, drunk riding, and unlicensed riding were associated with 1.21 times (AOR = 1.21; CI = 1.13–1.30), 2.38 times (AOR = 2.38; CI = 2.20–2.57), and 1.13 times (AOR = 1.13; CI = 1.06–1.21) higher odds of ROR crashes, respectively. Riding without a helmet may induce drunk riding and unlicensed riding. The three risky riding behaviours (i.e., unhelmeted riding, drunk riding, and unlicensed riding) significantly contributed to ROR crashes. The risk of unhelmeted riding and ROR crashes linearly increased with BACs.

Blood donation practices during COVID-19 pandemic among students of the College of Applied Medical Sciences, King Faisal University

Edric Estrella¹

¹University of the Philippines - Open University, King Faisal University, Saudi Arabia

Background and Objectives: A steady supply of blood should be made available at any time to meet the emergency need for transfusion which is a life-saving intervention. It is essential to determine if the fear of COVID-19 has negatively affected the willingness of individuals to donate blood. This analytical cross-sectional study compared the proportions of students donating blood before and during the COVID-19 pandemic and determined the factors that affected their willingness to donate.

Methods: A total of 187 students were invited to respond to a 14-item research-developed online questionnaire. Estimation of proportions, z-test and logistic regression were performed using Stata MP version 14.

Results: The estimated proportion of students who donated blood before the pandemic was 9.62% (95% CI: 6.12, 14.81) while the proportion of students who donated blood during pandemic was 3.74% (95% CI: 1.78, 7.69). The said proportions were statistically significantly different (z statistic = 2.2774, p value = 0.0114). The estimated proportion of students who had the willingness to donate blood in the next three months was 39.04% (95% CI: 32.25, 46.28). Those who had the fear of getting infected with COVID-19, those who thought that there would be no personal benefit to be gained, and those who were unaware of the locations of the blood donation facilities were 64%, 82%, and 36% less likely to donate blood in the next three months.

Conclusions: The proportion of blood donation among students significantly declined during the pandemic. Various factors identified to prevent one from

donating must be addressed.

Research project: Easier choices for public health -behavioral insights in policy making

Martina Elings-Pers¹

¹Hjärt-Lungfonden, Sweden

Background and Objective: Public health in Sweden is facing major challenges. Like in many countries the population is less physically active, eating habit have deteriorated, and the obesity trend shows an increase across the entire population, and in fact accelerates over time. Many countries are exploring policy options with basis in behavioral science to counteract the negative trend. Under the flag of "Public Health for all" The Swedish Heart and Lung Foundation and Swedish Cancer Society in collaboration with the Behavioral Insights Team at PBM in 2021 initiated a new research project. The objective was to investigate the application of behavioral insights in grocery stores to influence healthier consumer choices. This with the overall aim to provide new research and contribute to evidence-based policy making in the sphere of public health.

Methods: The research project includes theoretical explanation and dissemination of behavioral insights through a first report launched in September 2022. This report [1] covers examples on successful interventions other countries, and was launched at a seminar with representatives from civil society, industry, and government authorities to further spur joint policy discussions. In the second phase of the project, concepts (3) were designed, applied, and evaluated in grocery stores. This targeting e.g. price, position, information and social norms. Implementation was done in close cooperation with a local food chain and targeting healthier bread consumption. The project rests on a solid methodological framework COM-B model for behavior change [2] (and Behavior Change Wheel and Behavior Change Technique). The project has received attention through press and outreach. **Results** The practical application of project clearly shows how behavioral insights can influence healthier choices and inform policy discussions. **Conclusions:** While policy making to great extents is about influencing behavior, behavioral insight should be applied to greater extent in policy making. **Links:** -----[1] https://uploads-ssl.webflow.com/5fa2cbdd7a042c40b5711b1/632ad330e4ce4385bb043013_LaCC%88ttare%20val%20foCC%88r%20folkhaCC%88lsan%202022.pdf [2] <https://togetheragency.co.uk/news/the-com-b-model-of-behaviour-change-explained>

Public acceptance of default nudges to promote healthy and sustainable food choices

Simone Wahnschafft¹

¹University of Goettingen, Goettingen, Germany

Background: Default nudges constitute an increasingly relevant policy arena for promoting healthy and sustainable food choices while preserving individual freedom of choice. However, default nudge effectiveness and acceptance have been identified as trade-offs. This study examines public acceptance, and its drivers, of five nudges aimed at shifting food choices, as well as a design variation of each nudge anticipated to increase acceptance. Selected nudges were adapted from studies and/or policies with demonstrated precedent of effectiveness.

Methods: Participants of an online survey rated acceptance of ten nudge scenarios (five original, five variations) - (1) eat less butter; (2) eat less meat; (3) climate-friendly groceries; (4) low-energy side dishes; and (5) donation for regional dairy products. Participants then reported on three drivers for each nudge and variation: (1) perceived intrusiveness on individual freedom of choice; (2) perceived effectiveness; and (3) own engagement in the targeted behavior. Variables were measured using 7-point Likert scales. The effects of design changes on acceptance were examined via significant differences in median acceptance of original and variation scenarios. The effects of examined drivers on acceptance were estimated using proportional odds ordered logit models.

Results: Design variations increased the acceptance of three of the five nudges: (2) eat less meat (+24.5% full acceptance), (3) climate-friendly groceries (+9.0%), (4) low-energy side dishes (+10.5%). Perceived intrusiveness emerged as the most influential driver of acceptance, followed by perceived effectiveness. Own behavior and socio-demographics held relatively little effect on acceptance.

Conclusions: The results highlight opportunities for choice architects to achieve 'sweet spots' in designing default nudges that balance effectiveness and acceptance, principally by mitigating the costliness of opting out and improving nudge transparency. The protection of individual freedom of choice and, in most cases, effectiveness, emerge as key aspects for choice architects to emphasize

in default nudge communication to increase acceptance.

Popul. Med. 2023;5(Supplement):A1609

Embedding sustainability in medical education and practice: the student Medaid London approach

Vafie Sheriff¹, Soushma Seeburuth², Naureen Asim^{3,1}, Nadhira Samsudeen^{3,4}, Adele Mazzoleni^{3,5}

¹St Georges University of London, London, United Kingdom, ²School of Psychology, University of East London, London, United Kingdom, ³MedAid London, United Kingdom, ⁴Medical School, University College of London, London, United Kingdom, ⁵Barts and The London School of Medicine and Dentistry, London, United Kingdom

Background and Objectives: Current research shows there is a lack of education in sustainable healthcare teaching in the medical curriculum. A study in 2022, identified 1.8% of 850+ surveyed medical students showed no formal education on Sustainable health. To address the gap in healthcare education, Student MedAid London was created to raise awareness and provide opportunities for students to become involved in sustainable and global health work in providing access to excess medical supplies, and redistributing to locations in need.

Methods: For advocacy and education work, a teaching series was designed through Instagram and Twitter, such as Learn-with-Med-Aid, alongside seminars delivered by professionals. The latter focused on diving into sustainable and public health topics not addressed in medical school. Examples include "exploring health inequalities amongst migrants and south-asian youth" and "how women rights are integral to sustainable healthcare". For sustainable medical equipment redistribution work, a team of volunteers contacted local healthcare providers for excess equipment. The WHO sustainability criteria were used to screen receiving organisations to reduce incidence of inappropriate medical donations. Furthermore, utilising the "Flipped Model Operation" prevented stockpiling of resources.

Results: Social Media and seminar engagement increased by 62% and 176% respectively from last year, with now over 1000+ followers across all social media. Our demographic has also expanded from London medical students, to young healthcare professionals from across the UK, Ukraine and USA. The organisation has received a wide number of medical donations, and is currently liaising with an Emergency Obstetric and Newborn facility in Sierra Leone as a potential receiving organisation. Positive reception has been obtained from prospective donors.

Conclusions: The positive response from our educational events, advocacy work and resources demonstrate an evident gap in awareness and learning. This opens discussions on the importance of sustainability in curriculums and opportunities provided for tomorrow's doctors.

DOI: 10.18332/popmed/165512

Association of climate variables with malaria morbidity in a local municipality, Ghana

Isaac Boadu¹

¹University of Ghana, Accra, Ghana

Background: Available evidence indicate the profound impact of climate variables on malaria transmission dynamics. Climate variables especially temperature, rainfall and relative humidity affect the survival, reproduction and longevity of mosquito vector which undermines current global, regional and national efforts to control malaria.

Methods: A retrospective data (2011-2020) on malaria morbidity and climate variables (temperature, relative humidity, and rainfall) were sourced for this study. Climate data were obtained from the Ghana Meteorological Agency while malaria data were obtained from the Municipal Health Directorate. Evaluation of variables pattern was done using trend analysis and correlation was performed to determine the independent association of temperature, rainfall, and relative with malaria morbidity.

Results: Malaria morbidity for the 10-year period has more than doubled in the municipality. Average monthly rainfall ($r = 0.53$, $p = 0.07$) and relative humidity ($r = 0.49$, $p = 0.11$) were positively associated with malaria morbidity while average monthly minimum ($r = -0.29$, $p = 0.36$) and maximum ($r = -0.56$, $p = 0.06$) temperature were negatively associated with malaria in the municipality.

Conclusions: Efforts to control malaria should include climate factors especially rainfall patterns. This is important to achieve national, regional and global efforts of malaria reduction and possible elimination.

Dokha use-prevalence, predictors and the perception of youth residing in the UAE

Jayadevan Sreedharan¹

¹College of Medicine, Gulf Medical University, Ajman, United Arab Emirates

Background and Objectives: The study determined the prevalence, predictors, and perception of youth residing in the UAE towards Dokha use. **Materials and Methods:** Cross-sectional study was conducted among nurses working in a tertiary care centre in Ajman, UAE. A self-administered online questionnaire was used.

Results: The present study included 552 youth. Among the total, 310 were below the age of 20 years and 169 were ≥ 20 years, 300 were non-Arabs and 179 were Arabs. Among the total, 25 (4.5%) were dokha smokers, 454 (82.2%) with no habits and 73 (13.2%) with other types of tobacco habits. This study observed an association between Dokha use and, gender, age and nationality ($P < 0.05$). Among the males, the prevalence was 12 (13%) and 12 (3.2%) were Dokha users among females. Concerning to age group, 3.5% and 8.3 respectively, for ages < 20 years and ≥ 20 years. Prevalence among non-Arab nationals was 6 (2%) and 19 (10.6%) among Arabs nationals. To determine the degree of association, simple and multiple logistic regression were used. The crude OR observed was statistically significant; hence all the variables were included in the multiple logistic regression. The adjusted OR was 2.5 for age, 5.3 for nationality and 1.8 for gender. All the AOR observed was statistically significant ($P < 0.05$). The reasons why they started the habits were asked among the users. 13 (52%) each said recreation, peer pressure and feeling good. 17 (68%) each said relief from university problems, for fun, to control mood, experimentation, emotional distress and social gathering. 13 (52%) each said they had no fear of addiction and parental smoking. 7 (28%) each said low self-esteem and to overcome low confidence; 22 (88%) because of anxiety and stress; 15 (60%) said availability. **Conclusions:** The prevalence of dokha use was 4.5%. The predicates were gender, nationality, and age.

Popul. Med. 2023;5(Supplement):A1612

DOI: 10.18332/popmed/165581

Global challenges in implementing the international health regulations: a scoping review

Rafael Vasconcelos¹, Francisca Pulido Valente², Hélder Pinto³, Maria Santos⁴, Sara Barroso Travassos⁵

¹ACES Oeste Norte, Portugal, ²ACES Amadora, ³ACES Alentejo Central, Portugal, ⁴ACES Lisboa Norte, Portugal, ⁵ACES Entre Douro e Vouga I - Feira/Arouca

Background and Objective: The International Health Regulations (IHR) govern how 196 countries and the World Health Organization (WHO) collectively address the global spread of disease while avoiding unnecessary tampering with international travel and commercial trade. A total of four public health emergencies of international concern have been declared since its last amendment, with the COVID-19 pandemic demanding a special degree of health diplomacy. The purpose of this scoping review was to identify and compile literature reporting the main challenges associated with implementing the regulations, outlining key areas for revision.

Methods: A scoping review was conducted following the methodological framework developed by Arksey and O'Malley. PubMed was the only database used, plus backwards citation chaining. Data selection and analysis were performed by all five researchers using pretest forms. To complement the descriptive analysis of each publication, the researchers performed a qualitative thematic analysis of the identified challenges.

Results: From 128 articles screened, 52 met the inclusion criteria, and 135 challenges were identified. The thematic analysis revealed ten categories of challenges, listed in decreasing order of frequency: (i) requirement of financial and technical resources, (ii) lack of enforcement and accountability mechanisms, (iii) need for rules clarification, (iv) deterrents to reporting, (v) inadequate governance, (vi) insufficient cooperation between countries, (vii) sovereignty issues, (viii) scarcity of guidance and technical support from WHO, (ix) lack of inclusion of roles for relevant non-state actors, and (x) conflicts and emergencies.

Conclusion: The debate over updating the IHR is already ongoing, and it is expected to continue as countries continue to submit their proposals to the Working Group on Amendments to the International Health Regulations (2005). Studies like this scoping review provide the necessary evidence and framework for this discussion, confirming that a revision of the IHR is highly necessary to safeguard global health.

DOI: 10.18332/popmed/163831

Therapeutic pluralism policies in latin america: advances, gaps, and opportunities towards inclusive, people-centered health care

systems

Daniel Gallego-Perez¹, Jon Wardle², Eugene Declercq³, Veronika Wirtz³, Robert Saper⁴, Linda Barnes³

¹University of North Carolina at Chapel Hill 60 Otis St, Needham, MA. 02492 United States, ²Southern Cross University, ³Boston University School of Public Health United States, ⁴Cleveland Clinic

Purpose: The World Health Organization (WHO) encourages member states to develop national policies that advance the integration of Traditional and Complementary Medicine (T&CM) in national healthcare systems to harness their potential contribution to health, wellness, and people-centered health care. Yet, little is known about the characteristics and implementation of existing T&CM policies. No global guidelines exist for assisting countries in structuring and developing such policies.

Methods: A qualitative research design was used to conduct a landscape analysis characterizing existing therapeutic pluralism policies in Latin American countries through a comprehensive literature review, a policy-focused qualitative content analysis, key informant interviews, and a case study analyzing the formulation process of a landmark policy (Brazil's National Policy for Integrative and Complementary Health Practices -PNPICS). A technical cooperation tool to guide T&CM policy development and update for Latin American countries was proposed based on the study's findings, and refined through face validation and an expert consensus method (Delphi process). Data categorization and analysis were performed in MS Excel and NVivo, using deductive and inductive coding.

Results: A total of 74 T&CM policy documents from 16 Latin American countries were identified. Policies were enacted through various legal/administrative mechanisms including: constitutional provisions, national laws, national policies, national healthcare models, national guidelines, specific and supportive regulation. A typology of Latin American policy approaches identified policies as: health services-centered, model of care-based, participatory, and indigenous people-focused. The selection of T&CM practices for policy inclusion varies across countries. The proposed technical cooperation tool for T&CM policy development incorporated 17 key policy elements and was structured based on the policy cycle. **Conclusion:** With a few exceptions, policy implementation in Latin America seems to be a real political challenge, often reducing policies to cultural and political symbols. Continued research is needed on assessing the various stages of the T&CM policy process.

PHIRI Rapid Exchange Forum (REF): a key tool for cross-country exchange in times of crisis and beyond

Hanna Tolonen¹, Luis Velez Lapão², Petronille Bogaert³ Claudia Hahl, Neville Calleja

¹Finnish Institute for Health and Welfare - THL, Helsinki, Finland,

²Universidade Nova de Lisboa, Lisboa, Portugal

³Advanced Wellbeing Research Centre, Sciensano, Brussels, Belgium,

Since its start, the COVID-19 pandemic demanded a quick exchange between European experts and institutions supporting national governments in the crisis response to provide evidence-based information. However, there was no such regular cross-country forum established in the field of population health causing fragmented responses to the covid-19 crisis. Thus, European population health experts from public health institutes, ministries of health, universities or governmental agencies started in April 2020 to meet regularly online to foster cross-country exchange. In these meetings, partners could approach each other for questions and share views in a trusted environment regarding the management of the pandemic in their own country and learn from other participants' experiences. The European Commission recognized this achievement and supported this exchange as part of PHIRI - The Population Health Information Research Infrastructure (WWW.PHIRI.EU), allowing a quick exchange of data, indicators, good practices and experiences in the COVID-19 crisis response in an efficient manner. By 5/12/2022, 45 so-called Rapid Exchange Fora (REF) have taken place, involving project partners, national advisors to ministers/heads of agency, representatives of expert networks (e.g. Healthy Cloud), EU services (ECDC, JRC) and different health stakeholders (e.g. ELIXIR, OECD). The bi-weekly one-hour online meetings cover in a moderated, structured format pre-agreed topics in the field of population health that are proposed by the participating countries. Such topics include, but are not limited to, discussion on suitable Non-Pharmaceutical Interventions (NPI) and their application, child vaccination strategies, testing regimes, digitalization of death certificates or treatment options for Long COVID patient. In average, 25 delegates from different European countries attend each exchange. Responses by the countries (backed up by national reports, and guidelines that are briefly presented in the meetings)

are compiled and shared immediately after the meeting via the Corona-Corner of the Health Information Portal (www.healthinformationportal.eu/rapid-exchange-forum [1]). In addition, the Portal features a concise overview of NPIs established by European countries. This is of special interest as a sister project under the auspices of ECDC ended in Sept. 2022, whereby the PHIRI partners still update their country information. The main objectives of this workshop are: 1. To increase the awareness of the scientific community for the Rapid Exchange Forum and the Health Information Portal, 2. To stimulate their use and exploit all benefits and 3. To learn which topics and features are available for research and policy making purposes to stimulate the COVID-19 response – lessons learnt – process. After introducing PHIRI via video and four brief inputs from PHIRI partners there will be ample time for the delegates to: 1. Familiarize themselves with topics that were crucial during the COVID-19 pandemic, 2. Assess the features of the Health Information Portal and especially the REF section, 3. Suggest questions to be covered in upcoming bi-monthly meetings and 4. Identify need for further training in the field.

Popul. Med. 2023;5(Supplement):A1615

Developing comprehensive public health responses to gambling research, policy and practice

Samantha Thomas¹, May Van Schalkwyk², Darragh McGee³, Hannah Pitt¹, Simone McCarthy¹, Samantha Thomas¹

¹Deakin University, Australia, ²London School of Hygiene and Tropical Medicine, United Kingdom, ³University of Bath, United Kingdom

Background: Gambling has quickly emerged as a new global public health threat. While comprehensive public health approaches have been developed in relation to other harmful industries - such as tobacco and alcohol - gambling is still a relatively new area of research, policy and practice in public health. Most research to date has focused on individual and socio-cultural determinants of gambling harm, with little focus on commercial and political determinants. This is problematic, given that new technologies have meant that the gambling industry is able to rapidly develop and promote a range of highly addictive novel products across the globe, including in countries with inadequate regulatory structures to protect populations from harm. This also includes the lack of robust public health mechanisms to protect research, policy and practice from vested interests.

Aim: In this interactive, multimedia workshop, participants will learn from leading public health gambling researchers from the United Kingdom and Australia, with global expertise, about the development and implementation of comprehensive public health approaches to gambling harm prevention. The workshop will assume no prior knowledge in gambling. The aim of the workshop is to provide participants with key information (and handouts) about a comprehensive public health approach to gambling harm prevention that can be adapted or applied within their own countries.

Component Parts

The workshop will cover five key areas:

The key pillars of a public health approach to gambling harm prevention; The impact of industry influence on public discourses about gambling, and public health strategies that can be used to reframe these discussions; Research strategies and methods that can be used to map and monitor industry and policy responses; Mechanisms for engaging communities, including young people and those with lived experience, in public health advocacy strategies to respond to gambling industry tactics and convince decision makers about the need for regulatory reform; Lessons and cautionary tales from over a decade of research and advocacy in gambling harm prevention.

The Key Questions that the Workshop Will Address

What is a comprehensive public health approach to gambling harm prevention? Why is understanding the commercial and political determinants of gambling harm important in public health prevention strategies? How do the gambling industry (and governments) seek to influence the framing of gambling, and gambling research, policy and practice? What are the range of public health strategies that can be used to respond to the predatory tactics of the gambling industry? How can researchers build global networks to share and support independent public health approaches to gambling harm prevention?

This workshop is relevant for public health and health promotion researchers, policy makers, practitioners, and advocates.

"There was a lot of that [coercion and manipulation] happening and well, that's not very trustworthy": a qualitative study on COVID-19 vaccine hesitancy in Canada

Melissa MacKay¹

¹University of Guelph, Canada

Introduction: Although a large proportion of the Canadian population is fully vaccinated against COVID-19, millions of eligible individuals remain unvaccinated. Trust in public health and government impacts the effectiveness of crisis communication and the public's willingness to follow health recommendations. **Methods:** The research utilized a qualitative approach with semistructured interviews to understand the views and perspectives of vaccine-hesitant adults during COVID-19 in Canada. The interview questions were focused on questions about the key principles of the CDCs Crisis and Emergency Risk Communication Framework. Thematic analysis of the interviews was completed. **Results and analysis:** 12 participants were interviewed, contributing to four interrelated themes as important to COVID-19 vaccine hesitancy: (1) perceived low use of crisis communication guiding principles by public health and government is contributing to distrust of the spokesperson and message; (2) risk perception and decision-making around vaccine uptake are influenced by many sources and concerns surrounding vaccine research and development; (3) the pharmaceutical industry and perceived politicization of vaccine efforts are causing distrust; and (4) stigmatization related to COVID-19 vaccine status further entrenches views and erodes trust. **Conclusions and implications for policy, practice, and research:** This study highlights the importance of trust and how vaccine hesitancy is fueled by perceived ineffective crisis communication by officials. Crisis information that is targeted and tailored and evidence-based must reflect vaccine-hesitant individuals' information needs and values, rather than a one-size fits all approach.

Non-smoking outdoor environments in the health care sector in region Östergötland, Sweden

Linda Karlsson¹

¹Region Östergötland, Linköping, Sweden

Background and objectives: In January 2016, Region Östergötland introduced a completely non-smoking healthcare area. Tobacco smoking is today the single largest cause of disease and premature death in the Western world. It is important to prevent illness and especially to protect children from passive smoking. The aim is that non-smoking outdoor healthcare facilities become role model and provides a total smoke free environment for all: employees, entrepreneurs, patients, visitors and the population. In 2022, the region made an investment for a campaign to change lifestyle habits and reach better wellbeing. The campaign "Your guide to health" and reinforced earlier work to minimize the exposure for smoke and use of tobacco. **Methods:** The message focuses on the positive potential of non-smoking healthcare facilities outdoors. The organization takes responsibility for promoting health and disease avoidance. Employees in health care take responsibility and show that non-smoking healthcare environments are important. The patient is motivated to change and is offered a tobacco-subsidy aid. Inpatient patients are offered nicotine medicines.

Results: It has been a solid job, with many professions involved. Important conclusions have been identified; walking around the hospital environment to detect secret smoking places and extra cleaning if necessary to sweep away cigarette butts. Various campaigns like tobacco-free day and tobacco-free week, news and articles on the hospitals intranet and written information in different languages. **Conclusions:** Since 2018, there is a law in Sweden against smoking in certain places. As society becomes more smoke-free, compliance with healthcare's decision in non-smoking outdoor environments is likely to increase and be respected to a largely extent. Regarding behavioral changes, it is a matter of patience, continuously reminding and work from various arenas to reach a smoke-free outdoor environments in region Östergötland.

Mis/disinformation in a public health crisis: supporting the wellbeing of individuals with lupus through evidence-informed advocacy

Francesca Cardwell¹, Susan Elliott¹, Ricky Chin², Yvan Pierre³, Ann Clarke²

¹University of Waterloo, Canada, ²University of Calgary, Canada, ³McGill University Health Centre, Canada

Background and Objective: The spread of false information, unintentionally (misinformation) or deliberately (disinformation), can have serious consequences for trust in public health communication. Exposure to mis/disinformation also presents challenges for individuals with pre-existing conditions like systemic lupus erythematosus (SLE), as mis/disinformation can complicate patient decision-making and exacerbate stress, a potential trigger for SLE flares. The

spread of mis/disinformation has been amplified during the COVID-19 pandemic, as emphasized by The Lancet in their report on the 'infodemic'.

Methods: To increase understanding of how individuals with pre-existing conditions access and trust health information, we surveyed an international sample of SLE patients (n=2111) recruited from 18 research cohorts and five advocacy organizations. Respondents completed an online survey regarding the sources of health information accessed in the 12 months preceding (pre-03/11/2020) and during the pandemic (post-03/11/2020). The percentage accessing various sources of information and their level of trust in each source were compared pre- and post-03/11/2020 using McNemar tests.

Results: The mean age of respondents was 49 years and 93% were female, which is consistent with the characteristics of those affected by SLE. Adverse impacts to health due to accessing health information through news/social media were reported by 17%. Although lupus specialists and family physicians were the most trusted sources, they were accessed less frequently post-03/11/2020 (specialists: 79% pre vs 70% post; physicians: 57% pre vs 50% post), and news and social media, less trusted sources, were accessed more frequently (news: 53% pre vs 62% post; social: 38% pre vs 41%). Advocacy organizations were less accessed pre (36%) and post (37%) than other less/similarly trusted sources (e.g., news media). Trust in advocacy organizations decreased post-03/11/2020 (59% pre vs 54% post). **Conclusions:** Exploring how advocacy organizations can better support patients, particularly during times of crisis, is critical to mitigating the adverse impacts of mis/disinformation.

Rural-urban variation in willingness to donate blood in Ibadan region, Nigeria

Brigid Unim¹, Faithwin Gbadamosi², Yusuf Popoola³, Femi Olaniyan², Ridwan Adesola⁴, Brigid Unim⁵

¹Department of Cardiovascular, Endocrine-Metabolic Diseases and Aging, Istituto Superiore di Sanità, Rome, Italy, ²Department of Geography, University of Ibadan, Nigeria, ³Department of Computer Science, Adeleke University, Nigeria, ⁴University of Ibadan, Nigeria, ⁵Department of Cardiovascular, Endocrine-Metabolic Diseases and Aging, Istituto Superiore di Sanità, Italy

Background and Objective: Although there are ongoing blood donation campaigns in Nigeria, the prevalence of voluntary blood donation is about 10% and there is limited information about the determinants of blood donation behavior, especially across rural-urban geographic areas. The aim of the study is to assess the rural-urban differences in willingness, knowledge, attitude and practice of blood donation. **Methods:** A cross-sectional study addressing adults from three rural and three urban communities in Ibadan region was performed in 2021 using a structured interviewer-administered questionnaire. The study subjects were selected through a multi-stage sampling method.

Results: A total of 287 individuals were surveyed, of which 72% have never donated blood. The majority knew about blood donation (83.6%), considered it a safe practice (88.8%), and knew where to donate blood, especially rural dwellers (78.2% vs. 57.5%; p=0.001). However, urban dwellers were more willing to donate blood (67% vs. 58.6%; p=0.03). The main reasons for not donating blood for rural dwellers were 'never thought of it' (39% vs. 34.7%) and 'no one asked' (34.4% vs. 17%); most urban dwellers were afraid of needles (21.8% vs. 12.5%) (p=0.02). Of 76 blood donors, 68.4% had donated once and 47.4% donated for relatives or friends. Most rural dwellers declared that blood donors should be compensated (82.8% vs. 48.5%; p<0.001). **Conclusions:** Willingness to donate blood varies across rural and urban communities and is influenced by several factors, including cultural context, the need for motivations and incentives. Consequently, willingness to donate blood does not translate to active practice of blood donation, with consequences for the establishment of blood transfusion services. Public health interventions are required to enhance awareness and knowledge about blood donation and should be targeted to the cultural context and geographical area. The provision of incentives could be taking into consideration in areas with high blood shortage.

Communicating about COVID-19 vaccines with young adults: preferences, attitudes, and influences on decisions to get vaccinated

Caitlin Ford¹

¹University of Guelph, Canada

Background: Young adults have remained one of the least-vaccinated age groups against COVID-19, especially for third and fourth vaccine doses. As

such, understanding key motivators and barriers for vaccine uptake is essential for developing effective health communication that encourages them to get vaccinated. In our study we sought to understand the factors that motivated young adults to get vaccinated against COVID-19, the type of health information that young adults have received during the pandemic, and the communication needs and preferences of young adults.

Methods: Fifteen Canadian post-secondary students (aged 18-29) participated in semi-structured interviews where they were asked about the influence of various public health information on their decision to get vaccinated against COVID-19. Interview transcripts were then coded for common topics, and a thematic analysis was conducted to uncover major themes from the interviews.

Results: Four major themes regarding decisions to vaccinate emerged from our study population. 1) Participants had high science and health literacy which shielded them from being influenced by misinformation; 2) Participants expressed high trust in official sources which positively impacted their confidence in the vaccines; 3) Participants exhibited a low perceived risk from COVID-19 infection and their decision to vaccinate was influenced by factors beyond personal protection; 4) Participants responded best to communication that they perceived to be targeted and tailored towards them and messages that met their communication needs had a positive influence on their decision to vaccinate.

Conclusions: Together these themes form a foundation for effective vaccine communication campaigns targeted and tailored towards young adults. Our findings provide strategies for the creation of public health messages that meet the needs of this population, which is essential for gaining their trust during future public health crises.

Multilevel and multidimensional communications for health equity: experiences of the health equity network of the Americas

Luis Calvo¹, Rocío Sáenz^{2,3}

¹Centre for Research in Nursing and Health Care of the University of Costa Rica, San José, Costa Rica, ²Centre for Research in Nursing and Health Care, University of Costa Rica, San José, Costa Rica, ³Health Equity Network of the Americas, San José, Costa Rica

The Health Equity Network of the Americas (HENA) is a multidisciplinary platform for research, teaching, and social action, with a diversity of strategic visions and policies at a multilevel scale for the management, exchange, and dissemination of knowledge. In 2021-2022, it was proposed to consolidate an efficient and effective communication strategy from the dimensions of coordination, and internal, external, and corporate communication. A literature review and a participatory workshop with representatives of HENAs political and strategic direction were conducted from Discussion-generating questions about the identity, contributions, audiences, key messages, channels, and feedback on which HENA will be based, in addition to documentary analysis and diagnosis of content in social networks from its launch in 2020 until the transfer and consolidation of the Technical Secretariat to the Centre for Research in Nursing and Health Care of the University of Costa Rica (CICES-UCR) in 2021. The Communications Management Strategy has allowed the continuous flow of information, dissemination of activities of interest, and scientific production. In the corporate dimension, a graphic line was generated for the design and distribution of content, firstly creating an identifier and updating advertising and digital materials. In the internal dimension, the articulated work between the political and strategical teams internally was promoted. For the external dimension, communications, and annual media plans were generated to reactivate brand positioning strategies on digital platforms, with the launch of official chats, and social networks. Sharing knowledge for action in equity requires multilevel dissemination strategies with principles such as accessibility, feasibility, credibility, relevance, comprehensibility, and timeliness of information, targeted and adapted to audiences. HENA has managed to bring together actors for an articulated work and to position equity as an action that transcends intention, with powerful messages contextualized to priorities and experiences of the region that invite to act intersectionally, systemically, and people-centered.

Challenges for menstrual hygiene practice among adolescent school girls in West Midnapur district, West Bengal, India

Anumita Mallick¹

¹Vidyasagar University, Kolkata, India

Background: One of the most common issues that adolescent girls in India face is about their periods. Menstrual Hygiene for adolescent school girls is a neglected

issue coupled with social challenges in countries specially like India. Social norms, practices and limited availability of commodities influence adolescent girls' capacity to cope up the stress as well as take part in family and social life, and many girls even don't know how to maintain the menstrual hygiene. Objectives: This study Aims to explore the restrictions and menstrual problems among adolescent school girls. methods We conducted this cross-sectional study during January 2018 – December 2019 and interviewed Bengali school going adolescent girls in Paschim Medinipur district of West Bengal, India, using semi-structured validated questionnaire. Collected data were entered, cleaned and analysed using recommended statistical software and methods.

Results: Among 232 enrolled study respondents (age range from 9 to 16 years), average age at menarche was found 12.7 years (12.3, 12.9) In response to the question about challenges during menstruation, 97% of the respondents were keeping away from religious function and followed by didn't eat certain food (6%), didn't prepare food (27%), didn't play (39%). 82% felt abdominal pain, 14% in excessive bleeding and 4% felt breast pain) as primary challenges they face.

Conclusions: Menstruation continues to be a health challenge augmented by social norms and practice for adolescent girls, despite significant improvements to facilities and educational programs in the country. This biological phenomenon causes many of the adolescent girls to miss school days, regardless of the types of school. Adolescent girls safe health and recommended menstrual hygiene practices are also greatly influenced by the facilities provided at schools.

Keywords: Menstrual problem, adolescence girls, school toilet, sanitary pad

Prevalence of *Plasmodium falciparum* infection in children under 15 years in two oil palm plantations in Aboisso, Côte d'Ivoire

Agnimou Sadiakacou^{1,2}, Assi Serge-brice^{1,2}, Adja Maurice³, Anne Poinssignon⁴, Franck Remoué⁴, Guigbéhi Koudou⁵

¹Institut National de Santé Publique, Abidjan, Côte d'Ivoire, ²Institut Pierre Richet Bouaké, Abidjan, Côte d'Ivoire, ³Université Félix Houphouët Boigny, Ivory Coast, ⁴MIVEGEC, University of Montpellier, IRD, CNRS, France, ⁵Université Nangui Abrogoua, Côte d'Ivoire

Background and Objective: Malaria is a major public health problem in Sub-Saharan Africa including Côte d'Ivoire. It is a deadly disease for children under five year's old and pregnant women. The prevalence of malaria is not well studied in oil palm plantations in Aboisso district. Therefore, the aim of this study is to quantify the burden of *Plasmodium* malaria infection in two oil palm plantations in South Eastern region of Côte d'Ivoire.

Methods: Two cross-sectional surveys bearing on 388 children aged 1 to 14 years old from two oil palm agro systems namely Ehania-V1 and Ehania-V5. During the dry and the peak of the long-wet seasons, finger pricked blood was used to prepare thick and thin blood smears.

Results: 66.2% of children were identified as afebrile, with axillary temperature below 37.5°C. According to villages, this was 63.7% in Ehania-V1 and 61.4% in Ehania-V5. Microscopy identified an overall *Plasmodium falciparum* infection prevalence of 35.3%. 19.1% of children in Ehania-V1 and 53.3% in Ehania-V5 harbour *Plasmodium falciparum* the dominant parasites. *Plasmodium falciparum* was not associated with gender, age-group, fever and mosquito net use ($P > 0.05$). The prevalence of *Plasmodium* in febrile (43.7%) and afebrile (59.3%) was not similar in children of Ehania-V5 ($p = 0.04$). Children from Ehania-V5 were significantly more infected in the wet (62.7%) season than the dry (41.5%) ($p = 0.004$). Significant difference were observed in *Plasmodium falciparum* between the two villages during both the dry ($p = 0.005$) and wet season.

Safety education and child safety behavior on the Road in The Gambia

Paul Bass¹, Bakary Ndow¹, Manjally Ndow¹, Alhaji Jabbi¹

¹Department of Public and Environmental Health, School of Medicine and Allied Health Sciences, The University of The Gambia, The Gambia

In The Gambia, up to 30% of road traffic crashes involve students with a mean age of 14 years and more than half (51%) were injured as pedestrians. To our knowledge, no study in West Africa investigated child safety behaviours with a support system from parents. This study investigates the influences of safety education and parent support to improve child safety behavior on the road in The Gambia.

Methods: Using a controlled field experimental design, two public lower basic schools located along a public road (highway) in West Coast Region were randomly assigned as the intervention or control schools. Eligible participants were all

students aged 11 to 14 years. Parents of children in the intervention school were provided road safety education and their parent support was assessed, including the child's mode of transport to school, sources of distraction, and safety concerns. However, in the control school, both parents and students were given information about how to ensure dental hygiene. Real-time video recordings were used to observe child safety behaviour while on the road environment.

Results: The results showed that individuals or groups of students were more likely in the intervention school than in the control school to demonstrate ideal road crossing behaviours, such as looking left-right-left before road crossing, less likely to cross the road while there is an incoming vehicle, crossed the road without distractions from others, crossed the road at designated crossing areas and walking fast and not running while crossing the road. The mean crossing time was lower for children in the intervention school than in the control school.

Conclusions: The study demonstrated, to an extent adoption of ideal behaviour among students. These findings may fill in a knowledge gap and should initiate discussions on introducing road safety lessons in the basic school system in The Gambia.

DOI: 10.18332/popmed/165617

Do the same message effect differently vaccinated and unvaccinated?

Smiljana Cvjetkovic¹, Vida Stojkovic¹, Sanja Matovic-Miljanovic¹, Stefan Mandic-Rajcevic¹, Janko Jankovic²

¹Euro Health Group, Serbia, ²Faculty of Medicine, University of Belgrade, Serbia

Background and Objectives: Even something distinctly personal, as an attitude towards vaccination, is actually a social phenomenon that can be influenced by what others do or say. Rich history of persuasion research shows that different types of messages can influence attitude change in diverse directions. The aim of this study was to evaluate the effects of message features on attitudes towards COVID-19 vaccine and vaccination. Methods: Experimental study was conducted in two phases. In the first phase the preexisting attitudes towards COVID-19 vaccination were assessed. In the second phase respondents were randomly assigned to four message interventions, developed combining two prototypical pro-vaccination decision narratives (determined vs. hesitant) with two communication sources (physician vs. lay peer). After the message exposure, participants were asked to fill in the questionnaire regarding attitudes towards COVID-19 vaccination again. Total of 172 adults aged 18 and above from Western Balkans, both vaccinated and unvaccinated, participated in the study. Wilcoxon signed-rank test was applied.

Results: The message condition where the lay peer is expressing hesitant decision narrative elicited change in attitudes towards the COVID-19 vaccine safety in both the unvaccinated ($p < 0.05$) and the vaccinated ($p < 0.05$) producing positive change among the former and negative in the latter. Additionally, in the vaccinated the same message condition yielded a significant positive change in perception of the danger of disease ($p < 0.05$) and social responsibility ($p < 0.05$). After the message intervention they perceived danger of COVID-19 as higher and reported greater sense of social responsibility. Conclusions: The same message features elicited different directions of attitude change, depending on vaccination status. In the unvaccinated the exposure to the message enhanced the adoption of message-consistent vaccination attitudes, while in the vaccinated it triggered general sense of vulnerability, characteristic for their pre-vaccination emotional state.

Health agencies Facebook performance before and during the COVID-19 pandemic: insights for infodemic control

Leonor Bacelar-Nicolau^{1,2}, Susanah Diniz³, Leonor Bacelar-Nicolau^{4,5}

¹Instituto de Medicina Preventiva e Saúde Pública (IMPSP) and Instituto de Saúde Ambiental (ISAMB), Faculty of Medicine, University of Lisbon, Lisbon, Portugal, ²NOVA Information Management School (IMS), Lisbon, Portugal, ³NOVA IMS Information Management School, Lisboa, Portugal, ⁴IMPSP and ISAMB, Faculty Medicine of Universidade de Lisboa, Lisboa, Portugal, ⁵NOVA IMS, Lisboa, Portugal

An infodemic is an enormous flow of inaccurate information that may spread through social media, potentially causing confusion and damaging peoples' behavior and health, during an epidemic. It may intensify outbreaks and hinder the discovery of trustworthy sources and reliable guidance for populations. Our aim was to characterize the individual engagement performance of social media posts published before and during the COVID-19 pandemic (before and after vaccination) on Facebook's pages of selected national health organizations to

identify typologies of agencies. Publicly available data on 39525 posts from 17 health agencies Facebook pages between 01/01/2019 and 31/05/2022 was studied with univariate, bivariate, and multivariate exploratory data analysis (such as principal components and hierarchical cluster analysis) and text mining methodologies. Results showed that globally COVID-19 led to a relevant increase in the number of posts published on the health agencies' Facebook pages under study, and to a significant increase in their audiences' interactions. However, engagement during the pandemic period after starting the vaccination decreased, when compared with the previous pandemic period. Furthermore, 3 typologies of agencies were identified: agencies with high performance in total interactions; agencies with either higher or lower relative engagement; agencies with opposing performance before and after vaccination started during the pandemic period. Hence, audiences sought more information on Facebook with the COVID-19 pandemic. Different performances from health agencies' pages may be linked to different infodemic strategies. Our study provides valuable insights to health agencies, as infodemic management should not be confined to times of crisis but should be an ongoing investment and may contribute to more effective health promotion strategies.

Heating versus Eating - The framing of food and fuel poverty in UK media

Sarah Champagne¹, Omotayo Adefolalu¹, Jennie Macdiarmid¹, Euan Phimister¹, Aravinda Guntupalli¹

¹University of Aberdeen, United Kingdom

Background: In a time of economic turmoil, the UK is facing a stark cost-of-living crisis where people may be forced to choose between heating their homes and eating regular meals. Little research has explored this intersection of food and fuel poverty (FFP), though the "heat or eat" trade-off has been widely portrayed in the UK media. Hence, this media analysis seeks to assess how FFP are framed relationally in the UK news and how surrounding public health messaging has been portrayed.

Methods: Using Nexis Lexis, we searched for UK news articles about overlapping FFP, published between January 2010 and April 2022. Relevant data were extracted and analysed relying on framing theory.

Results: We identified 193 articles that met the inclusion criteria. Despite a spike in FFP news in 2013/2014, the issue largely gained momentum late 2021 into 2022, following the cost-of-living crisis and, later, Russian invasion of Ukraine. Journalists predominantly identified food poverty as a reliance on food banks, and fuel poverty as an inability to afford to heat and, to a lesser extent, power household (e.g., cooking) appliances. Many (68%) articles presented FFP as a trade-off ("heating versus eating"), while others framed FFP as "compounding," or "not distinct." Thirty per cent of articles framed the issue in relation to public health, with 10% drawing connections to mental health, 7% to death/mortality, and 18% to physical health. Children (n=78), older adults (n=48), and people with disabilities (n=28) were outlined as having a distinct relationship with FFP – either as particularly "hard hit," "vulnerable to consequences," or "unacceptably experiencing" FFP.

Conclusions: The intersection of FFP has been a reoccurring and growing topic in mainstream UK news since 2010. Public health research needs to do more to explore the "heat or eat" phenomenon and contribute to public awareness of FFP health implications.

DOI: 10.18332/popmed/165730

The newspaper coverage of public health policies and scientific research: lessons learned by the Italian National Institute of Health during the COVID-19 pandemic

Carlotta Fiammenghi¹, Elisabetta Ceretti¹, Loredana Covolo¹, Umberto Gelatti¹, Luana Penna², Anna Taranto², Silvio Brusaferro²

¹University of Brescia, Department of Medical and Surgical Specialties, Radiological Sciences and Public Health, Italy, ²Istituto Superiore di Sanità, Italy

Background: Most articles in the corpus appeared in Corriere della Sera (31,8%) in March 2022 (17,6%). Preliminary results show that across all publications special attention is paid to the semantic and discursive aspects related to the use of a specialized lexicon or register in journalistic texts. Terms such as "serological" (sierologico, 252.97 fpmw), "swab" (tampone, 1637.68 fpmw) and "R-value" (indice R, 83.56 fpmw) are often singled out and explained using lexicographic strategies (definitions, paraphrases, and synonyms); however, concordances show significant semantic shifts from scientific-institutional to journalistic use

of such words in context.

Conclusions: The linguistic analysis has shown the friction between medico-scientific, institutional, and journalistic narratives of the pandemic. The project aims to further this analysis by building a multidisciplinary research team comprising medical practitioners, public health researchers, linguists, and journalists, to reflect on these clashes and to develop best practices to face possible future public health crises.

Popul. Med. 2023;5(Supplement):A1629

TV medical drama: how to talk about public health in Italian primetime

Daniela Zago¹, Enrico Scarpis², Erika Pompili³, Gianluca Voglino³, Laura Brunelli⁴

¹University of Udine, Department of Medicine, University of Udine, Udine, Italy, ²University of Udine, ³University of Turin, Department of Public Health Sciences, University of Turin, Turin, Italy, ⁴University of Udine; Friuli Centrale Healthcare University Trust

Background and Objective: Television is one of the most effective media for conveying important public health messages and promoting prosocial behaviors. In addition, television medical dramas often depict the practice of medicine and thus can influence the knowledge and behavior of a large audience. Our aim was to analyze how public health issues are addressed in the most popular medical dramas.

Methods: We selected the two most popular television medical dramas in Italy that aired in prime time between 2012 and 2019 and are also available on DVD or paid platforms. A total of 94 episodes of Greys Anatomy and House, M.D. (49 and 45, respectively) were analyzed in double blind. Each episode was assessed using a checklist that described the health promotion topics covered and the compliance with infection risk prevention for each procedure performed.

Results: At least one public health topic was addressed in 57 (61%) episodes (86 total cases), including: blood and organ donation (33%), drug and alcohol abuse (27% and 17%, respectively), healthy eating (9%), physical activity (9%), sexually transmitted diseases (6%), immunizations (3%), screening programs (3%) and smoking (1%). No reference was made to sleep education and promotion of sleep hygiene. Proper hand hygiene was depicted in 10% of the potential 239 procedures. The use of disposable gloves and gowns (PPE=personal protective equipment) was appropriate in 92% and 74%, respectively, of the 191 procedures in which their use was required by the guidelines.

Conclusion: In the episodes analyzed, healthy lifestyles (i.e., smoking abstinence) or vaccination were addressed only superficially, and the use of PPE was also partially presented before the pandemic. Given their large audience size, medical dramas should better be used to communicate important public health issues to the general public.

DOI: 10.18332/popmed/163807

A health policy dialogue on emergency use authorization during COVID-19: a case of a YouTube influencer with millions of subscribers

Jenny Frasco¹, Lana Ivanitskaya¹, Elina Erzikova¹, Eva Reed¹

¹Central Michigan University, School of Health Sciences, 1200 S. Franklin St., Mount Pleasant, Michigan 48859, United States

Background and Objective: An essential element of managing a public health emergency is communication. The rise in popularity of YouTube videos about Emergency Use Authorization (EUA) matched the announcement of the first COVID-19 vaccine receiving an EUA. EUA communication by public health authorities coincided with social media messaging by individuals, some of whom amassed vast global audiences. We aim to analyze the EUA policy from the perspective of the 1) influencer, Dr. John Campbell, a U.K.-based nurse educator and popular YouTuber and 2) his global audience of social media users who watched Campbell's EUA-related videos 4.5M times, posting 38,000 comments.

Methods: We used descriptive statistics, content analysis, computational linguistics, and natural language processing in VOSviewer to analyze Campbell's video messages and YouTube statistics; 38,000 comments to his 5 videos about EUA; and audience engagement – likes and comments per video view. Video transcripts and audience comments were transformed into term networks that explain the main discussion topics by visualizing co-occurring terms.

Results: By November 2022, Campbell's 2.56M subscribers represented 0.03% of the global population. The YouTube videos about EUAs he uploaded in Nov 2020-September 2022 demonstrate high audience engagement. Campbell's YouTube follower comments provide evidence of social media users' concerns

with how EUAs are used, especially late in the pandemic. There is disagreement about the meaning and application of EUA. Some commenters question if the emergency continues to exist, challenge the process of granting EUAs, and question motivations by pharmaceutical companies and public health authorities. EUA comments are linked to other COVID-19 discussions, which we explain in depth.

Conclusion: While not without controversy, Campbell's messages invite participatory dialogue and broad audience engagement. This case study offers insight about how the influencer engages the audience and how the audience responds, each with implications for health communication, health administration, and health policy.

DOI: 10.18332/popmed/163812

Managing the financial risks and harms from gambling: a lived experience perspective

Sarah Marko¹, Samantha Thomas¹, Hannah Pitt¹, Mike Daube¹

¹Institute for Health Transformation, Faculty of Health, Deakin University, Australia

Background and Objective: Government messages about gambling typically frame gambling as a financial risk, and harm as being the result of an individual's choices. This study aimed to understand how people with lived experience of gambling harm conceptualise the financial risks and harms gambling can have, and how these were recognised and managed in their own lives.

Methods: Semi-structured interviews were conducted in Australia. The participants were fifteen gamblers who had experienced harm from their own gambling and six affected who had been harmed by a family member's gambling. The data were analysed using reflexive thematic analysis.

Results: Four themes were constructed from the data. First, participants did not generally think about the risks associated with gambling prior to experiencing harm. Those who did considered whether each bet was affordable. Second, they recognised gambling was harming them when their broader finances were negatively impacted by gambling losses. Third, the financial impact of gambling was managed by prioritising their expenses, limiting other spending, and borrowing money. Finally, the financial impact of gambling contributed to other long-term problems.

Conclusion: This study showed that messages about being financially responsible when gambling may not be effective as participants attempted to manage the financial impacts of gambling. Public messaging around gambling should move away from personal responsibility and instead highlight the realistic risks and harms gambling can have in the lives of gamblers and affected others.

Infectious diseases risk framing in Bulgarian media during early COVID-19 pandemic and the Ebola crisis

Zhivka Getsova¹

¹National Centre of Infectious and Parasitic Diseases, Bulgaria

Background and Objective: Newly emerging infections are a major challenge to public health. Motivation for compliance with recommendations may be life-saving and depends on effective communication. The study's aim is to review risk framings in the media in the early stages of the COVID-19 pandemic (January 2020) in Bulgaria and to compare results with the communication carried out in October and November 2014 when Ebola was exported from Africa.

Methods: Bulgarian public television central news emissions were screened for information on infections for 1 month in 2020 and 2 months in 2014. A content analysis was carried out. Period lengths reflect observed intensity of spread (EVD 2014 R0 range (1.51-2.53), COVID-19 (1.5-3.5 from early 2020)). Binary, continuous and categorical variables were introduced to match the needs of the analysis. Attention was paid to whether news mention epidemic, symptoms, masks, restrictions, mutation, vaccines, evacuation, testing, preparedness and others. Duration of reportages and choice of interviewees were compared.

Results: Cumulative duration of reporting on infections was 58 min in October-November 2014 and 55 min in January 2020. In both cases information on the epidemic situation in Europe prevailed. Duration of reportages that involve medical doctors as interviewees was higher in 2014 while the presence of foreign technical experts prevailed in 2020. Reporting on other infection was 57% more common in 2020 than in 2014. Evacuation, restrictions and masks were 5 to 10 times more frequently discussed in comparison with 2014, while testing, vaccines and preparedness were 1.14 to 1.6 times more common topics in 2014.

Conclusion: Diagnostic preparedness was framed as more urgent in 2014 while in 2020 early crisis response focused on prevention. To preserve public trust and

encourage compliance with measures communication should explain priorities and their consistency with the threat's nature while setting realistic targets specific to each epidemic.

Evaluation of the exposure to COVID-19 vaccination-promoting communication campaign in Armenia

Zaruhi Grigoryan¹, Zaruhi Grigoryan¹, Varduhi Hayrumyan¹, Tsovinar Harutyunyan¹

¹Turpanjian College of Health Sciences, American University of Armenia, Marshal Baghramyan 40, Yerevan, 0019, Armenia

Background and Objective: To raise awareness of the safety and effectiveness of COVID-19 vaccines and to boost the vaccination rates in Armenia, the Turpanjian College of Health Sciences of the American University of Armenia (AUA/CHS) launched an awareness-raising campaign in 2021, employing various communication channels. To understand whether the campaign reached its audience, we assessed the level of exposure to the campaign materials in June-July 2022.

Methods: We conducted a cross-sectional telephone survey among 312 adult participants from the capital Yerevan and other regions of Armenia. The exposure to communication materials in the past 12 months was assessed at the levels of aided and confirmed recall. The overall level of exposure and the distribution of exposure across socio-demographic categories were explored in descriptive and bivariate analysis.

Results: The mean age of participants was 47.73. Females constituted 57% of the sample. About 37% of the study sample was exposed to at least one of the COVID-19 vaccination-related communication materials produced by the AUA/CHS. The vast proportion (75.2%) of those who were exposed to any messages about COVID-19 vaccination in Armenia (n=149) were exposed to at least one of the AUA/CHS-produced materials. About 26% of participants reported exposure to any of the five TV spots and 18.21% to any of the three billboards/posters. The TV spots and billboards/posters were the most commonly recalled conduits of communication. A significantly higher proportion of 18-64-years old participants was exposed to communication materials compared with the older respondents (42.11% vs. 21.62, p=0.002).

Conclusion: The study findings showed that AUA/CHS campaign was well-represented in the awareness-raising efforts in the Armenian media, reaching mostly the younger and middle-aged audience. Given the higher rates of exposure to TV spots and billboards/posters, these communication means should be further utilized for awareness-raising efforts in the country.

Rational use of antimicrobials: use of technological resources for teaching-learning and health promotion

Claudia Liba¹, Tatiana de Araújo Alecrim², Isis Katayama³, Marcelo Corral¹, Diego Diniz⁴, Tatiana de Araújo Alecrim³

¹Facens Centro Universitário "Rodovia Senador José Ermírio de Moraes, 1425 - Jardim Constantino Matucci, CEP 18085-784 Sorocaba - SP, Brasil"
²Brazil, ³Facens Centro Universitário, Sorocaba, Brazil, ⁴Facens Centro Universitário, ⁴Facens Centro Universitário "Rodovia Senador José Ermírio de Moraes, 1425 - Jardim Constantino Matucci, CEP 18085-784 Sorocaba - SP, Brasil

Background: The antimicrobial resistance of microorganisms is a global issue. According to the WHO, in 2019 this phenomenon was one of the leading causes of mortality, with 5 million deaths associated. In this way, the FACENS University Center of Sorocaba/SP promoted an extension activity with academics from health courses, using digital technologies.

Aim: Elaborate an Educational Campaign in Public Health on the rational use of antimicrobials and sustainable consumption, using innovative pedagogic tools. METHODS: The students carried out a survey, in their homes, on personal hygiene and sanitizing products with antimicrobials. Next, they carried out a conversation circle, a directed study with the support of scientific texts and a Task-Based Learning (TBL) about "Mechanisms of Action of Antimicrobials and Resistance". The subject "Control by Physical and Chemical Agents" was taught with the method Learning Stations and the subject "Bacterial Genetics" with the method Phillips 66. Finally, the students elaborated texts based on the studied content, which were adapted for communication in digital platforms.

Results: Biomedicine and Dentistry students produced a successful educational campaign on the rational use of antimicrobials and the consumption of antimicrobial-free products. Ten videos were produced and released for the TikTok

network and an interview for the YouTube channel, complementing the classroom knowledge, with the perspective of Public Health in Sorocaba/SP.

Conclusion: The activities were important for the awareness and sensitization of academics about possibilities of social intervention. The students perceived themselves as powerful agents of social transformation, for having been able to inform to the public, in an accessible and assertive way through digital technologies, knowledge built and learned at the university.

Sources of information on formaldehyde-will it modify behavior among students?

Liju Mathew¹, Liju Mathew¹, Zeeshan Ali², Neema Halfa¹, Jayakumary Muttappallymyalil¹

¹Gulf Medical University United Arab Emirates, ²Gulf Medical University

Introduction: The essential standard usage of human cadavers in educational practice follows extensive preservation and maintenance to prevent tissue putrefaction which is achieved by embalming and formaldehyde fixation. Medical students spend a lot of time in the gross anatomy laboratory and show variable signs of acute exposure. Obtaining reliable information on the preservative fluid mixture is a major challenge among the students and the staff, due to the regional variation seen with the preservative techniques. In this study, an effort has been made to understand the impact of sources of information on the practical behavior of students to combat the effects of formaldehyde.

Methods: A cross-sectional self-administered questionnaire study was conducted among the student population. A total of 513 participated in the study. Descriptive and inferential statistical analyses were performed. The significance level was set at $p \leq 0.05$.

Results: A good level of literacy of 36.1%, an attitude of 70.4%, and practice of 54.0% were observed among the study population. There is a positive association between seminar, school teachers, and senior students and 57% of participants were reported to have better behavior change from other source input. Regarding the source of information on the fixation mixture and its ill effects, 47.2% of students agreed to have been taught by their respective medical school faculty; 16.6% were informed best by the seminar, and 24.8%, 41.9%, and 32.7%; identified senior students, schoolteachers, and friends respectively as source agents in this study.

Conclusion: Addressing the most influential source, the participants agreed source for formaline and other preservative fluids was introduced by the medical school faculty. And recommended improvising the information source-seeking habit, awareness, and information sources on the safety protocols related to handling fixed cadaveric specimens, especially for entry-level students in the university must be highlighted for safe practice and learning.

Public health observatories: information and communication networks for knowledge production and dissemination of reliable information in the COVID-19 pandemic

Marcele Paim¹

¹Federal University of Bahia/Brazil Rua Basílio da Gama, 72/901, Canela zip code 40110-040 Brazil

Faced with the observation of the growing use of observatories, as an institutional device for Public Health, as information and communication technologies inserted in cyberspace, an attempt was made to investigate their performance in the production of knowledge and dissemination of health information in the COVID-19 pandemic, in Brazil and in other countries. From research that mapped 70 health observatories, focusing on the analysis of health policies of observatories whose countries have universal health systems, a comparative study of multiple cases was carried out. The information content and technical-communicational aspects of 10 health observatory websites were analyzed. The observatories had the function of providing reliable information for monitoring health policies, strategic planning and evidence-based decision-making. The results pointed to the tendency to create new specific sections with information about the pandemic, curatorial work with news publications, epidemiological bulletins, links, articles, studies, research, insertion of new tools, the use of social networks and diversity of languages, revealing the relevance of monitoring health status; gather knowledge production and provide evidence-based quality information, enabling access to reliable information about the pandemic. A dynamic conceptual model is proposed that integrates a virtual repository of information, communication and intelligence in health. This model adds characteristics present in institutional and news sites, suggesting attention to aspects of interculturality and the role

of curatorship of information on health observatory sites. It concludes with reflections on the importance of universal health systems; the intercultural and communicative potential of these health observatories as information and communication networks for the production of knowledge and dissemination of information in the COVID-19 pandemic. In addition, one can defend the thesis of considering health observatories as sociotechnical networks based on the Actor-Network Theory (ANT).

The use of instagram for health promotion and prevention: a scoping review

Valerio Corona¹, Angelica Gris¹, Leonardo Villani¹, Michele Bonacquisti², Gabriella Pietro¹, Enrica Campo¹, Maria Morra², Maria Gualano¹, Walter Ricciardi¹

¹Università Cattolica del Sacro Cuore Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²Università Cattolica del Sacro Cuore

Background & Objective: Over the past 50 years, our knowledge about the impact of behaviors and lifestyles on health has evolved significantly. Strategies that encourage individuals to engage in healthy behaviors for their own health and the health of others are needed today, also considering that the abilities to access, understand and use health information has significantly changed. The aim of this scoping review is to describe how one of the most frequently used social network such as Instagram is used in communicating health promotion and prevention information. It also aims to identify what are the main factors that determine the dissemination of health information among users and its effects on health literacy and awareness.

Methods: The present scoping review was performed following the PRISMA-ScR Checklist. Thereby searching on 3 databases: PubMed, ISI Web of Science, Scopus. Articles published up to November 2022 that investigated the use of Instagram social media, for public health promotion and prevention, were included.

Results: A total of 2,452 articles were screened, finally 52 were included. We conducted a preliminary investigation dividing the included articles into 3 categories and from this first analysis, we can report that the articles were divided into the following percentages: Public Health Prevention and Health Promotion Interventions 25%, Specific Clinical Conditions 23% and Health Risk Factors 52%. Further investigations will be carried out, concerning the type of communication (stories, reels, posts, etc.) and how the communication influenced: dissemination of information, interest of users, awareness of users, health literacy and empowerment users.

Conclusions: Instagram and social networks are becoming increasingly relevant in public health communications, so it is necessary to consider this tool as a communication system in health promotion and prevention programmes, due to its ability to provide the correct information to the population, removing the physical barriers of traditional programmes.

Social networks and pandemic: netnography of a group about maternity and concerns with covid-19

Kamilla Vulcão¹, Mariana Gervásio²

¹USP Student Av. Dr. Arnaldo, 715 - Cerqueira César, São Paulo - SP, 01246-904 Brazil, ²USP Angela Cuenca USP College of Public Health Av. Dr. Arnaldo, 715 - Cerqueira César, São Paulo - SP, 01246-904 Brazil

Background and objective: As a consequence of COVID-19 social isolation has imposed a reality more immersed in social networks. An environment widely used by pregnant women and mothers, the internet has enabled them to have virtual contact and connect with support networks and ease the debate on maternity and parenthood. They use groups and forums to exchange information and calls on their support network to help in making parental decisions. From this perspective, a netnographic study is proposed to analyze interactions of Brazilian users on the social network "Babycenter", within the group "Concerns about coronavirus (COVID-19)" about the pandemic.

We objective to analyze the interactions of these users promoted in virtual support networks and understand the type of information about motherhood and parenting were exchanged in the face of a pandemic.

Method: Qualitative research using netnography applied to the group "Concerns..." on the BabyCenter social network from March 2020 to January 2022. All data shared in the tool are publicly accessible. For the analysis 17 topics related to COVID-19 were selected, themed as: General doubts, Narrative, Symptoms in babies and Symptoms in adults. Word cloud and interpretation in speech analysis

techniques were applied.

Results: The interactions are built around an emotional grammar that strengthen the maternal identity "selfless in the care of the child". It is on the mother that responsibility for the family health falls in practical dimensions, but also symbolical and emotionally. In this regard, was observed that mothers reported seeking the diagnosis of COVID-19 less when it came to themselves. The father appears merely as a provider than as active parent.

Conclusion: In the first two years of the pandemic the concerns narrated by participants are fear regarding their children's health, the impact on their routine, illness and sequels of the disease.

Knowledge and sources of covid-19 information in Nigeria during the covid-19 pandemic: a case study for evaluating outbreak health communication practices in Nigeria

Damilola Adesuyi¹, Nigeria Oluwarore¹, Nigeria Adewole², Ifeoluwa Oladapo², Nigeria Egwuenu²

¹Adekola Pathobiology and Population Science, Royal Veterinary College, University of London, UK United Kingdom, ²Nigeria Center for Disease Control Nigeria

Background and Objectives: COVID-19 was recognised as a global health crisis in January 2020 and declared a pandemic in March 2020 by the World Health Organization (WHO). In the advent of an outbreak like COVID-19, dissemination of accurate health information alongside measures to promote acceptance and adoption of public health guidelines is essential to prompt good health-seeking behaviours. The spread of facts and misinformation on COVID-19 in Nigeria highlights the need to examine people's sources of information and their impact on beliefs, perceptions, and health-seeking behaviours. Our study evaluates the knowledge and sources of COVID-19 information amongst Nigerians during the initial wave of the pandemic as a case study for health communication practices and spread of false information during pandemics.

Methods: A cross-sectional survey was conducted via an online questionnaire between 19th May, 2020 and 18th June, 2020 for adults (≥ 16 years old) living in Nigeria with access to internet. Descriptive statistics and chi-square (χ^2) were reported, while multivariable logistic regression was conducted to estimate the association between selected predictor variables and good COVID-19 knowledge. Results: International health organisations (73.9%) and health/public health workers (70.7%) ranked as the most reliable sources of COVID-19 information, and a lesser level of trust in government statements (40.6%) and social media sources (22.4%) was observed. Multivariable regression revealed some variables such as residential area, geopolitical zones, educational/professional background, and previous COVID-19 diagnosis as predictors of good COVID-19 knowledge.

Conclusions: Quality health information promotes proper health seeking behaviours. Misinformation promotes ignorance while preventing persons from taking proactive therapeutic and safety measures. It can also contribute to non-adherence to safety guidelines shared by governmental health organisations and other credible sources. Hence, it is pertinent that health communication during an outbreak is clear, factual, and specific to the context.

Effect of female education on contraceptive use in a selected coastal area of Bangladesh

Aung Loo¹

¹Directorate General of Family Planning (DGFP), Bandarban, Bangladesh

The present study was conducted on female education in a selected coastal area of Bangladesh that affected positively to contraceptive use. A descriptive type of cross sectional study was carried out among the total of 361 samples for selective purposive according to inclusion and exclusion criteria. In study area, majority of the females (77.3%) were in the age group of 18-30, followed by 13.3% in the age group 31-40 years, around 1.9% were less than 18 years and 7.5% above 40 years. Among them, the education level were 45.2% (primary), 42.9% (can sign only), 5.8% (secondary), 1.1% (higher secondary) and 5% (illiterate). Educational qualification their husbands were maximum (47.6%) can sign only followed by 39.3% primary level, 5.3% secondary level, 2.2% Bachelor, 0.6% higher secondary level, 0.3% master level and 4.7% illiterate. The occupation of the studied women revealed that maximum respondents were housewives (85.9%) and rest of them 6.9%, 1.9%, 1.1%, 3.3% were involved at fishing, business, service holders, household workers and other job/work, respectively. Family member (1-4) noticed in 49.3% family and more than 8 family members recorded 5% family. The 93.10% respondents could make decision on family planning method.

The respondents (83.4%) got information about contraceptives from neighbors. Among the respondent contraceptive use was the highest (96.3%) at the age group 'Above 40 years' and the lowest among the age group 'Below 18 years'. Chi-square test revealed that there was significant relationship between age of the respondent and contraceptive use ($\chi^2=14.852$, $p=0.05$).

DOI: 10.18332/popmed/164978

An assessment of COVID-19 vaccine communication from Canadian federal actors' Instagram accounts and the implications for vaccine-hesitant young adults

Caitlin Ford¹

¹University of Guelph, Canada

Background: In Canada, young adults remain one of the least vaccinated adult age groups against COVID-19. As such, targeting vaccine messages towards this demographic is important for encouraging them to get vaccinated. Because young adults are a prominent user group on social media, we sought to understand if the vaccine messages from Canadian federal actors on Instagram were effective in promoting vaccine uptake based on best practices. Best practice messaging strategies include implementing guiding principles for crisis communication (i.e., transparency, compassion and empathy, conversational tone, clarity, correction of misinformation, call to action) and addressing the 5C model for vaccine hesitancy (i.e., complacency, confidence, risk calculation, constraints, collective responsibility).

Methods: We performed a content analysis on 159 Instagram posts that mentioned COVID-19 vaccines from eight key federal accounts. In addition, we performed a sentiment analysis on the comment sections of these posts to understand public reaction to the messages being shared.

Results: Across the 8 federal accounts and 159 Instagram posts that mentioned COVID-19 vaccines, federal actors did not widely incorporate best practices for vaccine communication. Further, the accounts did not adopt a unified approach to vaccine communication, and overall public sentiment was neutral.

Conclusions: Our assessment has highlighted gaps in the social media communication strategy for COVID-19 vaccines. As such, these Results can encourage future vaccine communication campaigns that reach young adults to be informed by best practices and strategies to encourage vaccination.

Health-related social media advertising is affected by Message Appeals

Ekaterina Volevach^{1,2}, Hana Maršálová³, Hana Cukrová³, Robert Mikulík³

¹International Clinical Research Center, St. Anne's University Hospital Brno, Brno, Czech Republic, ²Faculty of Medicine, Masaryk University, Brno, Czech Republic, ³International Clinical Research Center (ICRC), St Anne's University Hospital (FNUSA) Brno, Czech Republic

Background: Emotional appeals in health-related advertising can increase public interest. However, only limited research exists concerning emotional appeals in advertising on social media and with regards to stroke. This study explored which type of advertising appeal achieves a greater audience engagement with the Stroke Riskometer mobile app.

Methods: Facebook users with Android OS aged 20+ living in the Czech Republic were exposed to Facebook advertising campaigns between 29/Jul/22-18/Aug/22. Using a Facebook split test experiment tool, users were randomly assigned to one of the three message appeals - humour, fear and identification. Message appeals were pretested in discussions with Facebook users. Data were analysed using a Facebook ads manager with the Click-through-rate as a standard main outcome. Results: 56100 users viewed advertisements (75% aged 55+; 60% women) and 2008 clicked (65% by women, 86% were >55 years.). Fear vs humour vs identification had a 3.9% (95%CI 3.6-4.2) vs 3.0% (95%CI 2.7-3.2) vs 2.8% (95%CI 2.5-3.0) click-through-rate.

Conclusions: This study on emotional appeals in health-related advertising on social media demonstrated that fear-based advertising led to the largest number of clicks to download the Stroke Riskometer app. Our results add to the limited evidence on the effectiveness of the fear appeal in health-related Facebook campaigns (e.g., about hypertension, smoking, drink driving). Our fear-based ads also provided better results when compared to previous ads that didn't use emotional appeals (e.g. 2.6% Click-through-rate for lung cancer prevention). Our results provide an insight into the use of emotional appeals in order to maximise user engagement in health-related social media advertising.

One health Melioidosis public knowledge measurement for driving public awareness

Chadaporn Phiancharoen¹, Chadaporn Phiancharoen², Chadaporn Phiancharoen¹

¹Division of Communicable Diseases, Ministry of Public Health Thailand,

²Division of Communicable Diseases, Ministry of Public Health 1/74 Alist B Condominium, Soi. Tiwanon 14/2, Talad khwan sub district, Mueang District, 11000 Thailand

Background: Melioidosis, also locally known as soil fever that is a public health concern for many countries in Southeast Asia including Thailand. Farmers and people who have careers that contact with soil and water might increase the chance of infection. Risk factors for melioidosis include the presence of diabetes mellitus chronic renal failure and thalassemia. Most melioidosis patients will eventually develop sepsis and life-threatening within 1-2 days of hospitalization. Thus, the Ministry of Public Health's goal in Thailand would like to focus on reducing the number of infections and deaths, raising awareness. All of the objectives lead to developing the public knowledge measurement to assess people's comprehension that will be developed the prevention program in the next step.

Objective: * To evaluate people's knowledge and risk behavior of melioidosis infection

* To increase melioidosis awareness in people by strengthening the health literacy of melioidosis prevention and control.

Method: The questionnaire was launched via an online platform. The result will demonstrate the level of understanding of risk groups and risk behavior which can lead to the implementation of the prevention and control program via increasing the health literacy of the healthy volunteer and people.

Result: From 2,644 Thai people who complete the melioidosis questionnaires, The result shows that 58% never heard of melioidosis and 41% had heard of this disease but some of them had misunderstood this disease. There are 23% of people believe that melioidosis patients cannot be cured. There are 94% of people who recognize that farmers are a high-risk category, but any job that involves water or soil might be infected.

Conclusion: As a result, Thai people still require additional information about melioidosis, along with enhanced prevention awareness. As a result, the melioidosis prevention and control plan might also promote prevention and awareness of Health volunteers and target risk groups.

General ombudsman in Brazil: Communication to support the management of the unified health system

Rafael Caliri¹, Dherik Santos², Jeanine Barbosa³, Marcos Cordeiro¹, Margareth Conceição⁴, Stephania Demarchi¹, Fabiane Simões¹, Bárbara Lacerda³, Rita Lima¹, Maria Andrade¹

¹Universidade Federal do Espírito Santo Programa de Pós-graduação em Saúde Coletiva Brazil, ²Universidade Federal de Catalão, ³Universidade Federal do Espírito Santo Brazil, ⁴Universidade Federal do Espírito Santo

Introduction: Communication through the ombudsman of the Unified Health System (SUS), in Brazil, supports the decision of health managers, based on data received from users, effecting social participation. The ombudsman built on a basis of communication, in providing information on the evaluation of services, the populations health needs, and proposals for improvement in the technical areas of the SUS, in response to citizens manifestations.

Objective: To present the participatory performance of the SUS Ombudsman network, from 2010 to 2022.

Methods: An analysis about communication via the SUS Ombudsman was made, demonstrating quantitative and qualitative data on services provided by the Ombudsman network, extracted from the Ministry of Health data panel, between the period of 2010 to 2022.

Results: According to data from the OuvidorSUS Computerized System, 4,710,356 manifestations were registered, since the beginning of its use in Brazil, in 2010. The registrations per year represented: 2010 (1.97%), 2011 (3.50%), 2012 (4.57%), 2013 (6.02%), 2014 (6.05%), 2015 (7.64%), 2016 (8.26%), 2017 (8.57%), 2018 (9.20%), 2019 (10.92%), 2020 (9.11%), 2021 (12.32%) and 2022 (11.87%) of demonstrations, indicating a growing trend in participation over the historical series. The most used means were telephone (55.34%), face-to-face (21.16%) and online form (10.52%). The classifications were related to: requests (40.04%), complaints (35.97%), compliments (10.61%), compliments (6.87%), information (5.22%) and suggestions (1.29%). The main subjects dealt with: management (36.33%), health care (29.44%), pharmaceutical care (7.98%), health surveillance (6.28%), health surveillance (5.96%) and others (14.02%).

Conclusion: Society's participation in the formulation, evaluation and supervision of public policies in Brazil is a social achievement. SUS ombudsmen are powerful management support instruments, as they encourage individual participation and allow managers to know the opinion of the population, subsidizing their health actions.

in Rio de Janeiro health management 60, João Alfredo, 504, Tijuca, Rio de

Janeiro, 20511-390 Brazil

Resume: With the pandemic of the new coronavirus (COVID-19) and the consequent decrease in preventive supply and curative dental care, there was a lack of attention to oral health. The application of the ART, by Mobile Units of Sesc-RJ, was a way to expanding dental care. In addition to the office, with a minimal invasive technique, without using rotary instruments, providing social inclusion, guidance, prevention and maintenance of oral health.

Aim: describe the experience of dental care through ART in students of the Municipal School Ary Schiavo, during the COVID-19 Pandemic. Methodology: Descriptive study with a qualitative approach. The project started in October 2020, covering children aged 5 to 12 enrolled at the Ary Schiavo Municipal School, 01 dental surgeon, 01 oral health assistant and 01 general services assistant were allocated in the project. The activities took place in a classroom provided by the educational institution. Lectures were held for all students, a survey of dental needs, supervised brushing for selected students and general guidelines for their guardians. The assessment of dental needs was carried out through visual clinical examination, using a flashlight, with the aim of identifying cavities. Later, the patient underwent ART.

Results: There was an improvement in oral health and quality of life of this population, during a critical moment for world health, minimizing risks of cross-infection by aerosols in dental offices and knowledge transmission for the maintenance of public health.

Conclusion: We found that teams performance was effective at the proposed time.

Communicating data to enhance comprehension and relevance

Matt Jacob¹, Vasileios Margaritis^{2,3,4}

¹Jacob Strategies LLC, Arlington, United States, ²Swiss School of

Management, Bellinzona, Switzerland, ³European Association of Dental

Public Health, ⁴KMOP, Athens, Greece

The data gathered by public health officials can be a powerful catalyst for improving health policies and practices. Unfortunately, public health data is often communicated in ways that can confuse both non-scientific audiences and health care professionals. Sometimes, a set of data is presented in the same way to different audiences without consideration of their different needs, interests, or literacy levels. In this workshop, the speakers will offer suggestions for disseminating data that enhance its relevance and impact. These suggestions can improve the clarity of data. Recommendations will also be offered for how the public health programs at universities can raise statistical literacy and educate students in appropriate strategies for communicating data. 1. Key public health data should be comprehensible to non-scientific audiences, 2. Data can help the public understand the rationale for public health recommendations, 3. Data can encourage policy makers to adopt evidence-based policies, 4. Communication approaches should be aligned with the audience, 5. Focus on the most meaningful data for the target audience, 6. Disaggregate data when possible, 7. Don't overwhelm them with technical terms, 8. Simplify or translate data, 9. Present data in whole numbers unless more detail is essential, 10. Consider expressing percentages as ratios, 11. Present preferably measures of association to enable comparison between different groups, 12. Use longitudinal data to tell a story, 13. Importance of statistical literacy among health care

professionals (HCP), 14. HCP are working with biological systems, with inherent variability and complex measures, 15. They need to draw accurate inferences, despite biological uncertainty, 16. HCP imperceptible apply statistical principles (e.g. the Bayes' theorem) during their daily duties, 17. Although most of HCP do not conduct formal research, they need to read and interpret research as effectively as possible, 18. Importance of the Statistical Knowledge for Teaching (SKT) framework for epidemiologists and biostatisticians, 19. SKT helps to make statistics comprehensible to others and it is needed to make high-stakes recommendations related to public health, 20. A combination of mathematical and nonmathematical knowledge is required, 21. Statistical knowledge alone is not adequate to advise the public about the evidential basis for recommended health practices, 22. Pedagogical content knowledge is also necessary to enable experts to communicate data and Results effectively to the lay audience, 23. Schools of public health can prepare epidemiologists, biostatisticians and HCPs, 24. Include in their curriculum SKT in quantitative reasoning and analysis courses, 25. Include in their curriculum courses about communication and dissemination strategies, 26. Enhance students' skills in developing and evaluating public health communication campaigns by applying social marketing principles, 27. Provide education on the application of crisis and risk communication, 28. Continuing education for health care professionals via seminars, webinars, short courses on science communication and data Interpretation. Key questions that the workshop answers: 1. How can public health data be presented or summarized to ensure that policy-makers understand its relevance and implications? 2. How can a storytelling approach enhance the comprehension of longitudinal data? 3. What role can the faculty at schools of public health play in educating epidemiologists, statisticians and health care professionals about better ways to communicate data and make valid recommendations related to public health?

Communicating data effectively: making statistics stylish

Gerold Dermid¹

¹School of Public Health, University of Nevada, United States

The Larson Institute for Health Impact and Equity within the School of Public Health at the University of Nevada Reno utilizes a wide variety of communication practices to support audiences being able to access, understand, and use data related to public health matters. Public health data is too often collected, analyzed, and put into extensive final reports that have limited impact. This session will present new ways to display data that support understanding and utilization. Using case study examples from Nevada's Public Health Workforce Development Surveys, session will highlight the impact data design can have when communicating. Examples will showcase how presenting data in new formats supported a better understanding across workforce tiers and was used to guide organizational training development plans throughout the state of Nevada. Attendees will be involved in pinpointing key questions that establish what communication tools should be used for distinctive audiences. In addition, attendees will learn communication tips to create useable reports for multiple levels of the public health workforce as well as the general public. Session will highlight simple data visualization techniques that can be made to help readers interpret what matters most and alter the readers experience, including how to share key findings using color, modern graphs, images, or special effects. Recognizing the importance of inclusivity and following the American Disabilities Act (ADA) standards, session will review common practices that are harmful to reader interpretability and provide alternative solutions. Attendees will gain knowledge of ways to use common programs, including excel and PowerPoint, to create reports that will do more than sit on a shelf.

Health emergency communication: which key elements?

Chiara Crepaldi¹, Alessandro Venturi², Guido Legnante², Ferruccio Di Paolo³, Giovanni Rezza⁴, Luisa Brgonzoli¹

¹Fondazione The Bridge, Italy, ²University of Pavia, Italy, ³University Unicusano, Italy, ⁴Ministry of Health, Italy

Outline of the workshop: COVID 19 pandemic is an example of health emergency at global level, in which institutional communication plays a fundamental role. WHO developed in 2005 general recommendations to be included in national pandemic plans: due to their vulnerable implementation, at the outbreak of the pandemic some countries have succeeded in promoting effective informative actions; others have not, promoting uncoordinated information actions inadequate to the situation.

The study is structured on 3 phases:

National and international literature review on institutional communication strategies; A retrospective and comparative analysis of countries proved to be of particular interest, identifying their strengths (level of coordination, authority and scientific nature of the communication, adequacy to the context, etc.) and criticalities (inadequacy to a state of crisis, overabundance of contents and sources, lack of centralisation, etc.). On this basis, the key elements to elaborate a communication model suitable for a crisis context will be identified.

Specific Aims: The presentation, starting from an analysis of how the pandemic has been institutionally communicated in some European and non-European countries, focuses on what worked and what failed, to identify key elements for an effective communication strategy.

These key elements, with their strengths and weaknesses, will be analysed according to relevant parameters such as timeliness, effectiveness, ability to manage information flows, inter-institutional coordination, communication channels. The results will be compared with the indications provided by WHO and the CDC.

Key Questions: Ineffective communication feeds collective fears and uncontrolled reactions in the population and in the economic system, while effective communication, made up of coordinated clear messages, based on the collective perception of risk, can influence the way in which citizens respond to adverse events, and support the exit from the emergency. The presentation aims to gather useful elements derived from past experiences to support future emergency situations.

The health information portal for better health research and policy decisions

Miriam Saso¹, Petronille Bogaert², Nienke Schutte³, Miriam Saso⁴

¹Sciensano Belgium Hanna Tolonen Finnish Institute for Health and Welfare (THL), Finland, ²Sciensano, Belgium, ³Sciensano Belgium, ⁴Sciensano Belgium Metka Zaletel National Institute of Public Health Slovenia (NIJZ) Slovenia

Brief outline of the overall workshop: The COVID-19 pandemic has shown the need for quick exchange of accurate health information between European countries. To respond to this need, the Population Health Information Research Infrastructure (PHIRI) Project developed the Health Information Portal, a one-stop shop that aims to facilitate findability and accessibility to health and healthcare information in Europe. Following the FAIR (Findable, Accessible, Interoperable and Reusable) data principles, metadata catalogue of population health information were developed following DCAT and Schema.org discoverability metadata standards. Through a collaborative effort between 41 organisations across 30 different countries, the information on the Portal is provided by national experts within National Nodes, organizational entities linked to a national institution that bring together relevant health stakeholders in European countries. The Portal promotes discoverability, access and dissemination of health information allowing researchers and policy makers to benefit from the most up to date health information available in Europe. On December 2022, the Portal contained metadata (incl. links) to 240+ national health data sources, 150+ national and European health information projects, 350+ dissemination sources (e.g. publications, web portals) and 95+ training activities in areas of population health. The Portal also has a dedicated COVID-19 corner. Policy discussions between public health institutes, Ministries of Health, research institutions and universities, on national experiences related to the management of the pandemic are posted to promote exchange of best practices and lessons learnt across countries. Such information is accompanied by an overview map where key COVID-19 policy measures implemented in Europe are displayed to further aid countries in learning from each other's experiences and provide the basis for COVID-19 research.

Specific aims/objectives and component parts

The main objectives of this workshop are: * To increase awareness of the scientific community of the Health Information Portal and the resources the Portal offers, * To demonstrate the use of the Portal, * To showcase, in a moderated environment, how to create a DCAT linked metadata record on the Portal. Throughout the session, the exchange of knowledge, experiences and opinions with the audience will be fostered by the moderator. Firstly, the Health Information Portal will be introduced by guiding the participants on the different sections of the Portal. Secondly, the attendees will be guided through practical examples how to find health information sources, training events, or projects relevant for the topic interested by the audience. Finally, the participants will be introduced to the FAIR data principles and their relevance, and they will be guided on how to create a DCAT linked metadata record on the Health Information Portal.

Key questions that the workshop will address

The Health Information Portal, places itself at the cornerstone of the European public health landscape. Timely and effective, public health actions require easy access to the most up-to-date health information available. The Portal supports researchers and policy makers by promoting the Findability, Accessibility, Interoperability and Reusability of health data across Europe.

A Brief Outline Of The Overall Workshop: Our workshop is intended to act as an overview of effective Public Health communication. We will examine various contexts, beneficiaries, and actors in Preventive Medicine and Public Health communication, stressing the importance of effective knowledge transfer in this field.

* First sub-session "HOW TO: COMMUNICATE DATA TO HEALTH PROFESSIONALS" (20 min):

* How to: Data Visualization - Lucia Palandri, MD, DrPH, PhD

* How to: Digital Communication - Prof. Tommaso Filippini, MD, DrPH, PhD

- [HALF-TIME - 10 min]: DO'S AND DON'TS: INFOGRAPHICS FOR HEALTH PROFESSIONALS VS GENERAL PUBLIC - Eleonora Ferrari, MD; Camilla Lugli, MD

* Second sub-session "COMMUNICATE HEALTH TO PEOPLE: SUCCESSFUL EXAMPLES" (20 min):

* Leo and Giulia - Prof. Anna Odone, MD, MSc, MPH, PhD

* Vaccine Pills on TV - Prof. Andrea Grignolio, MA, PhD

* Q&A session (10 min)

Moderator: Prof. Elena Righi, PhD

Specific Aims/Objectives And Component Parts

As Public Health professionals and residents, COVID-19 pandemic had a significant impact on our work, shedding light on a major issue: communication. As a matter of fact, in the last few years, scientific communication has undoubtedly been a challenge in two ways. On one hand, communication has been difficult even among professionals due to the significant volume of data constantly gathered and analyzed during the pandemic. On the other hand, we faced some difficulty with the necessity to constantly interface with the population in an infodemic setting.

Both challenges should be considered as important priorities in public health: the lessons learnt from the pandemic (and beyond) should routinely and inextricably guide us in carrying out our roles as PH specialists.

Hence, our necessity to delve into this topic and share what we have learnt with coworkers. To this end, we chose to organize our workshop into two sections. A first skill-building sub-session will be dedicated to the communication of scientific information and data among health professionals and "insiders". In the second sub-session we would like to present a couple of examples of successful general public scientific communication campaigns. We will merge the two sub-session with a practical guide about do's and don'ts in scientific posters and general public infographic creation.

The Key Questions That The Workshop Will Address

- How to present scientific findings and relevant data to scientists and health professionals? How to make data more comprehensible?

- How to deliver a clear message and maintain public trust in science through successful campaigns?"

Popul. Med. 2023;5(Supplement):A1651

DOI: 10.18332/popmed/164193

Applying the principles of communication during a public health crisis to safeguard health security and democracy

Background: During the COVID crisis government agencies around the world have embraced an open government approach and mobilized unprecedented resources to get information into the hands of citizens, address false and misleading content, and lead societies out of the crisis. Yet during the pandemic, we have witnessed how false information about medical treatments, vaccines, and the overall COVID-19 response, has spread fear and skepticism about science and perpetuated a sentiment of general distrust of the government and in some cases resistance to science-based policies. This study focused on governments' communication capabilities and functions to be enhanced in preparation for future emergencies.

Methods: We conducted interviews with 27 government officials across 19 countries and 5 continents who served in a position as spokesperson or direct advisor to the spokesperson during COVID-19 and other emergencies. Thematic analysis was used to organize and identify salient themes and patterns that emerged from the qualitative data.

Results: The themes emerged from the analysis include: transparency, accountability, coordination, consistency, timeliness, politicization, responsiveness, ethics, equality and trust. Interviewees highlighted specific examples of how maintaining effective communication across these themes and communication principles may be challenging and brought examples of what tasks public health agencies should oversee and pay attention to enhance communications. Examples include: internal processes to ensure transparency, quality of the information shared with the public, use of AI to monitor mis-disinformation, ethical principles in the code of conduct in social listening, monitoring and communication activities. This presentation will include practical recommendations on how to enhance communication plans.

Conclusions: During the COVID-19 pandemic, government agencies engaged in public health communication efforts have been challenged in applying principles of effective communication. This study has identified specific tasks government agencies can include in emergency plans to address the complexity of the information ecosystem and prepare for future crisis.

Ethical and practical implication of COVID-19 vaccine among pregnant women

Eunice Kimunai¹

¹Defense Health Agency, United States

Background: According to the CDC Health Alert Network, as of September 27, 2021, more than 125,000 confirmed laboratory cases of COVID-19 were reported among pregnant women that resulted in more than 22,000 hospitalized cases and 161 deaths, with the highest death toll of 22 women in the month of August 2021 alone. There are many adverse pregnancy outcomes that have been reported among pregnant women who have contracted COVID-19 including severe illness, stillbirth, preterm birth, neonates' hospital admissions into Intensive Care Units (ICUs), and death. Just one-third of pregnant women were fully vaccinated before or during pregnancy as of mid-September 2021. Evidence about the safety and effectiveness of COVID-19 vaccination during pregnancy, although limited, has been growing. The COVID-19 vaccine is recommended for pregnant women and those who are breastfeeding. This study examines ethical and practical implications of the COVID-19 vaccine among pregnant women.

Methods: In this paper, we reviewed and presented 16 cases of pregnant women who were either vaccinated or unvaccinated against COVID-19 and share their health outcomes as retrieved from media sources. **Findings:** The Findings mirror what the literature reports on the state of COVID-19 among pregnant women. Negative outcomes reported in the literature were also reported in our case reviews. **Interpretation:** This study presents a framework that will guide providers with messaging and provide information to help pregnant women make informed decisions about getting the COVID-19 vaccine.

A critical look at science-based policy-making during the covid-19 pandemic: the case of EU covid passes and lessons learned for the future

Danaja Povse^{1,2}

¹Health and Aging Law Lab (HALL), Belgium, ²Law, Science, Technology and Society Research Group (LSTS), Vrije Universiteit Brussels, Belgium

Background and Objective: This paper will critically appraise the Regulation 953/2021 [1] (DCCR) and its digital COVID-19 certificates (DCC) in the light of EU law's strict requirements for scientificity and objectivity, aiming to provide a normative framework and recommendations on drafting evidence-based policies for the current and future pandemic(s).

Methods: To answer the following question: "What role has scientific evidence played in the DCCR, and in the light of EU law requirements, was the inclusion of scientific evidence effective considering the policy Objectives?", the author will analyse how relevant provisions of the DCCR interact with scientific evidence. Building on the relevant EU case-law on evidentiary requirements, and on the work of sociological jurisprudence, law turning outwards and studies of evidence-based policy, a normative framework will serve to analyse the effectiveness of the DCCR approach. Preliminary findings: Like other EU pandemic laws, DCCR is vague about the inclusion procedures and the quality of science required to adopt additional restrictions. Nor is it clear what kind of scientific expertise should feed into the system – natural sciences, social sciences, public health ethics etc. The references to consultations and adapting the information on the pass to reflect the relevant scientific evidence are scant, and omicron has rendered several underlying assumptions about immunity and transmission outdated. Finally, while the DCCR was drafted to ensure a safe reopening, its implementation by member states has instead led to more social contacts and more infections.

Conclusions: Further research on this topic will lead to reorientation of the evidence-based standards in EU law during pandemics and periods of scientific uncertainty, as well as the eventual consequences of the both member state and EU action, such as nullification suits. This is likely to be difficult due to DCCR's claim to be a technical regulation, focusing on interoperability rather than substance. The role of law and human rights in public health: setting the agenda

Brigit Toebes¹

¹Faculty of Law, Aletta Jacobs School of Public Health, University of Groningen, Groningen, The Netherlands

Background and objective: Law is an important determinant of health. Previous research affirms the role of law in health inequalities. Burris and others have pointed out that law is both a vehicle through which health inequalities are exacerbated and a tool to reduce them and to improve social determinants. Within law, human rights are an important moral and legal tool to advance public health objectives. By giving expression to the vulnerability of the individual, human rights law can serve as an overarching framework protecting the rights and interests of those affected by health inequalities and poor social conditions. Law influences health, and human rights can protect important values when it comes to public health promotion and protection. However, truly interdisciplinary scholarship in the field is limited and it requires on-going maintenance. Legal and public health scholars should connect more to identify common approaches and to find common solutions. **Methods:** A literature review will be conducted to explore current interdisciplinary work addressing law, human rights and public health, with the aim of identifying research gaps and opportunities.

Results: While several authors have expressed the importance of law for public health, this approach requires maintenance. It should be placed on the agenda of law and public health researchers and public health policymakers. **Conclusions:** Law plays an important role in improving health and in reducing health inequalities. This paper has identified some pathways in how this understanding and approach can be strengthened. **References** Burris, I Kawachi, A Sarat, "integrating law and social epidemiology" (2002) *J L med ethics*, 30, 510–521; S Burris, "from health care law to the social determinants of health: a public health law research perspective" (2011) *U Penn L Rev* 159(6), 1649–1667. An examination of sugar-sweetened beverage tax regulations in six jurisdictions: applying a social justice perspective to beverage taxation and exemptions

Natalie Riediger¹, Tamara Neufeld¹, Myra Tait², Lorna Turnbull¹, Kelsey Mann¹, Andrea Bombak³

¹University of Manitoba, Canada, ²Athabasca University, Canada, ³University of New Brunswick, Canada

Background and Objective: Taxes, legislation, and politics are social determinants of health, which impact health through multiple pathways. Globally, sugar-sweetened beverages (SSB) are increasingly taxed as a public health measure, despite criticism that excise taxes are regressive. The purpose of this study was to review laws and regulations regarding taxation of SSB, and describe how various jurisdictions determine applicable taxes to meet their respective legislative objectives.

Methods: We reviewed SSB taxation schemes from Berkeley, Mexico, Philadelphia, San Francisco, South Africa, and the United Kingdom. A comparative review of supplementary government documents and academic publications helped differentiate rationales for taxation, exemption or zero-rating of beverages. Beverage categories selected reflect availability of similar beverages in Canada and the US.

Results: Several beverage types fell clearly into typically taxed or exempt/zero-rated categories across all six jurisdictions (e.g. pop/soda as taxed and water as zero-rated). However, no two sets of regulations were the same, regardless of having similar legislative objectives – to reduce consumption of SSB. Exemptions and ambiguities within the six jurisdictions can generally be grouped lacking clarity regarding the meaning and use of milk; the meaning of 'medical purposes' and 'supplemental'; the point at which a beverage is 'prepared'; the form of concentrate (i.e. liquid/frozen/powder) or medium used (e.g. water, coffee); and the location of preparation (e.g. pre-prepared or point-of-sale) or business size of retailer.

Conclusions: SSB tax regimes are complex, unclear, vary across jurisdiction, and unexplainably omit from taxation several added-sugar beverage types, potentially risking legal challenge. In addition, other research suggests tax complexity is associated with tax avoidance, diminished perceptions of equity and fairness, and increased regressive tax administrative and compliance costs, potentially amplifying negative impacts of SSB taxation on social determinants of health. Lastly, tax exemptions generally reflect and perpetuate existing, already inequitable, political dynamics within the food system.

Popul. Med. 2023;5(Supplement):A1656

DOI: 10.18332/popmed/165490

A public health ethics exploration of a novel mobile health application for public health surveillance

Thokozani Hanjhanja-Phiri¹, Pedro Velmovitsky¹, Plinio Morita¹

¹School of Public Health Sciences, University of Waterloo, Canada

Background and Objective: Digital health technology is poised to advance medicine across adult and aging populations but there is a social and ethical opportunity cost attached to this unprecedented advancement in technology. Moreover, these outstanding accomplishments of the 21st century often misalign with public health and global health goals such as the SDG (3) which aims to "ensure healthy lives and promote well-being for all, at all ages". The proposed study will first assess the expected health benefits for a target population in Canada of a novel mobile health application (app) against a systematic ethical framework. The app collects health data from mobile products, wearables, and wireless blood pressure cuffs to capture overall physical and mental health and detect the risk of developing a cardiovascular disease. The mobile health app has been created at the Ubiquitous Health Technology Lab (UBILAB).

Methods: Using qualitative measures, the proposed study will evaluate the (1) impact on individual autonomy; (2) impact on equity and (3) unintended impacts as a result of using this mobile health app from a Public Health and Ethics (PHE) perspective.

Results: The results will be presented in a table based on the systematic ethical framework by Marckmann and colleagues by answering the following questions in an evaluation: Is there health-related empowerment? (2) How equitable is the access to the public health intervention and what is the remedy? (3) What are the potential negative effects of using wearables and sensors? (4) How is respect for individual autonomy expressed?

Conclusions: The practice of PHE has complementary tools useful for examining the social and ethical factors affecting the quantifiable aspects of a digital health technology. The proposed study aims to inform practitioners and decision-makers in health policy with proposed guidelines on how to manage the ethical aspects of digital health technology.

Simplifying the information letter in health research to fit the needs of low literacy participants: a Delphi consensus study

Marion Delvallée¹, Ouazna Habchi², Marion Delvallée³, Ouazna Habchi⁴, Estelle Bravant^{5,6}, Anne-Marie Schott^{7,2}, Adèle Perrin², Julie Haesebaert^{7,2}

¹Research on Healthcare Performance (RESHAPE), INSERM U1290,

University Claude Bernard Lyon 1, Lyon, France, ²Hospices Civils de Lyon, Pôle de Santé Publique, Service de Recherche et Epidémiologie Clinique, Lyon, France, ³Research on Healthcare Performance RESHAPE, Université Claude Bernard Lyon 1, Lyon, France, ⁴Hospices Civils de Lyon, Pôle de Santé Publique, Service de Recherche et Epidémiologie Clinique, Lyon, France, ⁵Healthcare Performance RESHAPE, INSERM U1290, University Claude Bernard Lyon 1, France, ⁶Hospices Civils de Lyon, Pôle de Santé Publique, Service de Recherche et Epidémiologie Clinique, F-69003 Lyon, France, ⁷Research on Healthcare Performance RESHAPE, INSERM U1290, University Claude Bernard Lyon 1, France

Background and Objectives: Potential participants in clinical research must receive understandable and readable information in order to exercise their free will. The information letter (standard IL) imposed by French Health research authorities provide information that is difficult to understand and not adapted to participants with low health literacy (HL) level. We aimed to adapt the standard IL to participants with low HL level while respecting the regulatory requirements of clinical research.

Methods: A group of experts comprising researchers, members of institutional review boards (IRB), lawyers and patients were invited to participate in a "Delphi" consensus methodology. Three rounds were planned. We proposed to the experts to rate on understandability and conformity to regulatory requirement the standard IL and 2 simplified IL developed based on adapted communication guidelines: (1) Haute Autorité de Santé, (2) Santé Publique France and (3) "Facile à Lire et à Comprendre". The level of readability of each proposed letter has been evaluated by two readability analyzers (Scolarius and Translated Labs). In each rounds the IL were evaluated by the experts in an iterative process via an online questionnaire. **Results:** A total of 22 experts participated in the Delphi study group and a consensus was reached at the 3rd round on a simplified version of the IL. According to Scolarius, the standard IL had a university readability level and the final IL had a secondary readability level. The main adaptations concerned: the length of sentences, the creation of a glossary of research actors, the use of pictograms, the simplification of regulatory parts.

Conclusions: This new model of the IL will enable low HL participants to better understand information and could be generalized to every patient in clinical study. The final IL will be validated during a focus group with low HL patients and then presented to regulatory authorities.

Public health and humanity losses: A reiterated plead towards Jonathan Mann's principles

Sanja Špoljar Vržina¹

¹Institute of Social Sciences Ivo Pilar, Zagreb, Croatia

Jonathan Mann fought all his life for Public Health Rights. In 1998 he resigned from World Health Organization in protest of United Nations not humanely responding towards the rampant AIDS crisis. Mann called for a shift of human consciousness through the Universal Declaration of Human Rights. In a (post) covid-19 World we are urged to question whether today's millions globally consume the first article to which international pillars swear - 'All human beings are born free and equal in dignity and rights' (UDHR Article 1). Are we equal and dignified in consuming Public Health Rights? As in the times of Mann's fights for dignity and health little has changed on the global health scene? (Mann et al., 1999 posthumously). Are there ways of escaping a quantified humanity causing structural loss of Rights? Methodologically, this research is a long-term follow up of Croatian/European medical system downfall embedded in social level mapping (Bear et al. 1986) of decades long global medicine departures from equity for all (Walter et al. 2004, Bourdieu, 1992, etc.). The times of (post) COVID 19 demand a further critical seeking of Rights informed interventions upon the findings which prove the continuous structural violence done through today's neoliberal syntax of numbers not health for all (Špoljar Vržina, 2021). Results testify of people incapable of surviving future challenges without Public Health equity confronting the solidified medicine paradigms that wax and wane according to the continuous structural violence of monetary 'progress'. Without Mann's dignified humanity global transformations are solely ones into an endangered species cycles of pandemics, forced migrations and wars. Concludary, global desensitizing conditions continuously build upon disrespect towards the worsening realities of global medical contexts for which, reintroducing the basics of Mann's principles into Public Health actions of a (post) COVID 19 World are indivisible of future Public Health agendas.

DOI: 10.18332/popmed/164197

Moral suffering experienced by health workers in covid-19

screening centers in Brazil

Marta Verdi¹, Jaqueline dos Santos¹, Verdi Marta¹

¹Universidade Federal de Santa Catarina Associação Brasileira de Saúde Coletiva - ABRASCO Rua Laurindo Januário da Silveira 5125 casa 6 - CEP 88.062-201 - Florianópolis - Santa Catarina - Brazil

Background and objective: Moral suffering comes from negative emotions experienced by health workers resulting from morally undesirable situations. Faced with an ethical problem, the worker has his moral deliberation interrupted by obstacles that prevent him from implementing the course of the chosen moral judgment. The COVID-19 pandemic revealed new ethical problems that aggravated the moral suffering of health workers. This study aims to understand the experience of moral suffering of health workers at COVID-19 Triage Centers (CT) in the municipality of Blumenau-SC, Brazil.

Methods: This is field research with a qualitative approach. The study included 31 health workers who were involved in assisting users of the COVID-19 CT. Data were analyzed through content analysis, using the Atlas-ti software.

Results: Ethical problems present in daily work are related to the organization of work processes, working conditions and relationships between managers, workers and users. The relationship between ethical problems and the experience of moral distress was perceived at the moment when moral integrity was threatened and the worker was prevented from carrying out deliberate moral conduct. The most important component was the context of the health crisis, substantially aggravated by the political and economic tensions caused by the necropolitics undertaken by the federal government, which directly harmed the functioning of health services and had repercussions not only on the high mortality from COVID-19, but also on the moral suffering of health workers.

Conclusions: The experience of moral suffering exposes the context of microviolence that is made invisible and trivialized by workers, managers, users and society. TC workers experienced numerous threats to their moral integrity, as it is yet another space for the reproduction of moral suffering that already exists in the health work process, with even more strenuous overloads caused by the context of crisis evidenced by the COVID-19 pandemic.

Protecting passengers from exposure to tobacco smoke by enforcement tobacco control law & Bangladesh railways act

Mir Hossain¹, Sazia Saleh²

¹Initiative to Make Bangladesh Railway Tobacco Free - IMBRTF project, Ministry of Railways Ministry of Railways "Room 728 (6th Floor), Rail Bhavan, 16, Abdul Gani Road, Dhaka, Bangladesh" Bangladesh, ²Ministry of Railways

Background: Exposure to tobacco smoke causes to serious health risks including heart attack, stroke, cancer, chronic obstructive pulmonary disease (COPD) etc. Protecting passengers at the train and rail stations is legal and moral responsibility of Ministry of Railways and Bangladesh Railway. More than 90 million passengers used train as mode of transport, most of them are non-smokers Including children and women. The Railways Act 1890 restricted smoking in train compartment and Smoking and Tobacco Products Usages (Control) Act 2005 (amendment in 2013) banned smoking in railway station and train. First class officer of Bangladesh Railway (BR) included in the law as authorized officer to enforce these laws.

Methodology: To oversee the current situation of law implementation, a baseline survey conducted at 04 rail stations in Dhaka city [Kamalapur (central rail station in Bangladesh), Tejgaon, Cantonment and Airport] under the Initiative to Make Bangladesh Railway Tobacco Free -IMBRTF project. More than 100,000 daily passengers usage these stations. Based on the findings, a guideline has been developed for concerned officials to enhance law implementation. Audio and Video messages developed and on-aired frequently, posters, stickers and billboards were displayed on law and health hazards of second-hand smoking and frequent monitoring takes places to aware passengers.

Results/Impact: This initiatives strengthened the implementation tobacco control laws at the Railway stations in Dhaka, Bangladesh that protected hundreds of thousand passengers from second-hand smoking. Both train and rail stations become environment-friendly, floors are free from cigarette butts and air are free from nicotine.

Conclusions: Ministry of Railways and Bangladesh Railway is working to ensure tobacco free environment at the rail stations and train. These examples from 4 stations in Dhaka can be replicate other rail stations in across the country.

A critical study of the ethico-legal implications of expanding

cadaveric organ donation and transplant in Kenya: lessons for Kenya & Africa

J. Muthoni Mwangi¹

¹Jomo Kenyatta University of Agriculture & Technology Karen Campus off Bogani Road P.O. Box 68162 -00200 Nairobi, Kenya

Whilst many countries outside Africa have longstanding and well developed cadaveric organ donation and transplantation programs, majority of countries in Africa do not. Kenya legalized cadaver organ donation in 2017 vide Health Act No. 21 of 2017. The rationale for allowing cadaver organ donation and transplant is a belief within government that organ transplant compared to life sustaining treatment like dialysis for kidney failure is a better treatment option for the patient. This is because when the patient's quality of life is improved it means that the patient can go back to work, is less dependent on his/her family and friends for upkeep and costs of medical treatment. Despite these benefits and current law in place, the rate of cadaver organ donation is low and many people who require an organ transplant end up dying due to organ shortage. The objective of this study is twofold. First is to critically analyse the ethical and legal issues that are generic to cadaveric organ donation and transplant and country specific to Kenya. Secondly, to suggest practical and ethical solutions to the identified issues that can be applicable not only in Kenya but across Africa. The objectives will be achieved first, through critical analysis of existing literature on generic ethical and legal issues in cadaveric organ donation and transplant. Second, through empirical study that will involve the conducting of key informant interviews with personnel in hospitals around the country that offer organ transplant services. The importance of this research is to add to the existing body of knowledge by filling existing gaps in not only in the context of Kenya but Africa as a whole. The use of empirical research will contribute to new knowledge by way of research methodology.

Citizens' perceptions of ethical issues in covid-19 containment measures: A comparative quantitative study

Kevin Sabbata¹, Alessio Conti², Maurizio Balistreri³, Welcome Wami³, Dick Willems⁴, Klaassen Pim⁵, Rachel Brenner⁵, Regitta Agusni⁶, Lucky Andriyanto⁷

¹Keele University School of Law United Kingdom Marco Clari University of Turin Medical School Italy, ²University of Turin Medical School Italy, ³University of Turin School of Philosophy Italy, ⁴Universiteit van Amsterdam, ⁵Vrije Universiteit Amsterdam Netherlands, ⁶Airlangga University Surabaya Fajar Perdhana Airlangga University Surabaya Indonesia, ⁷Airlangga University Surabaya Indonesia

Background and objective: COVID-19 has confronted decisionmakers with choices impacting citizens' fundamental rights. Such impactful decisions tended to be taken following a technocratic logic, being seldom publicly discussed. Our study aims to analyse citizen's perceptions in four emblematic countries regarding choices on COVID-19 containment and study how different values and contextual factors lead to different moral views.

Methods: We circulated a survey to the public in The Netherlands, Italy, Indonesia and Kenya, with questions on their agreement with containment measures, plus the Moral Foundation Theory questionnaire, which aims to explain variations in ethical stances by reference to five dynamics (harm, fairness, loyalty, authority, purity). Proportions were compared using Chi-squared tests and regression analysis was performed to examine links between responses and socio-demographic factors and moral foundations. Data was collected between October 2020 and February 2021.

Results: We collected 1401 responses (The Netherlands: n=336; Italy: n=512; Indonesia: n=359; Kenya: n=194). In Italy and The Netherlands agreement with restriction was similarly high, despite the different approach the two countries had adopted. In Indonesia and Kenya agreement was significantly lower. In all countries except Kenya, participants (would have) endorsed a total lockdown in the first COVID wave. Dutch and Italian participants were less favourable to restrictions to protests than the others. We also found a link between old age and approval for curfew and closures of non-essential businesses, and males appeared more in favour of such measures than females. Agreement with mask mandates and hand washing seemed linked to the moral foundation of purity. Approval of mask mandates seemed linked with fairness

Conclusion: Our study shows that citizens' opinions on containment measures differ depending on their country, values and background, and provides indications as to what factors need to be taken into account in order to maximise the ethical acceptability of such measures.

Clinical safety of natural compounds, an evidence-based approach

Anna Bajek¹, Bartosz Tylkowski², Jarosław Bajek³, Oliwia Kowalczyk⁴, Małgorzata Maj¹, Magdalena Olkiewicz⁵

¹Department of Tissue Engineering, Chair of Urology and Andrology, Nicolaus Copernicus University in Torun, Poland, ²Chemical Technologies Unit, Eurecat, Spain, ³Poland, ⁴Research and Education Unit for Communication in Healthcare, Department of Cardiac Surgery, Nicolaus Copernicus University in Torun, Poland, ⁵Eurecat, Chemical Technologies Unit, Spain

There is an increasing use of natural products and compounds in medicine, also in oncology research. These products including medicinal plants, phytopharmaceuticals, vitamins and even bio-wastes. It is generally believed that these products are safe for patients. However, still there are some concerns associated with them. Different methods are used to evaluate the safety of these compounds, among which the in vitro studies are (evaluating the toxicities on different cells). The aim of our study was to check if the formulations of natural compounds are safe for patients, on the example of normal human cells.

How including scientific evidence in legal decision-making can help us answer questions in public health law. Case study: justifiability and proportionality of discrimination in EU Digital COVID Certificates.

Danaja Povse^{1,2}

¹Health and aging law lab (HALL), ²Law, science, technology and society research group (LSTS)

Background and Objective: EU digital covid certificates (DCCs) scheme, instituted in the summer of 2021 under the Regulation 2021/953 (DCCR) to facilitate reopening European borders, assumes that certificate holders pose less of a risk to public health and their freedom of movement should not be restricted. As the DCCR made sweeping assumption about the underlying mechanisms of immunity, transmission and risk, and access, questions about discrimination were raised. My doctoral project seeks to answer the following research question: In what manner should EU law consider scientific findings in its evaluation of legal questions such as discrimination, and how do scientific findings justify differential treatment?

Methodology: The question will be answered in the context of a case study - establishing discrimination under the EU Digital COVID Certificates scheme, in three parts. The first and second parts of the project is concerned with the normative framework: definition of scientific evidence, its relevance to and inclusion in the EU legal order, and how it can be used to answer legal questions. In the third part, the framework is applied to evaluate the possible discrimination stemming from the DCCs. Preliminary findings and conclusions: Individualised risk assessment of the DCCs is difficult to reconcile with the public health approach and if used as an access condition can lead to discrimination insofar there is no justification for differential treatment, such as quality scientific evidence. The latter is required by EU law to demonstrate permissible restriction on freedom of movement, as well as ECHR case-law in the context of discrimination in public health. Legislators should clarify the role, quality standards and inclusion process for scientific evidence in the decision-making process in order to preclude discriminatory impacts.

Research ethics in times of pandemic: the case of proxalutamide to treat COVID-19 in Brazil

Lucas Brojan¹, Fernando Hellmann², Núria Homedes³

¹Federal University of Santa Catarina, Brazil, ²Federal University of Santa Catarina/Université de Montreal, Canada, ³Salud y Farmacos, United States

The Brazilian Federal Senate created a Parliamentary Commission of Inquiry (CPI) to investigate the Bolsonaro governments irregularities in managing the COVID-19 pandemic. One of the cases that drew attention was the Proxa-Rescue AndroCov Trial, which tested proxalutamide, a second-generation, non-steroidal antiandrogen, against COVID-19 in Brazil. This study analyzes the ethical and scientific integrity issues related to its implementation. We analyzed the Senate CPI report, the letters from the National Research Ethics Commission, the article published by the researchers, the clinical trial records in Brazilian and US platforms, and the information disseminated by the media. Our findings show numerous problems. Even with 200 deaths from a total of 645 participants in the study, there was no interruption to the research. Researchers changed the consent form approved by the ethics board, omitting critical information such as the risk of using proxalutamide in pregnant women. There is evidence of conflict

of interest between researchers and sponsors and problems associated with scientific integrity. It is a case of scientific fraud that transgresses national and international ethical guidelines. The proxalutamide study served as government propaganda to promote ineffective drugs against COVID-19

The world healthcare I would not want...

Massimiliano Biondi¹

¹Pouav2 and univpm asur marche and univpm hospital: fabriano via stelluti scala n. 26 univpm: ancona via tronto 10/a Italy

Context and Objective: Transforming our world" This is what can be seen in the incipit of the 2030 Agenda for Sustainable Development. How can we transform our healthcare? ...a respectful methodology for human beings, paying attention to the various aspects that have serious repercussions on us and on our planet: COVID and other epidemics, wars, economic crisis, hunger, famine, digital divide. Against this, new awareness is emerging, which combines respect for cultures and traditions, with the possibilities offered by innovation ("intelligent" technologies, quantum, metaverse, robotics, energy transition, sharing economy, etc.) which will be able to focus health on the individual.

Method: An attempt has been made to identify the ten aspects that could constitute a decalogue of what we would never like to see. Healthcare in this decalogue meets a vision that starts from the WHO 1948 definition of health, passing through the 1974 Ladonde report, the 1978 Alma-Ata Declaration, the 1986 Ottawa Charter, up to the Charter of Bangkok, 2005.

- Results: 1. unequal health care, in which the little one has "small" rights
 2. a tortuous healthcare, in which everyone fails to reach their destination
 3. flat healthcare that flattens creative excellence
 4. a closed healthcare that traps its networks
 5. a blind healthcare, which darkens the eyes so as not to see within itself
 6. a deaf healthcare that does not listen to the silence of pain
 7. a mute healthcare, which is silent about its own needs
 8. a lame healthcare, which is unable to run towards a better future
 9. a dull healthcare, which extinguishes hope
 10. a cold healthcare, in his rooms and in his heart

Conclusion: The model is prospective and could be monitored by International Organizations through sets of indicators that should be created ad hoc for each of the points of the decalogue.

Advancing public health and health equity through human rights law

Giandomenico Barcellona¹, Emma Rawson², Rocío Sáenz^{3,4}

¹Framework Convention on Global Health (FCGH) Alliance, Italy, ²ManuKahu Associates, Indigenous Consultancy, New Zealand, ³Health Equity Network of the Americas, ⁴Sustainable Health Equity Movement, Costa Rica

This workshop will highlight the centrality of human rights law to advancing health equity and the important role it should take in public health policy. The workshop will offer proposals on ways that the law can create accountability around and improve implementation of the right to health, including a proposed treaty on the right to health, the Framework Convention on Global Health (FCGH). Advancing health equity requires working towards social justice and tackling inequality, which can be done through meaningful implementation of human rights, including the right to health. The workshop will consist of presentations and interactive portions throughout. Participants in this workshop will learn about human rights law and principles from presenters from different parts of the world with expertise in health and human rights. Presenters will offer specific examples of ways that human rights law can help achieve the goals of public health, with a particular focus on health equity. Presenters will also provide clear proposals for the implementation of human rights, and the right to health specifically. This will include a focus on the FCGH proposal, advocacy strategies, and steps that participants and the constituencies they represent can take to advance those proposals. During this workshop, participants will engage with presenters in an interactive session to gain a deeper understanding of the topics and examples presented and how they may apply in their own countries and contexts. After participating in this workshop, attendees will be able to answer the question of why accountability around human rights is necessary to advance health equity and must be a public health imperative. They will also be equipped with specific examples of how right to health implementation advances public health. Finally, participants will leave the session with an understanding of key demands, the FCGH in particular, targets, and calls for action to shape and inform their advocacy.

There is no public health without ethics - Code of ethics and professional conduct for good public health practice

Katarzyna Czabanowska¹, Jim Thomas², Farhang Tahzib³, Steven Bow⁴, Lena Lena Strohmaier⁵

¹Maastricht University / ASPHER Netherlands, ²University of North Carolina, United States, ³Faculty of Public Health, United Kingdom, ⁴University College London United Kingdom, ⁵University of Maastricht Netherlands International Working group on Codes of Conduct and professional Conduct International Working group on Codes of Conduct and professional Conduct Faculty of public health United Kingdom Faculty of Public Health Faculty of Public Health Faculty of Public Health United Kingdom

The professional discipline of public health is driven by its values. Public health is not merely a technical discipline concerned with statistics or facts. Our norms, values, beliefs and the way we see the world, as individuals, communities and institutions which serve us, do matter and fundamentally affect our decisions, behaviours, policies, and practice. The WHO-ASPHER road map to professionalizing the public health workforce and the WHO global report on building the public health and emergency workforce, have highlighted the development code of ethics and professional conduct (CoC) as one of the key pillars for professionalizing the public health workforce. There is evidence of significant variations in education and training in public health ethics which is considered a key competency for good public health practice. A joint international group of public health practitioners, ethicists and academics have been formed to develop guidelines and principles and support the development of CoC as part of the professionalisation of public health agenda and build competency and capacity of the workforce. The purpose of this workshop is to provide rationale and evidence on the importance of CoC for good public health practice, share learning, experience and resources, and discuss options and opportunities to advance the agenda in promoting ethical public health practice and policy making. The workshop will briefly share and reflect on the literature and work by the America leadership society, FPH, the Scottish and UK public health community and others. The workshop will provide the thinking and materials from the current International group on the principles and guidelines for development of CoC, and insights on the process, experience and learning in development codes of ethics and professional conduct and seek insights from participants on the implications for day to day public health practice. Among the key issues is appreciating fundamental role of norms and values in public health practice and policy making, and the importance of ensuring such work is linked to a strategy and activities to build competency and capacity around public health ethics and law and to ensure resources, systems and robust education and training activities are put in place for a sustainable development and effective implementation. Specific aims / objectives The session will provide: - insights on the importance and relevance of public health ethics and development of Code of ethics and professional conduct for good public health practice - learning and experience from development of Codes of ethical practice and professional conduct - work by International working group on guidelines, principles and process for development and implementation of Codes of ethics and professional conduct and their implications for behaviour and practice. Key questions: * Why are Codes of ethics and professional conduct key to good public health practice * What are the norms and values for good public health practice * What are the principles, values and processes for development for development of a Codes of ethics and professional conduct and their implications for practice * What are activities and options for building ethical competence and capacity of the public health workforce

Impact of the 2022 flood and the incidence of Malaria in Sohbatpur District, Balochistan-Pakistan

Zubair Ahmed¹, Ehsan Ahmed^{2,3}

¹Field Epidemiology and Laboratory Training Program (FELTP) Pakistan, Balochistan, Pakistan, ²Provincial Disease Surveillance and Response Unit (PDSRU), Field Epidemiology and Laboratory Training Program (FELTP), Balochistan, Pakistan, ³Ministry of Health (MoH), Government of Balochistan, Pakistan

Background: Heavy rain hit Pakistan including Sohbatpur district in August 2022 with subsequent flash floods. Study was carried out to assess the impact of flooding on incidence of malaria in Sohbatpur district.

Methods: This observational retrospective study compared malarial data during rainfall seasons in Sohbatpur community in flood 2022 with those of corresponding

rainfall seasons of previous two non-flood years 2020 and 2021.

Results: A marked increase of malaria cases and incidence rate was observed in 10 sentinel malaria notification sites in district (IR>4.01/100,000 person days in 2019 [95 % CI: 6.13-7.04] and 5.41 in 2020 [95 % CI: 6.33-6.51] to 11.24 in 2022 [95 % CI: 9.15-9.44]; $P < 0.0001$), with peaking of incidence rate in 5-15 years' age group. An evident increase in slide positivity rate ($P < 0.0001$) was observed in 4-week period of 2022 (SPR = 18.16% [95 % CI: 20.40-21.32%]) compared with same periods in 2020 (SPR = 8.72% [95 % CI: 8.36-9.08%]) and 2021 (SPR = 12.62% [95 % CI: 13.14-14.88%]), with more marked rise of SPR in 5-15 years' age group. Hospital OPD incidence proportion in 2022 was 22.3% (95% CI: 17.11-19.22%) compared to 10.15% (95% CI: 6.48-6.91%) in 2020, and 9.17% (95% CI: 7.82-9.21%) in 2021. The 5-15-year age group was responsible for overall rise in proportion of malaria cases in 2022. Incidence proportion of severe malaria cases increased to 22.5 % (95 % CI: 20.12 to 21.50 %) in study period of 2022 compared to 19.8 % (95 % CI: 18.6 to 21.0 %) in 2020 and 18.4 % (95 % CI: 17.4 to 19.5) in 2021.

Conclusions: Study revealed a significant increase in incidence rate of malaria in Sohbatpur following flash flood of August 2022. The flooding had highest impact on malaria incidence of age 5-15 years' age group.

DOI: 10.18332/popmed/164839

Population health trends analysis and burden of disease profile observed in Sierra Leone from 1990-2017

Jolleen Zembe¹, Flavia Senkubuge², Tanita Botha¹, Tom Achoki³, Haja Wurie⁴

¹School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, ²School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa, ³Africa Health policy, Kenya School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, ⁴University of Sierra Leone, Sierra Leone

Background: Sierra Leone, located in West Africa, is described as one of the worlds poorest developing countries. The country has endured numerous obstacles, including a civil war from 1991 to 2002, an Ebola outbreak from 2014 to 2016, and floods and landslides in August 2017. This culminated in health system scarring, which remains a challenge to date. There has been minimal research on the disease burden in Sierra Leone. Objectives The purpose of this study is to quantify and provide a comprehensive assessment of the burden of disease in Sierra Leone for the past 27 years.

Methods: In descriptive, this study analysed secondary data from IHME Global Burden of Disease to quantify the burden of disease patterns, injuries, and risk factors in Sierra Leone. Global Burden of Disease metrics was used to measure mortality rates, years of life lost, disability-adjusted life- years, years lived with disability, and risk factors all ages and both sexes from (1990 -2017).

Results: From 1990-2017, trends of mortality rates for all ages and sexes have declined in Sierra Leone although mortality rates remain some of the highest when compared to other developing countries. The burden of communicable, maternal, neonatal, and nutritional diseases is greater than the burden of non-communicable diseases due to the prevalence of endemic diseases in Sierra Leone.

Conclusions: Sierra Leones health status is gradually improving following the civil war and Ebola outbreak. Sierra Leone has a double burden of disease with CMNNS leading and NCDs progressively increasing. Despite these challenges, Sierra Leone has promising initiatives and programs pursuing the universal health coverage 2030 Sustainable Developmental Goals Agenda. There is need for accountability of available resources, clear rules, and expected roles for non-governmental organisations to ensure a level playing field for all actors to rebuild the health system.

DOI: 10.18332/popmed/164841

Investigation of the performance of public policies in risk management in the face of disruptive events in Brazil

Maria Bellini¹, Nadianna Marques²

¹School of Public Health and Humanities School, Pontifical Catholic University - State Secretariat of Saude, Brazil, ²Humanities School, Pontifical Catholic University, Porto Alegre, Brazil

This research investigates risk management in relation to disruptive events in 02 Brazilian regions suffering from the extremes of humidity, droughts and floods that cause the eviction of vulnerable populations. This imposes on science and public policies a commitment to investigate the impacts that violently affect communities, especially the most vulnerable to propose prevention and/or mitigation actions.

Methodology: Documentary research with analysis of documents such as: contingency plans, protocols, etc., Bibliographic research. Empirical research - interviews, focus groups, seminars-. The sample is representatives of the public

administrations of the municipalities, researchers from universities and members of civil society from 20 municipalities in the 02 Brazilian states-Amazonas and Rio Grande do Sul.

Results: The bibliographic search was initiated and also the list of documents that will be included in the search was started. The project has consultants from Australia, South Africa and Italy, countries systemically affected by disasters. It does not yet present Results analyzed. Conclusions:s or reflections: The investigation of disasters and/or disruptive events of social dynamics is a necessary inclusion in the commitment to know the impacts that disruptive events have especially on the most vulnerable populations. The inconsistencies in the definitions in relation to what is disaster generates insufficiency in the guidelines and accountability in relation to these events in the different professions, organs and public policies. Scientific research on these phenomena is the responsibility of researchers, but their confrontation is the responsibility of all actors of society in particular of the State through public policies.

Improving access to primary health care for refugee women and children using Health Emergency and Disaster Risk Management Framework during pandemic: a mixed method study in three countries

Yasir Shafiq¹, Francesco Adesi², Matina Valente³, Luca Ragazzoni³

¹Center for Research and Training in Disaster Medicine, Humanitarian Aid and Global Health (CRIMEDIM), Università degli Studi del Piemonte Orientale Amedeo Avogadro, Novara, Italy, ²Department of Translational Medicine (DIMET), Università degli Studi del Piemonte Orientale Amedeo Avogadro, Italy, ³Center for Research and Training in Disaster Medicine, Humanitarian Aid and Global Health (CRIMEDIM), Università degli Studi del Piemonte Orientale "Amedeo Avogadro", Italy

Background: Over 930 million people are living on the edge of poverty due to suspected out-of-pocket health expenses, leaving universal health coverage (UHC) behind. The agenda is even far from being accomplishment in humanitarian crises due to the lack of access to primary health care (PHC). Additionally, the COVID-19 pandemic put additional strain on health systems due to access to PHC. Globally, PHC faced disruption due to lockdown during pandemic, poor planning, shift to tertiary care, and silos in coordination. In these vulnerable communities facing humanitarian crises, community is facing poor accessibility to maternal, neonatal and child health (MNCH) services, Resulting in high morbidity and mortality. To ensure continuity of PHC, the World Health Organization has devised a framework called Health Emergency Disaster Risk Management (health-EDRM). Countries hosting refugees and displaced populations, the response to emergencies in well planned, coordinated, and integrated. Data is missing for vulnerable communities in crisis, and they are not the priority in the planning, preparedness, and implementation of PHC during emergencies. Study Aims to: (i) assess community barriers to accessing MNCH-related PHC services, (ii) identify barriers to implementing the h-EDRM policy framework, (iii) map partner's activities in targeted countries participating in emergency response.

Methods: A mixed-methods study will be conducted in Pakistan and Italy on refugee population from Afghanistan and middle-east, as well as in Ethiopia, where population is internally displaced due to the crisis in Tigray region. Cross-sectional survey will be conducted to assess MNCH-related PHC accessibility challenges at the community-level by conducting a cross-sectional survey. Humanitarian organizations and other stakeholders will be interviewed to understand the barriers to implementing health-EDRM. Activities of stakeholders will be mapped to understand how health-EDRM is being implemented. Outcomes: Workshops and consultations will be held with stakeholders to develop strategies, tools, and integrating health-EDRM into country-level emergency planning.

Changes in drug demand when a pandemic coincides with other outbreaks in a war zone country

Ebtesam Saleh^{1,2}, Bassam Saleh³, Randa Haddadin⁴, Eman Elayeh⁵

¹Department of Pharmacology and Toxicology, Aden University, Yemen, ²Charite University, Berlin, Germany, ³Health Department, The International Organization for Migration, Yemen, ⁴Department of Pharmaceutics and Pharmaceutical Technology, School of Pharmacy, The University of Jordan, Amman, Jordan, ⁵Department of Biopharmaceutics and Clinical Pharmacy, School of Pharmacy, The University of Jordan, Amman, Jordan

Background: Yemen's health system has severely deteriorated due to the ongoing civil war accompanied by the COVID-19 pandemic which coincided with other

endemic infections. Many health institutions closed due to insufficient supplies. Consequently, pharmacists became the available healthcare provider on the frontlines. This study aimed to evaluate the pattern of demand for drugs during the pandemic based on the pharmacist's perspective in Yemen, a conflict zone country. Methods: An online survey was developed, validated, and distributed among pharmacists. The questionnaire was composed of two sections: (1) demographic characteristics of the participants and (2) changes in the demand for different drug categories. Chi-square test and Fisher's exact test were used to find statistical associations.

Results: Responses (330) were received from pharmacists working in 12 out of 22 governorates in Yemen. During the pandemic, there was an increase in the demand for prescription drugs such as antibiotics, antimalarials, and sedatives (95%, 90%, and 71%, respectively) and an increase in the demand for nonprescription drugs such as vitamins (93%) and paracetamol (> 90%). In addition, there was an increase in the demand for prescription drugs without a prescription, which was reported by 50% of the participants. No statistical difference was seen between the frontline districts and major cities in terms of requesting these drugs without a prescription. On the other hand, most participants (75.2%) did not attend any training or workshop during the last 6 months of conducting this survey. Conclusions: COVID-19 has increased the demand for many prescription and nonprescription drugs, where the irrational use of these drugs may lead to devastating health effects. In war zone areas hit by a pandemic, policymakers and public health organizations should focus on training and educating pharmacists as important health care and medicine providers for the public.

Factors, health system preparedness, and response strategy for the recent cholera outbreak in Syria

MHD Alhaffar¹, Maria Gomez², Jemar Sigua², Anneli Eriksson²

¹Department of Global Health, Karolinska Institute, Sweden, ²Department of Global Health, Karolinska Institute, Solna, Sweden

On 22 September 10, The Ministry of Health in Syria officially announced a cholera outbreak in the country, primarily affecting northeast Syria and spreading fast to other cities and regions. With the decade-long armed conflict situation in Syria, the country's health system struggles to respond to the crisis. This article Aims to analyse the reasons and underlying factors that contributed to the current ongoing cholera outbreak in Syria, assess the preparedness of the country's health system in facing the outbreak, and recommend strategies to better prepare for and respond to future outbreaks.

Methods: A literature search of research articles and grey literature related to the ongoing cholera outbreak in Syria was conducted on online databases and search engines. Results were scanned for relevance to two overarching topics: factors that contributed to the outbreak and health system preparedness and response.

Results: Forty three out of 1,209 articles were included in the review. From these articles, underlying factors that contributed to the fast spread of the cholera outbreak in Syria were identified, including displacement due to armed conflict situations; chronic water insecurity and lack of water, sanitation, and hygiene (WASH) infrastructure; droughts due to climate change; weakened health system capacity; and political instability leading to an overall uncoordinated local and international response.

Conclusions: Syria has reported its first cholera outbreak since the country's decade-long armed conflict started. overall, the current state of the country's health system and political landscape is insufficient in adequately responding to this outbreak. As the outbreak has started to spread beyond the country's borders, external aid is much needed to assist the nation's fragmented response. Focusing efforts in arresting the outbreak in Syria now will not only prevent more casualties and losses in the country but can also save neighboring countries in the region.

SHARP Work Package 7: EMERGE Laboratory Network

Daniela Jacob¹

¹Robert Koch Institute (RKI), Germany

Embedded in the EU-funded projects and Joint Actions EQADeBa (2008-2011), QUANDHIP (2011-2015), EMERGE (2015-2019), and currently implemented into SHARP (2019-March 2023), the EMERGE Laboratory Network is a success story and essential for the protection of European citizens against exposure to a panel of high threat bacteria and viruses. Indeed, especially, for emerging and re-emerging pathogens, classified as Risk Group (RG) 3 and 4, the need for an efficient, rapid, quality assured and coordinated response is addressed to prevent and manage major public health emergencies. The EMERGE laboratory network

on highly infectious pathogens operates in compliance with the currently revised Decision No 1082/2013/EU and comprises about 40 reference laboratories. The network is deeply engaged in laboratory capacity and capability building by quality assurance exercises, evaluation of new diagnostics, training and improvement of biorisk management in high containment laboratories.

Poisoning assessment and patients' behavior seeking healthcare within urban and rural communities of Burundi

Azarias Nkengurutse¹

¹Faculty of Medicine, University of Burundi, Burundi

Background: Pesticides exposure (16.70%, 12.91%); food poisoning (30.05%, 35%), traditional medicine intoxication (10.85%, 14%), ingestion of unknown substances (13%, 16.9%), household products (3.5%, 7%), suicide attempts with hydrogen sulfur (6%, 0%). Clinically, patients had trouble breathing, nausea, vomiting, diarrhea and confusion. Among hospitalized patients, 18.65% developed kidney failure and liver problems. 85% delayed in consulting. Of 276 interviewed participants, 46% reported they experienced poisoning in their life. 65% consulted traditional healers. 24% consulted modern health professionals, 11% didn't consult.

Conclusions: There is a high incidence of food poisoning and ingestion of unknown substances in rural communities than in urban areas, in children than adults. The negative behavior of patients in seeking healthcare leads to diseases chronicity causing several preventable complications and an increase of death rate. Raising awareness and establishing poisoning control centers are essential to prevent and control threats associated with poisoning.

Differential ethnic approach as a strategy to reduce disaster risk in multicultural communities: the case of Colombia

Maria Moreno¹, Bahaa Alhaffar¹

¹Karolinska Institutet, Sweden

Introduction: Colombia is a country located in the extreme northwest of South America with 20% of the population composed of indigenous, Afro-Colombian, Raizal, Palenquera, Rom, and rural communities. The highest levels of vulnerability to natural disasters are found in these communities, who are the ones with the highest levels of poverty. The Objective of this article is to assess the importance of the differential ethnic approach in disaster risk reduction.

Methods: A literature review on the differential approach in disaster risk reduction in Colombia was conducted by searching different databases such as Web of Science, Clinicalkey, PubMed, Science Direct, and Lilacs. official documents and gray literature are also included.

Results: In Colombia, various plans have been made to incorporate the differential ethnic approach into disaster risk management. It has been observed that these communities participate in the response phase of a disasters, however, there is no participation in the prevention, preparation and recovery phases.

Conclusions: It is necessary to integrate the differential ethnic approach in all the phases of the disaster risk cycle through intercultural dialogue and scientific-ancestral knowledge; and take advantage of the community's knowledge about the natural dynamics of the territory they inhabit, community resources, vulnerability, resilience factors, and cultural practices.

Societal disruption as a disaster

Joseph Cuthbertson¹

¹Monash University, Australia

Introduction: This research aims to review the impact of drug addiction, domestic violence and suicide in Australia through the lens of disaster risk reduction. This study explores whether drug addiction, domestic violence and suicide can be considered as disasters according to established thresholds and definitions; and whether contemporary health emergency and disaster risk management (HEDRM) practice can be adapted to support action to reduce the impact of these events and inform disaster risk reduction. Methods: We conducted a literature review to explore drug addiction, domestic violence and suicide as societal disruptions causing disaster. Key Australian government reports describing deaths associated with suicide, domestic violence and drug addiction were identified, following which a constrained snowball sampling was applied to the bibliography of each document to gather further key articles and inform the evolution of the impact of these themes in Australia over the period 2000 – 2018. The search strategy

included both peer reviewed and grey literature. We used the search terms 'social disruption', non-traditional, 'drug addiction', 'domestic violence', 'suicide' and societal disruption as key words and included articles if they demonstrated an analysis of the theme related to health impact related to disaster settings.

Results: Utilising the Australian Disaster Resilience Knowledge Hub and the international CRED criteria for a disaster, the impact to human health of drug addiction, domestic violence and suicide upon the Australian population each meet the criteria of a disaster. Conclusions: Public Health practice through the lens of the determinants of social disruption combined with activities that consider hazards, vulnerability and exposure, can institute prevention, preparedness, response, and recovery programs to reduce the impact of drug addiction, domestic violence and suicide.

Direct and indirect economic impact model for imported hemorrhagic fevers outbreaks in the EU, UK and US

Tristan Learoyd¹

¹Emergent Biosolutions, Bruchsal, Germany

Background: Little information is publicly available to determine the economic impact hemorrhagic fevers with no available or stockpiled medical countermeasure (MCM) have on health care systems. This study examined the direct and indirect health costs of imported cases of the hemorrhagic fevers Crimean Congo (CCHF), Hanta, Lassa, Marburg, Nipah and Rift Valley (RVF) in the European Union, United Kingdom and United States. Methods: An adapted direct cost model using sourced conservative treatment regimens for the respective fevers were costed. Reported reproduction ratios, fatality ratios and case reports were used to determine the spread of infection, front-line mortality, and the cost of and extent of an imported outbreak. The average length of hospitalization and death rate was factored into the care costs including front-line casualties and cost of replacement. Native community replication was represented where transmission allowed. Costs were converted into American, British, and European healthcare costs.

Results: Interhuman infection applied to the replication number of the imported case increased the direct and indirect costs for Lassa and Marburg cases. CCHF, Hanta and RVF cases remained local vector dependent with Nipah costs confined largely to direct case zero cost (R0<0.6). Average hospital stays as published in case reports ranged from 4.4 days (CCHF) to 28 days (Rift Valley Fever). Direct costs ranged from \$77,865 (CCHF) to \$787,266 (Marburg) per first imported case with <1.6-fold increase for Marburg and <1.8 increase for Lassa in direct and indirect costs through reproduction. Conclusions: Significant direct healthcare costs were calculated for six imported hemorrhagic fevers with Lassa and Marburg having potential to increase costs beyond case zero through local transmission. The costs highlight the potential savings that effective local MCM availability could have in reducing the cost impact of hemorrhagic fever importation.

Gender roles and intra-household decision-making on child feeding practices: a qualitative study exploring gender power dynamics in Somalia

Adam A. Mohamed^{1,2}, Mohamed A. Magan¹, Samar Abdelrahman¹, Adan Y.

Mahdi¹, Said A. Mohamoud¹, Cashington Siameja¹, Meftuh Omar¹

¹Save the Children International, Somalia

²Department of Public Health, Faculty of Health Sciences, Başkent University, Ankara, Turkey

Background: The culture of Somali families is very collectivist, with communal responsibilities rather than individualist, in which culturally prescribed roles, values, traditions, and communication patterns are often significant factors at the household and community levels. This study sought to examine and thematically describe how gender roles and responsibilities influence the child feeding practice in the Somali context. Methods: A total of nine Focus Group Discussions (FGDs) were conducted on fathers "3-FGDs", mothers "3-FGDs", and Grandmothers "3-FGDs" in four villages in Kismayo town, Lower Jubba region between Jan-Feb 2022. The study employed a qualitative method to explore roles and responsibilities at home and in the community, as well as social barriers and gender dynamics related to child feeding and nutrition. Results: The pertinent findings of this study found that fathers and grandfathers have the overall family decisions, provide, and control family resources, and sometimes support and encourage women concerning family tasks, childcare, and feeding, whereas mothers are tasked with the internal household chores, decisions, and issues related to childcaring and feeding, while grandmothers and mothers-in-law act as a family advisory and take care of the children when the mother is absent or ill or busy. Conclusion: Traditional

gender roles and responsibilities regarding child feeding practices still exist in the studied communities of Somalia where fathers were the main financial provider and less involved in the decision of initiation and continuation of breastfeeding and give emotional support to breastfeeding and child feeding practice; At the same time, the mother is the primary caregiver, and elderly mothers have both determinantal and beneficial on infant practices. Key Words: Gender roles, Child feeding, power dynamics, household decisions, Somalia.

Reaching the unreached in high-risk population of Nepal - Mobile COVID-19 Vaccination Service

Ghanshyam Bhatta¹

¹Institute for Collective Health, Adventist Development Relief Agency, Kathmandu, Nepal

Background: The coronavirus disease 2019 (COVID-19) pandemic has affected billions of lives worldwide. Nepal, like many other countries, was severely affected by the pandemic. The socio-economic and health conditions of key populations, such as pregnant and lactating women, people with disabilities and morbidities were at high risk. In 2021, Adventist Development Relief Agency (ADRA) Nepal in collaboration with the Government of Nepal conducted a vaccine hesitancy survey in seven provinces of Nepal. The results revealed a high vaccine hesitancy in Madhesh province (37.5%), which was mostly attributable to the difficulties in accessing the vaccination service (26%).

Methods: To eliminate the barriers identified during vaccine hesitancy survey, Mobile COVID-19 Vaccination Service (MoCoVs) was started in coordination with the government to provide door-to-door vaccination service to pregnant and lactating women, people with disabilities and morbidities. A dedicated vaccination vehicle with a team of vaccinator and a nurse equipped with Adverse Effect Following Immunization kits, vaccine storage boxes, syringe disposal boxes were deployed to seven districts with low vaccination coverage in the province.

Results: MoCoVs was able to reach high-risk beneficiaries (elderlies-11%, people with disabilities and morbidities-9%), the majority of whom were female (57%), including 10% of pregnant and lactating women. The vaccination coverage increased from 24% to 72%, with the MoCoVs being responsible for the enhanced immunisation reach to high-risk populations.

Conclusions: The MoCoVs approach was highly effective in reaching the marginalized population, who generally lacked access to vaccination services. The door-to-door vaccination service was highly effective and easily replicable during public health emergencies.

The impact of violent conflict on pharmacy practice in the Middle East

Christina Steenkamp¹, Mayyada Wazaify²

¹Department of Public Health and Mortality Studies, School of Social Sciences, Oxford, United Kingdom, ²Department of Biopharmaceutics and Clinical Pharmacy, School of Pharmacy, The University of Jordan, Amman, Jordan

Background and Objective: The Middle East and North Africa (MENA) region has witnessed several intense and violent conflicts over the last 10 years. While much is known about the impact of war on various aspects of public health (including pressure on health care institutions, disease outbreaks amongst refugee populations and reduced access to medicines), very little is understood about how war impacts on levels of medicine abuse and misuse amongst populations. Pharmacists are ideally placed to witness and record these practices. This paper asks how violent conflict impacts on the work and experiences of pharmacists, who are at the frontline of managing drug misuse/abuse amongst the population. Methods: The paper is part of a larger two-year (2020-2022) study investigating the impact of violent conflict in the MENA region on medicine abuse/misuse and pharmacy practice in managing this challenge. The study used a mixed-method approach to data-gathering, involving a quantitative survey (n=160) and semi-structured interviews (n=20) with pharmacists in Syria, Libya, Yemen and Iraq. This paper, specifically, focuses on the public health role of pharmacists in violent contexts.

Results: The results show that violent conflicts have far-ranging consequences for pharmacy practice, especially in community settings. The results highlight the challenges which pharmacists face during conflict, including the (in)accessibility of medicines, the collapse of institutional frameworks, threats to personal safety, damage to infrastructure and the need to balance ethical considerations and their own wellbeing vis-à-vis that of the patient. The research outlines the safety measures that pharmacists take to protect themselves and how these measures impact on their provision of healthcare.

Conclusions: The research led to greater awareness of the role that pharmacists

play in the public health of conflict-affected populations. Recommendations are made for how pharmacists can be more effectively supported during war.

Implications of an intensive care unit urgent transfer in terms of clinical and infectious risk

Edoardo Miotto¹, Laura Brunelli¹, Massimo Pin¹, Daniele Celotto¹, Adriana Moccia^{2,3}, Gianni Borghi^{4,2}, Amato Monte^{4,5}, Cristiana Macor^{4,5}, Roberto Cocconi⁶, Luca Lattuada^{2,4}, Silvio Brusaferr¹, Luca Arnoldo¹

¹Dipartimento di Area Medica, University of Udine, Udine, Italy, ²Direzione Medica, Presidio Ospedaliero Universitario S. Maria della Misericordia di Udine, Italy, ³Azienda Sanitaria, Universitaria Friuli Centrale, Udine, Italy, ⁴Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy, ⁵Dipartimento di Anestesia e Rianimazione, Presidio Ospedaliero Universitario S. Maria della Misericordia di Udine, Italy, ⁶SOC Rischio Clinico, Qualità e Accreditamento, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy

Background and Objectives: Proper functioning of an intensive care unit (ICU) contributes to efficient hospital management, but what happens when the ICU needs urgent transfer? Considering that healthcare-associated infections (HAIs) are one of the most important factors that can negatively impact patient outcomes in an ICU, we retrospectively reviewed cases that occurred in an ICU in our hospital on January 6, 2017. We assessed the cumulative incidence of HAIs in patients admitted to the ICU before and after transfer, and overall impact on the three hospital's ICUs.

Methods: The clinical records of inpatients admitted to the ICU in the 6 months before and after transfer were analyzed to assess the occurrence of HAI. Demographic data were collected to describe the patients. The overall impact on ICU activity was analyzed considering six-month mortality rates for the period 2015-2019. Descriptive statistics and a multivariable model were performed including all parameters that were significantly correlated with HAI occurrence in the univariate analysis.

Results: The revision was conducted on 393 clinical records. The number of patients included in the study of the occurrence of at least one HAI was 304, as 89 patients were excluded because their length of stay in the ICU was less than 48 hours. HAIs occurred in 13.1% of patients before and in 6.9% after transfer. Pneumonia accounted for 52.9% of HAIs, bloodstream infections for 29.4%, urinary tract infections for 14.7%. No significant difference in incidence was observed between the two periods. The presence of a central venous catheter was significantly associated with the occurrence of at least one HAI ($p=0.045$). **Conclusions:** Urgent transfer of the ICU did not appear to have an impact on clinical and infectious risk, as no difference in infectious disease incidence and mortality was observed likely due to the dedicated work of the healthcare staff.

Implementation of Case Management in emergency departments: the influencing factors

Elodie Schmutz¹, Madison Graells¹, Joanna Moullin², Olivier Hugli³, Jean-Bernard Daepfen⁴, Julia Ambrosetti⁵, Julien Ombelli⁶, Michel Golay⁷, Vincent Ribordy⁸, Véronique Grazioli¹, Patrick Bodenmann¹

¹Department of Vulnerabilities and Social Medicine, Center for Primary Care and Public Health, Chair of Medicine for Vulnerable Populations, University of Lausanne, Switzerland, ²Faculty Health Sciences, School of Pharmacy and Biomedical Sciences, Curtin University, Western Australia, Australia, ³Emergency Department, Lausanne University Hospital, University of Lausanne, Switzerland, ⁴Addiction Medicine, Department of Psychiatry, University of Lausanne, Switzerland, ⁵Emergency Department, Geneva University Hospital, Switzerland, ⁶Emergency Department, North Vaud Hospital Group, Switzerland, ⁷Emergency Department, Broye Intercantonal Hospital, Switzerland, ⁸Emergency Department, Fribourg Hospital, Switzerland

Introduction: Frequent users of Emergency Departments (ED; ≥ 5 ED visits in the previous 12 months) often cumulate somatic, psychological and substance use problems. Providing a Case Management (CM) intervention may reduce their number of ED visits and improve their quality of life. However, there is limited knowledge about the implementation process of CM. This study aimed to identify the facilitators, barriers and needs encountered during the CM implementation in the context of a larger study that aimed to implement CM in EDs throughout French-speaking Switzerland. **Methods:** Mixed-method research were conducted with ED staff involved in CM implementation completed a questionnaire ($N = 31$) and took part in semi-structured interviews ($n = 23$) assessing implementing

influencing factors. Quantitative data were analyzed with Kruskal-Wallis one-way tests, whereas qualitative data were subject to an inductive content analysis.

Results: Using several dimensions of the RE-AIM framework, ED sites were split into two groups: more and less successful sites. Quantitative Findings showed a significant association between the perception of acceptability ($\chi^2 (2, n=30) = 14.39, p=.045$), appropriateness ($\chi^2 (2, n=30) = 15.36, p=.032$) and feasibility ($\chi^2 (2, n=30) = 17.25, p=.016$) of CM intervention measure and the success of the CM implementation. Qualitative Findings revealed four main facilitators: 1) Direct hierarchy support and flexibility; 2) Exchange with colleagues; 3) Supervision by the research team; and 4) Motivation. Lack of resources was an unanimously mentioned barrier. Participants identified the following needs to enable CM implementation: official and protected time for the project and at least two team members with complementary skills (e.g.: somatic, psychiatric and social). **Conclusions:** The way the CM implementation was perceived by the professionals contributed to the success of the implementation process. That said, beyond their convictions, human and logistical resources were found as crucial. Findings highlight that influencing factors for implementation are at individual and structural levels.

Climate change and threats to public health in Pakistan: a gender analysis of vulnerable communities

Farzand Bhanbhro¹, Sadiq Bhanbhro², Simi Kamal¹

¹Integrated Research Solutions Global, Karachi, Pakistan, ²Sheffield Hallam University, Sheffield, United Kingdom

Climate change is the biggest global challenge and an imminent threat to public health. The threats are particularly severe in low- and middle-income countries like Pakistan, which are often the least able to respond. Pakistan is among the countries that are most vulnerable to the risks associated with climate change. Pakistani women and girls in general, and poor rural women in particular, are the largest and most vulnerable group and unduly victims of climate change-triggered disasters. This study aimed to engage with local communities living at the country's largest natural water reservoir sites to investigate their understanding of climate change and its impacts. We used a gender analysis approach that informed the data collection using qualitative (focus groups, interviews and observations) and quantitative (household survey) methods. In total, 226 community members and 10 government officials participated from 6 locations in four provinces. The study found inadequate knowledge and awareness concerning climate change and its impact among the research participants. On the hand, most of the participants were aware and highly concerned with post-disaster (e.g., flooding, heavy rain and extreme weathers) health impacts, such as the spread of water- and vector-borne diseases, diarrhoea, skin infections, malaria, dengue, and malnutrition. Women participants expressed their views about the disproportionate impact of such disasters during their pregnancy and delivery. Government officials who participated in the study knew that climate change triggers natural disasters, a challenge for the country. Still, most of them believed that these were natural disasters, thus, not in their control to prevent them. This study concludes that women and men in these sites lack resources, knowledge and information about climate change and its risks to population health. Thus, the study recommends that decision-makers engage with these communities to raise their knowledge about climate risks and build their capabilities to mitigate them.

The effect of violent conflict on prescription/nonprescription drug misuse and abuse in four Middle Eastern countries

Mayyada Wazaify¹, Christina Steenkamp²

¹School of Pharmacy, The University of Jordan, Jordan, ²Oxford Brookes University, United Kingdom

Background and Objective: An important, yet poorly understood, impact of violent conflict on public health is the susceptibility of populations in conflicts to drug abuse and misuse as increased stress, the easy availability of drugs, and the relaxation of taboos against drug use exacerbate the problem. This study Aims to describe the types and patterns of prescription and non-prescription medicines suspected of being misused and abused amongst local populations in conflict zones, as reported by pharmacists.

Methods: The study is part of a larger two-year (2020-2022) project investigating the impact of violent conflict in the MENA region on medicine abuse and misuse and the experiences of pharmacists in managing this challenge. The study used a mixed-method approach to data-gathering, involving a quantitative survey ($n=160$) and semi-structured interviews ($n=20$) with pharmacists in Syria, Libya, Yemen and

Iraq. This paper focuses on the on prescription/nonprescription medicine misuse and abuse in violent contexts.

Results: So far, a total of 91 questionnaires have been filled (51.0% male, 54.9% between 26-35 years old, 44.0% Iraq, 25.3% Syria, 20.9% Yemen, and 9.9% Libya). More than half (n=52, 57.1%) reported that 20 customers or more were suspected of misusing/abusing medications in the past 3 months with 17.5% suspected more than or equal to 50 customers. The top suspected medicines were pregabalin and sedatives/hypnotics followed by gabapentin opioids like tramadol, in addition to cough and cold preparations. Qualitative data analysis shows the profile of users suspected by pharmacists, the reasons for misuse/ abuse, and the ways in which pharmacists react to deal with the problem, most of which are refusing the sale and claiming that the product is not available.

Conclusions: Based on the results above, policy recommendations about how to effectively respond to medicine misuse and abuse amongst conflict-affected populations are made.

Public health consequences of flooding: evaluation of Cholera outbreak in Nigeria

Deborah Komolafe¹

¹Obafemi Awolowo University, Ile-Ife, Nigeria

Background and Objective: Floods are the most common disaster worldwide and present a significant public health concern in countries where infectious diseases are endemic. The relentless rain in Nigeria, alongside the release of the Lagdo dam in Cameroon, Resulted in the most severe flooding in the past decade that struck at the same time as a worrying cholera outbreak. This study aimed to evaluate how floods influence the incidence of infectious diseases.

Methods: We conducted a narrative review of evidence to answer the aim of the study. Articles were retrieved from PubMed, Google Scholar, Scopus, and Science Direct from 2017 to 2022. Twenty-one studies were included with the Keywords in the title or abstract. Epidemiological data were obtained from newspapers and national country reports. We analyzed data on the incidence of infectious diseases during flooding compared to other years.

Results: Our findings revealed that multiple health impacts from flooding occur, from injury and death during an evacuation to worsened allergic symptoms, gastrointestinal infections, skin diseases, and mental health problems. As of October 2022 in Nigeria, the floods increased the incidence of infectious diseases such as malaria, cholera, and typhoid. More than 6000 suspected cholera cases and a 4-5% case fatality ratio were recorded. This is believed to be due to the high consumption of contaminated water, worsened sanitary conditions, and limited access to healthcare facilities.

Conclusions: The consequences of flooding pose significant challenges to public health. This study suggests improved health promotion and preventive measures for flooding to reduce current and future vulnerability to disease. There is a need for enhanced surveillance systems with an emphasis on training front-line health workers toward timely detection, reporting and response.

20-year disaster epidemiology in Italy: what have we learned and how prepared are we?

Nunzio Zotti¹, Francesca Di Serafino¹, Andrea Conti^{2,3}, Virginia Casigliani¹, Sara Civitelli¹, Giulia Geminale¹, Angelo Baggiani¹, Caterina Rizzo¹

¹Department of Translational Research and the New Technologies in Medicine and Surgery, University of Pisa, Pisa, Italy, ²Center for Research and Training in Disaster Medicine, Humanitarian Aid and Global Health (CRIMEDIM), Università del Piemonte Orientale, Italy, ³Department of Translational Medicine, Università del Piemonte Orientale, Italy

Disasters have always been part of Italy's history and the constant threat in our territory is represented above all by seismic and hydrogeological hazards, but technological risks can't be underestimated, too. Italian civil defense is articulated in a central organ, directly linked to Prime Minister's Office, which makes use of local institutions, materials and personnel for rapid deployment in case of emergency. In our work, we would first understand disaster epidemiology in Italy and then evaluate regional preparedness resources. Data on disasters in Italy from 2002 to 2022 were retrieved from the EM-DAT Database - Centre for Research on the Epidemiology of Disasters (CRED), from Université Catholique de Louvain (UCL). Italian regional data are taken out of Italian National Statistics Institute (ISTAT) and Italian Ministry of Health, regarding Emergency Departments (EDs) distribution, bed units, ambulances, number of healthcare facilities and health personnel. Descriptive analyses were conducted by disaster type and

years using Microsoft Excel. During the study period, 225 events occurred in Italy, affecting 899/100000 inhabitants on average (Range: 4-4480/100000inhab.), corresponding to 277645 individuals. The most affected Region was Sicily, with 26 events, the majority related to migrants' shipwrecks in Mediterranean Sea. Meanwhile, the majority of affected people were registered in Abruzzo and Molise (4480 and 3003/100000inhab.) because of L'Aquila and San Giuliano di Puglia earthquakes. With only 4/100000inhab., Aosta Valley was the less affected Region. Umbria reached best Results in Emergency Department [CR1] [1] distribution (1,59/100000 inhab.) and healthcare facilities (1,70/100000inhab), Molise scored the best bed units distribution (401,81/100000inhab.), Trento autonomous province has the highest number of ambulances (38,63/100000inhab.) and Liguria counts the higher distribution of healthcare personnel (746,55/100000inhab.). Our findings highlight the existing differences between different Italian regions and the importance of emergency preparedness and management, according to effective policy-making plans, strengthening infrastructure, materials, and health personnel. Preferable model of Public Health Emergency Operation Center in the regional level of Indonesia

Muhammad Hardhantyo¹, Hanevi Djasri¹, Happy Pangaribuan¹, Aldillas Nursetyo¹, Bernadetta Adipradipta¹, Bella Donna¹, Madelina Ariani¹, Gde Yogadhita¹, Andriani Yulianti¹

¹Center for Health Policy and Management, Indonesia

Background: WHO had provided a framework on the country development of Public Health Emergency Operation Center (PHEOC). This institution was required for the country to manage its public health event, including prevention, rapid detection, and response. As a country comprises of 17000 island and extend to more than 5000 km, the central level of PHEOC was not enough. PHEOC system reform is required to accommodate Indonesia's specific circumstances particularly in regional level. We outlined the potential of developing sub-national level PHEOC based on existing evidences. Policy Option and Recommendation: Indonesia need a fast and capable resources to be deployed during the surge capacity in Public Health Emergency situation. There are three different policy models for PHEOC at the regional level the base on the current evidence on PHEOC models in various countries. These concepts detailed different command structures for ad hoc agency models, independent agency models, and and Public Health Office (PHO)-based models. Each model has its own advantages and consequences.

Conclusions: The Ministry of Health of Indonesia is proposed to adopt the third PHEOC policy model, as the line of command lies under the Province Health Office. The PHO has the ability to mobilize units and access to resources in response to a current public health emergency situation, making this model the most practicable. However, routine training and capacity-building for the local surveillance staff are required to assist PHO in its role as regional PHEOC commander.

Long term post-traumatic stress disorders among the earthquake affected people of Sindhupalchok, Nepal

Laxmi Gautam¹, Prof. Khadka Mishra²

¹Manmohan Memorial Institute of Health Sciences, Institute of Medicine, Tribhuvan University, Soaltee mode, Kathmandu, Nepal, ²Madan Bhandari Academy of Health Sciences

Background: People who are suffering from PTSD have disturbing feelings and thoughts which is related to their experience even after a long time of such traumatic events happened. This study highlight the characteristics and prevalence of PTSD among the survivors after 4 years of earthquake- 2015, Nepal. Methods: Cross sectional study was carried out using standard PCL-5 PTSD questionnaire. Interview was taken among 376 survivors of earthquake after 4 years of earthquake in Sindhupalchok, Nepal. Descriptive statistics, Chi-square test and multiple logistic regression were used to describe data and test association.

Results: The mean age of the respondents was 39.47±16.18 years. Almost 2/5th of the respondents were either buried, injured or physically or mentally disabled during earthquake. Majority of the survivors had loss their loved one while most of them loss their property. Among the respondents who were buried 28.6% had develop PTSD which was 22.2% among physically or mentally disable during earthquake. All 20 indicators of PCL-5 were significantly associated with PTSD. The average score of PTSD was 22.48±13.57 with minimum score 0 to maximum 74 out of 80. The prevalence of PTSD was 71 (21.5%). Female (63.4%) were more prone to PTSD than male (36.6%). Respondents who lost their father (OR: 9.50,

95% CI for OR: 2.125-42.492), mother (OR: 9.027, 95% CI for OR: 2.861-28.487), and family members (OR: 5.068, 95% CI for OR: 2.380-10.790) were 9.501, 9.027, and 5.068 times more likely to develop PTSD respectively as compared to those who didn't loss known person.

Conclusions: PTSD was prevalent among 21.5% of survivors even after 4 years of earthquake which showed an urgent need to address PTSD among the respondents and necessity of immediate intervention to prevent and treat such problems in case of future disasters.

Identifying and scoping new options for healthcare system strengthening in North East Syria

Giulia Perego¹, Bardisan Gawrieh², Syria Maria José³, Cristina Renzi⁴, Carlo Signorelli⁴

¹Vita-Salute San Raffaele University, Global Health Center of the Tuscany Region, Italy, ²Un Ponte Per, ³Caldés Pinilla, Global Health Center of the Tuscany Region, Italy, ⁴Vita-Salute San Raffaele University

Background and Objectives: Nowadays, North East Syria (NES) remains a complex humanitarian emergency, still bearing the devastating consequences of over a decade of ongoing hostilities that caused more than 400.000 deaths in Syria and led it to be the country with the worlds highest number of internally displaced persons (IDPs) until last year.

NES security situation is still particularly fragile and highly dynamic, prone to escalations with the persistence of active armed clashes, airstrikes and shelling. The health sector has been severely hit by the conflict, which caused widespread destruction of healthcare infrastructure, fragmented health governance, depletion of healthcare providers and scarcity of supplies and equipment.

The primary purpose of our work is to comprehensively assess and map primary healthcare facilities and services currently present at territorial level in NES, as well as critical gaps and implementation capacities for each specific area, to identify new options for strengthening the healthcare systems, define future priorities and strategic actions to guide the decision-making process and help define a minimum health service package (MHSP).

Methods: This study will use secondary data review from data service providers and open-source research, in combination with extensive healthcare facilities assessment at each sub-district level (area-based) and key informant (KI) methodology at different levels of the healthcare sector: KI interviews will be carried out to relevant community leaders with sector-specific knowledge, healthcare professionals, hospital management and health experts. Therefore, the analysis will be based on both qualitative and quantitative data.

Results and Conclusion: Limitations and gaps in available healthcare services are hard to identify due to impediments in data collection: access restrictions, insecurity, rapidly changing governance dynamics and other challenges hinder the capacity to conduct analysis in the area. Thus, this report may not capture some of the most recent events and trends. Results are still ongoing.

Global capacities for Implementation of International Health Regulations

Milena Vasic¹, Vesna Karadzic², Dragana Jovanovic¹, Biljana Kilibarda³, Verica Jovanovic², Miljan Ljubicic³

¹Institute of Public Health of Serbia, Faculty of Dentistry, Pancevo, Serbia, Dr Subotica 5, Serbia, ²Institute of Public Health of Serbia, ³Institute of Public Health of Serbia, Dr Subotica 5, Serbia

Background and objective: In 2005, World Health Organization's (WHO) General Assembly adopted the International Health Regulations (IHR) as an international legal instrument aimed at strengthening global health security and empowering the global community to prevent and respond to public health threats. In 2019, European Commission launched new Joint Action Strengthened International Health Regulations and Preparedness in the EU (SHARP JA) with the aim to strengthen EU preparedness for serious cross-border health threats, and support the implementation of the IHR. Within the SHARP JA we have assessed the capacities of participating countries to implement IHR. The aim of this work is to expand that analysis to the global level.

Methods: Desk review and data analysis were done. The source of data was the WHO States Parties Annual Report (SPAR) for the years 2019, 2020, and 2021 for six WHO regions - African Region (AFRO), Americas Region (AMRO), Eastern Mediterranean Region (EMRO), European Region (EURO), South-East Asia Region (SEARO), and Western Pacific Region (WPRO).

Results: The average IHR global capacity remained unchanged from 2019-2021,

(64, 65, and 64%, respectively). The highest capacities for indicated period without any noticeable changes have been recorded in EURO (75, 74, and 74% respectively). In AMRO, the overall IHR capacities were over 70% in 2019 and 2020 (71 and 72%), while in 2021 there was a decrease (67%). The lowest capacities in observed period were in AFRO (44, 49, and 49%, respectively). Although capacities in AMRO are the lowest, increase during the pandemic is noted.

Conclusion: The results show the regional differences in IHR capacities. The SPAR results which represent countries' self-assessment on IHR capacities indicate some improvements during pandemic in countries with the lowest capacities. However, there is still room for IHR capacities improvement in all WHO regions.

The new normal: Ensuring Continuity of Family Planning and Reproductive Health Services During Health Emergency Response in Davao City, Philippines

Lady Molleno¹, Ashley Lopez², Azin Libanan³

¹Research Triangle Institute, "Pryce Tower, J.P. Laurel Avenue, Davao City, Philippines, ²City Health Office of Davao, Davao City, Philippines, ³Provincial Health Office of Davao Oriental, Philippines

Background and Objective: Responsive Health Care Provider Networks are borne out of a nuanced approach to organizing and operating the local health systems. In Davao City, health care is characterized by a service delivery system with a lone national government-owned hospital caters to not just the hospital needs of its constituents but also primary and secondary care services. The newfound demand for the novel COVID-19 services had profound consequences on the health care system downscaling both essential public health services in primary care facilities and non-COVID cases in the government hospital.

Methods: For a more responsive health system, the city together with its partners rearranged the structure and dynamics of the local government unit and the health facilities ensuring equal access, quality, efficiency, and sustainability of health care services. A Health Care Provider Network (HCPN), a new service delivery arrangement centered on service provision to identified target population, was established to address the demand for COVID-19 services and at the same time redirect displaced patients seeking essential public health care services to appropriate facilities. The network arrangements include referral, resource pooling and financing arrangements.

Results: The major outputs include improved access to health services especially to indigents making them more informed and properly navigated to appropriate facilities and increased service coverage and coordinated referrals for Maternal and Childcare services. This benefited the constituents especially the indigents who are most vulnerable and affected by the system-wide impact of the pandemic. Non-COVID cases were properly referred and accommodated in assigned hospital facilities. COVID services were decentralized to the established COVID Cluster clinics.

Conclusion: COVID-19 has exposed the weaknesses of the health system. It is critical to implement clear and timely health emergency response without compromising provision of other essential health services. Health services should be accessible to the people despite the pandemic. "

Implementing Public Health Policies in practice: how Local Health Authority Roma 1 managed the Ukrainian refugee crisis

Paolo Parente¹, Valerio Mogini², Andriy Melnyk³, Lavinia Barone⁴, Maryana Kohut¹, Rosaria Messina³, Paolo Lombardo⁴, Leonardo Villani³, Maria Riccardi³, Maria Martelli¹, Adriano Grossi¹, Andrea Barbara¹, Gennaro D'Agostino¹, Giancarlo Santone¹, Mauro Goletti¹

¹Local Health Authority Roma 1, Italy, ²Division of Public Health, Italian Red Cross International, ³Section of Hygiene - University Department of Life Sciences and Public Health, Università Cattolica Del Sacro Cuore, Rome, Italy, ⁴Department of Public Health and Infectious Diseases, Sapienza University of Rome, Italy

Background and Objective: Russian invasion of Ukraine forced citizens to flee as refugees. Displaced people face many obstacles, including physical, mental, institutional and economic ones. The migrant population represents a Public Health challenge given its different epidemiological and social backgrounds. Local Public Health implementation of the guidelines developed to assist the refugees. Our objective was to provide practical solutions to the emerging problems pertaining Local Public Health implementation of the guidelines developed to assist the refugees, in the context of the Local Health Authority (LHA) Roma 1.

Methods: LHA Roma 1 developed a strategic plan based on local expertise,

national and international guidelines to ensure infectious disease prevention and control, as well as continuity of care for non-communicable diseases and mental health. It was later refined based on national and regional decrees, the available literature, ECDC indications, and the feedback from the health professionals on the field. Community engagement, real time feedback and the formation of a multidisciplinary and multicultural central team allowed a smoother implementation process which covered refugee needs.

Results: Many challenges were faced during the implementation phase which required sensible and timely solution. These challenges include the necessity of rapid resource provision, overcoming linguistic and cultural barriers, guaranteeing a standard of care across multiple sites and coordination of interventions. Despite these, during the first three months of operations more than 9300 refugees were assisted and assigned an STP code, which guarantees healthcare services on par with Italian citizens.

Conclusion: Refugee assistance and socio-sanitary integration are an essential part of Public Health practice. Bridging the gap between refugee population needs and available healthcare provision requires sound leadership within a responsive and collaborative workforce. Evidence-based practices implemented to increase local health system resilience to the current crisis foster a preparedness-based environment to face the emergencies of the future.

Evaluation of individual preparedness for emergencies / disasters among members of health professions' chambers in Ankara - Turkey

Dilek Yildirim Pak¹, K. Altintas¹

¹Hacettepe University - Public Health Department Turkey

Objective: This descriptive study aimed to determine the factors associated with the individual emergency / disaster preparedness behaviour of the members of four different Health Professions' Chambers in Ankara - Turkey.

Methods: Ethical approval was taken from the Ethical Committee of Hacettepe University. As data collection form, a questionnaire consisting of 32 questions prepared by the researchers and the General Disaster Preparedness Belief Scale Based on Health Belief Model (31- items) were used. As the score increases, individual preparedness for emergencies/disasters is better (min.-max. 31-165). The data were first collected online using "Google forms". Since there was not enough participation, the face-to-face interview method was used afterwards. There were 401 health professionals in the study. The study group involved dentists (n=96, 23.9%), medical doctors (n=150, 37.4%), pharmacists (n=74, 18.5%), and veterinarians (n=81, 20.2%).

Results: Participants who received emergency/disaster-related training consisted of 35.2% of all participants (n=141). None of them received training from the chambers. 38.2% (n=153) of the participants experienced a disaster of any type. 33.2% of the participants (n=133) stated that they were not individually prepared for emergencies and disasters. The mean scale score of the participants was 112.39±12.77. Several factors were found associated with health professionals' individual preparedness for emergencies/disasters. These included education and training on disasters, presence of previous or current job about disasters, being assigned and/or being volunteered to disaster response.

Conclusion: Turkey is known to be a country which frequently encounters disasters and health professionals provide essential services during emergencies and disasters. They, as individuals, should not be affected from disasters in order to serve. Therefore, training on personal emergency/disaster preparedness is urgently needed for them. One way of achieving this is by organizing courses or web-based training provided by health profession chambers.

War and peace in public health education and training - a scoping review

Marta Miller¹, Yudit Namer², Lisa Wandschneider², Colette Cunningham², Tomasz Bochenek³, Łukasz Balwicki⁴, Oliver Razum²

¹Medical University of Gdańsk Poland, ²School of Public Health, Bielefeld University, Germany, ³Institute of Public Health, Jagiellonian University Poland, ⁴Department of Public Health and Social Medicine, Medical University of Gdansk Poland

Background and Objectives: Armed conflict and war are public health disasters. In such scenarios, public health action has a crucial role in emergency and rehabilitation, and the importance of war prevention and peace promotion ("peace through public health") is increasingly recognised. While this role is by now well conceptualised in public health research and interdisciplinary cooperation, the

translation into public health training and competencies is only beginning to emerge, especially in Europe.

Methods: With a scoping review, we systematically map the scientific literature on public health education and training relating to war and peace promotion. We searched in PubMed, CINAHL, PsycINFO, Embase, Web of Science Core Collections as well as the reference lists of included material. Eligible literature assessed war and peace in the European public health education context. We excluded any material that did not target the public health workforce.

Results: We included 21 sources that ranged from opinion pieces to empirical assessment of curricula and evaluation studies. The educational programs were predominantly short-term and extra-curricular in postgraduate courses addressing public health professionals both in conflict-affected countries as well as those not directly war-affected. Most of the literature focused on public health action in times of war, often without specifying the context and type of war or armed conflict. Emergency response and multidisciplinary collaboration were the most prominent competences, often drawing from closely related fields such as natural disaster and outbreak management.

Conclusions: The scientific discourse on competencies in times of war and promoting peace in public health in the European region mostly focuses on immediate emergency response. Peace promotion and war prevention are missing foci which need to feature more prominently in public health training. Professional organisations of schools of public health should ensure their competencies include peace promotion and war prevention in addition to war response.

Local response to humanitarian crises: the experience of Roma 2 Local Health Authority with the Afghani and Ukrainian crises

Annalisa Rosso¹, Alessandro Rinaldi¹, Daniele Coluzzi¹, Fabrizio Perrelli¹, Filomena Monaco¹, Pier Napoli¹, Giuseppe Angelis²

¹Migrants and Vulnerable Populations' Health Unit- Local Health Authority Roma e Italy, ²Department of Prevention- Local Health Authority Roma 2 Italy

Background and objective: In August 2021 and March 2022, Roma 2 Local Health Authority (ASL) was confronted with the prompt arrival of migrants from Afghanistan and Ukraine, following the humanitarian crises occurring in the two countries. The Migrants and Vulnerable Populations' Health Unit (MVPH) developed and coordinated an intervention model aimed at responding to the health needs of newly arrived migrants.

Methods: A multidisciplinary team was established in both emergencies, coordinated by the MVPH Unit, composed of nurses, medical doctors, vaccination staff, administrative staff, cultural mediators, responsible for outreach activities in the hotels where migrants were hosted. A basic assessment of health needs, COVID-19 tests and vaccination, TB screening were offered on-site. People were also granted access to health services through release of an STP (temporarily present foreigner) code. For the Ukrainian population, in addition to outreach activities a dedicated Hub was also set up to guarantee free access to COVID-19 tests and vaccination, medical screening, vaccinations included in the National schedule and STP code release, with the full time presence of cultural mediators. Collaboration with Non-Governmental Organizations (NGOs) working in support to the humanitarian crisis was activated.

Results: From August 21 to September 2 2021, 469 people from Afghanistan arrived in three facilities located in ASL Roma 2 area who were all assessed for their needs, were offered COVID-19 vaccine and received STP codes. From 1 April to 30 June 2022, 626 people accessed the dedicated Ukraine Hub. Forty-five site visits were carried out in the six hotels hosting Ukrainian refugees, with 343 people receiving a clinical examination.

Conclusions: The presence of a dedicated service has allowed a rapid reorganization of ASL Roma 2 services to deal with humanitarian emergencies and the prompt activation of already established collaborative networks.

Impact of Russian war in Ukraine on COVID-19 dynamics in Italy

Dmytro Chumachenko¹, Plinio Morita²

¹University of Waterloo / National Aerospace University "Kharkiv Aviation Institute" Canada Tetiana Dudkina National Aerospace University "Kharkiv Aviation Institute" Ukraine, ²University of Waterloo University of Waterloo Canada

On February 24, 2022, Russia invaded Ukraine, what led to a humanitarian catastrophe and mass migration. Italy received many refugees from Ukraine and ranked 4th in the world in terms of the number of refugees received. This study aims to test the hypothesis of the impact of the Russian war in Ukraine on the

dynamics of COVID-19 in Italy. To assess the impact of migration on the COVID-19 dynamics, a XGBoost model was built. We used data from the World Health Organization on morbidity and mortality from COVID-19 in Italy for the pilot study. We verified the model for the period 01/25/22 – 02/23/22. To assess the impact of migration, a forecast was built for the period 02/24/22 – 03/25/22. Model's performance was estimated using mean absolute percentage error. As a result, the accuracy of forecasting the COVID-19 dynamics in Italy for 01/25/22 – 02/23/22 was 98.4% for new cases and 99.7% for fatal cases. The accuracy of forecasting the COVID-19 dynamics in Italy for 02/24/22 – 03/25/22 was 95.8% for new cases and 99.5% for fatal cases. A comparison of the model's accuracy for different periods suggests that migration from Ukraine is an insignificant factor in changing the dynamics of morbidity. At the same time, it does not affect mortality. The reasons for the impact on the dynamics of COVID-19 are the lack of control over the medical histories of refugees, the low percentage of vaccinations (36.96%) and the population, received a booster dose (1.76%) in Ukraine. At the same time, the high level of vaccination in Italy (75.98% of the population with a booster dose) smoothed out the impact of migration on mortality. Therefore, additional COVID-19 control measures in Italy aimed at Ukrainian refugees are necessary, such as facilitating access to testing, medical care and booster vaccinations.

Popul. Med. 2023;5(Supplement):A1699

DOI: 10.18332/popmed/164575

Ukrainian refugees and migrants' access to healthcare services in Tuscany

Claudia Cosma¹, Michela Maielli², Chiara Lorini¹, Marco Del Riccio¹, Silvia Gandolfo², Andrea Belardinelli², Federico Gelli², Guglielmo Bonaccorsi¹

¹Department of Health Science, University of Florence, Florence, Tuscany, Italy, ²Health, Welfare and Social Cohesion Directorate, Region of Tuscany, Florence, Tuscany, Italy

Background and objective: Russian military invasion of Ukraine on 24 February 2022 has produced the largest humanitarian crisis in Europe since World War II. More than 14 million people have been forced to flee their homes seeking refuge in neighboring countries. Our aim is to assess the impact of migration on Tuscan healthcare system with a comparison of the number of accesses to three different healthcare settings in 2022 with data from the same period in 2021.

Methods: Data were collected from the Tuscan health registry "Digital Health and Innovation", period 01/03/2022-30/09/2022 and 01/03/2021-30/09/2021 and include administrative data, hospitalizations, emergency room accesses and outpatient care for citizens born in Ukraine.

Results: From 01/03/2022 to 30/09/2022 17399 Ukrainian refugees registered in the health registry using the STP code "Temporarily Present Foreigner" (9232) or CF "Tax Code" (8167) to obtain access to healthcare services. There were 891 hospitalizations, 61% more than in the same period in 2021. Discharges were mainly from obstetrics (7,30%), orthopaedics (6,74%), oncology (5,83%), gastroenterology (4,02%), and cardiology (3,17%) departments. There were 2964 admissions to the Emergency Room (ER, 2013 women and 951 men), 445% more than in 2021. Accesses of the 0-14 age group in 2022 increased fivefold. 66% of the people who accessed to the ER in 2022 were in the 15-64 age group. Outpatient care increased by 50% compared to 2021 for a total of 92908 visits.

Conclusion: Healthcare is a fundamental human right for people all over the world. Everyone, including refugees and migrants, has the right to access health services whenever they need them. European countries should be equipped with strong healthcare systems to cope with emergencies. Knowing refugees' experiences in host countries is important to design the best hospital and primary healthcare organisation.

What are the psychosocial health realities of women surviving wartime sexual violence in africa? a rapid qualitative systematic review

Aurelie Milord¹, Marie Hatem¹

¹Université de Montréal Canada

Intro: Africa has been marked with several armed conflicts in the past years. These armed conflicts often create favorable situations where a particular weapon of war is used against the population: wartime sexual violence. Women surviving wartime sexual violence are living with multiple trauma related consequences.

Aim: Using an original framework based on the theory of wartime sexual violence as a weapon of war and the nine categories of genocide rape trauma by Mukamana et al (2018), this review aims to explore the psychosocial wellbeing of women surviving wartime sexual violence in Africa.

Methods: This rapid qualitative systematic review followed the JBI Evidence

Synthesis approach to conduct such studies. Two data bases have been consulted as part of the search strategy: 1) Medline (n=136) and 2) APA PsychInfo (n=172). After the selection process, 17 articles have been selected to be included in the study according to our criteria of inclusion.

Data extraction was done using COVidence. The synthesis and interpretation of results was based on Harden and Thomas (2008) method for thematic synthesis of qualitative research in systematic reviews using Nvivo 12. The results have been evaluated using Grade CERQual.

Results: 1) Women surviving wartime sexual violence are experiencing overwhelming feelings and unbearable memories the most; 2) psychosocial health is affected by stigmatization, which is guided by cultural norms; 3) our framework does not account for two elements: i) the resilience emerging for the women surviving wartime sexual violence that is based on their faith and support from their communities and ii) the needs for institutional and educational changes and 4) the literature does not have enough information on the perception of women surviving wartime sexual violence regarding the framework used in the study on their psychosocial wellbeing.

Malaria transmission in the coastal zone and in the center of the Ivory Coast during the dry season

Gouamene Timan¹

¹University Nangui Abrogoua, Ivory Coast

Malaria remains a threat in sub-Africa, particularly in Côte d'Ivoire. In Côte d'Ivoire malaria is endemic. The strong climatic variations that exist between coastal and savannah area of Côte d'Ivoire. Malaria suggest that vector control measures take into account eco-epidemiological diversity before considering large scale action. This study evaluate bioecological parameters of vectors and malaria transmission in two districts of Côte d'Ivoire. It was conducted in the coastal (Jacqueville) and savannah (Beoumi) area of Côte d'Ivoire in the dry season. Humain landing catches conducted monthly to determine Anopheles vector species composition, aggressive density, aggressive cycle and biting location as well as entomological parameters of malaria transmission. Mosquitoes were captured for 12 hours, from 6:00 pm to 6:00 am plasmodium inside infected mosquitoes were tested by Enzyme-linked immuno-sorbent assay for P. falciparum circumsporozoite protein. A random sample of 100 females belonging to the An.gambiae complex together with all CSP positive anopheline, were further classified by PCR at the species and molecular form. In Jacqueville 853 (99,65%) An.gambiae s.l and 3 (0.35%) An.pharoensis. In Beoumi 811 (96,32%) An. pharoensis. An.coluzzi represented the only species of the An.gambiae s.l complex in Jacqueville. In Beoumi, 58% of An.coluzzi was found and the rest was constituted of An.gambiae s.s. The human biting rate in Jacqueville increased from 5.7 (b/p/n) in Novembre to 17.3 (b/p/n) in march. Unlike eoumi, where the rate decreased from 16.4 (b/p/n) in march. In novembre to 0.69 (b/p/n) in march. In Jacqueville, (EIR) varies from 0.21 to 0.56 (ib/p/n). There were no infections in the An.gambiae s.l pare population tested in Beoumi. This study shows us bioecological parameters of the two ares.

Knowledge, attitude, and preventive practices regarding dengue fever among sudanese citizens and associated factors in Khartoum state, Sudan

Teeba Hamdoun¹, Ibrahim Adel², Elaf Aziz^{3,4}

¹Faculty of Molecular Biology and Genetics, Kadir Has University, Istanbul, Türkiye, ²Faculty of Medicine, Alneelien University, Khartoum, Sudan,

³Faculty of Medicine, National Ribat University, Khartoum, Sudan, ⁴King Abdullah University Hospital, Sudan

Background and Objectives: Dengue fever is a mosquito-borne viral disease that causes nearly 390 million dengue infections annually, particularly in the tropical and subtropical regions of the world. According to the World Health Organization (WHO), 40 % of the world's population lives in these areas that are classified to be at high risk for Dengue infections. Sudan is one of the countries with a continuous risk of developing dengue fever outbreaks with 1197 reported cases in 2019. Our study aimed to assess the knowledge, attitude, and practice patterns regarding dengue fever among the public living in Khartoum state of Sudan. **Methods:** A descriptive cross-sectional community-based survey was conducted in August 2021, among 532 participants. Data were collected using a pretested, structured online questionnaire designed on Google form and were analyzed using Statistical

Package for Social Science (SPSS).

Results: Among the survey respondents (n=532), (56%) were male, (36.1%) aged 26-35, (75%) were in universities and institutes, (49.2%) were married and (60%) were working. (7%) had a personal history of dengue infection, while (19.7%) had reported knowing someone who get infected. Social media was the main source of information. Knowledge scores were significantly associated with occupation, marital status, source of information regarding dengue fever, history of personal infection, and family or friends' previous infection ($P<0.05$). The overall correct rate of the knowledge questionnaire was (52.12%). (69.7%) agreed that dengue fever is a serious illness in Sudan. (94%) used fans and (93.4%) covered their water containers. Conclusions: This study revealed that participants had an intermediate level of knowledge, while most participants showed a positive attitude and appropriate practices. The study highlighted that people with a personal or family history of infection had relatively higher knowledge compared to other groups. This warrants the development of appropriate public health interventions and educational programs.

Climate effects and health emergencies: analysis of response actions to floods in Bahia, Brazil

Marcelo Rocha¹, Ivône Maia², Karoline Rebouças³

¹Secretaria da Saúde do Estado da Bahia, Brazil, ²Secretaria da Saúde do Estado da Bahia, Bahia, Brazil

Background and Objective: Climate impacts have repercussions on the global agenda, as changes in temperature and climate patterns prompt the occurrence of storms, floods, and landslides, leaving populations vulnerable and susceptible to disease and food insecurity. In Northeast Brazil, a region traditionally affected by periods of drought, heavy rains intensified amid the pandemic, with floods that affected the lives of thousands of people and required comprehensive responses from the health system. In view of the installed set of crises, this study aimed to analyze the main interventions carried out to face the Public Health Emergency caused by floods.

Methods: Qualitative research with a critical-reflective approach based on the experience report of Health Surveillance professionals from the Southwest Regional Health Center of the Health Department of the state of Bahia, Brazil. The actions developed were described and analyzed between December 2021 and February 2022. Data were analyzed in two analytical categories: risk management and strategic response actions.

Results: The intersectoral work integrated sectors of health, public security and civil defense. Risk management prioritized strengthening the capacity for action at the regional level, with the installation of a Situation Room. Some of the strategic actions were the creation of teams on continuous duty to monitor the homeless and displaced people, distribution of medication, inspection of shelters, visits to the most affected municipalities, and analysis of water samples for human consumption.

Conclusions: The response measures were adequate and successful, being the coordinated and solidary partnership of the state of Bahia with the municipalities of fundamental importance. According to the regional experience, integration between different sectors is an essential strategy for overcoming the dimensions of vulnerability installed in climatic events that cause floods and overload the health systems.

Pandemic surveillance system pilot

Myagmar-Ulzii Enkhbaatar¹

¹Robot Systems LLC, Mongolia

Pandemic Surveillance System pilot and actual interface design and end-user components of the pilot project. It is extremely critical that making the right decisions during pandemic, such as imposing appropriate restrictions and reopening the economy at an optimal time and pace. Primary role of PSS pilot was designing and testing Pandemic management system architecture, it maintains pandemic related Master data as a single source. During piloting PSS implemented core four component systems including Data collection system, Pandemic information system, Lab management system, Early Warning Analytic system.

Methods: 1. After numerous meetings and interview among stakeholders including Ministry of Health, National Health Data Center, National Centre for Communicable Diseases, National Center for Zoonotic Diseases, we find out effective solution for multisource based Pandemic Surveillance System design. Based on this finding, we proposed integrated PSS system architecture that able to oversee most

important pandemic indicators at centralized storage and keep historical data for further study. 2. PSS is designed for enterprise architecture, functional abilities of PSS are very wide including data governance, data standardization, business glossary, and semantic mapping and data flow management.

Results: This component is aimed for delivering insight reports after receiving aggregated data from other components. End-Users able to set up expected outcomes and factors then system automatically generate analytical insights to user. Core aspects of this components is that it triggers messages when unusual activity or insight appears in data. Also, will integrate with EWS system at NEMA. Summary: Pandemic surveillance system (PSS) provides several benefits to government such as allowing to use MDM for more accurate analyses of the pandemic, and more informed decisions about reopening economies around the country. PSS is implemented for timely surveillance systems that collect information on epidemic prone diseases to trigger prompt public health interventions.

Adaptation of the hospital structure in response to covid-19 in Bahia, Brazil, year 2020

Ivône Maia¹, Marcelo Rocha², Karoline Rebouças³

¹Secretaria da Saúde do Estado da Bahia, Brazil, ²Em Frente à Escola de Música Cathalá, Secretaria da Saúde do Estado da Bahia, Brazil, ³Secretaria da Saúde do Estado da Bahia, Bahia, Brazil

Hospitals in the state of Bahia/Brazil as well as in other parts of the world had to quickly adapt to the COVID-19 emergency, which resulted in difficulties to adequately assist infected people. The necessary changes, be them of the physical structure or the care procedures, were based on the goal of protecting the health of patients and hospital workers. In this perspective, the objective of this work was to present the actions developed by the Sanitary Surveillance for guidance and monitoring of hospital units.

Methods: Experience report developed in the region of Brumado, state of Bahia/Brazil, comprising 21 municipalities, composed of technicians from the Regional Health Center/Bahia, from February to April 2020. Data were analyzed in two dimensions: actions for structuring the hospital network and implementation of care protocols.

Results: Sanitary inspections were carried out in all hospitals in the territory with the aim of adapting the physical structure to the flow of distinction in the areas of care for people infected with COVID-19 and people with other pathologies and actions of an educational and guiding nature were adopted. The (online) meetings were based on the following topics: patient safety, risk management, infection control and worker health protection. In the hospital network structuring category, the main focus was on adapting the structure. The main changes were necessary in the areas of attire, hospitalization, isolation, waste shelter, comfort, and place for the health professionals to eat. In turn, regarding the technical protocols, the need to implement standards aimed at the safety of the professionals involved and patients was taken into account, and the application this standards followed the guidelines of the National Health Surveillance Agency.

Conclusions: The applicability of scientific knowledge in the daily practice of health institutions provided the necessary changes to protect the lives of patients and health workers. development in the LEPH field for the public health community – including education in LEPH. Explore all these issues interactively with the audience.

Quality of life in patients with type 2 diabetes mellitus in a city in southeastern Brazil

Angelita da Silva Mansur¹, Maria Helena Monteiro de Barros Miotto¹

¹Brazil

Diabetes mellitus is a public health problem due to its incidence and prevalence. As it is a progressive disease, affected people tend to deteriorate their health over time, leading to complications. Although its negative impact on quality of life is recognized, there is a need to analyze it focusing on the context of southeastern Brazil. To fill this gap, this study Aims to evaluate the quality of life in patients with type 2 diabetes mellitus in a city in southeastern Brazil. Through an analytical cross-sectional observational study, we collected data from patients of the university in a city in southeastern Brazil. We applied a survey including questions related to the sociodemographic and clinical information, and from the SF-36 quality of life questionnaire. Descriptive analyzes and the t-test. The final sample consisted of data from 300 patients, mostly female (79.0%), aged over 54 years (73.3%), married or in a stable relationship, and predominantly with lower

income and lower education levels. Most patients were obese (48.3%) and did not practice physical activity (67.7%). Regarding the SF-36 domains, the highest average value found was for the Social Aspects domain (73.4). Between males and females, a significant difference was only observed between the scores of the Functional Capacity and Pain domains. Comparing age groupings, individuals with or without obesity, and with or without other comorbidities, significant differences were found for most domains (including Pain and General Health Status). The education level was also significant, with the highest averages in the SF-36 domains being obtained for individuals who had at least completed high school. Physical activity practice was significant for all domains. Evaluating the factors associated with the quality of life of Brazilians, considering the diabetes effects, can contribute to health promotion and disease prevention actions.

Impact of infrastructure disruptions on Puerto Rican household capabilities, health, and well-being

Ralph Rivera-Gutierrez¹, Susan Clark², Sara Peterson², Andrea Zabraná-Rosario³, Michael Shelly²

¹Graduate School of Public Health, University of Puerto Rico, San Juan, Puerto Rico,

²State University of New York at Buffalo, United States,

³Graduate School of Public Health, University of Puerto Rico, Puerto Rico

Critical infrastructure encompasses energy, water, communications, transportation, food, health, and emergency services. When critical infrastructure is damaged or fails, essential services are interrupted which can have severe health and well-being consequences. This study examines how infrastructure service interruptions place burdens on Puerto Rico households impeding their capabilities, i.e., accessing drinking water, storing and preparing food, and cooling homes. This study assessed impacts of power outages on households to help inform disaster mitigation and preparedness strategies. Respondents were identified significant power outages that occurred in the past three years to answer questions about its impact on household capabilities (e.g., cooling their homes, preparing food, etc.) and the physical, mental, and overall health and well-being of household members. Other questions covered access to food, water, and healthcare, and social capital. Disruptions to cooling and food refrigeration were the most frequently reported impacts, the most highly ranked impacts on the health and well-being of household members, and the most time and financially intensive disruptions. Respondents identified disruptions to communications and information access as negatively affecting their mental health. The outage reduced life satisfaction for most respondents and was a significant factor in determining the severity of impacts. The results suggest that providing cooling resources (i.e., fans and/or air conditioning at community centers with back-up power systems) and refrigeration (i.e., access to ice or community provided refrigeration for food and medicine) are important interventions to safeguard health during outages. For mental health, enhanced community outreach and diversified communication channels may be particularly impactful. Preparedness efforts should focus on identifying households that depend upon electricity to power medical devices or to refrigerate medication. Because households with young children and/or disabilities were found to experience more severe health consequences from outages, interventions focused on providing childcare and dependent care during disruptions are recommended.

Clinical-epidemiological description of the Ukrainian refugees in Italy: the experience of the local health authority roma 1

Paolo Lombardo¹, Andriy Melnyk², Leonardo Villani², Claudia Coppi³, Lavinia Barone¹, Maryana Kohut³, Maria Riccardi², Rosaria Messina², Adriano Grossi³, Fabiano Grassi¹, Andrea Barbara³, Gennaro D'Agostino³, Mauro Goletti³, Paolo Parente³

¹Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, ²Section of Hygiene - University Department of Life Sciences and Public Health, Università Cattolica Del Sacro Cuore, Rome, Italy, ³Local Health Authority Roma, Italy

Background and objective: Russia launched a full-scale invasion of Ukraine on the 24th of February 2022, causing Ukrainian refugees to flee to other nations. Host nations need epidemiological information on the newly arrived refugee population to program health services appropriate for them.

This study aims to investigate demographic composition, COVID-19 vaccinations performed, specialist care provided, and Non-Communicable Diseases (NCDs) prevalence in COVID-19 vaccinated refugees of the Ukrainian refugee in the Local Health Authority (LHA) Roma 1 area of competence.

Methods: We performed a retrospective analysis of collected data regarding Ukrainian refugees assisted on the LHA's territory from 2nd March 2022 to 2nd June 2022. NCDs were classified according to The International Statistical Classification of Diseases and Related Health Problems 10th Revision (ICD-10). Results: 9349 Ukrainian refugees were assisted by LHA Roma 1 with the consequent issuing of a STP code for each; 2784 (29.8%) were Males and 6565 (70.2%) were Females; median age was 25 (10-39). 2485 Ukrainian refugees got vaccinated for COVID-19; 569 (22.9%) were male and 1916 were female. 401 (16.1%) among the vaccinated refugees had at least one NCD. The most frequent diseases were diseases of the circulatory system (203; 50.6%), endocrine, nutritional and metabolic diseases (100; 24.9%) and mental and behavioral disorders (26; 6.5%). A total of 206 refugees needed second-level assistance, with endocrinology (25; 12.1%), cardiology (18; 8.7%) and gynecology (15; 7.3%) being the leading requested specialties.

Conclusion: The Ukrainian refugee population needs health services targeted mainly to minors and women. A noteworthy proportion of NCDs was detected, especially chronic diseases such as hypertension, hypothyroidism and diabetes; also, mental illnesses were relevant. LHA Roma 1 managed to produce a broad spectrum of care services for free to the refugees, as proven by COVID-19 vaccinations, STP codes issued and the specialist care provided.

DOI: 10.18332/popmed/163691

Nuclear Anxiety in a context of Russian-Ukrainian War 2022 (RUW-22): Descriptive Cross-sectional Study

Anton Drobov¹, Abanoub Riad¹, Aleš Peřina¹, Michal Koščik¹, Muhammad Alkasaby²

¹Masaryk University, Czech Republic, ²London School of Hygiene & Tropical Medicine, United Kingdom

Nuclear anxiety and its consequences, are expected to be heightened amid the Russian-Ukrainian War of 2022 (RUW-22). The main goal of the study is to assess the prevalence of nuclear anxiety and its possible risk factors in the group of Czech university students from March till April 2022 of RUW-22. A digital self-administered questionnaire (SAQ) was used to collect data. The SAQ consisted of multiple-choice items questioning about demographic characteristics, generalized anxiety symptoms using generalized anxiety disorder-7 (GAD-7), depressive symptoms using patient health questionnaire-9 (PHQ-9), attitudes towards civilian uses of nuclear power, and nuclear war-related anxiety. Of 591 participated students, 67.7% were females, 68.2% were Czech nationals, and 61.8% followed the RUW-22 news at least once a day. In terms of the civilian uses of nuclear power, most participants agreed that nuclear power was safe (64.5%), denied being afraid that civilian use of nuclear power might deteriorate their health (79.7%) and thought that public acceptance was important for building new nuclear power plants (56.9%). About 42.1% and 45.5% of the participants reported feeling depressed at the possibility of nuclear war and agreed that the chances of a nuclear war in their lifetime were very high, respectively. 23.9% reported looking for recommendations for protection against nuclear accidents and 19.3% were looking for the nearest bomb shelter. The depression about nuclear war possibility was positively and relatively strongly correlated with the level of "feeling concerned about the RUW-22" ($r_s = 0.401$), and it was moderately correlated with GAD-7 ($r_s = 0.377$) and PHQ-9 ($r_s = 0.274$) scores and weakly correlated with RUW-2-related news following frequency ($r_s = 0.196$). Within the limitations of the present study, nuclear anxiety was common among Czech university students. Its risk factors may include but are not limited to the female gender, common psychological disorders such as generalized anxiety and depression, RUW-22-related news following frequency, and level of "feeling concerned".

Knowledge, attitudes, and behaviors towards proper nutrition and lifestyles in ukrainian diabetic patients during the covid-19 pandemic

Paolo Castiglia¹, Oksana Urchysyn², Elena Castiglia³, Antonella Arghittu³, Marco Dettori⁴, Giovanna Deiana⁵, Andrea Cossu⁴, Gavina Pazzola³, Andrea Pischedda³, Paolo Castiglia⁴

¹University of Sassari Italy, ²Ternopil National Medical University Ukraine,

³Department of Medicine, Surgery and Pharmacy, University of Sassari Italy,

⁴Department of Medicine, Surgery and Pharmacy, University of Sassari -

University Hospital of Sassari Italy, ⁵University Hospital of Sassari

Background and Objective: A healthy lifestyle is the basis of diabetes prevention. The COVID-19 pandemic has led to major changes in daily life and social behavior that may affect glycemic control and diabetes self-management. The present work

aims to assess the relationship between diabetic patients' knowledge, attitudes, and behaviors towards proper nutrition and lifestyles in order to plan strategies for educational intervention from a health literacy perspective.

Methods: Diabetic patients registered at the clinic of endocrinologists and family doctors from Western Ukraine were interviewed through a cognitive survey. Because of the Russian-Ukraine conflict, the questionnaire was administered via google-form in the period September-December 2022. The questionnaire, already standardized during a previous survey conducted in an Italian context (<https://doi.org/10.3390/ijerph191811212> [1]), was consisted of 25 questions and 4 research areas (profile of participants, knowledge, attitude and behavior).

Results: Seventy-six questionnaires were filled during the survey period. Fifty-five percent of diabetic patients were female and 45% male with a mean age of 60.5 ± 14.2 years and 54.5 ± 15.8 years, respectively. The overall level of knowledge about the role of food and proper nutrition with respect to the risk of diabetes and its complications appeared to be generally unsatisfactory and inadequate. Despite a slightly better level of knowledge than the Italians a worse nutritional behavior was detected. Nonetheless, females generally showed a higher level of knowledge than males, whereas knowledge was seen to decrease according to the age of the patients. As for the possible impact played by the COVID-19 pandemic on lifestyles, it should be noted that about 46% of the respondents stated that they had difficult to maintain a healthy diet.

Conclusion: Thus, the study underlines the need to improve the knowledge of diabetic subjects about nutrition and, in particular, their self-management, positively influencing behaviors and attitudes. The experience of an italian local public health department in floods preparedness and response

Daniel Fiacchini¹, Simone Paradisi²

¹Local Public Health Department - Senigallia Asur Marche - AV2 Italy, ²Local ER Unit

Background: In Italy hydrogeological risk is one of the major environmental risks with significant impacts on human life and activities. The City of Senigallia (40.000 inhabitants) was recently hit by two floods (2014 and 2022). Before the last flood event, which occurred on 15 September 2022, the Local Public Health Department (LPHD), the Local Health District (LHD) and the Municipality of Senigallia worked jointly to improve the capacities for hydrogeological risk preparedness and response.

Methods: During the month of April 2022, a simulation exercise was carried out which allowed the confrontation between LPHD-LHD and the Municipality of Senigallia and made it possible to agree on objectives, procedures and activities aimed at managing a flood.

Results: According with the main outcomes of the simulation exercise LPHD-LHD agreed on an operating procedure to be activated in the event of a regional alert for hydrogeological risk and collaborated to have a list of non-ambulatory patients living on the ground floor, immediately available through appropriate home-care management software improvements.

In response to the 15 September 2022 flood, the Municipality of Senigallia promptly organized reception centres, alerted the population and secured the non-ambulatory patients living in risk areas 2 hours before the flood arrived. None of these actions has been implemented in neighboring cities.

Conclusion: In the flood of 15 September 2022, the territories of 7 municipalities were severely affected. The damage caused to the structures is enormous; 1 missing person and 12 victims were recorded, one of whom was resident in the municipality of Senigallia where no injuries and deaths were recorded among frail and non-ambulatory people. Given the increasingly frequent extreme weather events, preparation for hydrogeological events is pivotal and Local Health Authorities must be able to continuously improve floods preparedness and response involving all the municipalities in a systematic and timely way.

Public health governance and outcomes in ukrainian citizens moved in a part of the veneto region, Italy

Gloria Girolametto¹, Anna Voltolini², Luca Tribbia², Alessandra Corò³, Antonio Stano³, Emanuele Barbierato³, Francesco Calcaterra³, Cristina Velludo³, Lorenzo Bulegato³, Alessandra Zotto³, Mario Baruchello⁴, Vincenzo Baldo²

¹University of Padua - Italy Hygiene and Public Health school Italy,

²University of Padua - Italy, ³Aulss7 - Pedemontana, Veneto, ⁴Italian Red Cross - Bassano del grappa Italy

Background & Objective: As the Ukraine emergency broke out (24/02/2022), millions of Ukrainian moved worldwide, particularly in Europe leading healthcare authorities to implement different intervention plans. The Veneto Region (Italy), in its 7th Local Healthcare trust, released an identification-code for everyone arrived, offered screening for COVID-19 and Tuberculosis, vaccines prophylaxis and the possibility of medical visits / prescriptions for acute or chronic diseases. Together, the Italian Red Cross ran a refugees and migrant health point in Bassano del Grappa.

Methods: A database was created and analyzed from 01/03/2022 to 01/06/2022 through the Veneto Regional Registry and Q-lik-sense focusing on the registration date, identification-code released, age, gender, arrived-declared domicile, COVID-19 swabs and Tuberculosis tests results; COVID19, Diphtheria, Tetanus, Polio, Measles vaccinations coverage results. From medical visits' reports the diseases were grouped according to the International Classification of Primary Care and pharmaceutical flows were analysed too.

Results: 3964 people were registered and 1495 declared the arrived-domicile in our Municipalities. 68% were women, average aged 29.5 (± 18.4 years). 47.4% were minors, 31% 3-13 years old and 5% under-3 years old. 2.10% tested positive for COVID-19, none positive Quantiferon test despite 4 positive Mantoux. Of those eligible for COVID-19 vaccination: 13.92% get vaccinated abroad, 9.79% in Italy and 8.6% completed the primary cycle in Italy. At the Local Public Primary Healthcare Clinic 139 accesses were made and most frequently encountered diseases were respiratory, endocrine and cardiovascular systems. Communication's difficulties were reported in at least 22 visits. Most frequently prescribed medications were antihypertensive and antibiotics. Dates were qualitatively confirmed in Red Cross reality too.

Conclusions: Mainly female and young aged individuals arrived, their healthcare demand was limited but present. Despite the precarious conditions experienced during the migration route, the percentage of positivity to COVID-19 on arrival was limited. Fundamental is to raise awareness on vaccines prophylaxis.

War in eastern Europe: a humanitarian disaster

Barry Levy¹, Linda Gunter², Ira Helfand³

¹School of Medicine, Tufts University, Boston, United States, ²Organisation of the International Campaign to Abolish Nuclear Weapons, Maryland, United States, ³Physicians for Social Responsibility, Massachusetts, United States

War in Eastern Europe: A Humanitarian Disaster on February 19, 2022, Nobel Peace Prize winning International Physicians for the Prevention of Nuclear War (IPPNW) hosted a webinar entitled: "War in Eastern Europe – on the Brink of a Humanitarian Disaster." [1] It predicted, all too accurately, that conventional war in Ukraine would be devastating to civilians in addition to combatants, and that it threatens much worse if nuclear power plants are attacked or nuclear weapons are used. Five days later, the Russian Federation invaded Ukraine. The world has seen the crisis in Eastern Europe become a regional humanitarian disaster and that it still threatens to become global humanitarian catastrophe if war involving nuclear-armed nations erupts in Ukraine. In this workshop, IPPNW is updating its emergency briefing with the same distinguished panel of experts to examine the terrible human cost of the War in Ukraine so far, and the potential that exists for it to become much worse. Topics to be covered include: - Conventional war – The direct and indirect impacts of the ongoing conventional war in Ukraine continue to have devastating health, human rights, and environmental effects upon Ukrainian society and its landscape, with spillover effects in the surrounding countries and globally – including threats to global food security. - Damage to nuclear power reactors - The risk continues for large radioactive releases from the six Zaporizhzhia nuclear power reactors occupied by the military of the Russian Federation, or from reactors at the other three operating nuclear power stations in Ukraine that are vulnerable to deliberate or accidental destruction or meltdowns due to loss of power through either physical attacks or cyber-hacks. - Escalation to nuclear weapons use - The regional and global consequences would be catastrophic if nuclear weapons are launched intentionally or by accident or miscalculation. In addition to the immediate large-scale and indiscriminate carnage the use of a nuclear weapon or weapons would bring, the size, number, and conditions under which nuclear weapons might be used will determine whether there are environmental and climatic effects that could extend globally, reducing crop yields and harming or even devastating food security world-wide. IPPNW continues to support the petition it initiated through the group Avaaz with the Dalai Lama and 14 other fellow Nobel Peace Prize Laureates, signed by over a million people worldwide: "We Reject War and Nuclear Weapons" – Join the Global Call" [2]. It calls for an immediate ceasefire and the withdrawal of all Russian

military forces from Ukraine, and for Russia and NATO to explicitly renounce any use of nuclear weapons in this conflict. Links: —[1] <https://www.ipnw.org/no-war> [2] <https://secure.avaaz.org/campaign/en/nonuclearwarloc/>

Public health in emergencies, disasters, and wars: what is needed for regulatory preparedness?

Debra Yeskey¹, Elizabeth Sadove²

¹Coalition for Epidemic Preparedness Innovations (CEPI) United States, ²US Food and Drug Administration United States

Workshop Abstract

The COVID-19 pandemic illuminated the need for and challenges with making available the medical countermeasures (MCMs), that is the diagnostics, devices, therapies, and vaccines needed to respond to public health emergencies, disasters, and wars, available to the impacted populations in a timely manner. Healthcare and political leaders alike agree on the goals— immediate access to reliable diagnostics, sufficient supplies of personal protective equipment and other medical supplies, and rapid deployment of safe and effective vaccines and therapeutics.

Many public health emergency planners anticipated that for a public health event of the magnitude of COVID-19, that the regulatory agencies would be barriers to accessing the needed MCMs. COVID-19 demonstrated that wasn't necessarily the case. Now, as the COVID-19 pandemic continues its world-wide simmer, intentional and continued collaboration between public health and regulatory agencies is needed to identify the elements of regulatory emergency preparedness and response that are working and change the ones that are not. "For too long, we have allowed a cycle of panic and neglect when it comes to pandemics: we ramp up efforts when there is a serious threat, then quickly forget about them when the threat subsides. It is well past time to act." (Global Preparedness Monitoring Board, 2019). Building on the assessment of regulatory activities that did and did not work, now is the time for countries to assess and potentially change their legal authorities and regulations to ensure that they are working to expedite access to needed MCMs and are fit for all-hazard purposes.

This workshop will consider the importance of regulatory preparedness for making MCMs accessible from the perspectives of the regulators of MCMs, public health, medical, and non-profit communities.

Workshop components:

* Scene Setting- defining the issues regarding regulatory preparedness (5 mins)

* Lessons learned from COVID-19- a regulator's view- 2 regulators (5 mins each)

* Preparing for the next pandemic (20 mins)

* 100 Days

* Interface with public health and regulatory authorities

* Introduction of the GHSA Legal Preparedness Action Package (25 mins)

* Overview: Legal preparedness

* Regulatory Sub Working Group- workplan and deliverables

Key questions:

* How can public health preparedness include lessons learned by MCMs regulators?

* What actions can help to expedite access to MCMs in the next pandemic

* How can countries assess the gaps in their legal/regulatory frameworks for responding to the next pandemic?

Prevalence of violence against health care workers in the emergency department of a teaching hospital in Nigeria

Alphonsus Isara¹

¹Department of Community Health, University of Benin, Benin City, Nigeria

Background and Objective: Globally, violence targeted at health care workers (HCW) have reached an alarming level. The incidence of workplace violence is peculiar to both developing and developed countries with more workers at risk in developing countries especially in sub-Saharan Africa due to poorly developed work environment. According to World Health Organization, 8% to 38% of health workers suffer physical violence at some point in their careers. The Objective of this study was to determine the prevalence and forms of violence against HCWs in Emergency Department (ED) of University of Benin Teaching Hospital (UBTH), Benin City, Nigeria.

Methods: This was a cross-sectional study of all the 282 HCWs in the ED of UBTH. A standardized, pretested, interviewer-administered questionnaire was used for data collection. Data was analyzed using IBM SPSS version 25.0 software. Level of significance was set at $p < 0.05$.

Results: The mean age of the HCWs comprised of doctors 53 (18.8%), nurses 50 (17.7%), paramedics 36 (12.7%), porters 29 (10.3%), and laboratory scientist 19 (6.7%), among others, was 36.1 ± 8.4 years. The prevalence of physical violence was 63 (22.3%) while that of psychological violence was 247 (87.6%). The perpetrators were mainly patient relatives, 93.6% and 96.7% for physical and psychological violence respectively. The predominant forms of violence were verbal abuse (99.5%), kicking (96.8%), slapping (60.3%), bullying (45.3%), threat (40.4%), and sexual harassment (32.4%). Majority experienced post-traumatic stress disorder following the violence. Duration of service (> 5 years) was the only socio-demographic variable that showed statistically significant association with psychological violence ($p = 0.008$).

Conclusions: The study showed worrisome high prevalence of violence against HCWs in the ED of UBTH. There is an urgent need for intervention measures directed at patients, patient relatives, HCWs and the community, to be initiated to curb the menace of violence against HCWs.

Strengthening public health capacity in Africa - the case of advanced public health education and training in Cabo Verde

Isabel Araújo¹, Paulo Ferrinho², Elen Castanheira³, Inês Fronteira², Deisa Semedo⁴, António Delgado⁴, Mohsin Sidat⁵, Maria Mendonça⁶

¹Global Health and Tropical Medicine, Universidade Nova de Lisboa, Lisbon,

Portugal, ²Instituto de Higiene e Medicina Tropical, Universidade Nova de

Lisboa, Portugal, ³Faculdade de Medicina, Universidade Estadual Paulista

Júlio de Mesquita, Botucatu, São Paulo, Brasil, ⁴Universidade de Cabo Verde,

Cape Verde, ⁵Faculdade de Medicina, Universidade Eduardo Mondlane,

Maputo, Mozambique, ⁶Instituto Nacional de Saúde Pública, Cape Verde

Background: As recently as 2021, 32% of the WHO Africa region's 47 countries did not have postgraduate public health training. We describe the development of advanced public health training (APHT) in Cabo Verde (CV), emphasizing the unique aspects of the sustainability of this development. Methods: The presentation will be structured as a case study based on documentary analysis. Results: In 2022 public health competencies are still lacking and local training capacity is limited and the country remains without a functional national health workforce observatory. This situation is being corrected through the proposal by the Ministry of Health of plans for the development of human resources in health, through the strengthening of APHT and through partnerships, national and international. We review the development of advanced public health medical specialist training in (2011) analyze the failure to sustain it and trace the professional development of its graduates. We review the development of the first edition of the University of Cabo Verde (Uni-CV)-based public health master program (in 2010), analyze the failure to sustain it and review the professional development of its multi-professional graduates. We further describe the attempts to revitalize the master program, which already 2 new editions since 2019. We describe the development of the National Program to train field epidemiologists, coordinated by the National Public Health Institute, responsible for training of frontline epidemiologists, and the collaboration with the Uni-CV for advanced (master level) field epidemiologists. Conclusions: Sustainability of APHT in CV is achievable through institutional capacity building (at universities and national public health institute), the development of collaborative national consortia, including service providers and professional councils, establishment of strong international partnerships and adopting new information and communication technologies for distance learning.

Organisational policy to support oral health equity in Aotearoa New Zealand

Virginia Signal¹, Leeann Waaka², Justin Wall^{3,4}, Moira Smith¹, Bridget Robson¹, Kelly Richards⁵, Hatea Ruru^{6,7}

¹University of Otago, Wellington, New Zealand, ²Te Ao Mārama Aotearoa

Māori Dental Association, Ngāpuhi, New Zealand, ³Ngāti Toa, New Zealand,

⁴Wellington and Chair Māori Oral Health Providers Quality Improvement

Group, University of Otago, New Zealand, ⁵Māori Oral Health National

Coordination Service, New Zealand, ⁶Te Ao Mārama Aotearoa Māori Dental

Association, New Zealand, ⁷Te Aitanga-a-Māhaki, Ngāti Maniapoto, New

Zealand

Background and Objective: Severe, unacceptable and avoidable oral health inequities persist for Māori in Aotearoa New Zealand (NZ). Recognising and addressing equity should be core priorities of professional organisations, which in NZ, includes recognising Te Tiriti o Waitangi (Te Tiriti), the foundational treaty

between Māori and the Crown that ensures health equity for Māori. We aimed to understand oral health organisations' knowledge of, and commitment to, Te Tiriti and equity, and shift taken-for-granted practices, policies and systems generating and perpetuating inequities.

Methods: The spokespersons of nine organisations-professional networks, associations or organisations that support oral health professionals in fulfilling their role--were interviewed. Questions were sent in advance allowing participants to consider their responses, gather relevant documentation and obtain members' viewpoints. A Te Tiriti-based framework guided analysis. Each organisation was provided with strengths-based feedback on activities they were doing well and opportunities for improvement.

Results: Participant organisations represented a range of oral health professions, with members being either predominantly public-sector or predominantly private-sector. Knowledge and commitment to Te Tiriti and equity varied, but was greater among public-focused organisations. One organisation had a Tiriti responsiveness plan, otherwise there were few Māori health or equity plans, policies or position statements, or equity tools, used to guide and monitor activities. While some had Māori in leadership roles, there was little purposive co-governance and few activities supporting normalisation of Māori worldviews. All participants commented that the interview process was insightful and committed to future action.

Conclusions: Differences between public and private-facing organisations likely reflects equity being an expectation of public-facing work, and access to relevant training. Organisations that had Te Tiriti or equity policies or roles had progressed, demonstrating that purposeful policy enables action to promote health equity at group and individual levels. These findings have implications for all nations with indigenous populations.

Impacts of industrial actions, protests, strikes and lockouts by health and care workers during COVID-19 and other pandemic contexts: living systematic review

Isabel Craveiro¹, Pradeep Choudhury², Ana Oliveira³, Alessandra Pereira⁴, Inês Fronteira⁵, Raphael Chança⁴, Giorgio Cometto⁶, Mathieu Boniol⁶, Mario Poz⁷, Paulo Ferrinho⁸

¹Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa, Lisboa, Portugal, ²Zakir Husain Centre for Educational Studies, Jawaharlal Nehru University, Delhi, India, ³Instituto de Medicina Social, Universidade do Estado do Rio de Janeiro (UERJ), Rio de Janeiro, Brazil, ⁴Instituto Nacional de Câncer, Ministério da Saúde, Rio de Janeiro, Brazil, ⁵Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa (UNL), Lisboa, Portugal, ⁶Health Workforce Department, World Health Organization, Geneva, Switzerland, ⁷Instituto de Medicina Social, Universidade do Estado do Rio de Janeiro - UERJ, Rio de Janeiro, Brazil, ⁸Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa - UNL, Lisbon, Portugal

Background and Objective: Public health emergencies of international concern (PHEIC) like COVID-19 pandemic and others that have occurred since the early 2000s put enormous pressure on health and care systems and are a fertile ground for protests by health and care workers (HCWs). We aimed to (i) identify the impact of the COVID-19 pandemic and other PHEICs on the industrial actions, protests, strikes and lockouts (IAPSLs); (ii) analyze the demands of HCWs associated with these IAPSLs; (iii) identify and describe the relevant interventions to address these grievances.

Methods: Living systematic review of studies published between January 2000 and March 2022 in PubMed, Embase, Scopus, BVS/LILACS, WHO's COVID-19 Research Database, ILO, OECD, HSRM, and Google Scholar. Eligibility criteria were HCWs as participants, IAPSLs as phenomenon of interest occurring in the context of COVID-19 and other PHEICs. GRADE CERQual was used to assess risk of bias. **Results:** The searches retrieved 1656 records, of which 91 were selected for full-text screening. We included 18 publications for data extraction. A system-wide approach, rather than a limited approach to institutions on strike, will allow understanding the full impact of strikes on health and care services. PHEICs tend to aggravate already adverse working conditions (e.g., lack of PPE and financial issues), acting as drivers for HCWs strikes both in the North and Global South, particularly evident in Asia and Africa based on literature.

Conclusions: Evidence to assist policy-makers in defining strategies to respond adequately to the healthcare needs of the population during IASPLs is crucial. Adequate responses will minimize additional economic burden for the poorest families who cannot afford private health care when IAPSLs compromise access

to public health care. There is a lack of information on relevant interventions to resolve these IAPSLs, justifying periodic updates to capture emergent literature, helping to fill knowledge gaps.

Implementation of advanced practice nursing in primary health care in Brazil

Beatriz Toso¹, Vanessa Horewicz², Daria Bula³, Marcus Heumann³, Kerstin Hämel³, Rosa Rodrigues², Maria Rizzotto², Lígia Giovanella⁴, Elyne Engstrom⁴

¹Western of Paraná State University, Paraná, Brazil, ²Western of Paraná State University, Brazil, ³Bielefeld Universität, Germany, ⁴Oswaldo Cruz Foundation, Brazil

Background/Objective: The demographic and epidemiological transition challenges health care systems worldwide, also in Brazil. Consequently, primary health care (PHC) has to increasingly address complex patient demands. To reach this goal, several countries have encouraged the expansion of the nurses' roles in PHC, through Advanced Practice Nursing (APN). However, in Brazil – although discussions have already begun – the implementation and research initiatives on the subject are still scarce and in early stages. Since little is known about the obstacles and chances of the implementation of APN in PHC, this study investigates them from the perspective of nurses, physicians, and other stakeholders in Brazil.

Methods: We conducted 4 focus groups with healthcare professionals, representatives of health and professional entities, e.g. the federal council of nurses, state health secretariat, physician national federation, health national council, and representatives of physicians' and nurses' associations. Data was analyzed by means of thematic coding.

Results: The results show how nurses and physicians currently collaborate in primary care. Work overload resulting in nurses' reluctance to take over more advanced tasks, a deficit in training for interprofessional collaboration, lacking management support and possible non-acceptance of the population for the roles of APN are seen as the main barriers. Nevertheless, the implementation of APN in PHC may improve patients' access to care, strengthen the nursing profession and enhance organization as well as longitudinality in the regional healthcare networks. Professional nursing organizations were reported to be essential for the development of APN in PHC. Thus, the discussions should be expanded to the professional councils, to create legislation and guidelines to support nurses' role development.

Conclusions: The implementation of APN roles in PHC can be enabled by an ongoing dialogue between politics, professional representatives, and patients. The role of the APN should be clarified to strengthen its perception in the population.

Second victim phenomenon in Italian healthcare workers: IT-SVEST survey and latent profile analysis

Enrico Scarpis¹, Beatrice Favero¹, Yvonne Beorchia^{2,3}, Valentina Moretti¹, Federico Farneti⁴, Roberto Cocconci⁴, Rosanna Quattrin⁴, Luigi Castriotta⁵

¹Dipartimento di Area Medica, Università degli Studi di Udine, Italy, ²Azienda Sanitaria Universitaria Friuli Centrale, Italy, ³Istituto di Igiene ed Epidemiologia, Italy, ⁴Accreditamento, Qualità e Rischio Clinico, Azienda Sanitaria Universitaria Friuli Centrale, Italy, ⁵Istituto di Igiene ed Epidemiologia, Azienda Sanitaria Universitaria Friuli Centrale, Italy

Background and Objective: The second victim (SV) phenomenon concerns healthcare workers (HCWs) whose involvement in a medical error, as well as non-error patient safety events or near-miss events, has affected their well-being. Its prevalence ranges from 10% to 75%, and can predispose HCWs to burnout and depression, increasing the probability of committing errors. The primary aim of our study was to determine the prevalence of HCWs involved in an adverse patient safety event in Friuli Venezia Giulia Region (Italy). The secondary aims were to use latent profile analysis to identify profiles of SVs and factors influencing profile membership, and to evaluate the relationship between the severity of symptoms and desired support options.

Methods: A cross-sectional survey through the IT-SVEST tool was conducted in five Local Health Authorities, and all HCWs involved in direct patient care were invited. Descriptive statistics were conducted for all variables and correlations were evaluated with Kendalls tau-b test. Latent profile analysis was based on the scores of dimensions measuring SVs symptoms. Factors affecting profile membership were assessed through multinomial logistic regression.

Results: A total of 733 HCWs participated. Of them, 305 experienced at least one adverse event (41.6%). Among dimensions measuring SVs symptoms,

psychological distress had the highest percentage of agreement (30.2%). Three latent profiles were identified: mild (58.7%), moderate (24.3%), and severe (17.0%) symptoms. Compared to the mild symptom profile, the severe symptoms profile was positively associated with the agreement for extra-occupational support and negatively associated with the agreement for organizational support. The severity of symptoms was directly associated with the desire for support strategies. Conclusions: The prevalence of HCWs involved in adverse events is consistent with the literature. Three latent profiles have been identified according to SVs symptoms and the higher the severity of symptoms, the greater the reliance on extra-occupational support.

Public Health workforce development

Tahani Qadiri¹, Marília Paulo²

¹Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, ²Comprehensive Health Research Center (CHRC), NOVA Medical School (NMS), Faculdade de Ciências Médicas (FCM), Universidade NOVA de Lisboa, Lisboa, Portugal

Background: Health workforce and public health specialists are the cornerstones of any developed health system, as evidenced by the countries' management of the COVID-19 pandemic. The COVID-19 pandemic has highlighted the need for public health competences and urgency of health workforce innovation.

Methods: This is a review of healthcare systems, the educational structure of public health specialization, and the availability of public health cadres in six countries: the United States of America (USA), the United Kingdom (UK), Canada, Singapore, Saudi Arabia, and the United Arab Emirates (UAE) (Abu Dhabi). Information published by the World Health Organization (WHO), the World Bank, official data from ministries of health and the National Bureau of Statistics from each country, the European Public Health Association, international bodies concerned with public health, and studies conducted by universities was revised. Results: There are different experiences in the countries in establishing a special structure for public health, especially in the USA, the UK, and Saudi Arabia, and far less in Singapore and Canada, while it is noted that it is still in its early stages in the UAE. The review highlighted the need to changing concepts of preventable disease, provisions directed toward better mental health, growing emphasis on health education, the biostatistical, epidemiological approach, changes resulting from an aging population, concern regarding the quality of the environment and increasing interest of national governments.

Conclusions: All countries need to integrate the concept of public health into their programs and structure of the Ministry of Health, giving priority to the competence of public health for all workers in the health sector, and work in a long-term health strategy. This will enhance health systems preparedness.

Keywords: COVID-19 pandemic, health systems preparedness, human resources for health, public health workforce, United Arab Emirates

Individual and psychosocial study environment characteristics associated with exposure to sexual harassment at a large public university in Sweden

Jack Palmieri¹, Per-Olof Östergren¹, Markus Larsson¹, Anette Agardh¹

¹Lund University, Sweden

Background and Objective: Universities can be understood as work-like environments for students. Limited research has examined this study environment from a Demand-Control-Support perspective with regards to sexual harassment. Understanding this environment is key to designing preventative measures. This study therefore aimed to examine the association between individual and psychosocial study environment characteristics and exposure to sexual harassment among students at Lund University, Sweden. Methods: This cross-sectional study utilised survey data from an online survey conducted among university students (N=8960). Questions on background characteristics, exposure to sexual harassment while at university and psychosocial study environment as measured by a Demand-Control-Support-instrument were used. Descriptive analysis, bivariate, and multivariable logistic regressions were used to examine the association between individual and study environment characteristics and exposure to sexual harassment. Population Attributable Fractions (PAF) were calculated and synergy indexes (SI) used to examine the interaction between demands and control and potential buffering effects of support.

Results: High demands and low control were independently associated with higher odds of being exposed to sexual harassment among both females and males. When controlling for background characteristics, high study strain (combination

of high demands and low control) was associated with exposure to sexual harassment among both female and male respondents and accounted for a PAF of 14% and 15% of study environment sexual harassment for females and males, respectively. Low lecturer support was associated with higher odds for sexual harassment for females but not males. No evidence was found for a buffering effect of support on high strain and sexual harassment. Conclusions: Reducing high psychosocial strain in study environments could be an effective strategy for reducing sexual harassment in university settings. Improving support from lecturers could also modify this relationship, but more research is required to identify causal pathways for this results.

Understanding the impacts of COVID-19 on the mental health and intention to leave among the Canadian public health workforce

Emily Belita¹, Clemence Zogo², Sarah Neil-Sztramko¹, Sheila Boamah¹, Jason Cabaj³, Susan Jack¹, Cory Neudorf⁴, Gaynor Watson-Creed⁵, Maureen Dobbins¹, Vanessa Rubeis¹

¹McMaster University, Canada, ²University of Toronto, Canada, ³Alberta Health Services, Canada, ⁴University of Saskatchewan, Canada, ⁵Dalhousie University, Canada

Background and Objective: The public health workforce has been overwhelmed in meeting COVID-19 demands while attempting to deliver core public health programs at a reduced capacity. There is limited understanding of the pandemic's impact on the mental health of the public health workforce. This study will explore the extent of the pandemic's impact on the mental health of Canadian public health workers and their intention-to-leave the workforce.

Methods: In this cross-sectional study, participants are eligible to participate if they are public health professionals with advanced public health or discipline-specific education/training (e.g., nurses, epidemiologists) or other workers (e.g., family home visitors) and are employed in local public health units in Canada prior to March 2020 and for ≥8 months during the COVID-19 pandemic. Online communication channels (e.g., social media, email) of national and provincial public health organizations are being used to recruit participants. Data are being collected via an online survey on socio-demographic and workplace factors, burnout, anxiety, depression, and intention-to-leave. Descriptive statistics will be reported on the state of mental health and intention-to-leave. To determine who is at greatest risk, we will compare outcomes by socio-demographic (e.g., gender, ethnicity) and workplace factors (e.g., supervisor support) using regression analyses.

Results: Recruitment and data collection began mid-November 2022 and will be completed by January 2023. To date, 310 surveys have been completed, with the sample consisting of frontline public health/community providers (57%), program/project management staff (20%), senior management (5%), program assistants (5%), Chief Medical Officers of Health/Medical Officers of Health (1%), and other roles (12%). Final data analysis will be completed by February 2023.

Conclusions: Understanding the extent to which the mental health of the public health workforce has been impacted by the COVID-19 pandemic can inform strategic workforce planning, improve recruitment and retention efforts, and promote positive psychological health of workers.

Implementation of policy and management interventions to improve health and care workforce capacity to address the COVID-19 pandemic response: living systematic review

Ana Oliveira¹, Mariana Galante², Leila Maia², Isabel Craveiro³, Alessandra Pereira⁴, Inês Fronteira⁵, Raphael Chança⁴, Giorgio Cometto⁶, Mathieu Boniol⁶, Paulo Ferrinho⁵, Mario Poz¹

¹Instituto de Medicina Social, Universidade do Estado do Rio de Janeiro - UERJ, Rio de Janeiro, Brazil, ²Instituto de Medicina Social, Universidade do Estado do Rio de Janeiro (UERJ), Rio de Janeiro, Brazil, ³Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa (UNL), Lisboa, Portugal, ⁴Instituto Nacional de Câncer, Ministério da Saúde, Rio de Janeiro, Brazil, ⁵Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa - UNL, Lisboa, Portugal, ⁶Health Workforce Department, World Health Organization, Geneva, Switzerland

Background and Objective: The COVID-19 pandemic highlighted pre-existing weaknesses in health and care systems. Policymakers needed to adopt measures to face these challenges improving the surge capacity of the health and care workforce (HCW). This living systematic review (LSR) aimed to identify countries'

range of policies and management interventions implemented to improve HCW capacity to address the COVID-19 pandemic response.

Methods: LSR of studies, technical and political documents published in PubMed, Embase, Scopus, LILACS/BVS, WHO COVID-19 Research Database, ILO, OECD and the Health System Response Monitor from 2020 to March 2022. Data were collected and organized according to interim guidelines from WHO. For risk of bias the JBI Critical Appraisal Tools were used, and GRADE to assess the certainty of the evidence on the outcomes identified.

Results: A total of 69 documents were included, but only 14 publications offered outcomes for policy and management interventions implemented by countries. 66.7% of the documents described at least one intervention to increase the flexibility and capacity of the HCW. Most interventions were to attract and retain HCW in a safe and decent working environment (58% of the documents described at least one intervention). Interventions related to licensing and regulation were implemented to increase the HCW pool, such as making training received abroad more easily recognized and to regulation of practice within the respective countries.

Conclusions: Many of the systemwide health workforce enablers were viewed as intervention facilitators, and little was explored on how they were (re)structured and adapted to allow for the agility of implementation. The SR identified a lack of studies, particularly in the areas of social protection service provision, planning and evaluation, and human resources information systems, and no information was found regarding the role of community health workers and other community-based providers. The impact and effectiveness of strategies require further research.

Public health roles and responsibilities 2022-2030: a job task analysis

Allison Foster¹, Laura King², Allison Foster¹

¹National Board of Public Health Examiners, Washington, United States,

²Council on Education for Public Health, Silver Spring, United States

The public health workforce is ever evolving. As the work of the public health workforce changes, so must the skills, abilities and knowledge needed to address current challenges facing our nation's health. How can we measure the changes that have taken place and even more importantly, how can we anticipate what the workforce should look like to meet future challenges? The National Board of public health examiners conducts a Job Task Analysis at least once a decade. A Job Task Analysis is a highly-structured survey process that determines the most common tasks being performed by members of a professional field. Sequential job task analysis allow for a profession to measure changes in workforce responsibilities over time. The NBPHE has conducted two recent job task analysis, one in 2016 and another in 2022. The NBPHE is proposing a session to provide an overview of the roles and responsibilities currently performed by public health professionals. The 2022 results will be compared to the 2016 study, allowing participants to discern changes over the past decade. The 2022 JTA survey yielded responses from over 5,000 public health professionals. To increase the regional scope of responses, the 2022 JTA survey was made available in six languages (English, Mandarin, Hindi, French, Spanish and Arabic). This is the first-of-its-kind study using the JTA Methodology to at the global public health workforce at this level of detail. A special emphasis of the presentation will be made on the impact of COVID-19 and how the pandemic impacted the work of the public health profession. The audience will be invited to provide input into whether these changes to the roles and responsibilities are temporary or if they have permanently changed the nature of public health as a profession.

Interprofessional collaborations to improve the implementation of prenatal oral health care in primary health care

Kellen Gasque¹, Diana Diaz²

¹Regional Board of Brasília, Oswaldo Cruz Foundation, Brasília, Brazil,

²Oswaldo Cruz Foundation, Regional Board of Brasília, Gleba, Brazil

The interdisciplinarity of prenatal oral health care represents a strategy for an integral during pregnancy, valuing the interprofessional context and the collective view of health, in accordance to the guidelines of the Brazilian Unified Health System. The objective of this study was, through an integrative review, to map and analyze the scientific literature on the occurrence of interprofessional collaborations for the feasibility of prenatal oral health care in Primary Health Care. As a method, a systematic search of primary articles was carried out in the databases: BVS, BVS Dentistry, Scielo, Pubmed, Scopus, Periódicos Capes, Web

of Science and MEDLINE Complete (EBSCO)³ using the Decs/Mesh related to "Attention Primary Health", "pregnant women" and "prenatal dental care", without time restriction. The eligibility criteria of the studies were the Brazilian scientific productions referred to dental care in prenatal care, which included primary health care professionals and / or pregnant women who attended prenatal care in the primary health care. As a results, 20 articles were included, systematized into three categories, showing barriers, potentialities, and recommendations for the feasibility of the prenatal oral health care in primary health care. In conclusion, interdisciplinary collaborative dialogues were perceived as deficient /absent among prenatal professionals, managers and pregnant women. This gap makes it difficult to exchange knowledge, strengthen bonds, deconstruct fears, reducing the adherence to the prenatal oral health care by pregnant women. Strategies to implement this interprofessional collaborative work are necessary, such as: well-articulated communication and guiding flows between professionals, shared agendas for the care of pregnant women, spaces for interdisciplinary health education and permanent education in the team.

Widespread racism in the UK's health and social care sector is a significant threat to public health

Sadiq Bhanbhro¹, Anandi Ramamurthy², Faye Bruce³, Ken Fero⁴

¹Sheffield Hallam University, Sheffield, United Kingdom, ²Sheffield Hallam

University, United Kingdom, ³Manchester Metropolitan University, United

Kingdom, ⁴Coventry University, United Kingdom

The recent Lancet's Global Review says, "racism is a "profound" and "insidious" driver of health inequalities worldwide and poses a public health threat to millions of people". The review confirms the findings of our study, where hundreds of ethnic minority participants working in frontline health and social care roles shared shocking stories of racism at work. Racism impacts ethnic minorities and migrant staff working in NHS at all levels. We aimed to explore and understand the stories and experiences of healthcare staff from ethnic minority background during the pandemic and previously in their working lives. We conducted a questionnaire survey and qualitative interviews with nurses, midwives and other healthcare staff. Three hundred-eight respondents completed an online survey, and 45 people participated in the narrative interviews. Our findings report that racism is prevalent in the health and social care sector and is usually unreported. In the case of reporting to authorities, 77.3% of respondents who complained about racism said they were not treated fairly. Incidents of racism were not individual and isolated; it was a culture that permeated daily practice. Our survey findings revealed 59% of the survey respondents had experienced racism during their working lives, making it difficult to do their job; thus, 36% had left a job. Most participants reported that racial discrimination had impacted their physical and mental health and their patients' care. Our research underscores that the endemic culture of racism is a pertinent threat to public health in the UK; thus, it must be recognised and called out. There is a need to raise awareness and undertake interventions that recognise and address racial discrimination and stigma, institutional racism and structural racism as distinct driving forces of inequalities and inequity in the social determinants of health.

DOI: 10.18332/popmed/165684

In the eye of the storm: Hospital leaders' resilience during the COVID-19 pandemic

Nina Füreder¹, Nina Füreder¹, Charlotte Förster²

¹Sustainable Transformation Management Lab, Johannes Kepler University,

Austria, ²Faculty of Economics and Business Administration, Technical

University Chemnitz, Germany

Background and Objective: Hospitals make a significant contribution to public health and are part of the critical infrastructure. Unfortunately, hospitals are facing tremendous challenges such as general pressures of cost reduction, the need for high-quality care, and effective management of human resources. Amplified by the COVID-19 pandemic it is obvious that hospitals and especially their leaders must be more resilient than ever to cope with this stressful work climate. Recognizing the crucial role of the leader in overcoming organizational crises, few studies focus on how leaders cope with work-related stress during crisis. This study provides deeper knowledge of leaders' behavior and strategies for dealing with stress. We point to the importance of leaders' coping mechanisms when it comes to organizational resilience, whereby we consider resilience from the perspective of the conservation of resources theory, since two different types of resilience (acceptance and strategic resilience) arise from this theory. Methods: Qualitative interviews were made with leaders from different university hospitals in Austria

within different professions and leadership levels (n=44) and analyzed in a hybrid process of deductive and inductive coding.

Results: Mainly, we followed the call of Baradoel and Drago (2021) for qualitative studies to provide empirical data in terms of the two different types of resilience and their associated resources. Therefore, we show first our empirical data on acceptance resilience to then move to strategic resilience data and at least showing the interplay and possible triggers for switching between them. Conclusions: Our work shows how hospital leaders cope with the challenges resulting from the COVID-19 pandemic over time and point out how different coping mechanisms and their associated resources were used. At least we discuss the crises driven nature of hospitals and how the important dimension of temporality influence leaders and consequently influence organizational resilience.

Physician profiles according to determinants of scope of practice in Brazil

Ana Stralen¹, Cristiana Carvalho¹, Sábado Girardi¹, Ilka Reis¹, Samuel Silva¹, Mariangela Cherchiglia¹

¹Federal University of Minas Gerais, Brazil

The scope of practice of physicians impacts directly the quality of health services provided, and the cost associated with health. Proposals to enhance physicians' scope of practice have been encouraged, seeking to innovate the use of the health workforce and meet the populations needs in the most efficient and effective way. The study aimed to outline the profile of physicians in Brazil, considering the main determinants of their scope of practice. This is a cross-sectional, exploratory study conducted between December 2017 and June 2018. Data collection was carried out through an online survey with 1.418 physicians. The physicians were classified according to their main specialty. The number of procedures performed (n=32) was considered as a proxy for an expanded scope of practice. Determining variables of scope of practice were grouped into personal factors, training, and practice location practice. We used the method Grade of Membership (GoM) for generating the profiles according to the determinants of scope of practice. The results showed that the scope of practice can be described through four physician profiles. The profiles that were more likely to have a broader scope of practice showed important similarities, such as working in primary health care specialties, in basic health units, and in areas described as rural and unsafe urban areas with physician shortages. Among the three determinants analyzed (location, personal, and training factors), the location of practice was more likely to be associated with a broader scope of practice. The others showed that, in isolation, they do not necessarily impact the physicians' scope of practice. The continuous study of the physicians' scope of practice is important to help understand the main factors that affect them. This can allow health policy planners to develop strategies aimed to optimize physicians practice and improve population access to health.

DOI: 10.18332/popmed/165728

Is 'muddling through' the way forward for NCD program management in Nepal?

Selvanaayagam Shanmuganathan¹, Uday Yadav², Suresh Mehata³, Andrew Wilson⁴

¹Ministry of Health, Malaysia & Menzies Centre for Health Policy and Economics, The University of Sydney, Malaysia, ²National Centre for Aboriginal and Torres Strait Islander Wellbeing Research, Australian National University, ³Ministry of Health and Population, Nepal, ⁴Menzies Centre for Health Policy and Economics, The University of Sydney, Australia Chronic disease is well recognized as a significant health challenge in developed and many emerging economies. A key element in health system change is the role of leadership, management and organizational culture. The study aims to examine how leadership characteristics interact with management and influence the implementation of chronic disease management programs in Nepal.

An interview was done with 12 key informants from various district health offices in Province 1 of Nepal. The participants were district health officers and senior managers in charge of chronic disease management programs. The semi-structured interviews were transcribed into Nepali and then translated into English. Leaders at the district level are constantly challenged in addressing the lack of human, material and technical resources in implementing chronic disease programs. This shortage impacts the decision-making and handling of social and professional workplace relationships by the leaders. Leaders from the district described the necessity of building strategic alliances with stakeholders from across the public sector and non-governmental organizations. These alliances were crucial to resource mobilization, garnering material support, expanding

healthcare access and community outreach, and compensating for capacity constraints within the districts to address the issues in the implementation of NCD programs at the district level. Participants framed their leadership as a moral drive to change and some leadership styles used are democratic leadership, servant leadership, and collaborative leadership, which is leveraged flexibly depending on the demands of the moment or the task at hand.

The study provided a critical, preliminary understanding of leadership and challenges in healthcare. We found that there is a demand for healthcare leadership development, which will undoubtedly improve the health systems managerial, administrative and teamwork capacities at a micro-level in strengthening healthcare and improving health outcomes.

Popul. Med. 2023;5(Supplement):A1732

Leadership styles, which one fits better? A bibliometric analysis

Tommaso Osti¹, Angelica Valz Gris², Tommaso Osti³, Francesco Causio¹, Maria Gualano⁴, Carlo Favaretti⁵, Walter Ricciardi¹, Damiani Gianfranco¹

¹University Department of Life Sciences and Public Health, Section of Hygiene, Università Cattolica del Sacro Cuore, 00168 Rome, Italy, ²University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ³Università Cattolica del Sacro Cuore, Italy, ⁴UniCamillus-Saint Camillus International University of Health Sciences 00131 Rome, Italy, ⁵Leadership in Medicine Research Center, Università Cattolica del Sacro Cuore, 00168 Rome, Italy

Background and Objective: Leadership in healthcare is associated with several indicators related to health care performance both at local and supranational levels. A wide debate has been developed about which leadership model best fits the needs of different contexts. The aim of our study is to analyze the scientific output relating to three models of leadership (transactional, transformational and complexity leadership), to understand to what extent they have met the interest of the scientific community.

Methods: We conducted a bibliometric analysis of the 100 most influential articles for each of the three leadership styles. We searched Scopus database using three different research strings including keywords like "Leadership OR leadership style" and, respectively, "transformational", "transactional" and "complexity". Articles were sorted according to the number of citations, median citation values of each string were calculated and Kruskal-Wallis (KW) test was used to verify that the distribution of the number of citations were significantly different. Research was then extent to the total number of results for each string, relative frequency of citations was calculated for each query.

Results: The median number of citations for each 100 articles was respectively 24 for transactional leadership, 80 for transformational leadership, 207.5 for complexity leadership (KW p < 0,001). Relative frequency of citations was 4.8% [95%CI 4.75 – 4.98] for transactional leadership, 16.6% [95%CI 16.48 – 16.86] for transformational leadership, 78.5% [95%CI 78.28 – 78.70] for complexity leadership.

Conclusion: Our research shows that the type of leadership that seems to best interpret the interest of academia is complexity leadership in place of traditional models linked to reward mechanisms or pure motivational incentive. This follows up with the notion that complex systems cannot be reduced to simplistic models of a one-size-fits-all cause-and-effect nature but require more complex analyses therefore more ductile and articulate leadership models.

Determinant factors of choosing public health as a medical residency in Portugal

Rafael Vasconcelos¹, João Dionísio², Daniel Resendes³

¹ACES Oeste Norte, Portugal, ²ACES Baixo Mondego, ³ACES Lisboa Central, Portugal

Background and Objective: The Public Health (PH) workforce in Portugal is in a state of decline, with a large number of medical specialists entering the age of retirement before 2025. Despite government efforts to increase the number of vacancies available for medical residents, some are still vacant. Our study attempts to identify the factors that contribute to the choice of PH as a medical residency in Portugal.

Methods: From publicly available data regarding the Portuguese medical residency application and selection process from 2016 to 2022, we analyzed the differences between new residents in PH (n=275) and other medical specialties (n=11.483) regarding gender, number of application attempts, medical school, and percentile rank of grades in medical school and in the national access exam.

Results: A significant association between male gender and choosing PH was

found with an Odds Ratio (OR) of 1,6 (95% CI: 1,3 - 2,1). Among the eight included medical schools, only one was associated with a higher choice of PH by medical residents (OR=2,0; 95% CI: 1,3 - 3,1). Choosing PH was also associated with a higher average number of application attempts (PH: 1,19 vs. other medical specialties: 1,14, $p<0,01$), lower grades in medical school (PH: 33,1% vs. other medical specialties: 54,6%, $p<0,01$) and in the national access exam (PH: 32,3% vs. other medical specialties: 61,2%, $p<0,01$).

Conclusion: To maintain the sustainability of the PH workforce in Portugal, efforts should be made to understand these factors. Decision makers should reflect if the current curricula in Portuguese medical schools are adequate in raising interest in PH and if the application and selection process is suitable in selecting PH medical residents.

DOI: 10.18332/popmed/163782

The Portuguese national health accreditation program - does it fit a public health unit reality?

Gustavo Paiva Monteiro¹

¹USP Entre Douro e Vouga I, Portugal

Background and Objective: The Portuguese National Health Accreditation Program (NHAP), based on the Quality Model of the Andalusia Agency, has adequate characteristics, answers to the main needs of the Portuguese health system and it's suitable for most of the healthcare institutions in Portugal.

The main goals are to verify if the NHAP is applied in the context of Public Health Local Units and if it has specific criteria directed to these institutions.

Methods: It was conducted an audit of the Public Health Local Unit Entre Douro e Vouga I, with the format of the ISO 19011 guideline. It was based on the 41 required elements of group I of the accreditation model for healthcare institutions, determined by the NHAP.

Results: It was found that is not fully applicable in the context of a Public Health Local Unit since there are no specific requirements or criteria aimed at the function of these institutions, which have quite different particularities, such as the lack of clinical activity or the fact that they don't have results that are easily measured. 7 of the 41 requirements were evaluated as non-applicable to the context of Public Health, since they were connected to functions and responsibilities out of the Public Health Unit context. Furthermore, the requirements of NHAP model, appears to be addressed to the user of the institution as a singular form, and not to the population as a whole, which makes the process of certifying Public Health Local Units very difficult, since these, with some exceptions, intervene in the community and not in a patient itself.

Conclusion: It's urgent to develop a specific manual for the reality of Portuguese Public Health, with the creation of a consultancy and guidance organization for the certification processes of these institutions.

Variability of patient safety culture among nursing home staff: a cross-sectional cohort study

Ilaria Tocco Tussardi¹, Lucia Cazzoletti², Maria Zanolin², Donatella Visentin³, Annarita Comini¹, Emanuele Torri⁴, Stefano Tardivo¹, Francesca Moretti⁵

¹Department of Diagnostics and Public Health, Section of Hygiene, University of Verona, Italy, ²Department of Diagnostics and Public Health, Section of Epidemiology and Medical Statistics, University of Verona, Italy, ³Agency for Health Services of the Autonomous Province of Trento, Unit of Hygiene and Public Health, Trento, Italy, ⁴Agency for Health Services of the Autonomous Province of Trento, Department of Health and Social Policies, Trento, Italy, ⁵Department of Neurosciences, Biomedicine and Movement, University of Verona, Italy

Background and Objective: Residents of nursing homes (NHs) are a highly vulnerable group and at risk of adverse events. Knowledge of patient safety culture (PSC) is essential to ensure patient safety and guide effective improvements. However, research on the variability of PSC in NHs is still scarce. This study explored whether and how PSC differed among NH staff (managers, nurses, direct care, support and administrative staff) in the Autonomous Province of Trento (Northeastern Italy).

Methods: The Nursing Home Survey on Patient Safety Culture (NHSPSC) was administered to the staff of 25 NHs (2368 beds) in June 2019. Linear mixed models were used for the score analyses of the 12 NHSPSC domains, with each domain score as response variable and staff type as the fixed effect of interest. Results: Overall, 1224 employees participated in the survey (mean facility response rate: 59%, range 31-90%). The majority (61.7%) of respondents were direct care staff. The mean aggregate NHSPSC score for all staff type was 3.54/5.00 (\pm SD

0.58) (64.5 \pm 14.6% using a 0-100 scale). There was a statistically significant difference in 9/12 domain scores between staff categories. We detected that: managers and administrative staff had higher scores than other staff types in 9/12 domains; support staff had the lowest scores in almost all domains (10/12); the domain with the highest score was 'Handoffs and Transitions' for managers and administrative staff (mean 82.5 \pm 17.1%) and 'Feedback and Communication about Incidents' for nurses, direct care and support staff (mean 76.2 \pm 20.1%); and the domain with the lowest score was 'Staffing' for all staff categories (mean 49.6 \pm 18.3%). In 10/12 domains and overall NHSPSC scores, a statistically significant reduction was evident for the support staff category compared to the others.

Conclusions: There are differences in PSC between different professions in NHs, which need to be addressed to build a positive PSC.

Midwives struggle for recognition: a constructivist grounded theory study

Bielka Carvajal¹, Helen White¹, Jane Brooks¹, Ann Thomson¹, Alison Cooke¹

¹The University of Manchester United Kingdom

Background: Midwives are a cornerstone in women's reproductive care and vital to achieving sustainable maternal and neonatal development goals. After the enactment of a bill that allows abortion under three clauses, midwives have managed to expand their scope of practice to include induced abortion care. In this new scenario, this study aims to elucidate how Chilean midwives understand and provide abortion care and how they have (re)defined their professional identity to include abortion care.

Methods: The study followed a constructivist grounded theory methodology using in-depth online semi-structured interviews. Midwives were purposively and theoretically sampled until data saturation was reached. Fifteen Chilean midwives working in various settings and with various years of working experience were interviewed. Interviews were recorded, transcribed verbatim in Spanish and translated into English. Interviews were read and reread by the research team and coded incident-by-incident using NVivo. The team discussed the categories' properties and relations to each other. A model using constructivist grounded analysis and Honneth's recognition theory was generated to explain Chilean midwives' understanding of their professional identity and experience providing abortion care.

Findings: The preliminary analysis of this study shows that 1)Chilean midwives understand abortion care provision as part of midwifery care. However, midwives are also aware of the contradictions of their practice. 2)Chilean midwives agree that midwifery's scope of practice has moved from pregnancy and childbirth only to providing sexual and reproductive health care in broader terms. 3)Midwives' autonomy is restrained by the healthcare systems current structure and laws regulating healthcare. Chilean healthcare provision continues to favour medics over non-medical professionals, creating tensions that fuel midwives' struggle for recognition and their ability to provide optimum care.

Conclusion: Examining midwives' experiences as a call for recognition could help to reduce midwives' dissatisfaction and secure better future access to sexual and reproductive healthcare in Chile.

Definition of the staffing standard of the family or community nurse

Domenico Mantoan¹, Maddalena Iodice¹, Marica Scotellaro¹, Lorena Martini¹, Alice Borghini¹

¹National Agency for Regional Health Services Via Piemonte 60, 00187 Rome Italy

Background and Objective: The Family or Community Nurse (FCN) is the health professional that ensures nursing assistance in primary care and serves as point of reference for the population. The FCN was recently introduced in the Italian National Health Service. The objective of the present study is to define FCN staffing standards for the territorial healthcare facilities, estimating the minimum number of FCNs that will be involved in Community Health Houses (CHH), Community Hospitals (CH) and Territorial Coordination Centers (TCC) in order to assure the quality of healthcare services.

Methods: To define the minimum standard of nursing staff necessary to assure the quality of healthcare services in primary care facilities throughout the Country the following parameters have been considered: services offered, operating hours and catchment area.

Results: The reference standard, according to reform, is 1 FCN every 3,000

inhabitants within the primary care facilities. The FCNs will be distributed as follow: for each CHH (1350 financed by National Recovery and Resilience Plan – NRRP) 7-11 FCNs are planned, ranges 9,450-14,850; for each TCC (600 financed by NRRP) 4-6 FCNs are planned, ranges 2,400-3,600; for each CH (400 financed by NRRP) 7-9 FCNs are planned, ranges 2,800-3,600. The total amount of FCN will range from 14,650 to 22,050.

Conclusion: The number of FCNs, that will be involved in the new territorial facilities, constitutes the standard of nursing staff that each region of the Italian territory will adopt to implement the new primary care reform and assure the quality of care services. Considering the additional number of nurses needed in the near future, our result will help the policymaker to program the training offer.

Integration of oral health with primary health care, an interprofessional collaborative approach in udupi district, South India

Ramprasad Vasthare¹, Dr. Udupa²

¹Manipal College Of Dental Sciences, Manipal, Manipal Academy Of Higher Education Manipal College Of Dental Sciences, Manipal Department Of Public Health Dentistry, Manipal College Of Dental Sciences, Manipal, Manipal Academy Of Higher Education, Manipal, Udupi District, Karnataka, India PIN – 576104 India, ²District Health Office, Udupi

Background and Objective: Udupi district in Karnataka State, South India is a progressive district with a relatively high literacy rate and socioeconomic status as compared to the other districts in the country. Udupi district has a population of 1.3 million, 60 Primary Health centres, 6 Community Health Centres and 247 Health and Wellness Centres - Sub Centres.

There were no oral health screening and treatment services available at any of the Primary Health Centres run by the Government and personnel recruitment had not happened. With this background, an oral health service support was thought would be very helpful and add value.

Objective: The Objective of this study was to find the means and methods to achieve integration of oral health with Primary Health Care.

Methods: An Interprofessional team comprising of faculty of Community Medicine, Physicians, Nursing staff and Dental Screening and Treatment Teams were constituted in alliance with the District Surveillance and District Health and Family Welfare Office. Focus groups were created covering the entire District of Udupi. Weekly screening and referred treatment of vulnerable populations at identified Community Health Centres Dental treatment for identified Fishing community and Industrial workers groups. Incremental Dental and Comprehensive Dental Treatment for school students. Providing monthly screening and treatment facilities by adopting the Wellness centres. Installation of Dental Chairs at identified Primary Health Centres and making Dental Treatment accessible.

The following core areas were given due importance : Risk assessment, Oral health evaluation, Preventive intervention, Education and communication, Interprofessional Collaborative Practice.

Results: The First year results are very encouraging paving the way for enhanced integration and greater participation by the local residents of Udupi district.

Conclusion: Interprofessional Collaborative practice greatly supports the integration of oral health with primary health care.

Distribution and availability of medical doctors in the state of Rio de Janeiro, Brazil: The need for medical workforce regulation

Thaianne de Souza Gonçalves¹, Paulo Almeida Rodrigues¹, Rodrigo Alves Torres Oliveira², Rodrigo Dias Lages³, Marcela de Souza Caldas³, Alice Medeiros Lima², Paulo Xavier de Mendonça⁴, Mônica Testa Morangueira⁴, Ana Matheus Peres⁵, Lucas da Silva Cabral³

¹IMS/UERJ Brazil, ²COSEMS/RJ, ³COSEMS/RJ Brazil, ⁴UFRJ Brazil, ⁵UNIFASE and COSEMS/RJ Brazil

Background and Objective: Medical doctors (md) shortage is one of the most important difficulties for ensuring access to quality health care. In Brazil, the public health system faces major challenges in retaining medical professionals, notably in specialties associated with diseases that cause more hospitalizations and deaths. The competition presented by the private health sector is one of the main factors for this. The objective of this study is to describe the distribution and availability of mds and their specialties in the state of Rio de Janeiro (srj), Brazil. Methods: Open data, from 2020, provided by the Brazilian government was used to calculate the ratio of number of doctors, doctors in public system and in strategic specialties, by inhabitants of municipalities and health regions in the srj. Also,

linear regression charts were created associating these data with the following related variables: population size, gross domestic product per capita, population coverage of private health insurance and availability of hospital beds.

Results: The distribution of mds showed great inequality. The number of professionals in many specialties proved insufficient. There are blanks of mds across the state, notably in specialties related to oncological treatment. The variable that showed highest positive linear correlation with the ratio of mds was coverage of private health insurance. Mds in Brazil use to work both in the public as well as the private sectors, the correlation suggests strong influence of the private market.

Conclusion: Improvement of universal health services depends on overcoming shortage of mds. The lack of specialists generates long queues and displacements of populations in search of services. The presence of the private sector seems to be the greatest factor to explain the availability of physicians. State regulation of medical workforce, formation of specialists, and policy incentives for professional allocation seems to be important to overcome shortcomings.

Continuity of care service for the benefit of difficult discharges

Michele Capraro¹, Veronica Ciorba², Michele Lagiola¹

¹IRCCS Istituto Clinico Humanitas Italy, ²IRCCS Istituto Clinico Humanitas

Background and objective: Difficult discharges are defined as those characterized by situations of permanent or temporary disability, resulting from an acute event, which requires economic, human, and organizational resources, which go beyond the potential of the patient and his social network, requiring the involvement of integrated home care services, long-term hospital stays, nursing homes, and hospices. The need for these services is often unpredictable and the timing of access is lagged. That increases the duration of hospitalizations and reduces the optimization of beds and professionalism of acute hospitals. During the pandemic, one cause of difficult discharge was the lack of territorial availability to welcome fragile COVID+ patients, as well as the difficulty of implementing physical isolation at home in clinically stable patients.

Methods: In 2000, continuity of care service (SECC) was set up in our hospital, managed by 7 social workers, who can be activated directly by CCE by the case manager following a difficult discharge forecast. Following activation, the SECC interfaces with the patient to assess the health and social needs and, if necessary, with the territorial network of the most appropriate services, optimizing the reception times of the request.

Results: In the last two years of activity, 5555 patients have been reported and managed. Of these, integrated home care was activated for 30.7%, 19.3% were sent to rehabilitation, 18.5% were managed at home, 10.7% in RSA, 6% in hospice, 4.3% were sent to the spoke network, 1.3% in subacute cases, 8.2% of requests not handled due to death, 1.1% of covid patients were hosted in our guesthouse.

Conclusion: A better hospital-community integration, also thanks to ad hoc trained personnel to manage their interactions, including communication, can be helpful in reducing the managerial impact of difficult discharges and ensuring the appropriate use of hospital resources for acute care.

Exclusive versus expanded, and shared scopes of practice of medical specialties in Brazil

Sabado Girardi¹, Lucas Der Maas¹, Joana Cella², Ana de Sousa van Stralen¹, Jackson Araujo¹, Cristiana Carvalho³, Valeria Penzin Goulart², Leda de Oliveira²

¹Federal University of Minas Gerais Brazil, ²Oswaldo Cruz Foundation Brazil,

³Pontifical Catholic University of Minas Gerais Brazil

The extension of common acts and competencies shared among medical specialties can be considered a strategy to improve access to specialized care in health systems. However, initiatives in this direction run into continuous disputes over exclusive and private practices. The present study investigates the exclusive versus expanded practice around medical specialties among physicians in Brazil. It was a cross-sectional study based on data collected from official Brazilian State and medical entities records (2015 and 2021). Were carried out: (i) identification of the prevalence of physicians with expanded activities in the scope of more than one specialty and, on the contrary, exclusive to a single specialty; (ii) analysis of differences according to individual attributes and relative to the professional practice locations; and (iii) binomial logistic regression for analysis of factors associated with extended versus exclusive practice.

About 36% of Brazilian doctors had an expanded practice around medical specialties in 2021 - a small reduction compared to 37.9% in 2015. The

professionals with the greatest tendency towards expanded scopes are those who work in surgical, cardiology, and oncology specialties, associated with working in a small, remote municipality with a shortage of doctors, where professionals tend to travel to provide care, but also in environments with greater clinical diversity, such as hospitals. Exclusivity occurs more frequently in Ophthalmology, Psychiatry, Otorhinolaryngology, Dermatology, and others, and is associated with having a corresponding specialist title, being female, working in a private establishment, and working in large urban centers.

The results point to a significant extension of physicians' scope of practice between medical specialties in Brazil, despite the resistance of the model characterized by private and exclusive acts. Therefore, possibilities of migrating to a model characterized by shared acts are identified, particularly focused on competency-based training, following the trend that is currently observed in several countries.

The reflection of the covid-10 pandemic on physicians' work practices in Brazil

Jackson Araujo¹, Samuel Gomes da Silva¹, Lucas Der Maas¹, Ana de Sousa van Stralen¹, Joana Cella¹, Ana Maciel Chagas¹, Cristiana Carvalho², Valeria Penzin Goulart³, Leda de Oliveira³, Sabado Girardi¹

¹Federal University of Minas Gerais Brazil, ²Pontifical Catholic University of Minas Gerais Brazil, ³Oswaldo Cruz Foundation Brazil

Background and Objective: COVID-19 was characterized as a pandemic by the world health organization in march 2020 and since then it has directly impacted the work practices of health professionals. The present study aimed to investigate aspects related to the impact of the pandemic on the employment relationship and professional practices of physicians in Brazil.

Methods: We carried out a descriptive exploratory cross-sectional study through an online survey with 2.541 physicians in Brazil between october 2020 and january 2021. Respondents were classified according to their primary specialties.

Results: For clinical, surgical, and diagnostic/therapeutic specialists, the biggest changes of the pandemic were the suspension of elective procedures and the decrease in office activity. About 20% of primary care and diagnostic/therapeutic physicians stated they had started to perform activities that were usually performed by other specialties. 35% of surgical specialists began to perform fewer types of procedures. For 63% of primary care physicians, there was no impact on their income during the pandemic. As for the surgical specialties, there was a reduction in income for almost 80% of the respondents. More than half of the physicians started to value more stability in work and social security rights. 20% of primary care physicians expanded their employment relationships, while 21% of the surgical specialties had their contracts reduced. Clinical and surgical specialists were the ones that most felt the impact of the pandemic on their services: around 20% of the physicians in both categories reduced their services. **Conclusions:** The impact of covid-19 was felt differently across all specialty groups. The social isolation recommendations, the suspension of elective procedures, and the reduction of movement in the offices were the impacts most felt by the respondents, especially among clinical, surgical, and diagnostic/therapeutic specialists.

Patterns of physicians' circularity in health regions in Brazil: a cluster analysis

Danielle Bivanco-Lima¹, Paulo Seixas², Danielle Bivanco-Lima³, Silvia Bertolini⁴, Maria Ferreira⁵, Edgard Fusaro⁶, André Gonçalves⁵, Cristiana Carvalho⁷, Sábado Girardi⁷, Valéria Goulart⁸, Leda de Oliveira⁸

¹ObservaRH-SP/FCMSCSP/USCS Brazil, ²FCMSCSP/Instituto de Saúde Brazil, ³FCMSCSP, ⁴ObservaRH-SP Brazil, ⁵Fundação SEADE Brazil, ⁶ObservaRH-SP, ⁷NESCON - UFMG Brazil, ⁸FIOCRUZ Brazil

Background and objective: The shortage of health professionals generates inequalities in access to healthcare and is also related to misdistribution of medical specialists, multiplicity of jobs and mobility among health regions in Brazil. The aim of this study is to describe patterns of physicians' mobility and the workforce dependence to identify mediator factors. **Methods:** The study design is a survey based on the National Registry of Healthcare Establishment (CNES), in which health services and professionals are registered. It was analyzed 19 specialties of physicians' registrations in CNES in June 2018 in 435 health regions. It was performed a factorial analysis including 38 variables, which indicated two synthesis variables: medical specialists supply and exclusive physicians working in health region (72% of variance). It was performed a cluster analysis that identified different groups among health regions.

Results: It was identified 5 clusters of health regions that correlate to mobility and dependence. In cluster 1 there are all metropolitan areas and greater cities, with all medical specialties and a high percentage of exclusive physicians (N=92 health regions). In cluster 2, there are regional hubs, with all medical specialties, with mixed exclusive and non-exclusive physicians (N= 145). In cluster 3, there are smaller and midsize cities with shortage of medical specialties with high rate of non-exclusive doctors, with high dependence from cluster 1 regions (N=119). In cluster 4, there are smaller cities with shortage of medical specialties, with mixed frequencies of exclusive and non-exclusive physicians (N=35), and higher rates of primary care physicians. In cluster 5, there is the lowest rate of specialists with greater predominance of primary care and exclusive physicians (N=44).

Conclusion: Different patterns of mobility were identified, related to specific healthcare structure and socioeconomic characteristics. Those findings contribute to guide directed human resources redistributive strategies for each cluster of health regions.

Public health workforce capacities and the challenges for preparedness

Ricardo Mexia¹, Marta Barreto¹, Liina Voutilainen², Erika Lindh², Laura Kalin-Mänttari², Máire Connolly³

¹Epidemiology Department, National Health Institute Doutor Ricardo Jorge (INSA), Lisboa, Portugal, ²Department of Health Security, Finnish Institute for Health and Welfare, Helsinki, Finland, ³School of Medicine, University of Galway, Galway, Ireland

Background and objective: The COVID-19 pandemic has exposed the threat posed by communicable disease outbreaks and the importance of the public health workforce in responding to such outbreaks.

Therefore, there is a need to identify key skills, competencies and training of relevant personnel, considering also personal impacts of public health emergencies and developing a path to a more resilient public health system response.

This study, part of PANDEM2 Project, aims at reviewing methodologies and tools already in use to measure workforce capacity and training needs to prevent, detect and respond to infectious disease threats.

Methods: A scoping review was developed, including searching several databases: PubMed, Scopus, Web of Science, among others. Documents of grey literature were also included, from several different sources: WHO, CDC, ECDC, among others. Search words included, but not limited to, "pandemic", "preparedness", "response", "workforce" and "tools", for articles published in English, between 2008 and 2022.

Results: The review highlights the difficulties in defining the public health workforce and workforce diversity across countries and systems.

The review identified tools measuring workforce capacity, as well as gaps and challenges of the public health system response, which was already facing difficulties before the COVID-19 pandemic.

Many countries do not have a dedicated public health workforce policy or plan.

Conclusion: To strengthen public health and emergency preparedness and response, it is fundamental to define and monitor the public health workforce and its capacity.

Several tools were identified, as well as Public Health work force needs and training priorities for response.

The information gathered is key for the future steps in classifying the public health workforce, as designed by the roadmaps and other resources presented by ECDC, WHO and other organizations.

Supporting the ukrainian health professionals - war refugees - to study czech language and czech health system in one place

Alena Petrakova¹, Alena Petrakova¹, Nora Veselá²

¹Institute for Postgraduate Medical Education Czech Republic, ²Institute for Postgraduate Medical Education

Background: The Institute for Postgraduate Medical Education (IPVZ) is responsible for a postgraduate education of health professionals, in particular of physicians, pharmacists and dentists. The Institute on behalf of the Ministry of Health shall prepare and organize the approbation examination of physicians, dentists and pharmacists who as foreign nationals have obtained medical qualification outside the European Union and wish to practice their profession in the Czech Republic or the European Union. The School of Public Health (SPH) is an integral part of this Institute (IPVZ) and is responsible for public health training for all health professionals. Since March 2022, the School of Public Health works in close

collaboration with the Institute's leadership on preparation and implementation of various support activities for the Ukrainian health professionals - war refugees. Objectives: To respond to the needs of Ukrainian war refugees and to support in particular those health professionals who plan to stay in the Czech Republic, the IPVZ leadership in close collaboration with the School of Public Health, initiated the project to organize the Czech language courses, led by the native Ukrainian speaking tutors, and to develop the cycle of short bilingual videos - webcasts - supplemented by a translation of the Czech spoken word into the Ukrainian language, to introduce Czech health system in summary, available free of charge on IPVZ website at <https://ua.ipvz.cz> [1].

Results: Starting on 2 May 2022, implementation of language courses in both presence and online forms are in progress for Ukrainian health professionals - war refugees. To support their knowledge of the Czech health system, the cycle of bilingual webcasts is under continuing development, all webcasts are available at <https://ua.ipvz.cz> [2].

Conclusions: Czech language classes and cycle of bilingual videos as introduction to the Czech health system will support Ukrainian health professionals to prepare for their approbation exams. Links:-----[1] <https://ua.ipvz.cz>[2] <https://ua.ipvz.cz>

New trends of practice arrangement among specialist doctors in Brazil

Sabado Girardi¹, Lucas Wan Der Maas², Joana Cella¹, Ana van Stralen¹, Cristiana Carvalho²

¹Federal University of Minas Gerais Brazil, ²Federal University of Minas Gerais

Background and purpose: Physicians practice arrangements are defined by a combination of structural and relational attributes that characterize the ways and conditions in which medical work is performed and remunerated. The objective of this study is to describe changes in practice arrangements of medical specialties in Brazil between 2010 and 2021.

Method: Practice arrangements include: (i) type of practice; ii) practice ownership structure iii) employment relationship, iv) practice size, defined by the number of physicians working in the establishment and how it is remunerated. Data were collected from the Ministry of Health of Brazil referring to the universe of physicians working in health establishments in the country in the period from 2010 to 2021/2022.

Results: There is a trend to increase practice in solo practice and in small single-specialty practice groups as well as in medium and large multi-specialty groups. The precariousness of work also increases and appears in different ways: through the increase in typical outsourcing, the use of employing agencies such as social organizations, by the use of fictitious firms constituted as legal entities to escape the tax and social protection obligations of the typical employment relationship; by the increase in formal temporary employment contracts and by the expansion of the use of work by residents in hospitals as well as self-employed workers in public outpatient clinics. There is a deepening of the trends observed in the last years of the series as a possible impact of the COVID-19 pandemic.

Conclusions: During the last decade, especially in recent years, with the COVID-19 pandemic, there was a trend to expand the precariousness of work and unstable flexible practice arrangements among specialist doctors in Brazil

Interprofessional collaboration and the law: the importance of interdisciplinary research approach

Marie-Andrée Girard¹

¹Université de Montréal Canada

Background: Interprofessional collaboration (IPC) is central to effective care around the globe. This practice is structured by an array of laws, regulations and policies but the literature on their impact on IPC is scarce. Using the managerialization of law theory as pillar, a novel mixed-method approach was design.

Methods: The study of the legal framework of IPC must be seen in a global way. A design was built using a convergent parallel mixed-method approach. One arm was a legal analysis of all the elements coming from all relevant legal field and the second arm was a survey to clinicians to complete perceptions, knowledge and prioritization of law in the clinicians themselves.

Results: Analyzing each fragment in isolation only gives an incomplete portrait due to the interrelation between several elements. The legal knowledge and perception of the law of health professionals are quite different from those of lawyers. Their perception of the increase in responsibility when working in a team, of the standard of practice which is determined by the usual continuum

of care of their institution, of the team liability and their hierarchical vision are indicators of their "with the law" position. This attitude is the result of several interrelated elements: an intrinsic ignorance of the principles of liability and case law, an implicit bias in the acquisition of this knowledge from the main sources of knowledge and infrequent interaction with the legal system that is limited to conflict and adversarial situations.

Conclusion: This study potentially can impact the outcome of any legal change. A single change in the law will only have limited effects if it is not accompanied by teaching of the principles of law and a thorough examination of the clinical practice legal framework.

Popul. Med. 2023;5(Supplement):A1748

The institutional support and its impacts on healthworkers'groups in two Brazilian public hospitals

Denise Diniz¹, Eliane Teixeira¹

¹National School of Public Health Sérgio Arouca (ENSP/FIOCRUZ), Brazil

Background and Objective: The institutional support work in the SOS Emergencies Program (Ministry of Health) aimed to qualify the public hospitals' gateway. One of the strategies 'support was to offer a care management's training course to healthworkers in the emergency service (Health System Emergency Management Course - GES-SUS). Thus, the present study intends to present an experience report about dual role: institutional support and learning facilitator, in emergency professionals groups of two public hospitals (Ha and Hb, fictitious names).

Methods: These experiences have happened from 2011 to 2016 and were analysed based on supporters-facilitators workes records in their respective diaries. Some fundamental concepts were used like "Paideia support", "Extended clinic" and "professional training" (Campos, 2000, 2013); "institutional imaginary", "groups bonds" (Enriquez, 1994); "intermediate formations" (Kaës, 2001, 2011), "cooperation" and "practical intelligence" (Dejours, 2004).

Results: SOS Emergencies Program set up collegiate groups that combined to GES-SUS could promote local interventions. However, the Ha team did not receive support from hospital management, had difficulty to see themselves as a group and always questioned the transformative potential of the program. While the Hb team had an intense support from management hospital, took advantage of the course to create better strategies to apply in hospital, strengthened social bonds around a common project as well as used this opportunity to improve hospital care.

Conclusions: Therefore, although not all Results have responded to Ministry of Health expectations, both hospital teams reflected the respective institutional supporters autonomy, the groups dynamics, the type of leadership support and the teams desire to change the reality of the service.

Quantitative research on the structural empowerment of nurses and the emotional intelligence of their managers in a Moroccan tertiary hospital

Sofia Yahyaoui¹, Zeggwagh ali², Ahmed Idrissi³

¹Faculté de Médecine et de Pharmacie, Université Mohammed V de Rabat, Morocco, ²Faculté de Médecine et de Pharmacie de Rabat-Université Mohammed V de Rabat, Morocco, ³Ecole Nationale De Santé Publique, Morocco

Background and Objective: The link linking emotional intelligence to the performance of healthcare teams is based on the improvement of elements of structural empowerment or accountability. The aim of the study was to measure the structural empowerment (SE) of nurses and the emotional intelligence (EI) of their managers in a Moroccan tertiary hospital and examine the link between the variables under study. Methods: Descriptive and correlational study, carried out between June and July 2019, with 118 nurses and 39 hospital managers, including 19 heads of clinical departments and 20 head nurses, using the Conditions for work effectiveness questionnaire-II (CWEQ II survey) and the self-scale reported emotional intelligence (SSREI).

Results: The SE of nurses was moderate (11,5 ±3.2). The EI of medical managers was found to be highest (137.1±16.5) compared to that of nursing managers (121±29). A positive correlation was established between these variables among medical managers (r = 0.310; p <0.01). Conclusions: The study opens up research perspectives on the development of SE and EI in hospitals.

Relationship between working conditions and incidence of Arterial

Hypertension in ethylene production workers

Vanya Nedkova-Milanova¹, Martina Narduli², Mariyana Stoynovska³, Radka Kirilova⁴

¹Department of General Medicine, Medical University, Pleven, Bulgaria,

²Faculty of Medicine, Medical University, Pleven, Bulgaria, ³Department of Hygiene, Medical Ecology, Occupational Diseases and Disaster Medicine, Medical University of Pleven, Pleven, Bulgaria, ⁴Department of Physiology and Pathophysiology, Medical University of Sofia, Sofia, Bulgaria

Background and Objective: Occupational safety and health management provides a comprehensive framework for public health leadership. Ethylene belongs to the unsaturated hydrocarbons (UH) and is the most important starting substance in chemical industry. Almost a third of all organic products are obtained from it, used to obtain polyethylene (50%), ethylene oxide (20%), vinyl chloride (15%), styrene (5%), also ethanol, acetaldehyde, freons, vinyl acetate, propanoic acid. As substances with a narcotic effect UH, have toxic effect on the cardiovascular system. THE Objective of the study was to monitor the health status of workers in ethylene production.

Methods: Periodic prophylactic screening of workers in the chemical industry is a condition for early diagnosis of pathological deviations related to the impact of the working environment. 73 ethylene production workers (51 men, 22 women) were studied, distributed according to the degree of their occupational risk, age, gender. The control group is 51 persons without professional contact with chemical substances.

Results: Elevated blood pressure was found in 32.2% of exposed workers and 14.5% of controls. The exposure-effect and exposure-response relationships between the degree of professional exposure and the incidence of arterial hypertension are manifested. The disease is recognized with an increase in age and specialization of work experience. There is a significant difference between female workers with more than 10 years of work experience (44.4%) compared to controls (17.2%). Data from study that has been carried out has shown that there is an increased risk.

Conclusions: Unsaturated hydrocarbons contained in the air of the working environment are a risk factor for the development of cardiovascular pathology. There should be widespread use of disease management programs for chemical workers to improve the efficiency, effectiveness and equity of care. The management of health and safety at work provide an overarching framework for the management of public health.

Cultural aspects and the work of community health workers: community values and health services

Marciglei Brito Morais¹, Luis Cosme Silva Santos¹

¹Federal University of Bahia (UFBA), Brazilian Association of Public Health/ Scholarship by Coordination for the Improvement of Higher Education Personnel (CAPES), Brazil

Background and Objective: The study analyzes how cultural aspects influence the work process of the Community Health workers (CHWs) in the service daily life, considering culture as a factor that conform the profile of care provided the population.

Methods: This is a qualitative research with a descriptive approach, carried out in a Family Health Unit in the city of Vitória da Conquista-Bahia, Brazil, with the 10 CHWs participation from teams linked to the Family Health Strategy (FHS). The construction of data took place through the focus group technique. The data were analyzed using the hermeneutic-dialectic technique. We organize into three analytical categories: cultural aspects: contributions to the quality of home visits; cultural boundaries: constituting barriers in the quality of assistance in the daily service; and the interweaving between the work of the CHWs and the health management model.

Results: The FHS seeks to promote the life quality of the Brazilian population, intervening in the factors that put health at risk, in the prevention and health promotion perspective, with an axis of reorientation of the care model based on the principles of universality, equity and integrality, structuring the Unified Health System. In the CHWs perception, the cultural aspects present in the work process interfere, enhancing or weakening, the quality of care performed in the daily service. Health workers, users and their families, build webs of relationships based on social interactions, forming symbolic structures, achieved by living in the territory and by establishing bonds.

Conclusions: We recommend as essential the appropriation of a cultural system for effective assistance in the territory according to the real health needs of the population. Cultural aspects are reference points for intervention at home and in the community, influencing health care practices and impacting on the

establishment of a link between user-CHWs-health service-community.

DOI: 10.18332/popmed/163833

Strengthening public health functions in azerbaijan through community oriented primary care training

Hande Harmanci¹, Belgin Unal², Bulent Kilic³, Mestan Emek³, Oyku Turunc⁴, Kevser Vatansever⁵, Sevgi Turan¹, Halil Durak⁶

¹WHO Country Office of Azerbaijan 62 Uzeyir Hajibeyov str. Marine Plaza, 5th floor. Baku AZ-100 Azerbaijan, ²WHO Country Office of Azerbaijan Dokuz Eylul University Faculty of Medicine Department Of Public Health 62 Uzeyir Hajibeyov str. Marine Plaza, 5th floor. Baku AZ-100 Azerbaijan, ³Dokuz Eylul University of izmir Dokuz Eylul University Faculty of Medicine Department Of Public Health, Inciralti, Izmir, Turkiye Turkey, ⁴Akdeniz University Faculty of Medicine Dept of Public Health Akdeniz University of Antalya Akdeniz University Faculty of Medicine Dept of Public Health, Antalya Turkey, ⁵Mardin Health Authority, MoH Turkiye Turkey, ⁶WHO Country Office of Azerbaijan 62 Uzeyir Hajibeyov str. Marine Plaza, 5th floor. Baku AZ-100 Turkey

Background and Aim: WHO Country Office in Azerbaijan in collaboration with Ministry of Health, developed a general strategy to strengthen the public health policy framework, service delivery and public health capacity in Azerbaijan. Community oriented primary care (COPC) is a strategy that elements of primary health care and public health are systematically developed and brought together in a coordinated practice. The aim of this work is to present the use of COPC training as a starting point for public health capacity development in Azerbaijan.

Methods and Results: A public health capacity group was selected from the applicants to an advert, by a panel of representatives from the MoH, TABIB, Mandatory Health Insurance Agency, and WHO-Azerbaijan Office. A 5-day face-to-face COPC training was organized in Baku on 14-18 November 2022. The training included one field visit for observing the community, 7 interactive lectures on principles of COPC, 3 group works on practicing the skills of COPC and 3 group presentations and discussions.

The training was evaluated with a self-evaluation form that the participants scored their competency on community characterization, interpretation of health indicators, prioritization, detailed assessment, intervention planning and evaluation using 1 to 10 Likert score, anonymously at the beginning and end of the training. Wilcoxon test was used for statistical analysis.

Results: In total 20 participants took part in the training. For all six items of the self-evaluation form, the scores given at the end of the training was higher than the initial scores ($p \leq 0.01$ for all six items).

Conclusion: COPC training is a useful method in teaching basic skills needed to address the health problems of a defined community and gives participants to use their existing knowledge and experience together with the new knowledge and skills.

Strengthening advanced practice nursing and collaboration in PHC in Brazil and Germany

Kerstin Hämel¹, Marcus Heumann¹, Beatriz Toso², Daria Bula¹, Elyne Engstrom³, Maria Rizzotto⁴, Ligia Giovannella³

¹School of Public Health, Bielefeld University, Bielefeld, Germany, ²Center of Biological and Health Sciences, Western Paraná State University, Cascavel, Brazil, ³National School of Public Health, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, ⁴Center of Biological and Health Sciences, Western Paraná State University, Brazil

Brief outline of the overall workshop: Strong and robust primary health care (PHC) models are able to address the majority of population health needs close to people's homes. Evidence shows that improved collaborative practices among PHC professionals, in particular, effectively contribute to meet complex needs of the increasing number of people with chronic conditions and vulnerable groups while ensuring continuous care. In the last decade, strengthening the nursing profession as part of collaborative interprofessional PHC teams has been a promising approach to further evolve PHC models. Accordingly, PHC nurses' responsibilities and autonomy have been expanded in many countries. However, the development of Advanced Practice Nursing (APN) roles in PHC is pacing differently across different countries. In the focus of this workshop are two countries - Germany and Brazil - which have not yet implemented APN in primary care but are discussing and developing visions for APN roles. Both countries differ concerning resources, the organization of PHC, and the role of the nursing profession. However, similarities can be observed considering the vision of APN in PHC: Promising approaches in both countries build on the idea to

reach beyond the sheer extension of individual care and advanced clinical tasks. They focus on strengthening family- and community-oriented PHC approaches, e.g. by conducting home visits and collective health promotion activities. In this workshop, we present Results of a study analyzing strengths, possibilities, and obstacles of APN implementation, and ultimately, new models of interprofessional collaboration in PHC in Brazil and Germany. Workshop participants are invited to discuss with us about the possibilities, chances, and challenges for both countries. In addition to that the Discussion Aims at identifying new arrangements of APN in PHC in the two countries which can be indicators for further development in other countries. Specific Aims and Objectives: The workshop presents results of an exploratory comparative study comprising of a document and literature search and focus groups with stakeholders in Brazil and Germany. Building up on the study results, workshop participants will learn and discuss different perspectives for APN development and collaboration in PHC and identify future research needs. The key questions that the workshop will address: What are strengths, possibilities, and obstacles of APN implementation, and consequently, new models of interprofessional collaboration in PHC in Brazil and Germany? What conditions enable or hinder APN development in Brazil and Germany? How can APN roles contribute to a more community-oriented PHC? Which research is needed in the context of APN development in PHC?

Popul. Med. 2023;5(Supplement):A1754

Emerging young health leaders and their roles in tackling global public health challenges

Atiya Mosam¹, Jaifred Lopez², Biljana Gjoneska³, Juan Nuñez-Enriquez⁴, Suraj Bhattarai⁵, Omary Chillo⁶, Dipendra Khatiwada⁵, Duha Shellah⁷
¹Young Physicians Leaders, Academy of Science of South Africa, South Africa, ²Young Physicians Leaders, National Academy of Science and Technology - Philippines, ³Young Physicians Leaders, Macedonian Academy of Sciences and Arts, MASA, Macedonia (Republic of), ⁴Young Physicians Leaders, Mexican Academy of Sciences and National Academy of Medicine, Mexico, ⁵Young Physicians Leaders, Nepal Academy of Science and Technology (NAST), Nepal, ⁶Young Physicians Leaders, Tanzania Academy of Sciences-TAAS, Tanzania, ⁷Young Physicians Leaders, Palestine Academy for Science and Technology, Palestinian Territory, Occupied

Effective leadership emerged as one of the most important aspects of the recent public health crisis during the COVID-19 pandemic. Leadership training programs, such as the Young Physician Leaders (YPL), aim to provide and build important skills for emerging physician leaders in the fields of research, policy and practice. YPL also aims to address the need for global health leadership by fostering engagement with global peers and experienced mentors. Launched through a collaboration of the Interacademy Partnership (IAP) medical panel and the M8 alliance, YPL presents an important way forward in ensuring the relevance of medical and health professional leadership training amid an evolving health landscape. YPL also catalyzes the representation of young scientists in inter/national academies of science. In 2021, the YPL programs marked its 10th year anniversary including more than 200 representatives with diverse backgrounds (in terms of education, specialization and geographic representation). Such diversity is reflected in the YPL alumni steering committee (YPL-ASC) aiming to take forward the YPL mission and disperse its key learnings via increased networking and engagement among alumni cohorts.

Global health issues, including the ongoing pandemic, have set the stage for the YPL program concepts and skills to be put to the test, as YPL alumni worldwide assume leadership in biomedical and public health research and practice. The YPL-ASC was recently awarded a grant to conduct profiling of YPL alumni and their shared traits, styles, ambitions, challenges, with an aim to use these insights to broaden the discussion on emerging leadership.

In understanding the impact of leadership programs such as the YPL as well as how to better utilise these programs for effective leadership, we propose the above-titled session to address the following questions:

What are the common profiles and shared experiences that define emerging health leaders around the world, regardless of their race, gender, region, origin, education and other socio-demographic variables?

Is emerging health leadership a dynamic construct?

What can we do, to effectively tackle this issue and improve leadership capacities of young public health professionals?

This will be addressed through the following activities:

Question 1 will be addressed through - A brief overview of the initial results from our IAP supported project, exploring the personality traits, styles, roles, responsibilities and challenges of YPLS and insights drawn.

Question 2 will be addressed through - An interactive survey of the workshop

participants allowing them to understand their own leadership traits and styles and contrasting this to the findings highlighted in activity a.

Question 3 will be addressed through - A panel discussion with distinguished young experts and leaders, offering insights and drawing conclusions on the results, as well as sharing past experiences and lessons learned and a Q&A session to encourage interactions among session attendees, panelists, and YPL-ASC. The panelists will be drawn from the IAP membership, ensuring representation that is broader than medical and health sciences.

DOI: 10.18332/popmed/163757

The public health leadership coalition: a valuable experience during hard times

Louis De Souza¹, Alex Jadad², Jean Okwo-Bele³, Rocio Saenz⁴, Walter Ricciardi⁵, Bettina Borisch⁶, Marta Lomazzi⁶

¹WFPHA, Brazil, ²Public Health, Canada, ³Public Health Africa, Democratic Republic of Congo, ⁴Public Health Costa Rica, Costa Rica, ⁵WFPHA, Italy, ⁶WFPHA, Switzerland

Brief Outline of the Overall Workshop

Since 2020 our world is living unprecedented challenges to public health: a strong leadership in public health is an urgency. In this scenario, several leaders formed the public health coalition within the World Federation of Public Health Association (WFPHA). The Public Health Leadership Coalition (PHLC) brings together world-class leaders to support decision makers by providing the most updated and robust scientific evidence from the public health field in order to build a common front in response to the pandemic and future global issues and to create a more equitable and sustainable approach to health for all. Now more than ever before it is important to create a bridge between the world of researchers and scientists and the world of decision-makers, at each level.

The speakers and the chairs will discuss about the mission, the activities and the goal achieved by the Coalition during the last 3 years.

Specific AIMS/Objectives and Component Parts

The aim of workshop will be to analyze the experience, the activities and the outcomes achieved by the Coalition. Since the beginning of the COVID-19 pandemic, more than 20 public health leaders from all continents took part to several meetings, supported by the Executive Director and Manager, Administrative and Communication Office of the WFPHA and by a team of researcher of Leadership Research Center of Università Cattolica del Sacro Cuore in Rome. They produced documents and papers that were shared with scientific community and citizens and were spread through social media and the official website of the WFPHA also. As an example, since the PH leaders strongly believe that global challenges can only be overcome through global efforts and the adoption of appropriate global approaches to address health threats at the animal, human, and environmental interfaces, in December 2021 a Call to Action was released, published in English language and then translated in Spanish, French, Italian and Arabic.

The Key Questions that the Workshop Will Address

The specific key questions addressed by the workshop are focused on analyzing the best ways to afford and guide with the fair leadership the decision-making process in the health care sector during pandemics or other challenge for humans and for the planet. Indeed, every initiative undertaken by the members of the Coalition during the last 3 years, was committed to provide scientific advice and region-specific solutions to enable decision makers to implement the best evidence-based policies in public health and to make the right choice for the health and wealth of each country. The PHLC consolidates the WFPHA commitment to advocating for Global Public Health by recollecting and sharing best practices and accountable data, performing effective advocacy, and facilitating a right governance for the health sector.

Leading out of the turmoil - perspectives from early career public health professionals as future leaders on the vision of public health for the 22nd century

Fatai Ogunlayi¹, Farhang Tahzib², Mehreen Hunter³, Monica Brînzac⁴, Tara Chen⁵, Steven Bow⁶, Stefan Buttigieg⁷, Fatai Ogunlayi¹

¹UK Faculty of Public Health and UK Health Security Agency United Kingdom, ²UK Faculty of Public Health, United Kingdom, ³University of Cape Town, South Africa, ⁴European Public Health Association Netherlands, ⁵Association of School of Public Health in the European Region (ASPHER) Belgium, ⁶University College London (UCL) United Kingdom, ⁷World Federation of Public Health Association (WFPHA) Switzerland

Brief outline of workshop: I didn't define myself for myself, I would be crunched

into other peoples fantasies for me and eaten alive.” Audre Lorde In alignment with the vision of the main conference, seeking to build a sustainable and equitable future, this workshop will provide a platform for early career public health professionals (ECPs) as future leaders in public health. These future leaders will reflect on globally relevant challenges and discuss the need for responsive and adaptive models to address these current and emerging health threats. The recent pandemic has propelled public health into the limelight and reminded the world of the important role that public health professionals play in population health. However, the unintended consequence of this remains the risk of portraying public health as simply a specialty concerned with infectious diseases or pandemics. Some of the challenges facing public health, presently and into the future, include non-communicable diseases, climate change, air pollution, digital transformation and other social determinants of health. Public health core values centre around health equity and social justice which is rooted in the understanding that optimal health is predicated on the eradication of issues such as racism, conflict and displacement. The future of public health needs to be bold and embrace this fundamental part of its identity. Whilst it is to be welcomed that, as part of ‘building-back-better’ initiatives post COVID-19, public health leaders are engaging in discussions about the future of public health and importance of strengthened public health systems, these conversations are often lacking the voice of ECPs. It is important to engage these future leaders in discussions that will inform future public health structures. If we are serious about building a sustainable and fair future, it will require the energy and determination of ECPs at the helm. This is an opportunity for future leaders to lead the discourse that will inform future direction and set the vision of public health for the 22nd century.

Specific aims/objectives: The session will: * Explore reflections among panellists and audience on the challenges/opportunities of global public health * Provide panellists and audience opportunity to share visions of how future public health needs to be shaped to meet those challenges * Generate an output that will form the basis of an editorial article for publication.

Component parts: After playing an introductory “vox pop” from a broad range of ECPs, the expert panel of ECPs will share their insights on challenges/opportunities facing public health today and in the future. Audience will also be invited to participate via Mentimeter/Q&A to share their views on the subject. There will be discussion on the case for a multidisciplinary, value-driven public health systems that recognise global nature of the challenges facing public health. The key questions the workshop will address

- * What are the perspectives of ECPs on the public health challenges of the future?
- * How should the public health systems be shaped to meet those challenges? *
- How do we empower ECPs to take ownership in designing solutions to address future public health challenges?

Popul. Med. 2023;5(Supplement):A1757

DOI: 10.18332/popmed/164581

Industry responses to the work of those involved in exposing the harmful practices of corporations

Mélissa Mialon¹, Phil Chamberlain², Karen Evans-Reeves², Nino Paichadze³, Anna Gilmore², Britta Matthes²

¹Trinity College Dublin, Ireland, ²University of Bath, United Kingdom, ³George Washington University, United States

Understanding and addressing harmful corporate practices is a key building block in protecting and promoting public health internationally. Corporations are however aggressive and inventive in their responses to health professionals, civil society organizations, scholars, journalists, and government officials, whose work focuses on highlighting these corporate practices. The tobacco industry, for example, monitored and spied on the activities of public health professionals, used misleading criticism of their work, and attacked their reputation and motivation. With the present project, our Aims were i) to map industry responses to the work of health professionals, civil society organisations, and scholars involved in identifying, monitoring and raising awareness about the harmful practices of corporations, across the globe, ii) to identify solutions to address these responses and better protect public health professionals, and, ultimately, public health policy. Our project comprised three interrelated work packages. The first (WP1) involved a scoping review of: a) industry responses to the work of those exposing their harmful practices; b) public health community's responses to these industry activities. The second (WP2) comprised an online survey sent to approximately 50 individuals who, through their profession, expose the harmful practices of corporations to generate new and up-to-date data on the form and trends in industry responses to health activities. We focused on the perceptions and experiences of the survey participants. Thirdly, we conducted interviews (WP3) aimed at identifying solutions to face these responses from the industry. Ethics approval was granted from the ethics committee of Trinity Business School,

Trinity College Dublin, Ireland.

The impact of care continuity on health care use and costs: evidence from movers

Anna Nicolet¹

¹University of Lausanne, Switzerland

Background/Objective: As healthcare expenditures continue to increase worldwide, strategies are needed to ensure healthcare is delivered in an efficient and sustainable way. One of the prominent strategies based on a construct of primary care, is continuity of care (COC) reflecting long-term patient-provider relationships, and greater knowledge of patient's medical conditions. In this study, we exploit rich cAims data to study the causal effect of longitudinal COC on healthcare costs by analyzing the effect of moving to a region with better COC. **Methods:** We used data on 240'000 insured individuals aged 50+ in 2015-2018, obtained from one of the largest Swiss health insurance company. We calculated Bice-Boxerman index of COC in primary care based on visits to the general practitioners (COC GP). To identify the causal effect of COC on costs, we estimate individual fixed-effects models and exploit the fact that some individuals move across regions.

Results: The COC GP varied from 0.86 to 0.92, while mean total costs varied from 9768 CHF to 8,129 CHF (highest vs. lowest COC tercile). The model Results, controlling for 10-year age bins, calendar year fixed effects, morbidity status, deductibles level, and type of insurance model showed that the move to a region with higher COC GP Resulted in decrease of 1'817 CHF in total, 1,059 CHF in ambulatory, 409 CHF in inpatient, and 395 CHF in costs of medications.

Conclusions: Better COC Results in lower cost- this is an especially important finding in a highly fragmented health care systems like Switzerland, and in view of upcoming policy Discussions to implement generalized gatekeeping in the country. As COC is a multifaceted construct, future research and policy-makers should obtain additional evidence on informational COC (e.g., electronic health records promotion and effective management). The mechanisms behind the effects identified in this work should also be further investigated.

DOI: 10.18332/popmed/164992

More for less: why some primary health care centers in Addis Ababa are more efficient than others

Serkalem Serkalem¹

¹Ethiopian Public Health Officers Association, Addis Ababa, Ethiopia

Background: Globally, it is estimated that 20% to 40% of all resources spent on health are wasted. Evidence from the African region shows a similar trend wherein limited health sector resources compounded with weak health systems and high disease burden impede effective health service delivery in the continent. The ongoing health sector transformation programme of Ethiopia places considerable interest and focus on improving the performance and efficiency of the health system. **Design and Methods:** An explanatory sequential mixed methods design was utilized to measure the technical efficiency scores of 94 primary health care facilities and explore the factors that lead to improved performance levels among efficient health care centres. Institutional survey conducted to collect health service input and output data for one fiscal year from July 2018 to 30 June 2019. The Results utilized to pick the best performing health centres. Followed by a qualitative study to explore why and how the high performers standout and identify key drivers of efficiency.

Results: The Results showed that out of the ninety-one (91) healthcare centres included in the data envelopment analysis, four (4%) are found to be technically efficient. There is huge variability in efficiency levels of 91 healthcare centres the average tuned at 69 percent. Scale inefficiency was found to be the major source of inefficiency followed by pure technical inefficiency. This study evidenced that at the Addis Ababa level 15% of the healthcare budget can be saved if all healthcare centres achieve the best performance efficiency. The defining features that drive efficiency in three best performing health centres are multifaceted in nature.

Conclusions: Technical efficiency measurement sheds light on the possibility of maximising utilisation of limited primary healthcare centre resources. The study highlighted the individual staff, the team, and the institution are fundamentally inseparable components of efficiency drivers.

DOI: 10.18332/popmed/165034

Governing the commercial determinants of health: the role of non-government organisations

Sharon Friel¹, Belinda Townsend¹, Rob Ralston², Jeff Collin², Fran Baum³, Katherine Cullerton⁴, Rodney Holmes⁵, Jane Martin⁶, Liz Arnanz⁷

¹Australian National University, Australia, ²Edinburgh University, United Kingdom, ³Adelaide University, Australia, ⁴University of Queensland, Australia, ⁵FARE, Australia, ⁶Obesity Policy Coalition, Australia, ⁷NCDAlliance, Switzerland

Background and objectives: There is accumulating evidence of the ways in which commercial entities influence population behaviours, daily living conditions, and the policy and regulatory environments in ways that affect human health. While non-government organisations are increasingly involved in the governance of the commercial determinants of health, the strategies used by them to effectively influence industry practices for public health purposes has been underexplored. The objective of the research presented here is to identify which non-government organizations are involved in the governance of the food and alcohol industry in Australia and globally, and to understand the different types of direct and indirect strategies used by non-government organizations to influence commercial actors, and the conditions that facilitate or constrain their effectiveness at positively influencing commercial practices.

Methods: We undertook a descriptive analysis of NGOs in Australia and globally, identified from an online search based on the typology we developed of type, issue area and governance function. In addition, a narrative review of the political science, policy studies, law, economics and public health literature identified the type of strategies used by non-government organizations to influence the practices of various industries relevant to public health.

Conclusions: Non-government organizations are involved in policy agenda setting, capacity building, program implementation and monitoring and accountability governance functions. The literature identified the use of a wide range of strategies to attempt to influence commercial practices across extractive, tobacco, alcohol, food, infant formula, and medicines industries. We present these strategies in a matrix according to inside and outside tactics, targeting either industry directly or targeting government and/or intergovernmental organizations.

DOI: 10.18332/popmed/165039

Addressing the corporate determinants of ill-health and health inequity: a scoping review and proposed solutions-oriented research agenda

Benjamin Wood¹, Jennifer Lacy-Nichols², Kate Sievert³, Ella Robinson³, Gary Sacks³

¹Global Centre for Preventive Health and Nutrition, Institute for Health Transformation, Deakin University, Burwood, Victoria, Australia, ²Centre for Health Policy, School of Population and Global Health, The University of Melbourne, Parkville, Australia, ³Global Centre for Preventive Health and Nutrition, Institute for Health Transformation, Deakin University, Burwood, Australia

Background and Objective: Despite the well-documented concerns about the myriad ways in which powerful business corporations negatively impact on health and equity, Discussions on how to fundamentally address excessive corporate power remain relatively uncommon and underdeveloped in the field of public health. This study aimed to review and categorise actions that have the potential to address excessive corporate power for the betterment of public health. **Methods:** A scoping review of diverse literature, including from the fields of public health, law, business, economics, and political science, was conducted to identify actions to address excessive corporate power. Categorisation was guided by Meagher's '3Ds' heuristic, which broadly classifies actions to curb or address corporate power into three groups: dispersion, democratisation, and dissolution. Where possible, we identified real world examples at the local, national, and international level where actions have been implemented, and collated potential implementation challenges.

Results: We found 150 documents covering a broad range of policy, regulatory, and collective action levers. 15 strategies were identified and grouped under four interlinked strategic Objectives: i) disperse concentrated corporate wealth and power; ii) democratise corporate decision-making; iii) dissolve unchecked and harmful corporate power; and iv) developing and strengthening countervailing power structures. We found several examples from multiple regions where these actions have been effectively implemented. **Conclusions:** The 15 complementary strategies provide a blueprint for addressing the corporate determinants of ill-health and health inequity. Given that there are likely to be considerable political challenges in the implementation of many of these strategies, a rapid escalation in research, advocacy, activism, and collaboration is required to support efforts to implement and scale-up these strategies in and across many contexts.

Popul. Med. 2023;5(Supplement):A1762

DOI: 10.18332/popmed/165058

Children's food environment

Anette Jansson¹

¹Swedish Heart Lung Foundation, Stockholm, Sweden

Background and Objective: Unhealthy dietary habits are causing a large part of the global disease burden. One third of the population lives with overweight or obesity. The cause of energy overconsumption is multifactorial and affected by both external and internal factors. One external factor affecting our attitudes, preferences and choice of food is our food environment, the social and physical environment in which we live.

Methods: Students (age 13-14 years), from four schools were asked to take pictures of food advertisements in their surroundings. The purpose was to investigate what type of food advertisements children see in their everyday lives. The project involved 54 children and aimed to: locate areas where children are exposed to food advertisements, investigate what proportion of all food advertisements that promote unhealthy food in comparison to healthier foods and investigate the children's thoughts about their food environment. The content of the ~3000 pictures was analysed. Six focus group interviews were conducted, where the students got to discuss their experiences of participating in the project and their thoughts about their food environment.

Results: The analysis showed that 78 percent of all the recorded food advertisements promoted unhealthy foods or beverages, 21 percent marketed fruits, vegetable, berries, fish, or other seafood. The dominance of advertisements for unhealthy foods was evident in all the analysed areas. The analysis showed that approximately one in every four food advertisements contained some kind of special offer (for example buy 3 pay for 2). Out of these, 74 percent contained unhealthy food or beverages.

Conclusions: The results of the report raises concerns about the food environment that children in Sweden are exposed to. The type of dietary patterns that are reflected in the Swedish advertising landscape are the opposite of how the national dietary guidelines recommend us to eat.

Popul. Med. 2023;5(Supplement):A1763

DOI: 10.18332/popmed/165068

A global policy index to create healthy, equitable and environmentally sustainable food systems at national and local levels

Celia Burgaz^{1,2}, Stefanie Vandevijvere³

¹Sciensano, Belgium, ²Université libre de Bruxelles, Belgium, ³Sciensano, Ixelles, Belgium

Background and Objective: Current global food systems are unhealthy, unjust and environmentally unsustainable. Transitioning to healthy and sustainable food systems is challenging; needing "double and triple-duty actions", which are interventions and policies that have the ability to simultaneously reduce the risk or burden of undernutrition and/or overweight, obesity and/or climate change. Therefore, we propose the use of different policy indicators to inform policymakers in the design and implementation of policies towards healthy diets from sustainable food systems.

Methods: Through a compilation of international recommendations, a scoping review, four regional workshops with food policy experts, eight country-based policy mappings and policy stakeholder interviews, the International Network for Food and Obesity/NCDs Research, Monitoring and Action Support (INFORMAS 2.0) Aims to create a new Food Systems Policy Index to monitor governments' actions on sustainable food systems. The tool will take into account the impact of policy indicators on obesity/non-communicable diseases, undernutrition and environmental sustainability. Two secondary outcomes (nutrition inequalities and women's empowerment) will also be considered.

Results: A total of 291 international policy recommendations have been compiled, classified and merged into two policy domains (food supply chains and food environments) and ten subdomains (including, among others, agriculture, food waste and labelling) that impact food security, obesity and/or climate change. Their effect has been assessed both in a scoping review and through a survey, four workshops and a ranking consulting international experts, to decide the final list of 44 policy indicators with double and triple-duty potential. A mapping of the policies and interviews with national and local policy stakeholders from eight countries is being conducted to pilot test the policy index.

Conclusions: Given the heterogeneity and complexity of food systems, the index will represent a useful tool for governments to tackle malnutrition in all its forms, nutrition-related inequalities, climate change and biodiversity loss.

Is implementing a national preeclampsia screening program worth it?

Gonzalo Sanchez¹, Juan Bayon², Lorea Galnares³, Asun Gutierrez², Maria Portillo⁴, Jorge Burgos⁵, Ana Campo⁵

¹Osakidetza, UPV/EHU, Spain, ²Osteba, Spain, ³OSTEBA - Basque Office for Health Technology Assessment, Spain, ⁴Osakidetza, Biocruces, ⁵Osakidetza, Biocruces, Spain

Preeclampsia is a multisystem progressive disorder characterized by the new onset of hypertension and proteinuria in the last half of pregnancy or postpartum. Due to the high risk for the mother and also the child it would be really useful to detect as early as possible if a woman is at high risk of developing preeclampsia or not. Nowadays the risk is assessed evaluating determined risk factors from clinical records which has a limited precision. In some places are developing a "combined preeclampsia screening" that uses medical records plus other factors such as biomarkers like placental growth factor, pregnancy associated plasma protein-A or uterine arteries pulsatility index. Our objective is to evaluate security, efficiency an efficacy of preeclampsia screening programs on pregnant women. To evaluate efficacy and security of screening programs based on predictive models and low dose aspirin for preeclampsia prevention we made a revision of systematic reviews from the latest scientific evidence available. To analyze the cost-effectivity of screening programs based on predictive models and low dose aspirin on women at high risk of developing preeclampsia versus common practice we made research on economic evaluations available. All selected articles were evaluated following AMSTAR-2 criteria. As results, we found that the first trimester models where biophysics and biochemical markers plus maternal characteristics were used, presented the best detection rate for early preeclampsia. We also found that the use of aspirin decreased between 15%-18% preeclampsia risk being statistically significative achieving a greater reduction when given to a high number of nulliparous women. To conclude, according to the evidence found, preeclampsia screening in first trimester based on Fetal Medicine Foundation algorithm plus low dose aspirin treatment in women at high risk of preeclampsia was more effective, prevented preeclampsia cases and was cheaper than costs related with preeclampsia's clinical management.

Determinants of COVID-19 vaccination worldwide: a retrospective observational study

Alberto Peano¹, Gianfranco Politano², Maria Gianino¹

¹University of Turin, Italy, ²Polytechnic of Turin, Italy

Background and Objective: COVID-19 vaccines represented a light in the darkness, but a great disparity in vaccination coverage between countries still persists after 18 months their introduction. As this global public health issue rises, questioning the reasons becomes mandatory: the aim of this work is to analyse several variables to identify possible determinants of COVID-19 vaccination.

Methods: A retrospective observational study was conducted using pooled secondary data sourced from institutional sites, including 205 countries and territories worldwide. Two indicators of vaccine coverage were identified as outcomes: The percentage of the population vaccinated with at least one dose and the total doses administered per 100 residents. A raw and an adjusted for delivered vaccine doses multivariate GLM were fulfilled using R. Variables were in multiple fields: socio-demographic, cultural, infrastructural, economic, political and of health system performance.

Results: GDP per capita (Odds = 1.401 (1.299 to 1.511) C.I. 95%), Access to electricity (Odds = 1.625 (1.559 to 1.694) C.I. 95%), Political stability and absence of violence/terrorism (Odds = 1.334 (1.284 to 1.387) C.I. 95%) and Civil liberties (Odds = 0.888 (0.863 to 0.914) C.I. 95%) proved to be strong determinants of COVID-19 vaccination. Other several variables displayed a statistically significant association with outcomes, although the associations were stronger for Total doses administered per 100 residents. There was substantial overlap between raw outcomes and their adjusted counterpart.

Conclusions: This pioneering study identified strong determinants of vaccination coverage such as GDP per capita and Access to electricity. Political decision-makers should consider these Findings in order to organize a mass vaccination campaign able to reduce inequalities between nations in a pandemic context.

Cost-effectiveness analysis of procalcitonin and lung ultrasonography guided antibiotic prescriptions in primary care

Giulio Cisco¹

¹Health Economics and Policy Unit, Centre for Primary Care and Public

Health (Unisanté), University of Lausanne, Switzerland

Unnecessary prescription of antibiotics contributes to the development of treatment-resistant strains. Antimicrobial resistance comes with high morbidity and mortality burden, especially for future generations, with potential high impact on healthcare costs. Efficient strategies are therefore needed to limit overuse of antibiotics. This paper investigates the cost-effectiveness of screening patients suffering from lower tract inflammation with procalcitonin or lung ultrasonography, two diagnostic tools that help detect the presence of a bacterial infection, therefore guiding antibiotic prescription decisions. The clinical effectiveness of these strategies has been demonstrated in the primary care setting (Ihopitalier 2021), but evidence is needed on the cost-effectiveness of these options. We used data from a cluster-randomized multicenter clinical trial conducted in Switzerland and estimated patient-level costs using data on resource use to which we applied Swiss tariffs. By combining the incremental costs of the two treatments and the reduction in the 28-day antibiotic prescription rate (APR) compared to usual care, we calculated incremental cost-effectiveness ratios (ICER). We also used the cost-effectiveness acceptability curve as an analytical decision-making tool. The robustness of the findings is ensured by probabilistic sensitivity analysis and by scenario analysis. In the base case scenario, the ICER with respect to usual care is 2.2 Swiss francs (CHF) per percentage point reduction in antibiotic prescription for the procalcitonin-treated group, while it is 4.2 for the ultrasonography group. This is because, despite similar clinical effectiveness, the incremental cost of the ultrasound group is almost double that of procalcitonin. Furthermore, we found that for a willingness to pay per patient more than 2 CHF per percentage point reduction in the APR, procalcitonin is the strategy with the highest probability to be cost-effective. Our findings suggest that testing patients with respiratory symptoms with procalcitonin to guide antibiotic prescription in the primary care setting represents good value for money.

Arguments made by the alcohol industry in submissions to the WHO consultation for the Alcohol Action Plan 2022-2030

Deborah Gleeson¹, Paula O'Brien², Robyn Dwyer¹, Megan Cook³, Robin Room⁴

¹School of Psychology and Public Health, La Trobe University, Australia,

²Melbourne Law School, University of Melbourne, Australia, ³Institute of

Social Marketing and Health, University of Stirling, Stirling, United Kingdom,

⁴Centre for Alcohol Policy Research, La Trobe University, Australia

Background and Objective: A growing body of research has revealed the strategies and arguments used at the national level by alcohol industry actors to influence policy. To date, however, there has been little research into industry's arguments in global alcohol policy forums. The 2020 consultation by the World Health Organization (WHO) on a Working Document for the 'development of an action plan to strengthen implementation of the Global [Alcohol] Strategy' provided an opportunity to critically examine industry perspectives and arguments in relation to global alcohol governance.

Methods: Forty-eight alcohol industry submissions were coded in NVivo. Directed content analysis was used to examine the policy positions and arguments made by industry actors. Thematic analysis was employed to further explore the framing of industry arguments.

Results: In framing their arguments, alcohol industry actors positioned themselves as important stakeholders in policy debates; differentiated 'normal' drinking from consumption that merits intervention; argued that alcohol policy should be made at the national, rather than global, level; and supported industry self-regulation or co-regulation rather than cost-effective public health measures to prevent harms from alcohol.

Conclusions: The alcohol industry actors' submissions to the WHO's 2020 consultation repeated some of the same positions and arguments that industry actors have been found to have made in domestic policy processes. Their arguments could be seen as efforts to stymie improvements in the global governance of alcohol. The arguments appeared to have had some, but not complete, traction in the creation of the Alcohol Action Plan. There are moves towards improving global governance of alcohol in the future. The industry can be expected to continue strong advocacy against such developments.

The macro-economic determinants of health outcomes in EU member states

Joseph Piscopo¹, Milena Pavlova², Wim Groot³

¹Malta, ²Department of Health Services Research, CAPHRI, Maastricht University Medical Center, Faculty of Health, Medicine and Life Sciences,

Maastricht University, Netherlands, ³Department of Health Services Research, CAPHRI, Maastricht University Medical Center, Faculty of Health, Medicine and Life Sciences, Maastricht University, The Netherlands

Background: Health outcomes differ between countries, even in a relatively homogenous area such as the European Union. Research has been inconclusive about the explanation of this heterogeneity in health outcomes. Our study contributes to the literature by analyzing the impact of health financing and economic, behavioral and country-specific characteristics on health outcomes in EU member states.

Methods: This study is based on macro-level EU panel data covering the period from 2000 to 2018. The association between health outcomes and explanatory variables is analyzed by random-effects and fixed-country effects regression models. To address the endogeneity problem of health expenditure, instrumental variables are applied. Life expectancy and infant mortality are used as outputs, and a vector of independent variables is used as inputs.

Results: The explanatory variables included in this study are more associated with infant mortality rather than with life expectancy. The impact of the explanatory variables on life expectancy appears to be only marginal. Public health expenditure, the number of physicians, consumption of fruit and vegetables, the decentralization of the health system, and fixed-country effects are the main determinants of both life expectancy and infant mortality.

Conclusions: Health status differences Results from complex and often intertwined processes. Increasing public health expenditure is not sufficient to achieve better health outcomes. Such increases must be complemented by giving more importance to the promotion of healthy lifestyles, improved education and additional human resources to sustain health services.

Aiding empirical research on the commercial determinants of health: a scoping review of lobbying research

Jennifer Lacy-Nichols¹, Madalyn Quinn², Katherine Cullerton³

¹University of Melbourne, Australia, ²The University of Melbourne, Australia,

³The University of Queensland, Australia

Background and Objective: Challenging the influence of powerful commercial actors on health requires a deeper understanding of corporate political activities. This project explores political science scholarship analysing lobbying to identify new datasets and research methods that can be applied to public health and stimulate further research and advocacy.

Methods: We undertook a systematic scoping review of peer-reviewed and grey literature reports analysing lobbying. Titles and abstracts of 4533 peer-reviewed and 285 grey literature reports were screened, with 233 peer-reviewed and 280 grey literature reports assessed for eligibility. We used a two-stage process for data extraction. In stage one, we collected information about data sources and indicators used to measure lobbying. In stage two, we extracted data from 16 studies that focused on meetings.

Results: The most common indicators used to measure lobbying activity were: registrations of active lobbyists; expenditure on lobbying; meetings; written comments and submissions made to government consultations; bills; and committee participation. A range of data sources were used to analyse lobbying, including from governments, not-for-profits and commercial sources. All 16 studies analysing lobbyist meetings were from high-income countries. The studies analysed three key variables: the types of government actors targeted by lobbying; the policies of interest; and the lobbyists and/or their clients. The studies used a range of taxonomies to classify policy issues and the types of actors engaged in lobbying. All studies discussed challenges with accessing and analysing lobbying data.

Conclusions: Political science scholarship offers many insights that can support public health research and advocacy concerned with the commercial determinants of health. This includes both conceptual frameworks and sources of empirical data. It is important for public health actors to advocate for government transparency and public integrity. Better political transparency will make it easier to monitor and take on the commercial determinants of health.

Implementation evaluation of regional health consortia in Bahia, Brazil

Daiane Melo¹, Ana Chancharulo², Luis Souza²

¹Departamento de Ciências da Vida (DCV), Universidade do Estado da Bahia, Brazil, ²Departamento de Ciências da Vida, Universidade do Estado da Bahia, Salvador, Brazil

Background: Although Brazil has a universal health system, the inequity of access to health care persists, especially to specialised services. To overcome it and guarantee full and equal access to health care, a federative (intergovernmental) cooperation strategy has been adopted: the regional health consortium. The implementation of these consortia, as a promising strategy, deserves research attention.

Objective: Estimate the degree of implementation of health consortia in three regions of the state of Bahia, in Brazil.

Methods: To estimate the actual degree of implementation of health consortia, we created an Evaluation Matrix of the Degree of Implementation, considering three dimensions: normative, managerial and services provision. Document analysis and interviews were carried out with key informants, with each consortium finally classified as totally, partially or incipiently implemented.

Results: The Bahia state government and municipalities formed the regional health consortia. The three evaluated consortia started their activities in 2017 by building and managing regional health polyclinics, which offer specialised medical care. Considering the normative, managerial and services provision dimensions, all consortia were classified as totally implemented. There was an increase in the services provision of all consortia, and the differences related to the access to services were reduced between the state regions.

Conclusions: The three health consortia are effectively implemented, increasing services provision and reducing access-related inequity. The federative (intergovernmental) cooperation was fundamental to organising the consortia and establishing the regional health polyclinics. Most importantly, it minimised the gap related to access to specialised clinical care in the different regions of Bahia.

How ready is the Italian healthcare system regarding the use of genomics in medicine? An application of the Beyond 1 Million Genomes (B1MG) Maturity Level Model (MLM)

Valentina Baccolini¹, Erica Pitini², Americo Cicchetti³, Stefania Boccia^{4,5}, Paolo Villari¹

¹Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy, ²General Directorate for Health Prevention, Ministry of Health, Rome, Italy, ³Department of Management Studies, Faculty of Economics, Advanced School of Health Economics and Management (ALTEMS), Catholic University of the Sacred Heart, Rome, Italy, ⁴Section of Hygiene, Department of Woman and Child Health and Public Health, Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy, ⁵Department of Life Sciences and Public Health, Catholic University of the Sacred Heart, Rome, Italy

Background and Objective: The integration of genomics into healthcare systems allows to fulfilling the potential of Personalised Medicine for patients and citizens. This demands countries to make extensive adjustments in key areas, such as technical infrastructure, health professional competencies, or ethical and legal frameworks. Within this context, effective identification of current challenges and barriers to integrating genomics in the healthcare system is crucial to define a path toward sustainable implementation.

Methods: We applied the B1MG MLM framework to assess the maturity of the Italian national health system (NHS) regarding the key aspects of genomics implementation. From March to June 2022, 18 experts from academic and non-academic institutions that participate in the B1MG activities rated on a 5-point scale (from ad hoc to fully implemented) the level of maturity of 49 indicators grouped into eight domains: governance (I), economic aspects (II), ethics and legislation (III), public awareness (IV), workforce skills (V), clinical organization (VI), clinical genomics guidelines (VII), and data infrastructure (VIII). From July to September 2022, consensus procedures were carried out within each domain. **Results:** The analysis showed that Italy stands at a local level of genomics implementation in most indicators, but several regional and/or national initiatives are currently ongoing. Specifically, genomic medicine is considered a priority but still lacks updated strategies, governance, and investment plans. The highest maturity is reached for ethical and legal aspects, followed by domain VII. There is a strong need to invest in workforce training for some health professionals, citizen engagement, and literacy. Infrastructures to improve data security and fairification are still under development.

Conclusions: We defined the status of genomics implementation in the Italian NHS, drawing a comprehensive picture of all key domains and identifying areas that need immediate investment. Regional and national initiatives currently ongoing need to be monitored.

Where is the evidence supporting voluntary and public-private partnership policies for promoting healthy food environments? Findings from four evidence syntheses

Laurence Blanchard¹, Laurence Blanchard¹, Stephanie Ray¹, Cherry Law², Matt Egan¹, Harry Rutter³, Mark Petticrew¹, Cécile Knai¹

¹London School of Hygiene and Tropical Medicine, United Kingdom,

²University of Reading, United Kingdom, ³University of Bath, United Kingdom

Background and Objective: Policies are increasingly being implemented to promote healthy food environments. These include regulations by governments, voluntary actions by governments and private actors, and public private partnerships (PPP). PPPs have particularly been encouraged by global leaders. This project aimed to assess the effectiveness of these approaches.

Methods: Studies of national and state policies promoting healthy food environments were searched in 14 databases and two websites. Four evidence syntheses were generated relating to effectiveness: 1) An evidence map of primary research; 2) An overview of reviews of regulatory, voluntary and PPP approaches. Quality of the systematic reviews was assessed using the SIGN checklist; 3) A systematic review of PPPs; 4) A systematic review of voluntary commitments by private actors. In systematic reviews 3-4, risk of bias was appraised using a modified Newcastle-Ottawa Scale.

Results: Among the 483 publications in the evidence map, 60 % (n=288) reported on at least one regulatory initiative, 43% (n=209) on at least one voluntary, 15 assessed policies combining both, and 31 assessed a PPP (of which 22 on two partnerships in England and Australia). The overview of reviews included ten systematic reviews. Most regulatory approaches were effective at improving health, consumer behaviour (e.g. food intake, purchases), or food environment outcomes, whereas effects for voluntary approaches were mixed. No PPP was included. The review of PPPs included 17 studies on eight PPPs. Partnerships with the food industry were not effective to improve the food environment. Lastly, sixteen studies assessed nine voluntary approaches by private actors. The direction of effect for most outcomes was either inconclusive or worse for participants.

Conclusions: Regulatory approaches are generally effective for improving food environments while voluntary approaches by governments or private actors and PPPs are not. Data on PPPs are limited. This questions why PPPs have been encouraged globally.

Chronic diseases attributable to a diet rich in processed meat in Brazil: Burden and financial impact on the healthcare system

Mariana Menezes¹, Carla Rocha¹, Magda Parajára¹, Ísis Machado¹, Aline Folgal¹, Adriana Meireles¹

¹Federal University of Ouro Preto, Brazil

Objectives: This study aimed to describe the burden of chronic noncommunicable diseases (NCDs) attributed to a diet rich in processed meat (PM) between 1990 and 2019 in Brazil and Federative Units, and the financial burden on the Unified Health System (SUS) in 2019. **Methods:** Secondary data from the Global Burden of Disease (GBD) and SUS Information Systems were used in this study. The metrics used to assess the burden of NCDs attributable to PM consumption were deaths and disability-adjusted life years (DALYs). The age-standardized rates per 100,000 people for both sexes are presented. The cost of hospitalizations and outpatient procedures covered by SUS for the treatment of NCDs attributable to PM consumption was estimated using the population-attributable fraction. The amount spent was converted into international dollars.

Results: The age-standardized mortality rates decreased between 2009 and 2019. The cost of hospitalization and outpatient procedures in Brazil for NCDs attributable to the consumption of PM was US\$8,672,668.30, of which US\$5,887,880.13 was spent on ischemic heart disease, US\$2,626,585.15 on colorectal cancer, and US\$1,582,03.02 on type II diabetes mellitus.

Conclusions: The NCD burden showed a slight decrease during the years evaluated, while the financial burden was high in 2019, with higher treatment costs for ischemic heart disease. These results can guide political, economic, and health education interventions to advance the fight against NCDs.

Popul. Med. 2023;5(Supplement):A1774

DOI: 10.18332/popmed/165640

Territorialization of health care equipment in Minas Gerais, Brazil

Allan Barbosa¹, Pedro Amaral^{2,3}, Lucas Carvalho^{2,3}, Maria Turci⁴, Philipe Mendes^{2,3}

¹Universidade Federal de Minas Gerais (UFMG), Belo Horizonte, Brazil,

²CEDEPLAR, Brazil, ³UFMG, Brazil, ⁴UNIFENAS, Brazil

This study analyses the supply of health equipment (tomograph, mammography, MRI, bone-densitometer) in the state of Minas Gerais, Brazil, between 2017 and 2020, considering the geographical distance in the provision of health services. The results point out that even if there exists, whether in the public or private network, this quantity is sufficient for total care of the population. However, the distribution needs to be more spatially assertive. Due to the parameters according to the Ministry of Health: (i) a maximum limit of the coverage distance and (ii) the capacity of each health equipment, the population of several municipalities may find themselves uncovered or without direct access to them.

DOI: 10.18332/popmed/165660

Issues of high relevance for sustainable health: a validation study in Portugal, 2021

Ana Cristina Garcia^{1,2}, Pedro Aguiar³, Paulo Ferrinho¹

¹Global Health and Tropical Medicine (GHTM), Institute of Hygiene and Tropical Medicine, NOVA University of Lisbon, Lisbon, Portugal, ²Department of Epidemiology, National Institute of Health Doctor Ricardo Jorge, Lisbon, Portugal, ³National School of Public Health, NOVA University of Lisbon, Portugal

Background and Objective: The 2030 Agenda for Sustainable Development represented a decisive advance for the planning and implementation of sustainable health strategies. Instruments such as the GAPFRAME framework are available to support its complex operationalization. The need to identify sustainability issues of high relevance to health was felt within the scope of the National Health Plan 2021-2030 of Portugal (NHP 2021-2030), not being known a validated reference for Portugal. The objective of this study is to assess the internal consistency of a framework for translating the Sustainable Development Goals (SDGs) into relevant issues for achieving high levels of sustainable health and well-being in Portugal, adapted from the GAPFRAME.

Methods: A descriptive study was conducted with data collection through a self-completion questionnaire, applied to 127 stakeholders of the NHS 2021-2030. Data were collected related to the perceptions about thirty-two sustainability issues as determinants or facilitators of achieving high levels of health and well-being. Issues were organized according to four sustainability dimensions (planet, society, economy and governance) in a frame adapted from GAPFRAME. Internal consistency was assessed using Cronbachs alpha coefficient.

Results: Seventy-five stakeholders participated (59.1%); 55 (75.3% of valid responses) reported working in the health area and 64 (85.3%) in the public sector. Fifty-five (in 61 valid responses) were from the social sector and 13 from the environmental and, or economic sectors. Cronbachs alpha coefficient of the framework as a whole was 0.93, varying between 0.76 (dimension: society) and 0.97 (dimension: planet), compatible with moderate to excellent internal consistency (0.84 for dimension: economy; 0.91 for dimension: governance).

Conclusions: The framework adapted from the GAPFRAME model seems to have adequate precision for its use in Portugal as a tool for translating the SDGs into relevant issues to include in the planning for sustainable health and well-being.

Seeking to be seen as legitimate members of the scientific community? An analysis of the involvement of two transnational tobacco companies in scientific events

Britta Matthes¹, Alice Fabbri¹, Sarah Dance¹, Louis Laurence¹, Karin Silver¹, Anna Gilmore¹

¹University of Bath, United Kingdom

Background and Objectives: Tobacco companies have misused science for decades in order to protect and increase their profits. Among other things, they undertook research obscuring the harms of their products, created doubt about work that countered their interests and engaged in flawed publishing practices. Efforts to address this misconduct included rulings requiring the shut-down of scientific 3rd parties, journals refusing to publish tobacco industry-funded research, and conferences excluding the tobacco industry. In recent years, however, tobacco industry engagement in science appears to have increased. Evidence has shown, for example, the establishment of a new major scientific 3rd party and failure of industry-linked authors to declare conflicts of interest. The industry's engagement in scientific events, including conferences, symposia and workshops, has not yet been examined. We fill this gap focusing on the two largest transnational tobacco companies, British American Tobacco (BAT) and Philip Morris International (PMI).

Methods: To identify events, we collected and collated publicly available data from BAT and PMI's websites. To assess the nature of the involvement, we extracted

data from websites and materials linked to events.

Results: Between April 2012 and September 2021, BAT and/or PMI employees attended 213 scientific events, mostly held in Europe and North America. Events covered a diverse range of disciplines: toxicology (28.1%), medicine (11.7%), biology (11.3%), chemistry (10.8%), aerosol science (8.5%), dentistry (4.2%), pharmaceutical science (3.8%), and computing (3.8%). BAT and PMI provided 77 presentations linked to 65 events and 356 posters linked to 118 events. Companies rarely sponsored events (n=9), acted as exhibitors (n=3) or were represented in organising committees (n=1).

Conclusions: BAT and PMI were present at a large and diverse number of scientific events. The tobacco industry can use such events to (re-)build scientific credibility. This study underscores the need to address the tobacco industry's presence in such spaces.

Feasibility of the requirements and recommendations of the Brazilian school feeding program

Daniela Canella¹, Ana Azevedo², Daniel Bandoni³

¹Rio de Janeiro State University, Brazil, ²Rio de Janeiro State University, Rio de Janeiro, Brazil, ³Federal University of São Paulo, Brazil

Background and Objective: Brazilian School Feeding Program offers adequate and healthy meals for public basic education students. In 2020, it aligned its recommendations to the Brazilian Dietary Guidelines establishing that most foods purchased should be unprocessed or minimally processed, in variety, and limiting the purchase of processed and ultra-processed foods. The study Aims to analyze the percentage of municipalities that complied with the recommendation for variety and with the fund limit requirement established for the purchase of processed and ultra-processed foods.

Methods: Secondary data from the Accountability Management System of the National Fund for Educational Development was used. The foods were grouped according to the NOVA classification system. Resolution No. 6 recommends that the annual offer of at least 50 different types of unprocessed or minimally processed foods and establish that, at most, 20% of the funds can be used to purchase processed and ultra-processed foods. The feasibility of the municipalities to meet Resolution No. 6 were assessed using data from 2016. Descriptive analyses were run.

Results: A total of 3,698 municipalities were evaluated, equivalent to 66.4% of the Brazilian municipalities. The mean number of unprocessed or minimally processed foods purchased in Brazil was 33.77, ranging from 0 to 169, and the mean percentage of municipalities that followed the recommendation was 8.68%. Considering the funds used to purchase processed and ultra-processed foods, the mean was 25.77%, from 0 to 100%, and 35.83% of the municipalities were within the established limit.

Conclusions: The findings show the feasibility of the resolution, since some Brazilian municipalities had already been practicing to the established limits and recommendations. Combining the restriction on the purchase of processed and ultra-processed foods and a specific recommendation for a variety of unprocessed or minimally processed foods in the program is important to provide students with adequate and healthy meals.

Popul. Med. 2023;5(Supplement):A1778

DOI: 10.18332/popmed/165740

Diagnostic technology: trends of use and disponibility in the last decade among sixteen OECD countries

Manuela Martella¹, Jacopo Lenzi², Maria Gianino¹

¹University of Turin Department of Public Health Sciences and Pediatrics Italy, ²University of Bologna Department of Biomedical and Neuromotor Sciences Italy

Background: Appropriate use of medical technologies affects several aspects of clinical practice. Besides the analytical validity, examinations' clinical usefulness and validity allegedly lead to better outcomes. Further, a reasonable ethical and economic approach contributes to improving healthcare delivery. Conversely, imaging overuse and low-value care dramatically drive up costs with scarce or no benefit for patients. The current research aims to assess a trend over a 10-year timeframe on the proportion between imaging tests and radiology devices in 16 countries belonging to the Organisation for Economic Co-operation and Development (OECD).

Methods: A time-trend analysis based on OECD indicators on diagnostic imaging (Computer Tomography CT, Magnetic resonance imaging MRI, and Positron emission tomography PET) involved 12 European countries and four overseas countries. OECD indicators were annual number of exams per 1000 population,

annual number of devices per million population and annual number of exams per device. Country-specific trend was measured as average annual percent change.

Results: The trend exam-to-scanner ratio for CT, RMI and PET grew during the study-period in most of countries (11, 13 and 12, respectively). Predominantly, it highlighted a faster rise of exams' amount than number of devices. During the same timeframe, Italy registered an increase of CT, MRI and PET units, although exams did not. However, the contraction of medical procedures during 2020 was crucial in defining this trend. Solely in Luxemburg, CT and PET examinations increased despite the reduction of scanners, whereas for MRI a reverse trend was reported.

Conclusion: According to our analysis, the exam-to-scanner ratio has grown in most of the countries involved, accounting for a raised amount of both exams and devices. Overuse is likely to be increasing worldwide, however these trends may reflect defensive medical decision making, or rather an improvement of diagnostic supply in response to a higher demand.

Healthcare costs of the progression of chronic kidney disease in patients with type 2 diabetes mellitus in Colombia

Luis Alvis Estrada¹, David Vivas Consuelo², Nelson Alvis Guzman¹, Fernando Salcedo Mejia³, Justo Paz Wilches⁴, Cartagena

¹Universidad de Cartagena, Colombia, ²Universidad de Valencia, España Spain, ³Alzak Foundation, ⁴Mutual Ser EPS, Colombia

Background: chronic diseases represent significant economic costs for health systems. The study of the costs associated with the care of these diseases helps to develop strategies to reduce the economic impact of these pathologies

Objective: To estimate the incidence and direct cost of care for chronic kidney disease (CKD) in patients with type 2 diabetes.

Methods: A survival analysis was performed with the Kaplan-Meier estimator, where the probability of the appearance of CKD is estimated. Direct costs were estimated in a cohort of 34,444 patients with type 2 diabetes mellitus over 4 years. The data on the costs were extracted from the database of patients registered with a health insurance company. A Markov chain model was built to measure the economic impact of the disease.

Results: 66% of the patients in the cohort are women. The average age of the patients is 59.4 years (SD = 12.5). CKD survival in the study cohort was 66%. The mean cost of patients with type 2 diabetes mellitus with CKD was US\$ 28,116 [US\$ 21,403 – US\$ 34,828]. Regarding chronic kidney disease transition costs, it is estimated that the discounted direct costs of care for the simulated cohort ranged from US\$ 62,599,647 to US\$ 190,157,827. However, by stages of CKD, the most expensive stage in average terms was CKD3b, where a higher prevalence of patients is recurrent in these stages.

Conclusions: The progression from diabetes mellitus to chronic kidney disease generates an escalation of costs that affects the health system.

Efficacy of low-level laser therapy in reducing local manifestations of bothrops atrox envenomations: a randomized clinical trial

Erica Carvalho¹, Lioney Cabral¹, Felipe Araujo¹, Andre Sachett¹, Andrea Souza¹, Dessana Melo², Altair Farias¹, Beatriz Rodrigues¹, Gabriela Ribeiro¹, Mariela Caggy¹, Wuelton Monteiro¹, Jacqueline Sacchet¹

¹Universidade do Estado do Amazonas, Brazil, ²Fundação de Medicina Tropical Dr Heitor Vieira Dourado, Brazil

Introduction: Antivenom is the only treatment that neutralizes the systemic effects of snake venoms. For local results, the inflammatory process of residual tissue damage remains. Laboratory research directs the use of laser therapy as a regenerative option for tissues. To evaluate the use of low-level laser in sites with the presence of Bothrops venom to minimize skin damage, reduce inflammatory effects, and reduce myonecrosis.

Methodology: The phase II A clinical trial was randomized and double-blind performed in patients who had bothropic accidents from May 2020 to March 2022, coming from Tropical Medicine Foundation Doctor Heitor Vieira Dourado. The study was carried out with 60 patients divided into 2 groups: 1. Control; 2. Those who Received laser 30 minutes after antivenom. The laser was applied to the skin lesions at 24, 48, and 72 hours in both groups at a dose of 4j/cm2, to the extent shown by thermography, in placebo with the device turned off. As outcomes, a 53.0% decrease in CK was obtained in the laser group while the control group increased by 35.0%, with p=0.03, thus evaluating myonecrosis.

Results: As for the outcomes of inflammatory signs, this clinical trial showed a decrease in pain on the third day of 33.0% in the control group, while the laser

group decreased by 66.0%, with a significance of $p=0.001$. Edema in extension measures decreased in the laser group by 21.0%, and in the control group, there was an increase of 15%, $p=0.006$. As for the circumference of the edema, the control group had an increase of 23% while the group that received the laser treatment showed a decrease of 29%, $p=0.018$.

Conclusion: The effects of low-level laser were positive in reducing the local pathological effects caused by snake venom of the *Bothrops atrox* genus and accelerating myotoxicity-related tissue regeneration.

How can public participation improve health equity? a case study comparison of citizens' juries and health impact assessment

Katie Hiron¹

¹RPS Consulting UK, PhD candidate, University of Edinburgh, 1 BOTHWELL STREET, Edinburgh, EH7 5PY, United Kingdom

Background and Objectives: For over thirty years we have known that social, environmental and political factors are the primary causes of health inequities[i] [1], yet policy efforts to improve these have largely failed[ii] [2]. To address this, recent initiatives have aimed to create 'healthier' policies by incorporating public perspectives in their design. While there has been increasing scholarship on public and patient involvement in healthcare delivery, there remains a lack of evidence on how public participation can affect health equity outside of healthcare settings.

Methods: This research examines how participatory processes affect health equity through changes to non-healthcare governance (such as social housing or infrastructure spending). This research was undertaken through qualitative comparison of four cases in the UK and Australia using two forms of public participation: health impact assessment and citizens' juries.

Results: The participatory processes generated governance and interpersonal outcomes. Outcomes were largely influenced by the context in which the process took place and the expectations of participants. Despite limited evidence of direct improvements to health, changes in governance structures that influence the social determinants of health have the potential to improve health equity.

Conclusion: Though evidence on public participation often focuses on perfecting the form, this research found that the technology was less relevant than other context-specific features. This comparative research can help to develop a better understanding of how public participation can improve health equity through examination of the mechanisms and context in which they take place.

Organizational setups and strategies for new healthcare models: integrated practice units

Alessandro Berionni¹, Angela Ancona¹, Roberta Pireddu¹, Hesham Gaafar², Fabrizio Vaccaro³, Carlo Signorelli¹, Verdiana Morando³

¹Università Vita-Salute San Raffaele, via martiri delle foibe istriane 7, Italy,

²WHO, Egypt, ³GSD Healthcare, Italy

Background: Throughout the whole care cycle, IPUs are positioned functionally around the health issue. A committed multidisciplinary team that operates as a unique organizational unit prioritizes the patients needs, offering various health services. This reviews objectives are to describe and examine IPUs, evaluate their effectiveness, and provide suggestions for future integration initiatives.

Methods: In March 2022, three search queries were introduced on different Academic Databases. Only 61 publications were chosen in a double-blind review by two separate researchers out of 1300 findings, using inclusion and exclusion criteria.

Results: "Integrated Care Model" and "Integrated Practice Units" were the most commonly used terms to allude to integration in the collected papers, 57% and 26%, respectively. 85% of the studies addressed chronic illnesses. Primary medical centres and tertiary facilities comprised the bulk of integrated delivery models, 51% and 49%, respectively. The most prominent professional category was the speciality consultant (80%). Only 16% of the initiatives had a well-defined finance model, with public funding predominating on private ones. Numerous research (82%) that primarily evaluated clinical outcomes demonstrated improved results. Conclusions: Research showed that care integration had a favourable effect on medical expenses and clinical results. IPUs continue to receive scant citations

in the literature, demonstrating a paucity of comprehensive and well-organized integration. Due to the underreporting of financial information, further study and work are required to fully understand values-based payments.

The extent of financial risk protection among households enrolled under national health insurance schemes in West Africa

Sydney Odonkor¹, Salma Mekkes², Ferdinand Koranteng³, Lorena Dini¹, Martin Appiah-Danquah⁴

¹Charité - Universitätsmedizin Berlin, Institute of General Practice and Family Medicine, Charitéplatz 1, 10117 Berlin, Germany, ²Charité - Universitätsmedizin Berlin, ³University of British Columbia, Life Science Institute, V6T 1Z3, Canada Germany, ⁴Parkside Hospital

Background: To facilitate the drive towards Universal Health Coverage (UHC) several countries in West Africa have over the years adopted the National Health Insurance (NHI) to finance their health services. However, most of these countries continue to face challenges safeguarding insured populations against catastrophic health expenditure (CHE) and impoverishment due to health spending. The aim of this review is to describe the extent of financial risk protection among NHI enrolled households in West Africa from published literature.

Methods: A systematic review of articles published in English between 2005 and 2022 was conducted. Articles were searched using keywords related to NHI and financial risk protection in all West African countries on PubMed/Medline, Web of Science and CINAHL, Embase and Google Scholar. Two independent reviewers assessed the articles for inclusion, extracted data and conducted quality assessment. A narrative synthesis consisting of thematic synthesis for qualitative data and Synthesis Without Meta-analysis (SWiM) for quantitative data was done.

Results: Of the 1,279 articles initially identified, nine were eligible for inclusion. These were cross-sectional studies ($n=8$) and retrospective cohort study ($n=1$) published between 2011 and 2021 in Ghana ($n=8$) and Nigeria ($n=1$). Two-thirds of the included studies reported enrollment into the NHI had a protective effect on CHE at different thresholds whereas one study reported a protective effect of NHI on impoverishment due to health spending. However, almost all of the included articles ($n=8$) reported that a proportion of insured households encountered CHE with one-third of included articles reporting more than 50% of insured households incurring CHE.

Conclusion: To protect insured households from the financial burden due to health spending in West Africa, governments should consider investing more in NHI research, implementing nationwide compulsory NHI programmes and establishing a multinational West African collaboration to design a sustainable context-specific NHI system based on solidarity and equity.

The costs of psoriasis and atopic dermatitis in Europe: a systematic literature review

Florian D'Ambrosio¹, Ada Maida¹, Ciro Pappalardo¹, Anna Scardigno¹, Anna Nisticò¹, Roberto Ricciardi², Giovanna Calabrò¹

¹Università Cattolica del Sacro Cuore, Roma, Section of Hygiene, University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²VIHTALI (Value In Health Technology and Academy for Leadership & Innovation), Spin-Off of Università Cattolica del Sacro Cuore, Rome, Italy

Background & Objective: Psoriasis and Atopic dermatitis (AD) are chronic, noncommunicable, painful, and disabling diseases included in the so-called group of inflammatory skin diseases. Their rising prevalence and consequent quality-of-life impairment represent an important but still underestimated public health issue. An assessment of their costs may be useful in providing recommendations for policy and decision makers, in order to avoid incorrect or delayed diagnosis, inadequate treatment options and insufficient access to care. Thus, this study aimed to summarize existing literature regarding the costs of psoriasis and AD in Europe.

Methods: A systematic literature review was performed querying three database (PubMed, Scopus, Web of Science) from January 2012 to October 2022. It included studies carried out in European countries, written in English language, and focused on the economic burden of psoriasis and AD in the adult population.

Results: Overall, 18 studies were considered. Across countries, psoriasis and AD were associated with large healthcare expenditures. Annual direct costs per patient with psoriasis, whose main expenses were hospitalizations, medications, and outpatient care, ranged between €4755,00 and €7999,00. Similarly,

pharmacological treatments, specialized care and hospitalizations contributed to total direct costs within a variable range of €3133,00-€5191,00 for AD patients. Mean out-of-pocket (OOP) expenditures to manage psoriasis and AD per patient per year were approximately €60,00-€531,00 and €350,00-€927,12, respectively. Productivity loss was the key driver of annual indirect costs, which amounted, per patient, to €379,00-€4221,00 for psoriasis and €370,00-€14.236,00 for AD. The severity of skin lesions, gender, age, and the involvement of comorbidity also affected the economic burden of these diseases.

Conclusion: The management of psoriasis and AD requires an urgent need for public health measures in Europe, in order to save personal and social resources. Assessing the burden of lifelong conditions could guide the identification of the most appropriate patient-centred responses.

The shift to domestic healthcare before and after COVID in South-East Tuscany

Sandro Limaj¹, Simona Dei², Maria D'Amato³, Roberto Turillazzi⁴, Gabriele Messina⁵, Nicola Nante⁶

¹University of Siena. Post Graduate School of Public Health, Italy, ²Azienda USL Toscana Sud Est, Health management, Italy, ³Azienda USL Toscana Sud Est, Tuscany, Italy, ⁴Azienda USL Toscana Sud Est, Tuscany, Italy. Health Management, Italy, ⁵University of Siena, Department of Molecular and Developmental Medicine, Italy, ⁶University of Siena

Background and Objectives: The South-Eastern area of Tuscany covers a wide surface but has a significantly low density of population. This scenario, alongside the COVID pandemic, has brought the Local Health Authority to find a solution and a governance model based on telemedicine and e-health, to treat patients in the domestic environment or close to it. Furthermore, creating a network of health professionals with different competencies and specialties proved crucial to allow them to work together. This study aims to describe how the South-Eastern Tuscany Local Health Unit tackled this issue while dealing with chronic patients before and after the COVID years.

Methods: After describing all the models created and adopted for the health governance in the area, we performed a retrospective study gathering data from our repositories, collected by the related software which were and are used during the selected timeframe, and we confronted them with the data from ARS Toscana. Results: 1/1/2020 to 31/05/2022, the LCA followed 12,6671 COVID+ patients, 32573 of whom were 65 years old or older. 976579 health services were performed, and 66 health residences were followed. Over 90% of COVID patients were treated in their own houses, with rates for mortality and lethality lower than the regional mean (197.79 vs 288.67, 0.54 vs 0.77)

Conclusions: The centralization of all data in a single repository allowed our COVID Central to coordinate patients, follow them constantly, to create a multidisciplinary team of different health professionals who can discuss and help each other to treat patients in their home setting, even the unstable ones, to prevent avoidable ER accesses. In the era of the new Community Healthcare Italian law (DM77), community medicine is going in the same direction: empowering telemedicine and an increased reach of health services and health professionals.

National recovery and resilience plan: a framework to strengthen the Italian territorial health care system

Domenico Mantoan¹, Alice Borghini¹, Mimma Cosentino², Ivano Leta¹, Marica Scotellaro¹, Maddalena Iodice²

¹National Agency for Regional Health Services (AGENAS) Via Piemonte 60, 00187 Rome Italy, ²National Agency for Regional Health Services (AGENAS)

Background and Objective: COVID-19 pandemic has highlighted the need to strengthen the capacity of the Italian National Health Service (NHS) to provide outreach health services, integrated with social services. In this context, Mission 6 Health Component 1 (M6C1) of the National Recovery and Resilience Plan (NRRP) 'Proximity networks, facilities and telemedicine for territorial health care' was developed. The NRRP-M6C1 aims to strengthen territorial health care through the creation of territorial facilities and proximity networks throughout the country, the strengthening of home care, the development of telemedicine and of a more effective integration between health and social services.

Methods: Italy issued Ministerial Decree No. 77/2022, as ratification of the reform planned by M6C1-NRRP, defining models and standards for the development of territorial care in the NHS. The reform defines services offered and operating hours, as well as health workforce personnel involved, and catchment area of the population served, starting from socio-health needs, orographic conditions of the

country, taking into account ecological and digital transition.

Results: By 2026, M6C1 investments and reform will provide a new territorial healthcare organization, described as follows: a) 1350 Community Health Houses, easily identifiable and accessible for health and social needs; b) 600 Territorial Coordination Centres, which coordinate the taking charge of the person and will facilitate the relations between services and professionals involved; c) 400 Community Hospitals, healthcare facilities of the territorial network characterized by short-term hospitalization and medium/low clinical intensity; d) the taking charge at home of 10% of the population over 65 years old (estimated at around 1,500,000 people in 2026); e) consolidation of telemedicine within the Italian NHS to improve health outcomes and equity.

Conclusion: Enhancing public primary care services across the country, through the NRRP resources, will improve overall health status and decrease health inequalities across population also by reducing geographical variation.

Healthcare Homes and Community Health Homes: strengthening community-based care to build resilient health systems. The case study of the Romagna Local Health Authority.

Chiara Reno¹, Chiara Reno¹, Irene Gabutti², Fiorella Lanzillotta¹, Ruben Biagini¹, Maria de la Rosa², Massimo Menozzi¹, Gabriele Gentilini¹, Tiziano Carradori³, Maria Fantini¹

¹Alma Mater Studiorum - Università di Bologna Department of Biomedical and Neuromotor Sciences Italy, ²Alma Mater Studiorum - Università di Bologna, ³Romagna Local Health Authority General Management Italy

Background and Objective: The Italian National Recovery and Resilience Plan and the National Decree (ND) n.77 boosted the reorganisation of community-based care focusing on Community Health Homes, an evolution of Healthcare Homes (HH), previously introduced in some Regions. The goal is to strengthen a population management approach. The aim of this study is to analyse the state of the art of the HH in the Romagna Local Health Authority (LHA) providing a picture before the implementation of ND n. 77.

Methods: A database with 130 variables describing the 38 HH of the LHA was built. The 38 HH were geolocalised, their Hub&Spoke networks mapped, and the organisation of General Practitioners (GPs) explored. An organisational analysis was performed for 7 HH through semi-structured interviews to key stakeholders. Results were validated with professionals.

Results: The territorial distribution of HH is variable. GPs are present in every HH, but 40% of the GPs operate outside these structures. 35 out of 38 HH have a nurse-led ambulatory for chronic patients. Informal communication with GPs and specialists is favoured by spatial contiguity. Occasionally, electronic platforms shared among professionals are available. Social services are present in less than half of the HH. Community building activities are present but vary depending on the context. The HH organisational manager is always a nurse, supported by a board with different professionals and institutional actors and varying strategic or operational functions. Of note, 80% of the considered HH are former hospitals. **Conclusion:** Different professional composition and managerial solutions emerged. Each HH is based on "contingent" pillars that affect organisational design. There is no one best way to organise services, rather a best fit: the trade-off between standardisation and personalisation must be found. This also implies the need of a monitoring and evaluation system to understand what works under which conditions.

Global and regional governance of One Health and implications for global health security

Olaa Mohamed-Ahmed¹, Azza Inaiem², Osman Dar¹

¹UK Health Security Agency (UKHSA) University of Oxford United Kingdom,

²Royal Free London NHS Trust

Introduction: The apparent failure of global health security to prevent or prepare for the COVID-19 pandemic has highlighted the need for closer cooperation between human, animal and environmental health sectors. However, the vast number of institutions, processes, regulatory frameworks and legal instruments with a direct and indirect role in the global governance of One Health, has led to a fragmented global multilateral health security architecture.

Methods: We used a grounded theory approach to identify and evaluate the structures and processes underpinning the global and regional governance of One Health, with a focus on legal and financial frameworks.

Results: We explore four challenges: first, the sectoral, professional and institutional silos and tensions existing between human, animal and environmental health;

second, the challenge which the international legal system, state sovereignty and existing legal instruments pose for the governance of One Health; third, the power dynamics, and asymmetry in power, between countries represented in multi-lateral institutions and its impact on priority-setting; fourth, the current financing mechanisms which predominantly focus on response to crises, and the chronic underinvestment for epidemic and emergency prevention, mitigation and preparedness activities. We illustrate the global and regional dimensions to these challenges and how they relate to national needs and priorities, through three case studies on compulsory licensing, the governance of water resources in the Lake Chad basin and the desert locust infestation in East Africa. Finally, we propose 12 recommendations for the global community to address these challenges.

Conclusion: Despite its broad and holistic agenda, One Health continues to be dominated by human and domestic animal health experts. Significant efforts must be made to address the socioecological drivers of health emergencies. These drivers include climate change, biodiversity loss and land use change and therefore require investment, capacity building and integration of other sectors and professionals beyond health.

The impact of two decades of conditional cash transfers on child health in Latin America: An integrated evaluation and forecasting analysis to mitigate effects of the economic crisis

Davide Rasella¹, Daniella Cavalcanti², Jose Ordoñez², Temidayo Aransiola¹, Cristina Almeida³, Juan Diaz⁴, Daniela Zuluaga⁴, Alejandro Zamudio⁵, Renato Tasca⁶, Tereza Campello⁷, Luiz de Souza², Philipp Hessel⁸, Carlos Chivardi⁹, Ana Moncayo³, Davide Rasella¹⁰

¹Institute of Collective Health (ISC) at the Federal University of Bahia (UFBA), Bahia, Brazil, ²Institute of Collective Health, Federal University of Bahia, Bahia, Brazil, ³Centro de Investigación para la Salud en América Latina (CISEAL), Pontificia Universidad Católica del Ecuador, ⁴Universidad de los Andes, School of Government Colombia, ⁵Health Research Consortium - CISDAT Mexico, ⁶School of Business Administration at the Getulio Vargas Foundation (EAESP/FGV) Brazil, ⁷Center for Epidemiological Research in Nutrition and Health. (NUPENS), at the University of São Paulo (USP) Brazil, ⁸Swiss Tropical and Public Health Institute, Department of Public Health and Epidemiology Switzerland, ⁹Center for Health Economics, University of York, United Kingdom, ¹⁰Institute of Global Health (ISGlobal), Barcelona, Spain

Background: The COVID-19 pandemic, Climate change, and Conflict/war(3C's) slowed down the progress of the achievements of the Sustainable Development Goals(SDGs), and they even reversed years of progress in child deaths. On the other hand, social programs can contribute to mitigating these effects. We aimed to investigate the effect of conditional cash-transfer programs(CCT) coverage on child health in Latin-America and the Caribbean(LAC) and forecast the relationship between these programs and under-five mortality rate(U5MR) up to 2030 in the context of the 3C's and current global economic crisis.

Methods: This study has a multicountry municipal-level design, covering 7,204 municipalities in Brazil, Ecuador, and Mexico(BEM). We estimated the impact of CCT target coverage on child hospitalizations and mortality, adjusting for relevant factors, using fixed-effects negative binomial models in 4,882 municipalities with adequate quality of civil registration and vital statistics(CRVS) from 2000-19. Several sensitivity analyses were performed to warranty the robustness of results, including difference-in-difference(Diff-in-diff) with propensity-score matching(PSM) like a triangulation approach. Thereafter, we integrated this with validated dynamic microsimulation models, projecting U5MR trends for 7,204 municipalities up to 2030.

Results: High coverages of CCT programs were associated with a statistically significant reduction in child, infant, and post-neonatal mortality rates, with rate ratios(RR) of 0.76(95%CI:0.75-0.76), 0.73(95%CI:0.72-0.73), and 0.69(95%CI:0.68-0.70), respectively; avoiding 738,919(95%CI:695,641-782,104) child deaths between 2000-19 in the hypothetical case these programs did not exist. The effect of consolidated CCT coverage was highest on poverty-related U5MR such as malnutrition 0.33(95%CI:0.31-0.35), HIV-AIDS 0.32(95%CI:0.28-0.37), diarrhea 0.41(95%CI:0.40-0.43), and lower-respiratory infections 0.66(95%CI:0.65-0.68). Considering a scenario of moderate economic crisis, a mitigation strategy that increases the coverage of CCT proportionally to the increase of poverty could avert 114,513(95%CI:93,846-135,896) deaths by 2030.

Conclusion: CCT could strongly reduce childhood hospitalization and mortality in LAC and their expansion should be considered an effective mitigation strategy for the adverse health impact of the current global economic crisis.

Introduction: In 2017, in order to overcome regional inequalities related to healthcare, Regional Health Polyclinics (Policlinicas Regionais de Saúde: PRS) were set up in the state of Bahia. These were principally aimed at filling the gap between Primary and Hospital Healthcare by providing specialized services of medium and high complexity.

Aim: To assess the effectiveness of the implementation of PRS in 8 health regions in the state of Bahia.

Methods: An impact assessment of the polyclinics was undertaken using municipal-level health indicators, which were followed over time, from January 2015 to December 2019. Two groups were defined, a border treatment group, which assessed, between 2017 and 2019, municipalities that belong to one of the 8 regional polyclinics and are located at the consortium's geographical boundary, creating a border with the non-treatment municipalities; and a border control group, containing municipalities that do not belong to any of the polyclinics we assessed, but share a border with those that do. We used Difference-in-Difference and Event-Study approaches to capture the effect of the PRS.

Results: The PRS were seen to be effective locally. Medium and high complexity care increased by 14.8% and 32.3% respectively within the treatment municipalities compared to the controls. There was also an increase in the number of diagnostic procedures, for example MRI and echocardiography, which increased by an estimated 79.1% and 60% respectively. There was a reduction in urgent admissions (-4.5%, or -14 admissions per quarter), admissions due to preventable causes of death (-3% or -6 admissions per quarter) and their respective filtering for urgent admissions due to diseases with a preventable cause of death (-3.4%, or -5 admissions per quarter).

Conclusion: The polyclinics we assessed are effective and have had a positive impact on improving access to specialized outpatient care, with consequent reductions in admissions and deaths."

Popul. Med. 2023;5(Supplement):A1791

Are hospital beds endowment a driver of patients' migration?

Giovanni Guarducci¹, Giovanni Guarducci¹, Simona Carbone², Gabriele Messina³, Nicola Nante³

¹University of Siena Post Graduate School of Public Health, University of Siena, Italy Via Aldo Moro, 2 - 53100 Siena (SI) Italy, ²Ministry of Health, ³University of Siena Department of Molecular and Developmental Medicine, University of Siena, Italy Via Aldo Moro, 2 - 53100 Siena (SI) Italy

Background and Objective: In a decentralized healthcare system like the Italian, where regions are in a potentially competitive regime since citizens are free to choose their place of treatment, healthcare migration is particularly relevant. The study aims to analyze the fulfilment of the need for hospital rehabilitation services on site and to assess whether bed endowment is a driver of patients' migration.

Methods: From 2011 to 2019, admission data for rehabilitation were collected from the Hospital Discharge Cards database of the Italian Ministry of Health (IMH). For the same period, data of bed endowment were collected from the website of IMH and population data from the Italian National Institute of Statistics website to calculate the number of beds (NB) x 1,000 inhabitants. For each region, data on Residents, Attractions and Escapes were developed through Gandys Nomogram and summarised through Attraction (AI) and Escape (EI) Indexes. NB x 1,000 inhabitants were correlated with AI and EI through Spearman's test.

Results: Gandy's Nomogram showed that only Piedmont, Lombardy, A.P. of Trento, Veneto had good hospital planning for rehabilitation. A statistically significant correlation ($p < 0.05$), between AI and NB x 1,000 inhabitants was found for Veneto ($\rho = 0.7000$), Latium ($\rho = 0.7333$), Molise ($\rho = -0.8667$) and Basilicata ($\rho = 0.8500$), while between EI and NB x 1,000 inhabitants were found for A.P. of Bolzano ($\rho = -0.667$), E.Romagna ($\rho = -0.7000$), Umbria ($\rho = -0.6667$), Latium ($\rho = -0.8333$), Molise ($\rho = -0.7333$), Basilicata ($\rho = 0.7667$), Calabria ($\rho = -0.7776$) and Sicily ($\rho = -0.9500$).

Conclusion: Only four regions appear able to satisfy the care needs of their Residents, with an Attractions minus Escapes positive balance. The beds' endowment seems to be a driver of Patients' migration, mainly for escapes. Indeed, the research of Patients' migration drivers needs further investigation, given the paradoxical situation that appeared in Molise and Basilicata.

Hunters' behavior change preferences and perceived risk of Tuberculosis and Brucellosis infection from bison in Canada

David Hall¹, Louise Caplan¹, Kyle Plotsky¹

¹University of Calgary Canada

Background and Objectives: Although Canada is officially free of bovine tuberculosis (bTB) and brucellosis, wood bison in Wood Buffalo National Park are a known reservoir of these and other zoonotic diseases. Several issues complicate the situation: wood bison are a threatened species; the species is an important cultural and food resource for indigenous communities; and the zoonotic diseases pose an economic and public health risk. As part of a larger project, we wanted to know if hunters would change behavior based on proximity to infected bison. Methods: We investigated potential influences on Alberta hunters' stated willingness to change (WTC) their hunting practices in response to a hypothetical case of a zoonosis in a species they hunt. We anticipated significant predictors would include demographics, risk perceptions, and knowledge of zoonoses. A questionnaire link was distributed to 100,000 hunters in Alberta exploring opinions on managing wood bison health; 139 useable responses were evaluated. Hunters' were asked how close an animal infected with bTB or brucellosis could be before hunters would change hunting practices. Risk awareness was calculated as an aggregated score from questions addressing bTB and brucellosis impact on health and economic livelihood; knowledge was similarly based on questions evaluating knowledge of bTB and brucellosis.

Findings: Results of multiple variable linear regression models show significant predictors of WTC ($p < 0.05$) include income, knowledge of brucellosis and tuberculosis, and threats to hunting opportunities. Age and education were not significant predictors.

Discussion and Conclusions: Although hunters show WTC practices, they were not as sensitive to risk of zoonoses as we expected. Part of the reason may be a false sense of ability to recognize a bTB+ve animal without laboratory confirmation. Our research provides important findings addressing potential policy support that engages hunters in wildlife conservation and their willingness to engage in the particular supportive behaviors.

Popul. Med. 2023;5(Supplement):A1793

DOI: 10.18332/popmed/164207

A sustainable resource management model: Establishment of an orphan drug-day for the administration of patisiran

Margherita Cozzio¹, Alessandro Melis¹, Marco Montalti¹, Pasquale Siravo², Donatella Scarlattei², Flavia Lioi², Andrea Ziglio³

¹Hygiene Unit, Department of Biomedical and Neuromotor Sciences, University of Bologna Via San Giacomo 12, 40126, Bologna, Italy,

²Pharmaceutical Department IRCCS Istituto delle Scienze Neurologiche di Bologna - AUSL Bologna Via Altura 3, 40139, Bologna, Italy, ³UOC Health Management IRCCS Istituto delle Scienze Neurologiche di Bologna - AUSL Bologna Via Altura 3, 40139, Bologna, Italy

Background and Objective: Patisiran is the first therapy based on short interfering RNA technology indicated for a lifelong treatment of hereditary transthyretin-mediated amyloidosis. It is administered through intravenous infusion at a dosage of 0.3 mg/kg of body weight (KBW) once every three weeks. Patisiran is supplied in single-use 10 mg/5mL vials, and any drug residues must be disposed of immediately; it is sold at an ex-factory price of €8,529.41/vial.

This work aims to demonstrate how unifying patisiran administration sessions on a single day ('Drug-Day') for patients followed by different clinicians is advantageous for containing pharmaceutical expenditure.

Methods: We conducted an observational study in an Italian Research Institute for Neurological Sciences (ISNB) in the period between February 2021 and November

2022, divided into two phases: Phase 1 (February 2021-March 2022) and Phase 2 (April-November 2022), corresponding to before and after the establishment of Drug-Days, respectively. Applying this model (Drug-Day), at the beginning of Phase 2 at the ISNB the nine patients undergoing treatment with patisiran were divided into two groups for two distinct drug administration sessions according to their body weight: the sum of the total body weight of each group was a value very close to a multiple of 33 (each vial covers 33.3 KBW).

Results: During Phase 1 patisiran monthly wastage was on average 9.2% of the vials used; during Phase 2, we recorded a drug wastage of 1.8%.

The data collected show that this strategy resulted in a saving of €27.29/KBW/administration and €32,480/model patient (70 KBW)/year (corresponding to 3.8 vials).

Conclusion: This study showed that careful management of drug administration sessions, by reducing the leftover drug, allows creation of a more economically sustainable model and redirection of resources.

Therefore, a multidisciplinary collaboration between different professionals is necessary for implementation of strategies to make pharmaceutical spending more sustainable.

Delivering prevention in an ageing world: the healthy ageing and prevention index

Arun Himawan¹, Patrick Swain¹

¹International Longevity Centre UK United Kingdom

Introduction and objectives

People are living longer but not necessarily healthier, resulting in significant health and economic costs. Yet policy makers continue to fail to invest in preventative health, with OECD countries spending on average only 3% of their health budgets on prevention. Our global initiative will:

- * Hold Governments to account by tracking progress on prevention through the launch of a digital Healthy Ageing and Prevention Index.

- * Demand action by forming a Global Coalition with leading organisations

Methods: * Our Index ranks 118 countries on six dimensions (life, health and work span, income, the environment and happiness). Data is obtained from: United Nations; World Bank; World Health Organisation; International Labour Organisation; and Yale.

- * Our coalition will elevate the importance of prevention among global actors and respond to key calls to action.

Results: * We've ranked countries using 2019 data – the most complete dataset currently available. We are currently developing the online tool.

- * We have identified the top 100 stakeholders to invite to join the Coalition. Invitations will be sent out before the new year.

Conclusion: With the Decade of Healthy Ageing and the European Union revising its Global Health Strategy, we're presented with an important opportunity to drive change. We will hold a series of global policy forums to get commitment from senior policymakers and key stakeholders to drive action. Last month, we held a policy debate at the House of Lords on the future of healthy ageing ahead of G20 in India. We aim to launch the Index and Coalition alongside the 76th World Health Assembly.

The community pharmacy integration in colorectal cancer screening: the Italian model

Silvia Deandrea¹, Silvia Deandrea², Petra Valle³, Francesca Battisti⁴, Paola Brusa⁵, Paola Mantellini⁶, William Mantovani⁷, Elena Narne⁸, Anna Odone¹, Carlo Senore⁹

¹Pavia Health Protection Agency, Pavia, Italy, ²Pavia Health Protection

Agency, Directorate General for Health Pavia Health Protection Agency,

Pavia, Italy, ³University of Pavia, Pavia, Italy, ⁴Istituto per lo Studio, la

Prevenzione e la Rete Oncologica, ⁵Dipartimento di Scienza e Tecnologia del

Farmaco, Università degli Studi di Torino, Torino, Italy, ⁶Istituto per lo Studio,

la Prevenzione e la Rete Oncologica, Firenze, Italy, ⁷Azienda Provinciale per

i Servizi Sanitari di Trento, ⁸Azienda Zero, Padova, Italy, ⁹AOU Città della

Salute e della Scienza di Torino, Torino, Italy

Background and objective: Despite its effectiveness, compliance to colorectal cancer (CRC) screening remains low. Different strategies to improve uptake are available, including the involvement of stakeholders such as the community pharmacists. In Italy a recent national initiative developed this strategy, scaling-up the collaboration between pharmacies and screening programs from the local level up to the national level.

Methods: The regional representatives of the CRC screening programs provided to the National Screening Monitoring Centre the agreements arranged between the Regions/Autonomous provinces and their respective pharmacy owners representatives. The agreement decrees were analysed describing the fecal occult blood test pathway (e.g. kit supply and delivery) and supplementary activities provided by the pharmacies together with the CRC screening kit delivery, such as health promotion.

Results: Eighteen Regions and Autonomous provinces (86% of the total) provided requested data. The amount paid for each kit varies a lot, with a range from 0 to 18 EUR. The number of kit pathway processes covered by the agreements ranged from a maximum of 16 (out of 18) to a minimum of none. Processes more frequently included were the supply of the kit, the delivery of the kit, and education/awareness of CRC screening (68.8%), followed by sample transfer to the laboratory, test tube tracing and counselling (62.5%). Less covered processes were the warehouse management and awareness of other healthcare initiatives (12.5%); a supplementary agreement on delivery of preparation for intestinal cleansing was included only once.

Conclusions: The Italian model showed good potential for collaboration, but the lack of a unique collaboration model. Integration of pharmacies in CRC programs is promising and quality standards of the service should be set at international level.

The experience of approaching child labor in a Brazilian public school

Michelly Andrade¹, Camila Nascimento², Bruna Silva³, Carla Chamouton³, Helenice Nakamura²

¹University of Campinas - UNICAMP Luso Ventura Street, number 410.

Jardim Santa Genebra. Campinas - São Paulo. Code Zip: 13080-170. Brazil,

²University of Campinas - UNICAMP, ³University of Campinas - UNICAMP Brazil

Background and objective: In Brazil, child labor is defined as being carried out by children or adolescents under the age of sixteen years old, except in cases of minor apprentices programs. However, according to data from 2019, 1.8 million children and adolescents are working in Brazil. The complexity of the reality experienced by children and adolescents in front of work mobilizes the engagement of various governmental and non-governmental agencies and institutions for the eradication and prevention of child labor, as well as actions to encourage learning. The objective of the present work is to present the experience of a health promotion action developed by Speech, Language and Hearing Sciences undergraduate students about child labor in one Brazilian public school.

Methods: The activity was developed as part of a practical discipline of worker's health in a Speech, Language and Hearing Sciences undergraduate course. The selected public school is located in an area of high social and economic vulnerability. The actions included a theoretical discussion about child labor and its health repercussions, the pact with the school board and the planning of the strategies to approach the students.

Results: Ten Speech, Language and Hearing Sciences undergraduate students conducted the activities in which 300 students, between nine and twelve years, participated. The approach consisted of defining what child labor means and the repercussions of work for children and adolescents, impacting health, education, and the future. The undergraduate students evaluated the experience as being important for developing specific knowledge and communication abilities. The school board perceived the importance of discussing child labor and saw their students using the new information in their daily lives.

Conclusion: Child labor is a matter to be discussed and approached in health and educational institutions, considering its repercussions on all aspects of children's lives and their future possibilities.

Economic impacts of covid-19 on patients with type 2 diabetes in Tanzania and Kenya: a costing analysis

Caroline Karugu¹, Peter Binyaruka², Shukri Mohammed¹, Richard Sanya¹, Sally Mtenga², Gershim Asiki¹, Eleanor Grieve³, Manuela Diedda³

¹African Population and Health Research Centre (APHRC) APHRC Kenya,

²Ifakara Health Institute, ³University of Glasgow United Kingdom

Introduction: Globally, healthcare systems were adversely affected by the COVID-19 pandemic. COVID-19 affected healthcare access, utilization, and affordability, especially for patients suffering from chronic diseases including diabetes. We estimated direct healthcare costs among patients with type 2 diabetes in Kenya

and Tanzania.

Methodology: This cross-sectional study was conducted in Kenya and Tanzania in March-June among 1000 patients with type 2 diabetes (500 in each country). Data entailed the direct healthcare costs, societal costs, and other clinical and social variables for the period before COVID-19 and during the pandemic. The main outcome was the total direct healthcare costs, while the primary predictor was the time before and after COVID-19 adjusted for patient sociodemographic and clinical factors. A generalized linear regression model (GLM) was used in Kenya, while the Two-part model (logit + GLM) was used for Tanzania to identify predictors of costs.

Results: A small non-statistically significant increase in total direct costs was observed in both countries. The mean direct healthcare costs for patients with type 2 diabetes in Kenya and Tanzania during COVID-19 increased to Kshs. 5,267.0(0-60,000) and TZshs. 17075.8(0-180,800), respectively. Type 2 diabetes testing costs increased significantly in both countries (Kenya: increase by Kshs. 567(233.56), $p<0.05$); Tanzania TZshs.754 (144.20), $p<0.01$). Outpatient costs increased substantially in Tanzania (TZshs. 902.50(2,151.79), $p<0.01$, but decreased significantly in Kenya (Kshs. 385(370.34), $p<0.05$). Type 2 diabetes medication costs decreased significantly in Kenya: increase by the amount (SE) of Kshs. 649.49(289.32), $p<0.05$, but the decrease in Tanzania was not statistically significant (TZshs. 166.20(568.02), $p>0.01$).

Conclusion: Overall, all costs increased slightly over time in Kenya and Tanzania illustrating that the COVID-19 pandemic situation has some impact on patients' management of diabetes. Economic measures and policies should be implemented to improve the funding and financing of patients with chronic conditions in East Africa during emergencies and pandemics.

Relations between the public administration and the private sector in the contracting of health services in a hospital complex in the city of Rio de Janeiro, Brazil

Tiago de Carvalho¹, Mônica Morangueira¹

¹Hospital Municipal Evandro Freire Brazil

Background, objective: The Brazilian Public Health System, provides in its Organic Law the actions of the private sector in health. The public administration partners with the private sector to manage the provision of assistance to the population. The objective is to present the conflicting relationships due to the scarcity of resources and the impacts of this on access and quality of care for the population. **Methods:** Michel Porters Value equation model was used, presenting strategies to improve quality and reduce costs considering the scarcity of resources in public health, applied in the management of the Evandro Freire hospital, which is composed of an emergency room and a hospitalization.

Results: In the midst of a scenario with restrictions on the minimum functioning of the services contracted by the partnership with the municipal administration, measures were adopted based on a decision matrix, namely: alignment of processes, people and technologies; turnaround to increase operational excellence and reduce the variability of indicators. As a result, there was a gain in production and an increase in the quality of care expressed by care indicators such as the reduction of institutional mortality through the management of care protocols, in addition to the reduction of costs and engagement with the purpose of delivering a result of value to the community. user population of the Public Health System. **Conclusion:** Despite the conflicting situations between the public administration and the hospital complex management operation in fundraising, the implemented measures impacted the work process and the quality of care provided to the population. The differentiated position with the public power for the recognition of the quality services generated possibilities of negotiation in the partnership of the successful results. Concluded that despite the weakening of public health policies in Brazil, it is possible to deliver valuable results for users Public Health System.

Public health actions implemented by the Lombardy Region to revamp cervical cancer prevention

Silvia Deandrea¹, Chiara Marrocu², Sudwaric Sharma², Roberta Lattanzio², Giovanni Cicconi², Sara Piccinelli², Danilo Cereda¹, Catia Borriello¹, Silvana Castaldi², Riccardo Vecchio², Gaia Ferraguzzi²

¹Directorate General Welfare Region Lombardy Italy, ²Postgraduate School in Public Health, Department of Biomedical Sciences for Health, University of Milan

Introduction: In Italy in 2020, 2,400 new cases of cervical cancer were diagnosed, equal to 1.3% of all cancers occurring in women.

Even though organized cervix screening was part of the Italian Essential Levels of Assistance (LEA), it was not actively offered in Lombardy Region, where opportunistic screening was more widespread. Instead, an active papillomavirus vaccination campaign was in place. This study aims to describe the public health strategies adopted in the Lombardy Region to revamp cervical cancer prevention. Methods: To achieve this goal, crucial regulatory acts were implemented. Some of these are:

- Issue of the Regional Prevention Plan 2021-2025 (DGR 5389 of 18/10/2021).
- Inclusion of screening programs among the performance evaluation objectives of the General Directors of the Health Protection Agencies (ATS) and the Local Social Healthcare Agencies (ASST) (DGR 5832 of 29/12/2021)
- Creation of the "Regional Oncological Screening Multidisciplinary Coordination" and of the "Cervix Working Group" (Decree 2125 of 22/02/2022)
- Launch of the primary screening pilot project for the prevention of cervical cancer using self-collected sampling combined with the HPV test (DGR 7435 of 11/30/2022)

Results: As a result of the above actions, significant results were obtained:

* Primary prevention goal: active invitation of the 1997 cohort to vaccination on their first screening appointment, which led to a 32.4% vaccination coverage in this cohort

* Secondary prevention goal: 153,703 invitations to HPV screening

* Issue of a guidance document covering all aspects of the screening pathway, from laboratory to follow-up management

Conclusions: The Lombardy Region has successfully initiated the screening for cervical cancer with ongoing roll-out, expecting a complete invitation coverage in few years.

New goals in perspective include expanding the free offer of the vaccine to young women between 18 and 25 years of age and increasing overall immunization coverage.

A conceptual framework to evaluate the socioeconomic impact of in-silico models for implantable medical devices

Siegfried Eisenberg¹, Miriam Reiss¹, Thomas Czipionka¹, Markus Kraus¹, David Rösler¹

¹Institute for Advanced Studies Vienna Austria

Background/Objectives: The use of in-silico technologies in the development of implantable medical devices has gained importance in the last decade, but impacts on the economy and society have been hardly investigated. As part of the EU-funded project SIMCOR, we therefore developed a conceptual framework to describe the impact channels from primal effects along the product development cycle to numerous socioeconomic endpoints.

Methods: We applied an iterative process to build concepts from data and set them in relation to each other using the method described in Jabareen (2009). Information from a scoping review of the literature were complemented with expert interviews from academia, companies and regulatory bodies. Repeated steps of literature work, exploratory interviews and frequent discussion sessions among the research team led to the presented framework. The resulting framework was validated through feedback from experts.

Results: The conceptual framework describes the whole chain of impacts from the technical changes brought about by the use of in-silico technologies along the product development cycle up until the socio-economic endpoints. These are allocated to four different levels, namely 'Firm', 'Market', 'Health System' and 'Society'. The conceptual framework indicates that in-silico methods could not only accelerate product development and reduce costs, but also patient safety is expected to be improved, innovations are supported and the price for a medical treatment might decrease. Underrepresented patient groups may also benefit from the use of the technology, as it expands the possibilities to augment the number of individuals in clinical trials and model rarer anatomical configurations. Conclusions: The conceptual framework serves as a basis for the quantification of the impacts of in-silico technologies on firm, market, health system, and society and, consequently, the potential benefits as well as disadvantages can be estimated and better classified from different perspectives.

Dots therapy as an "idealized body" making project: Participation of pulmonary tuberculosis patients in the national tuberculosis control program (ntp) of Bangladesh

Sudipta Gupta¹, AFM Zakaria¹

¹Shahjalal University of Science and Technology, Sylhet Bangladesh

The fight against TB has a long history in Bangladesh since 1965. By 2007, NTP reached 100% DOTS coverage nationwide, with a 96% success rate of tuberculosis treatment in Bangladesh. Additionally, TB care coverage improved to 81% in 2019. We employ the concept of Biological Citizenship to critically examine the mechanisms of creating and turning pulmonary tuberculosis patients into "Idealized Body" through governing techniques of DOTS therapy in Bangladesh. This study followed a Focused Ethnographic Study (FES) approach, including 28 In-depth Interviews and 16 key informant interviews with TB patients, caregivers, community people, and TB healthcare officials, along with multiple short field visits, direct observations, and relevant document review. The study took place in the urban settings of Sylhet city, Bangladesh, and the participants were selected purposively. Based on the existing TB control program implemented by government organizations and non-government organizations to understand the notion of the pulmonary TB healthcare-seeking and providing process and its effect on the pulmonary TB patients as 80% of TB in Bangladesh are pulmonary Tuberculosis. Our study highlights how pulmonary tuberculosis patients are disciplined, governed, and turned into "Idealized Bodies" through DOTS therapy. The DOTS therapy for Tuberculosis emphasizes self-management, individual responsibilities, health optimization, and disease prevention. Our study showed that the governing mechanisms of DOTS therapy help pulmonary TB patients to understand the disciplinary mechanisms currently effective in DOTS therapy in Bangladesh to make a self-disciplined patient that eventually and gradually turns into an "Idealized Body."

The comprehensive health impact of cash transfer, social pensions and primary health care in Brazil: An integrated evaluation and forecasting analysis to mitigate the effects of the global economic crisis

Jose Ordoñez¹, Temidayo Aransiola², Davide Rasella³, Jose Ordoñez¹, Daniella Cavalcanti¹, Temidayo Aransiola⁴, Phillip Hessel⁵, Ana Moncao⁶, Carlos Chivardi⁷, Alberto Sironi², Renato Tasca⁸, Tereza Campello⁹, Romulo Souza¹⁰, Gulnar Silva¹¹, Felipe Rubio², Luis de Souza¹², James Macinko¹³

¹Federal University of Bahia Federal University of Bahia Brazil, ²Federal University of Bahia, Brazil, ³Institute of Collective Health (ISC), Federal University of Bahia (UFBA), Brazil, ⁴Federal University of Bahia, ⁵Swiss Tropical and Public Health Institute, Department of Public Health and Epidemiology Switzerland, ⁶Centro de Investigación para la Salud en América Latina (CISEAL), Pontificia Universidad Católica del Ecuador Ecuador, ⁷Center for Health Economics, University of York, UK, ⁸School of Business Administration at the Getulio Vargas Foundation (EAESP/FGV) Brazil, ⁹Center for Epidemiological Research in Nutrition and Health. (NUPENS), at the University of São Paulo (USP) Brazil, ¹⁰Fiocruz Brazil, ¹¹Universidade Estadual de Rio de Janeiro Brazil, ¹²Institute of Collective Health, at the Federal University of Bahia (ISC-UFBA) Brazil, ¹³University of California, Los Angeles (UCLA) United States

Background: In the past few years, Brazil has implemented some of the world's largest Conditional Cash Transfers (Bolsa Família Program -BFP), Social Pensions (Benefício de Prestação Continuada -BPC), and Primary Health Care (Family Health Strategy -FHS). We evaluated their impact on morbidity and mortality indicators over the last two decades. We then forecasted their mitigation effects on the adverse health impact of the economic crisis due to the COVID-19 pandemic.

Methods: In the retrospective impact evaluation, we used fixed-effects negative binomial models with a cohort of Brazilian municipalities from 2004-19 to estimate the impact of BFP, BPC, and FHS coverage on hospitalizations and mortality, adjusted for all relevant demographic, social, and economic factors. Subsequently, we integrated the longitudinal dataset and parameters with validated dynamic microsimulation models, projecting hospitalization and mortality trends up to 2030 according to different intensities and durations of the economic crisis, and alternative policy responses.

Findings: Consolidated coverages of BFP, FHS, and BPC were associated with a statistically significant reduction of overall age-standardized mortality rates. Stronger effects were found for under-five mortality, with RR of 0.87 (95%CI:0.85-0.90), 0.90(95%CI:0.88-0.93), and 0.84(95%CI:0.82-0.86), respectively. A significant impact was also found on over-70 mortality and hospitalizations. Considering a scenario of moderate economic crisis, a mitigation strategy that will increase the coverage of BFP, FHS, and BPC proportionally to the increase of poverty will avert 778,845 (95%CI: 665,074-893,674) deaths and 10,780,108 (95%CI: 8,003,123-13,523,359) hospitalizations by 2030, if compared with the current coverage trends, and 1,424,624 (95%CI: 1,264,552-1,587,859) deaths and 15,656,283 (95%CI: 11,963,641-19,358,468) hospitalizations, if compared with

scenarios of fiscal austerity.

Interpretation

Cash transfers, social pensions, and primary health care could strongly reduce morbidity and mortality in low and medium income countries, and their expansion should be considered as an effective mitigation strategy for the adverse health impact of the current economic crisis.

Background & Objective: The incidence of cutaneous malignant melanoma (CMM) has continued to rise with predominantly fair-skinned populations in recent decades. The introduction of innovative therapies has resulted in a rising burden on healthcare resources for this condition. This study analyzes potential drivers of the direct costs of healthcare services for the melanoma patient care pathway.

Methods: A cohort study was conducted, based on all CMMs collected in 2015 and 2017 by the Veneto Cancer high-resolution registry of incident cases of melanoma (RTV). Costs were assessed from the perspective of the Italian national health system. Each patient was linked via an anonymous unique identification code to all administrative data regarding their hospital admissions, day hospital service usage, drug prescriptions, admission to the emergency room, medical devices used at home, ambulatory services, and hospice admissions. The data used to calculate the melanoma-related costs spanned from one year before the diagnosis to four years afterwards. Data were stratified by age, sex, tumor characteristics (TNM stages and histologic subtypes), and survival time.

Results: The cost analysis showed that expenditure peaked in the first year after diagnosis and then decreased over time. Males incurred higher costs, especially during the peak (+37%). Stratifying by TNM stage, the average melanoma-related expenditure for stage I was 15 times lower than for stage IV. The largest cost item was for drugs, except for stage I disease. The nodular subtype was associated with higher costs.

Conclusion: Hospitalization, inpatient drugs, and outpatient visits emerged as the main cost items for CMM patients. The cost of hospital stays was higher in the first year after diagnosis. In subsequent years, spending of hospitalization decreased and spending on drugs increased proportionally.

Significant differences in the average costs over the 4 years after diagnosis depended on tumor's anatomopathological features, stage of disease, and patients' sociodemographic characteristics.

Opportunistic hepatitis c screening in emergency department to curb undiagnosed fraction

Antonello Agostini¹, Angelo Baggiani², Caterina Rizzo¹, Lara Tavoschi¹

¹Università di Pisa Italy, ²Università di Pisa

Background and objective: WHO(World Health Organization) aims at eliminating HCV(Hepatitis C Virus) by 2030. To reach the purpose increase testing activity is required in order to reduce undiagnosed fraction. Screening performed in hospital settings and Emergency Department(ED) in particular has the potential to reach large number of individuals, including those with suboptimal access to healthcare services.

Methods: We searched in PubMed, Scopus and Google Scholar the keyword HCV and screening and hospital. We included articles published between 2013 and 2022 dealing with HCV hospital or ED screening activities in European Countries.

Results: We found 27 articles across 7 countries.

According to two United Kingdom cost-effectiveness studies, HCV screening is cost-effective in high prevalence areas, and is likely to be so in low prevalence areas.

Subnational studies focusing on opportunistic screening in ED(n=15) were performed in Belgium,Germany,Ireland,Italy and UK. Included individuals were 15 years or older. The rate of new HCV diagnosis(i.e HCV RNA+ or HCVAg+)ranged from 0.08% to 0.75% in UK

Subnational studies focusing on opportunistic screening among hospitalised individuals(n=10) were carried out in Germany, Italy,Poland,Romania. Patients included were aged 0-104 years. In Germany, Italy, Spain studies focused on pre-surgical screening. In Italy, Poland, Romania and Spain studies focused on individuals hospitalised for different reasons, including three studies on SARS-CoV2 patients. New HCV diagnoses rate(i.e HCV RNA+) ranged from 0.02% in Germany to 0.37% in Italy, where new diagnoses represented the 38.59% of the total.

Conclusion: ED screening resulted cost effectiveness in high prevalence areas. HCV opportunistic screening in hospital settings is effective in identifying previously undiagnosed individuals, including those with suboptimal access to preventive healthcare services. Policy makers could evaluate whether to promote ED screening in order to reduce the undiagnosed fraction

Primary healthcare and health district : Regulatory, functional and application aspects

Elisa Gabrielli¹, Mara Morini²

¹University of Bologna Alma Mater Studiorum University of Bologna Bologna Italy, ²SIIt

Background and Objective: The Health District in Italy is an organizational unit of the Local Health Authority system. It is deputed to analyze the District healthcare needs, plan economic and technical healthcare resources, and monitor healthcare services, according to the "Health Needs Assessment" model. During years the functions of the Health District have constantly evolved and now in consideration of the large European investments (PNRR) we would analyze with this article the challenges for a future Health District.

Methods: In the present paper we analyzed the legislation during the year on Health District function, governance and healthcare management. We collected the Italian population features on ISTAT data. We identified the best practices for a new Health District paradigm.

Results: From a regulatory perspective, the functions of the Health District have constantly evolved since it was established in 1978, and they currently include production, governance, purchasing, planning, guarantee towards citizens and integration between territorial and hospital healthcare services.

The Health District represents the practical application of the Primary Health Care founding principles and it can best respond to the peculiar Italian epidemiological and social setting. Given the progressive aging of the Italian population coupled with the increase in chronic diseases, the growth of small nuclear families that struggle to assist their sick elderly people and the rise in healthcare costs, a paradigm change is necessary to help move towards health promotion and disease prevention, as well as to implement strategies of healthcare co-production and community building.

Conclusion: In the current post-pandemic scenario and in consideration of the large European investments (PNRR), it is crucial for the Italian Health System to focus on the Health District organizational structure, and to identify and share its best practices in order to effectively respond to community social-clinical needs and improve the territorial healthcare services.

Understanding the normative leadership of the world health

organization (who): a mixed-method approach

Catherine Regis¹, Miriam Cohen¹, Jean-Louis Denis¹, Pierre Larouche¹, Gaëlle Foucault¹, Marie-Andrée Girard¹

¹Université de Montréal Canada

Background and objective: Created to achieve the highest attainable level of health for all, the WHO is empowered to adopt international norms to guide Member States (MS). If the adoption of a norm can be an essential step in global health governance, ensuring compliance by MS is equally important if WHO normative leadership is to reach its full potential. How can we evaluate the WHO normative leadership? Answering this complex question calls for an interdisciplinary approach with the purposeful addition of a mixed method approach.

Methods: To ensure a global approach to the research question, we designed a novel four-step mixed-method approach led by an interdisciplinary team (scholars from law and social sciences, with clinical experts). Our first step was the building of an initial theoretical framework on the implementation of international norms, based on an in-depth study of the relevant literature. This step allowed us to identify factors influencing state compliance, in order to build an analytical grid for our case studies (second step) and a guide for semi-structured interviews (third step). The second and third steps were conducted in a convergent parallel design, with quantitative and qualitative analysis of WHO references in the domestic law of 7 countries and interviews with key international and national actors.

Results: Developing a specific design ensures that the research object is thoroughly understood. The interdisciplinary approach improves on the current theories on the WHO normative leadership. Various challenges arose from this mixed method, such as the selection of key actors and the plurality of working languages.

Conclusion: A comprehensive study of the WHO normative leadership requires a novel mixed-method approach that better captures both legal and governance aspects.

The role of family practitioners in the primary healthcare system in Rio de Janeiro

Maria Falcão¹, Gabriel Velloso²

¹Secretaria Municipal de Saúde do Rio de Janeiro Coordenadoria Geral de Atenção Primária 3.2 R. Aquidabã, 1037 - Lins de Vasconcelos, Rio de Janeiro - RJ, 20720-292 Brazil, ²Secretaria Municipal de Saúde do Rio de Janeiro

Background and objectives: The historical, political and geographic context determine complex obstacles for healthcare managers and staff in the Brazilian public health system, that require managerial strategies which could induce positive changes for healthcare services, professionals and patients. In this sense, a new model of managerial intervention started in the early 2000s in Brazil, named Institutional Support, defined as a series of actions including coordination, planning, evaluation and supervision of a healthcare service shared by its own workers and professionals of other management levels. Traditionally, in the Brazilian Primary Healthcare (PHC), the medical specialists in Family Practice are kept away from managerial roles. The purpose of this study is to present the PHC system in Rio de Janeiro and the role of Family Practitioners in its management. **Methods:** This is an experience report based on the narrative of Family Practitioners working in public PHC management and in the identification of their role in Institutional Support.

Results: Family Practitioners have several roles as managers in the PHC management, such as medical directors of PHC services, regional medical coordinators and administrator in the Municipal Secretary of Health. Potentialized by an expanded understanding of care demands, including clinical and administrative aspects, and by developing institutional democratization and co-management, Family Practice specialists have been qualifying the PHC system through Institutional Support, strengthening its role in health promotion and prevention, treatment and rehabilitation of diseases, and also promoting financial sustainability for the health system.

Conclusions: Family Practice is a comprehensive medical specialty, with focus on individual, familiar and community care, but also with important competencies that can contribute for healthcare management, especially in roles of Institutional Support.

COVID-19 'infodemic' management: Russia's key tool for influencing geopolitics

Halyna Padalko¹, Plinio Morita²

¹National Aerospace University "Kharkiv Aviation Institute" Ukraine,

²University of Waterloo Canada

Russian propaganda has become a famous tool for influencing geopolitics, significantly impacting the US election. The research aims to analyze the Russian foreign influences in the info space of the USA and Ukraine using infodemic about COVID-19 in social media and affiliated media. As a research method, we used comparative case studies of countries, including qualitative analysis of open sources, reports from analytical companies, journalistic investigations, and governmental documents. The research results showed that Russia has a significant impact on sharing disinformation about COVID-19 in US and Ukraine, aiming to undermine countries authorities efforts to eliminate pandemic consequences and try to cause a substantial public health crisis. They used similar narratives, such as conspiracy theories, but their strategies differed. In terms of the US, they used the polarisation of society to amplify polar opinions on social media, increasingly dividing society. In Ukraine, many narratives were building around the inability of the authorities to protect the population and offering of Russian vaccine for Ukrainians. The weakening of Ukrainian power and delegitimization of the Ukrainian government, using the infodemics about COVID-19, was strategically significant for Russia to prepare solidly for a full-scale invasion of Ukraine on February 24th, 2022. The rising power of authoritarian regimes in Russia and worldwide strengthens their ability for digital totalitarianism, allowing them to use foreign propaganda to undermine other countries health systems. Democratic governments, which respect the freedom of speech, are especially vulnerable to disinformation challenges. In that case, democracies need strategic changes and new approaches to information warfare. This requires in-depth research and interstate coordination to launch campaigns that will include data sharing and countermeasures to effectively counter Russian propaganda and fight digital totalitarianism.

Impact of covid-19 policy responses on health, socio-economic and environmental dimensions in five countries

Federica Morani¹, Stefano Odelli¹, Edoardo Croci², Annamaria Bagaini¹, Federica Morani¹, Stefano Odelli¹, Alessandra Candia¹, Silvia Steri¹, Cristina Renzi³, Anna Odone², Carlo Signorelli¹, Gianmarco Imperiali¹

¹School of Public Health, Vita-Salute San Raffaele University Italy, ²Bocconi University Italy, ³School of Public Health, Vita-Salute San Raffaele University University College London Italy

The COVID-19 pandemic generated devastating impacts on human health and economic activities. Three groups of policy strategies are adopted to address health and socio-economic problems: containment, economic and health policies. This report is part of the Coronadx EU funded project (n. D7.4) and aims to examine the impact of COVID-19 policy responses on health, socio-economic and environmental dimensions in five countries.

The analysis (2020-2021) involved Denmark, Italy, Israel, Sweden, United Kingdom. For each country we set up a matrix aimed at identifying the relevance of statistical relationships between the economic, social, health and environmental variables and the policy responses examined in the study cases. The effectiveness of each country's policies was examined using a cost-effectiveness approach. We attributed monetary values to the costs of policy responses and their effect indicators. The policy response costs included national economic support and health policies (vaccination campaigns, contact tracing, face masks). The policy effect indicators included GDP recovery, CO2 emission reduction and COVID-19 deaths averted.

Stricter containment policies have significant economic, environmental, and health impacts. Economic support policies had limited relevance, and health policies, especially vaccination campaigns, were highly effective. Italy, Sweden and the United Kingdom are the countries where the overall positive effects overcome costs. Overall positive effects are two times higher than costs in the UK and almost three times higher in Italy and Sweden. Conversely, Denmark and Israel report a negative balance. Denmark shows the lowest policy effectiveness, with policy costs four times higher than positive effects. The cost-effectiveness assessment shows high effectiveness for the Italian and the UK models.

Countries that eased measures quickly after the epidemic curve declined benefited economically without significant negative health effects. High cost-effectiveness has been demonstrated for models with strong lockdown and strict health policies. Long-term impact of stronger economic policies could be further evaluated.

Acceptance rate, cost avoidance of clinical pharmacy

Interventions: A follow up interventional study from Palestine.Raya Sawalha¹, Raya Sawalha¹¹An Najah National University Assistant Professor Ramallah/Palestine
Palestinian Territory, Occupied

Background and objective: The increase in drugs numbers and their complexity and the potential of drugs interactions have increased the need for the introduction of a unique clinical pharmacy services. Having a clinical pharmacist in all health care settings in general and in hospitals in specific is important to promote the rational use of medicines and to increase the awareness about the potential harms of medicines. This study aimed to find out the acceptance rate of physicians to clinical pharmacy interventions and cost avoidance resulting from clinical pharmacy interventions.

Methods: An interventional, follow up study was performed over a period of 6 months using well-constructed clinical pharmacy interventions note form in surgery department at An-Najah National University Teaching hospital in Palestine, the acceptance rate of clinical pharmacy interventions was calculated. The cost of each prescription was calculated before and after each intervention to find out the cost avoidance from every intervention and to calculate the cost avoidance from overall interventions.

Results: 313 interventions were done of the 1075 the admissions to the surgery department. The most prevalent interventions were changing the regimen as the clinical pharmacist saw that it was not appropriate, followed by the conversion of the dosage form for the patient from the Intravenous (I.V) route into the oral route. Physicians in the surgical department were seen highly cooperative and accepted by 97.70 %. The reduction in the average daily drug costs throughout the period of 6 months followed the application of clinical pharmacy interventions was clear. Some interventions resulted in clear cost reductions; others had minor reductions.

Conclusion: Clinical pharmacy practice has the potential to reduce costs and ensuring rational use of drugs.

The association between informal care and labour market outcomes in South Africa and Zambia: a cross-sectional analysis of data from HPTN071 (PopART) studyRebecca Anderson¹¹Imperial College London, United Kingdom

Introduction: Fragmented access to health and social care in low- and middle-income countries places the burden of care for the sick and elderly on informal carers (ICs). Whilst literature highlights detrimental impacts of caring on ICs workforce participation in high-income countries, there is a scarcity of empirical evidence on this area in Sub-Saharan Africa. This paper investigates the relationship between employment and informal caring in South Africa and Zambia, with a specific focus on gender differences.

Methods: Data were obtained from the baseline survey of the HPTN071 (PopART) study, a cluster-randomised controlled trial in 21 communities across South Africa and Zambia. Here, randomly selected adults (18-44 years) were asked about employment status, caring responsibilities, and other socio-demographic factors. Respondents' employment status was modelled as a function of informal caring duties, age, sex, education, and wealth, using multiple logistic regression models.

Results: The sample consisted of 5,881 individuals (71.7% female), including 376 ICs (72.3% female). Analysis showed being an IC was associated with increased employment odds for men (Odds Ratio (OR):1.732, 95% confidence intervals (CI):1.073-2.797). Whilst no association between employment and caring was seen for women, they experienced significantly lower employment odds than their male counterparts, in the total sample (OR:0.335, 95%CI:0.283-0.397) and the subsample of ICs (OR:0.238, 95%CI:0.188-0.298). Tertiary education increased employment odds, particularly for female carers ((OR: 8.798, 95%CI:4.985-15.526)).

Conclusions: The Results highlight a major disparity between mens and womens employment odds – with women disadvantaged, irrespective of their caring status. This imbalance threatens achievement of sustainable development goal 5, gender equality, evidencing the economic barriers facing women in Sub-Saharan Africa. Incentivising retention of women at the highest levels of education is recommended as one route to dismantling this inequality. Whilst formalised support for ICs is also recommended, thorough cost-benefit analysis is needed to ensure productive resource allocation.

A qualitative exploration of dentists' insight, perceptions, and acceptability related to different payment mechanisms and**incentive schemes: the perspective of a group of Italian key informants**Alessandro Vitali¹¹Università degli Studi di Brescia, Italy

Background: Even though oral disorders are among the most common diseases worldwide and have a considerable influence on private and public health expenditures, oral health is a neglected area of health. There is evidence that how dentists are paid can affect the type and amount of treatment they deliver. In Italy, oral healthcare is primarily paid for out-of-pocket, which carries the danger of under-servicing patients because of financial constraints. A limited public provision is managed through salaried dentists. The amount of care supported by employer-sponsored health insurance has significantly expanded because of recent legislative reforms.

Methods: After a scoping review of quantitative and qualitative scientific literature on how the payment model could impact the provision of oral health care and a policy review on the intermediation of care through third-party payers in Italy, an interview guide was developed to interview seven Italian key-figures investigating their insight, perceptions, and acceptability on different payment mechanisms and how they impact on oral health care provision analysed through a thematic framework.

Results: Public dentists recognized that the motivational role of being in a formative team compensated for the economic limitation attributable to salary, which doesn't reward increased job efforts. Private dentists recognize how the reimbursement system affects clinical decisions made by both the dentist and the patient. They complained a severe reduction in reimbursement and an increase in administrative workload. They emphasized the complete absence of communication with the insurance companies, whose input they strongly value in order to deliver better care.

Conclusions: Dentists support a legislative and policy intervention to promote dialogue with insurance providers and recognize the structure and management of insurance coverage as a powerful tool to influence the provision of care, both positively and negatively. According to dentists, these policy tools could improve both clinical outcomes, access, and quality.

Framework for implementing and monitoring the national public health policy in Sweden: towards a new national public health infrastructureMalin Kark¹, Chatrine Höckertin², Nina Lindqvist²¹Institute for Collective Health, Public Health Agency of Sweden, Sweden,²Public Health Agency of Sweden, Sweden

Background and Objective: In 2019, the Swedish Government commissioned the Public Health Agency of Sweden (PHAS) to develop a framework to enable systematic and coordinated efforts for realizing the national public health goal. The framework builds on the work of The Swedish Commission for Equity in Health and the national public health policy.

Methods: The framework requires systematic and coordinated efforts among key stakeholders at different societal levels and comprises four parts; Monitoring, Coordination, In-depth analysis and Dissemination of knowledge. The four parts are inter-connected and driven by the indicator-based monitoring. PHAS started implementing the framework in 2021.

Results: The PHAS has developed a monitoring system to track social determinants of health and health outcomes. This system includes a set of core indicators and annual reporting of public health developments published in various formats for different target groups. Additionally, the monitoring identifies areas where further knowledge is required. In 2022, the PHAS initiated cross-sectoral collaboration by inviting 14 national authorities to a strategic dialogue within the target area; Work, working conditions and working environment. This resulted in two joint seminars and one in-depth analysis. Seminar 1 focused on education and opportunities on the labour market and Seminar 2 on an inclusive working life and sustainable work environment for people with disabilities. The in-depth analysis focuses on individuals enrolled in adult education programmes, looking at their health status and possibilities for increased employability. Public health work is in many ways the responsibility of county councils and municipalities. The PHAS has been commissioned to, in partnership with county administrative boards, support public health work of county councils and municipalities. The framework forms a basis for this work.

Conclusions: A structured framework building on systematic monitoring and collaborative efforts can optimize public health work and provide a fitting knowledge base for end-users.

Confidence in midwives in prevention of HPV - associated diseases in Bulgaria

Elitsa Stoyanova¹, Mariela Kamburova², Eleonora Mineva²¹Medical university, Pleven, Bulgaria, ²Medical University, Pleven, Bulgaria

Introduction: The main methods of prevention of viral infection caused by human papilloma virus (HPV-associated diseases) are: the health literacy, prevention through vaccination and the quality of health care. The lack of confidence in the health professionals is one of the main reasons for the high prevalence of HPV-associated diseases in developed countries and Bulgaria. The aim of the study is to analyze the confidence of female patients towards the midwife as a health care specialist, in the prevention of HPV-associated diseases.

Methods: In the period 2020-2022 in the city of Pleven, Bulgaria, a case-control study was conducted. 200 female patients with and without HPV-associated disease are covered in the study. The sociological method through direct individual questionnaire was applied. The data analysis throws MS Office Excel software program 2019 and SPSS v.28 was performed.

Results: 200 women are included in the study: 100 of them (cases) were diagnosed with HPV-associated disease, and 100 were clinically healthy or with another gynaecological problem (controls). More than half of the surveyed reported that they would turn to the midwife for advice on preventing HPV-infection. The proportion of cases (61.0%) prevail that of controls (54.0%). A statistically significant relationship was established between the high level of education and turning to the midwife for help ($\chi^2=30.744$, $df=6$, $p=0.00$, Cramers $V=0.277$). Over 50% of participant declare trust in midwives regarding the screening of HPV-associated disease: 54.0% of the control group and 51.0% of the cases. Statistically significance between education and confidence in the midwife as a health provider specialist ($\chi^2=27.071$, $df=6$, $p=0.00$, Cramers $v=0.260$) was proven. **Conclusions:** The higher level of education of the women increases the trust in the midwife in the preventive activity and proves that there is a need to popularize the midwives activities at prevention of HPV- associated diseases.

Impact of COVID-19-related economic crisis and mitigation effects of social protection on AIDS and Tuberculosis: a mathematical modelling approach

Feliipe Rubio¹, Temidayo Aransiola¹, Robson Oliveira¹, Rodrigo Anderle¹, Davide Rasella²¹Federal University of Bahia (UFBA), Brazil, ²Institute of Global Health (ISGlobal), Spain

Background and Objective: Mathematical models are widely used to perform experiments in silico and predict how diseases evolve over time under different scenarios. It is estimated that the COVID-19 pandemic will still have long-term effects in increasing poverty and social inequalities, compromising the achievement of the Sustainable Development Goals (SDGs) for diseases such as Tuberculosis (TB) and HIV/AIDS. Our aim is to estimate the future impact of different economic crisis scenarios on AIDS and TB incidence and mortality, and the mitigating effect of alternative policy responses to reduce poverty by 2030 in Brazil.

Methods: We developed two compartmental models of HIV/AIDS and TB transmission dynamics, integrating economic and epidemiological aspects. The annual poverty rate in Brazil was included in the formulation of the models main parameters, based on the National Household Sample Survey. We project three poverty scenarios (no mitigation, one-year mitigation, and long-term mitigation). Using a genetic algorithm, the model parameters were estimated to fit the AIDS and TB incidence and death rates from 2003 to 2019.

Results: The models suggest that the implementation of social protection policies could mitigate lasting increases in poverty, avoiding a 13% (CI: 4% - 31%) increase in incidence and 21% (CI: 12% - 34%) in mortality from HIV/AIDS, and 16% (CI: 10% - 25%) in incidence and 22% (CI: 15% - 31%) in mortality from TB. Also, more than 140 (CI: 87 - 240) thousand cases and 22 (CI: 15 - 32) thousand deaths from HIV/AIDS and TB could be prevented by 2030.

Conclusions: Understanding complex phenomena such as the pandemic effects of COVID-19 on socioeconomic and health outcomes requires the integration of multidisciplinary models. Here, we show the importance of implementing social protection policies to avoid a large increase in morbidity and mortality from HIV/AIDS and TB during the post-pandemic period.

Towards the implementation of the first National Health Policy in Tunisia

Hind Bouguerra¹, Hela Mesmia¹, Seifeddine Rhouma¹, Chokri Zoghalmi¹, Awatef Touihri¹, Oussama Daly¹, Ali Mrabet²¹Studies and Planning Directorate, Ministry of Health, Tunisia, ²Ministry of Health, Tunisia

Introduction: For the first time in Tunisia, all health system actors highlighted the problems related to health and social equity. In response to that, the Societal Dialogue for health system produced the first National Health Policy (NHP) that was officially adopted by the government in 2021. Currently, the Ministry of health is leading the operationalization process of this policy. Our objective was to present this process and its state of progress.

Methods: The operationalization process of the NHP is a strategic planning process based on a results-based management approach. Four working groups, which included the main stakeholders, treated the four main reforms identified: (i) primary healthcare services (ii) health insurance (iii) hospital sector and (iv) health system governance. Deep problems analysis was conducted to set the appropriate results and find realistic solutions.

Results: This work provided a coherent framework with three types of results: (i) the impact that aims to improve health and well-being for all, (ii) the outcomes based on the universal health coverage dimensions (essential health services, protection against catastrophic expenditure), citizen satisfaction, health in all policies, and health security and (iii) the outputs based on health services accessibility and quality, effective demand of users and health system resilience. Strategic focus areas were then classified according to the seven pillars of the health system. In each area, intermediate results and strategic activities were identified.

Conclusions: Post COVID-19, the HNP 2030 is an important opportunity to improve the Tunisian health system and a major effort towards achieving universal health coverage. These results will be discussed and finalized during regional meetings with citizens and health professionals to keep the same participatory approach of the societal dialogue, key to the success of this policy and a model for several countries in the world.

Is the Portuguese National Health Accreditation program suitable to its reality? - a review

Gustavo Paiva Monteiro¹¹USP Entre Douro e Vouga I, Portugal

Background and Objective: Accreditation programs have many benefits that contribute to a more effective and efficient performance of the healthcare institutions: improvement in organizational efficiency, cost reduction, better communication between professionals and consequently improved teamwork and greater satisfaction on the part of users.

The National Health Accreditation Program (NHAP) was implemented in 2009 due to the need to standardize the accreditation of all healthcare institutions and it was adapted from the Quality Model of the Andalucía Agency (ACSA).

The main goal is to evaluate three models used to accreditate healthcare institutions, comparing their methodologies and verify which model is more suitable to the Portuguese reality.

Methods: It was revised three accreditation models, such as the Joint Commission International, the Caspe Healthcare Knowledge Care and the ACSA that were compared taking into account the eight principles of certification of the ISO 9000. **Results:** The ISO 9000 certification is not fully adapted to the healthcare units, but has eight principles that are a good referential to establish comparisons. It was found that ACSA model is suitable for most Portuguese healthcare institutions, since it takes into account all the principles of ISO certification - customer focus, leadership, involvement of people, process approach, system approach to management, continual improvement, factual approach to decision-making and relationship management, and it was built for a similar reality to the Portuguese health system - the Spanish one, so it was a good basis to build the NHAP.

Conclusion: NHAP has adequate characteristics and answers to the main needs of the Portuguese health system and it's suitable for most healthcare institutions.

Cadmium and risk of cardiovascular disease and stroke: a systematic review and dose-response meta-analysis

Pietro Verzelloni¹, Teresa Urbano¹, Marco Vinceti¹, Tommaso Filippini¹¹University of Modena and Reggio Emilia, Environmental, Genetic and Nutritional Epidemiology Research Center (CREAGEN), Department of Biomedical, Metabolic and Neural Sciences, Medical School - University of

Modena and Reggio Emilia, Modena, Italy

Background and Objective: Exposure to environmental toxic metals is known to be a global public health concern because of the serious adverse effects on human health. Many studies reported an increased risk of developing cardiovascular diseases (CVD), the leading cause of death in the “developed world”, linked to cadmium (Cd) exposure. This meta-analysis aims to assess the correlation between different levels of cadmium exposure and the risk of overall CVD and of stroke.

Methods: The protocol registration in PROSPERO has been submitted for publication (registration number CRD42022360751). To find eligible articles, we conducted a literature search on three different databases from inception up to 7 December 2022: PubMed, Web of Science and Embase. We used MeSH terms and keywords related to “cadmium”, “cardiovascular diseases” and “stroke”, excluding reviews. We defined the following inclusion criteria according to the PECOS statement: adult population, lower or higher Cd exposure (occupational, smoking, food products and water) and the related risk of developing overall CVD or stroke, and observational studies (cohort, cross-sectional or case-control). Whenever possible, we will perform a dose-response meta-analysis using the one-stage approach through a random-effects model.

Results: In the preliminary literature search, we found a total of 1459 articles and we deleted 312 duplicates. Further study selection according to inclusion criteria is ongoing.

Conclusions: The study is currently under way and its results will be presented at the Congress.

Cervical cancer elimination in Italy: current scenario and priority actions for a values-based prevention

Giovanna Calabrò¹, Floriana D'Ambrosio¹, Carolina Castagna², Martina Sapienza², Maria Riccardi¹, Rossella Millevolte³, Andrea Pellacchia³, Roberto Ricciardi⁴, Rosa de Vincenzo⁵, Chiara de Waure³

¹Università Cattolica del Sacro Cuore, Rome, Italy, ²Università Cattolica del Sacro Cuore, Rome, Italy, Section of Hygiene, University Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ³University of Perugia, Italy, Department of Medicine and Surgery, University of Perugia, Perugia, Italy, ⁴VIHTALI (Value in Health Technology and Academy for Leadership and Innovation), Spin-off of Università Cattolica del Sacro Cuore, Rome, Italy, ⁵Università Cattolica del Sacro Cuore, Rome, Italy, Gynecologic Oncology Unit, Fondazione Policlinico Universitario A. Gemelli, IRCCS, Dipartimento Scienze della Salute della Donna, del Bambino e di Sanità Pubblica, Rome, Italy; University Department of Life Sciences and Public Health, Università Cattolica Italy

Background and Objective: In 2020, the World Health Organization (WHO) called for the elimination of cervical cancer (CC). In order to get it, vaccination against Human Papillomavirus (HPV), CC screening and timely management of the disease must be implemented at international level. Our study aimed to describe the current scenario of HPV prevention in Italy and to get a consensus on indicators and priority actions for the CC elimination at national level.

Methods: In order to address the progress of HPV-vaccination and CC screening at regional level in Italy, a project was conducted in 2021-2022. In particular, information was collected on both coverage indicators (for vaccination and screening), screening adherence, history and characteristics of the vaccination and screening offer. Collected data were shared with a multidisciplinary experts' panel to issue recommendations to foster the CC elimination in Italy. A survey was also conducted to identify potential actions in respect to vaccination, screening and treatment.

Results: The mapping of the Italian Regions highlighted an important regional heterogeneity in respect to organizational/operational issue of HPV vaccination and CC screening. Indicators for monitoring CC elimination strategies have been distinguished by disease outcomes, vaccination coverage, screening participation and treatment uptake. The following actions were identified to implement vaccination, screening and treatment: educational campaigns, reminders and active calls for both vaccination and screening and more data interoperability and definition of clinical pathway involving a multidisciplinary medical team for the proper management of all HPV-related diseases.

Conclusion: The identification and constant assessment of specific indicators for monitoring the progress toward CC elimination are fundamental actions to be able to respond to the WHO call. To achieve the CC elimination, all available means must be used focusing on a comprehensive approach in favor of value-based interventions of prevention and best practices to be implemented at regional level.

Federal de Catalão, Catalão-Go, Brasil Departamento de Medicina Brazil,

⁴Universidade Federal do Espírito Santo, Vitória - ES, Brasil Programa de Pós-graduação em Saúde Coletiva Brazil

Introduction: The COVID-19 pandemic provoked uncertainties, disrupted implementation of health policies in the Unified Health System, known as SUS in Brazil, and new healthcare demands. Therefore, efforts to assemble resilient health systems with post-pandemic recovery plans, maintenance and protection of advances in public health, which narrate experiences with the practice of institutional support and collaborate with the implementation of public health policies are necessary to inspire governments and people in other health related projects. **OBJECTIVE:** To share the learning synthesis developed with institutional support during the implementation of SUS regionalization policies.

Method: The following study was developed in three Brazilian states, in the Project for Development of Institutional Support in SUS (PROADISUS). Thus, virtual meetings were held between specific working groups of institutional supporters and those supported: health managers and technicians respectively. Furthermore, the following strategy expanded the technical debate within working groups, strengthened the process of planning activities and agreed on the expanded work agenda to carry out the Health Situation Analysis and identification of regional health priorities, mediating the intervention proposals, products of the interaction and reflection between the tripartite strategic actors, their priorities and demands of healthcare areas.

Results: The greater interaction, debate and instrumentalization of managers and technicians affected transformations in work processes, contributing to overcoming the challenges of regionalization and building the tripartite agenda, strengthening regionalization beyond a physical plane, that is, capturing the perceptions and subjective views that mediate the desires of the responsibilities assumed in joining the project.

Conclusion: In the context of the pandemic, the institutional support strategy transformed work processes, operated as a strategic method that induces new ways of health management by expanding institutional democracy, impacting the implementation of policies capable of responding to health needs directed by the values of equity and social solidarity.

New wine in old bottles: wicked problems associated with inter-LGU cooperation and its implication on the governance of integrated local health systems

Vergil Claro¹, Ma. Torralba¹, Laurentiu Stan¹

¹RTI International Philippines Philippines

Introduction: Achieving universal health coverage (UHC) has gained wide acceptance and is considered a key health policy goal in many countries. In the Philippines, a national legislation on UHC served as an overarching policy for implementing sector-wide health reforms. Central to the process is the concept of health systems integration which policymakers look toward as a means to address longstanding fragmentation in health. The underlying push is the belief that bringing together of inputs, delivery, management, and organization of services in an integrated manner will improve access, efficiency, and quality of health services. Experience from other countries shows that the road to UHC is inextricably linked to the complex process by which policy decisions take place - one that is fraught with challenges, diverse pathways, and pitfalls. To jumpstart the reform, inter-LGU cooperation was the main governance mechanism that was proposed.

Methods: A descriptive and explorative case comparison methodology was used involving three individual case studies followed by a cross-case analysis for the selected study sites. The study aims to understand the socio-economic and political underpinnings, consensus-building process, and integration pathways using Bosserts decision space framework. We synthesize the findings to identify issues and challenges associated with inter-LGU cooperation and its implication on governance in integrated health systems.

Findings: Results show that there was no uniform conceptual model for local health systems integration across the study sites. Local health systems resort to implementing cooperative models that are contextually appropriate based on local evidence and competence. However, potential diverging interests of cooperating LGUs were observed to have created collective action problems resulting in large inefficiencies termed as wicked problems. The study offers evidence for comparing experiences in other settings. It is also imperative that the identified wicked problems be further explored to understand their mechanism and impact on health systems performance

Impact of price reductions on pharmaceutical expenditure in Greece

Isidoros kougioumtzoglou¹, Panagiotis rigopoulos², Apostolos stratopoulos³, Kalliopi mortaki⁴, Areti lagiou¹, Nikos maniadakis¹, Dimitrios kouvelas¹

¹Laboratory of Hygiene & Epidemiology, School of Public Health, University of West Attica Greece, ²Laboratory of Clinical Pharmacology, Faculty of Life Sciences, School of Medicine, Aristotle University of Thessaloniki,

³Laboratory of Pharmacogenomics and Individualized Therapy, Faculty of Life Sciences, Department of Pharmacy Greece, ⁴Barcelona School of Management, Pompeu Fabra University Greece

Background and objective: The annual re-pricing procedure in pharmaceutical products in Greece has been instituted as a measure to control public pharmaceutical expenditure. However, price reductions over the past decade, combined with increasing mandatory pharmaceutical industry's contribution (clawbacks and rebates), have led to the withdrawal of low-cost treatments (retail price 2.5€ million at 2011. Total values and units were calculated along with their respective absolute and relative change during the period of 2011-2021.

Results: Six ATC4 categories were included in the analysis, with a total expenditure of 90,657,197€ in 2011. In three of the respective categories, the change in units due to withdrawal of low-cost treatments, did not lead to an equivalent change in total expenditure. Specifically, the withdrawal of treatments in iron products, thyroid preparations and intestinal anti-inflammatory/anti-infective agents led to a change in units of 212%, 99.1% and -4.4% respectively. At the same time, the change in pharmaceutical expenditure for the aforementioned categories was 445% (30,254,755€), 182% (13,212,534€) and 18% (468,676€) respectively, with the cumulative expenditure increasing from 16,714,697€ to 60,750,762€. For the remaining categories, the withdrawal of low-cost treatments was associated with proportionate reduction in expenditure.

Conclusion: Price reductions are not panacea for the containment of pharmaceutical expenditure. The exclusion of low-cost treatments from further price reductions and/or clawbacks and rebates should be considered to ensure treatments' viability by avoiding potential withdrawals, which can lead to increased pharmaceutical expenditure.

Conflicts of interest (Col) and undue corporate influence in public health: from the international context to local interventions

Mélissa Mialon¹, Rima Nakkash², Martin McKee³

¹Trinity College Dublin, Ireland, ²George Mason University, United States,

³The London School of Hygiene and Tropical Medicine, United Kingdom

Participants will first learn about conflicts of interest (Col) and undue corporate influence in public health. They will then participate in an interactive session, where they will reflect on their personal experiences. They will collectively identify solutions to these issues, and discuss challenges they may face in trying to adopt those solutions, individually and collectively. Finally, participants will discuss the next steps, which will build on the new knowledge they will get from the workshop, the reflection they will have made, and the collective Discussion on solutions. Specific Aims/Objectives: 1. To introduce the issues of conflicts of interest and undue corporate influence in public health, in the international and local contexts, 2. To reflect on the personal experiences of participants in relation to this topic, 3. To discuss solutions to address these issues, with a focus on local interventions. Component parts: 1. Introduction to the workshop and topic, 2. Presentations Col and undue corporate influence: examples and risks to population health, 3. Q&A, 4. Interactive session, 5. Next steps, as identified by participants and closing remark. Key questions that the workshop will address: 1. What examples of conflicts of interest and undue corporate influence participants have they observed in the professional practice/during their training? 2. How to address these issues in our professions? What examples of good practices do we know exist? 3. What are our challenges?

Governing for planetary health equity

Sharon Friel¹, Megan Arthur¹

¹Planetary Health Equity Hothouse, Australian National University, Australia

Planetary health equity (PHE) – the equitable enjoyment of good health in a sustainable ecosystem – is in crisis. Addressing this demands ambitious and urgent action on the structural drivers of social inequity and climate change. These drivers come in the potent form of the global consumptogenic system. Yet, despite the unfolding catastrophe, little effective political and policy attention is given to transform the consumptogenic system and act in the interests of PHE. The overarching aim of this workshop is to explore theoretical and analytical approaches to unpack and understand the role of actors and institutions, policy processes, power dynamics, and governance possibilities that could transform the consumptogenic system towards PHE goals. Specific Aims/Objectives and component parts: 1. Unpack the meaning and relationship between the global consumptogenic system and planetary health inequities, 2. Identify and discuss approaches to understanding how to optimise mitigation policy for climate, social and health goals, 3. Explore new conceptual and methodological approaches for researching governance for planetary health equity, 4. Expand and deepen networks of governance for health equity among the academic, government and civil society communities internationally. Drawing on emerging work from the Planetary Health Equity Hothouse [1], the workshop will present two short provocations (20 mins total) based on the new research from speakers Friel and Arthur. This will be followed by small group work focused on three PHE issues, with plenary feedback. Presentation: 1. Transforming the consumptogenic system – key to planetary health equity. 2. Optimising climate change mitigation policy and coherent governance for planetary health equity goals. 3. Critical dimensions of climate change mitigation policy design for reducing planetary health inequities. 4. Understanding dimensions of power that shape governance for PHE in different contexts. 5. A research and advocacy agenda to mobilise structural change for PHE. The key questions that the workshop will address: The workshop asks: What does planetary health equity mean and how to measure it? What does climate mitigation policy look like that optimises social and health outcomes? How do power dynamics in policy systems shape the outcomes of mitigation policies? What does coherent governance for planetary health equity look like? Links: —[1] <http://www.hothouse.anu.edu.au>

Anemia and its determinants among apparently healthy women from pastoralist communities of Ethiopia: a community based cross sectional study

Sahardiid Abdilahi¹

¹Jigjiga University, Ethiopia

This study examined the magnitude of anemia and its determinants among 468 apparently healthy women randomly selected from the pastoralist communities of Somali region, Ethiopia. The overall prevalence of anemia was 39.98%, of which mild, moderate and severe anemia were 108(25.17%), 57(13.29%) and 6(1.40%), respectively. Most (65%) of the anemic women are from rural settings. The mean Hgb level (adjusted for altitude) was 12.01(±2.1SD) gm/dl and ranged from 7-16gm/dl. As expected, anemia was significantly lower among contraceptive users (p=0.005), got iron supplementation (p=0.104), had no malaria (p=0.901) and counseled on anemia (p=0.375). Low consumption of meat (p=0.001) and fruits (p=0.029) were the significant factors associated with Anemia. To improve anemia in the community, a concerted effort comprising of public health measures and nutrition counseling in addition to the ongoing weekly iron folic acid supplementation is recommended.

Ending the epidemic: High- and middle-income country responses to scaling HIV prevention strategies in real world settings

Inês Dourado¹, Henrique Barros², Amy Nunn³

¹Instituto de Saúde Coletiva, Universidade Federal da Bahia, Brazil, ²Institute of Public Health, University of Porto, Portugal, ³Brown University School of Public Health, United States

Outline: Strategies to reduce HIV transmission can radically reduce HIV transmission, including pre-exposure prophylaxis (PrEP), with the use of one daily pill. Clinical trials have demonstrated its efficacy in reducing HIV transmission from 92-96% for people at the highest risk for HIV acquisition. Objectives AND

COMPONENT PARTS: We propose to discuss how the epidemiological profile of HIV/AIDS in the South and in the North, as well as the country responses and new prevention technologies adopted by countries such as Brazil, the USA, Spain, and Portugal, taking into consideration that the epidemic was driven by different key population and under extremely disparate political, social and cultural conditions in the four contrasting countries. Key Questions: 1- While access to PrEP has improved since its regulatory approval in 2012, access for populations at the highest risk for HIV acquisition is suboptimal and uneven. 2- While these factors vary by country and population, global trends suggest that disparities in access to PrEP and retention in PrEP care, and access to other HIV prevention strategies can be observed in many different global settings. 3- We will discuss several upper and middle-income countries' efforts to eliminate HIV transmission by expanding access to PrEP, other HIV prevention strategies, and the epidemiological and health system challenges in a variety of different contexts. This includes efforts to eliminate HIV by expanding access to prevention measures in the United States Deep South among African Americans; through Brazil, Portugal, and Spain HIV/AIDS Programs of the National Health System of these countries. We present several programs that have successfully expanded access to PrEP and other HIV prevention strategies among populations at high risk for HIV acquisition. 4- Participants will learn about comparative health systems as well as trends in scaling up PrEP and other prevention method for vulnerable populations in real-world settings outside of clinical trials. 5- The response to the HIV/AIDS epidemic indicates the stabilization of the incidence of cases in some regions of the country and in some populations. However, there are regional inequalities in epidemic surveillance indicators and a worrying increasing trend among adolescents and youth. 6- People living with HIV/AIDS face challenges in maintaining good health, including those related to economic well-being and ongoing health needs. 7- Discuss the countries response to HIV/AIDS and the goal of EHE (ending the HIV epidemic), based on the various innovative prevention, treatment, and care strategies, and the challenges of taking into account the issues of social determinants, inequalities, discrimination, and stigma.

The commercial determinants of health: models, tools and solutions

Anna Gilmore¹, Jennifer Lacy-Nichols², Sharon Friel³, Monika Kosinska⁴
¹University of Bath, United Kingdom, ²University of Melbourne, Australia,
³Australian National University, Australia, ⁴WHO, Switzerland, Tobacco Control Research Group, Department for Health, University of Bath, United Kingdom

Presentation 1: Defining and Conceptualising the CDOH, Anna B Gilmore
 This presentation outlines a definition for and simple conceptual model of the CDOH. It explains the system nature of the problem in which our current global political and economic system enables rather than constrains harmful commercial practices and, consequently, why downstream interventions are wholly insufficient to address NCDs and other commercially driven health harms.

Presentation 2: Understanding Commercial Actors: A new Framework, Jennifer Lacy-Nichols

This presentation outlines a new framework to enable meaningful distinctions between commercial entities. It explores how this framework can be operationalised, for example as tool for decision-making about engagement, managing conflicts of interest, or monitoring and research around the CDOH.

Presentation 3: Finding Solutions to the Commercial Determinants of Health: The need for Systemic Transformative Change, Sharon Friel

This presentation explores solutions to the CDOH. It proposes a multi-level governance system that privileges public interests over profits and challenges contemporary capitalism. This includes progressive economic models, international frameworks, government regulation, compliance mechanisms for commercial entities and business models that incorporate health, social and environmental goals.

Key Questions that the Workshop Will Address

How can we best define and understand the CDOH? Can we develop a simple model that allows us to conceptualise and therefore address the CDOH? What are they key pathways through which the commercial sector influences health? How can we better understand and deal with the diversity of corporate actors? What potential solutions can be taken to redress the inequitable health harms arising from this complex problem? What role can be played by WHO and other public health actors?

Is the HIC/LMIC country classification still relevant in today's health equity dialogue?

Colette Cunningham¹, Bettina Borisch², Fatia Kiyange³, Brian Turner⁴, Olga Kalinowska-beszczyńska⁵, Colette Cunningham⁶, Bettina Borisch⁷

¹School of Public Health, University College Cork, Ireland ASPHER Western Gateway Building, University College Cork Ireland, ²World Federation of Public Health Associations, Institute of Global Health, University of Geneva, Geneva, Switzerland, ³ASPHER, Kampala, Uganda, ⁴School of Economics, University College Cork ASPHER Aras na Laoi, University College Cork Ireland, ⁵Department of Public Health, Medical University of Gdansk ASPHER "Department of Public Health and Social Medicine, Medical University of Gdansk, Poland Dębinki 7, budynek nr 15, 80-211 Gdańsk" Poland, ⁶School of Public Health, University College Cork, Ireland ASPHER University College Cork Ireland, ⁷WFPHA WFPHA Geneva Switzerland

Background and Objectives: The World Bank categorises economies into Low Income Countries, Lower Middle-Income Countries, Upper Middle-Income Countries and High-Income Countries (HICs), based on Gross National Income (GNI), with 136 (63%) countries in the Low- and Middle-Income Country (LMIC) categories. The ubiquitous use of LMIC suggests it represents something meaningful, however, we argue that its far-reaching impact lacks a people-centred focus required for health equity. The measurement requires change in today's world where there are low-income settings (LISs) in HICs and vice-versa. Are health outcomes in LISs in HICs better or worse than those of HICs in LMICs? The use of these terminologies cannot be separated from decisions on resource allocation and their impact.

Methods: A rapid literature review was conducted from peer reviewed journals, published during the last 5 years. Search terms included public health; health equity; in combination with terms such as LMIC; HIC, deprived community; deprivation index. WHO data was used to examine the proportions of the population in LMICs and HICs exposed to catastrophic health expenditure.

Results: We conclude from the literature that the human aspect should be a key thread to follow when assessing LISs. The evidence points toward the need to talk about specific groups; indigenous, migrants, travellers or those from deprived communities and their settings. This approach provides a better insight into health equity. The structure of national health systems also plays a role in determining the extent to which sections of the population are exposed to catastrophic health expenditure.

Conclusions: Considering the purely economic nature of the categories, we conclude that the current classification requires adaptation, specifically a shift towards a human-focused perspective rather than a geographical focus. In changing to a setting approach, we believe that health-related challenges and health equity will be better addressed.

EU4Health Programme and the role of national focal points for 2023 and beyond.

Leticia Copano Casanova¹, Marilena di Stasis², Giovanni Nicoletti², Florina Telea³, Claudia Hahl⁴, Matthias Wismar⁵

¹Ministerio de Sanidad Paseo del Prado Madrid" Spain, ²Italian Ministry of Health, Italy, ³HaDEA - Health and Digital Executive Agency Pl. Saint-Josse-ten-Noode, Brussels Belgium, ⁴Austrian National Public Health Institute - Vienna Austria, ⁵European Observatory on Health Systems and Policies Place Victor Horta/Victor Hortaplein, Brussels - Belgium"

Background/Outline: The EU4Health programme is the 4th programme of the EU for action in the field of health, established by EU Regulation 2021/522. Adopted in the wake of the COVID-19 pandemic, it represents the most ambitious European Health Programme yet, providing substantial financial support to post-COVID-19 recovery efforts and the resilience of European healthcare systems, as well as to the EU's preparedness in facing major cross-border health threats such as large-scale communicable disease outbreaks. However, strengthening the compatibility of health systems and policies across the EU must reach beyond acute responses to current and future health crises, which is why the programme is likewise geared toward addressing long-term challenges in public health such as antimicrobial resistance, access to medicinal products, and non-communicable diseases (Regulation (EU) 2021/522, 2021).

Since 2014, Member States and associated countries have designated National Focal Points (NFPs) to assist the European Commission in promotion of the EU Health Programmes, and to build capacity among national stakeholders so as to ultimately enhance engagement with the Programmes across all participating countries. With the significant extension of the Health Programme's content and budget in its fourth programming period, the role of NFPs in national dissemination,

consultation, and capacity building has become even more crucial. The Joint Action on Increasing Capacities of National Focal Points (JA NFP4Health, www.nfp4health.eu), supported by funding from the third EU Health Programme, aims to strengthen NFPs' knowledge and foster a consolidated and sustainable NFP network that can support Member States in achieving the health objectives established under EU4Health.

Aim and Key Questions: The workshop has a TRAINING CHARACTER and aims to give an overview of the current EU4Health Programme, recent calls and funding opportunities to show existing and explore potential synergies with other health related funds and programmes, to introduce and discuss the roles of National EU4Health Focal Points and finally to learn which topics and features are of interest for future research and training purposes.

After a state-of play of the EU4Health Programme (e.g., current open calls) by the European Agency in charge, HADEA three interventions from JA NFP4Health Work package leaders will take place. They will give an insight into the role and tasks of a National Focal Point and will seek the input of delegates on their features (e.g., which activities could be expanded, or which seem not necessary).

The workshop will be concluded by a FAQ session, where delegates have the excellent opportunity to receive firsthand feedback on their questions regarding the EU4Health Programme and other health related funds and programmes.

Decolonising Global Health: understand, reflect, improve

Domitilla Marconi¹, Beatrice Sgorbissa², Elena Mazzalai³, Anna Zannoner⁴

¹School of Public Health, University of Siena, Italy, ²University of Padova Italy, ³University of Roma La Sapienza Italy, ⁴University of Bologna Italy

In recent years, the question of decolonisation has progressively become more and more central, involving various sectors, including Public and Global Health. After the global protests over the death of the Afro-descendant George Floyd in America, decolonising and anti-supremacist instances also reached the major European Global Health institutes thanks to the mobilisation of students. The students' movement started a debate on the link between Global Health and colonialism and the need for the Global North to confront their colonial heritage. The result has been an intense production of papers, whose authors include Dr. Seye Abimbola, chief of BMJ Global Health: the need to become aware of the roots on which the discipline of Global Health is based is highlighted, with reflections on approaches, metrics and relationships that underlie a legacy of domination. Tropical Medicine, as the ancestor of Global Health, was born in the period of Western colonialism and was often subjected to opportunistic logics to justify the expropriation of resources and property by leveraging biological differences between colonised and coloniser. But that is not all: reflections of this colonial legacy can still be found in Global Health institutions and academies today, for example in the almost absent representation of minorities in decision-making positions, the limited access of students and lecturers from the Global South to the most prestigious schools of Global Health in the Global North, the poor representation of local authors in the research, and the difficult access for local colleagues to impact journals. This is not just about diversity and inclusion and it does not have to turn into "whitewashing": the debate also focuses on the need for a paradigm shift in how Global Health is understood, operated and taught. Starting from a collective reflection on the violations of the past and the power dynamics that are still current, there is a need to rebuild a community of Global Health researchers and practitioners based on the understanding that there is no health without social justice. While the debate is enriching at a global level, involving various actors (academies, NGOs, activists), in Italy the topic still remains largely neglected, including in the field of health, where resistance and hesitancy coexist, despite it being recognised that inequalities and power imbalance are determinants that can negatively impact the health outcomes of populations. As the Junior Working Group on Health Inequalities of the Italian Society of Hygiene, we believe that the World Congress on Public Health is a great opportunity to promote and facilitate a workshop with experts on decolonisation of the Global Health, to better understand the topic, to create space for reflection and to look forward to future perspectives.

Geospatial Analysis of Type 2 Diabetes Mellitus and Hypertension in South Sulawesi, Indonesia

Andi Zainuddin¹, Haerani Rasyid¹

¹Faculty of Medicine, Hasanuddin University, Indonesia

Background and objectives : Indonesia has faced the problem the prevalence of non communicable disease has increased with the prevalence of Type 2

Diabetes Mellitus (T2DM) and Hypertension recently rising. Spatial analysis gives more information about risk based on spatial variation making prediction more accurate. Knowledge about the risk of diabetes mellitus and hypertension in each district or city area can help health agencies carry out activities to prevent these two diseases effectively. This study aimed to determine the level of risk of diabetes mellitus and hypertension in each district or city area in South-Sulawesi Province, which can be done by identifying spatial cluster in the number of people with the disease, carrying out geospatial analysis and applying a Generalized Poisson Regression (GPR) model to determine the potential effect of diabetes mellitus on hypertension.

Methods: The Local Moran's I, the Getis-Ord, and regression analysis were applied to identify the characteristics involved. The methods were performed based on T2DM and hypertension of the Social Health Insurance Administration Body data from 2017 and 2018 in South Sulawesi Province, Indonesia. **Results :** The spatial variation of T2DM and Hypertension showed that the prevalence rate of T2DM tends to form a cluster hotspot and there is no cold spot and spatial outlier. Meanwhile, the prevalence rate of hypertension tends to occur randomly. In analyzing the relationship between T2DM and Hypertension, we utilized the Generalized poisson regression analysis and the Results showed that there is a significant relationship between T2DM and hypertension (p-value = 1.695e-10). **Conclusions:** The districts have the same characteristics but have different patterns in the distribution of T2DM and hypertension in South Sulawesi. T2DM and hypertension prevention programs in South Sulawesi Province need comprehensive monitoring and evaluation.

Popul. Med. 2023;5(Supplement):A1832

DOI: 10.18332/popmed/164769

Understanding what really drives 'healthy' public policy: the human systems coherence framework

David Lilley¹

¹University of New South Wales (UNSW), Sydney, Australia

Background and Objective: Public policies and projects usually have multiple and potentially conflicting goals, some of which are unstated. This means that the explicit use of health-related language is an unreliable indicator of the actual priority accorded to health. The objective of this research was to develop a framework that could be applied to existing or proposed policies and projects, to assess the priority and coherence of health relative to other goals and factors. **Methods:** The framework was developed iteratively. Its application involves coding and analysing policy and project documents based on their boundary judgements (sources of motivation, control, expertise, and legitimacy), their core policy content (goals, instruments, and settings), and their strategic content (diagnoses, approach, and actions). The Resultsing data is then assessed for coherence within and across policies and projects. The framework was validated by applying it to the redevelopment of a large public housing estate in Sydney, Australia.

Results: Looking for coherence proves a strong entry point for policy assessment. Assessing the coherence of variables within individual policy and project documents clarifies their underlying rationale, which can then be compared to their stated goals. In the case study project, this revealed a superficial commitment to health, accompanied by a constraining focus on instrumental and financial outcomes. A comparison of variables across different policies and projects revealed the same pattern, providing evidence that the case study is representative of a broader value base and approach to public policy and administration at this time.

Conclusions: The Human Systems Coherence Framework is a useful tool for disentangling explicit and implicit policy and project goals, and assessing the priority and coherence of health relative to other policy factors. It can be applied to any area of public policy and administration where health is or should be a priority (i.e., all areas).

Co-creation of health-enabling initiatives in food retail: academic perspectives

Carmen Vargas¹, Jillian Whelan², Julie Brimblecombe³, Steven Allender⁴

¹Global Centre for Preventive Health and Nutrition (GLOBE), Institute for Health Transformation, School of Health and Social Development, Deakin University, Australia, ²Deakin University, Australia, ³Department of Nutrition, Dietetics and Food, School of Clinical Sciences, Monash University, Australia, ⁴Global Centre for Preventive Health and Nutrition (GLOBE), Deakin University, Australia

Introduction: Co-creation of healthy food retail comprises the systematic collaboration between retailers, academics and other stakeholders to improve the healthiness of food retail environments. Research into co-creation of healthy food

retail is in its early stages. Knowledge of the roles and motivations of stakeholders in intervention design, implementation and evaluation can inform successful co-creation initiatives. This study presents academic experiences of stakeholder roles and motivations in co-creation of healthy food retail environments. Methods: Purposive sampling of academics with research experience in the co-creation of healthy food retail initiatives. Semi-structured interviews gathered participants' experiences of multi-stakeholder collaborative research. Thematic analysis identified enablers, barriers, motivations, lessons and considerations for future co-creation of healthy food retail.

Results: Nine interviewees provided diverse views and applications of co-creation research in food retail environments. Ten themes were grouped in three overarching areas: i) identification of stakeholders required for changes to healthier food retail; ii) motivations and interactions which included the intrinsic desire to build healthier communities along with recognition of their work; and iii) barriers and enablers included adequate resourcing, effective and trusting working relationships and open communications. Conclusions: This study provides insights that could help future co-creation in healthy food retail environments. Trusting and respectful relationships and reciprocal acknowledgement between stakeholders are key practices in the co-creation process. These constructs should be considered in the development and testing of a model that helps to systematically co-create healthy food retail initiatives that ensure all parties meet their needs while also delivering research outcomes.

DOI: 10.18332/popmed/164877

Development and internal validation of a diagnostic prediction model for psoriasis severity

Mie Liljendahl¹

¹Department of Dermatology and Allergy, Herlev and Gentofte Hospital, University of Copenhagen, Hellerup, Denmark

Background and objectives: While administrative health records such as national registries may be useful data sources to study the epidemiology of psoriasis, they do not generally contain information on disease severity. To inform clinical and public health research on psoriasis treatment at the country level, it is crucial to estimate the national distribution of the disease severity based on clinical characteristics to identify the patients who are candidates for systemic therapy but not receiving this treatment yet. This study aimed to develop a diagnostic model to distinguish psoriasis severity based on administrative register data.

Methods: We conducted a retrospective registry-based cohort study using the Danish Skin Cohort linked with the Danish national registries. We developed a diagnostic model using a gradient boosting machine learning technique to predict moderate-to-severe psoriasis. We performed an internal validation of the model by bootstrapping to account for any optimism.

Results: Among 4,016 adult psoriasis patients (55.8% women, mean age 59 years) included in this study, 1,212 (30.2%) patients were identified as having moderate-to-severe psoriasis. The diagnostic prediction model yielded a bootstrap-corrected discrimination performance: c-statistic equal to 0.73 [95% CI: 0.71 – 0.74]. The internal validation by bootstrap correction showed no substantial optimism in the Results with a c-statistic of 0.72 [95% CI: 0.70 – 0.74]. A bootstrap-corrected slope of 1.10 [95% CI: 1.07 – 1.13] indicated a slight under-fitting.

Conclusions: Based on register data, we developed a gradient boosting diagnostic model returning acceptable prediction of patient with moderate-to-severe psoriasis. This model allows one to identify patients with moderate-to-severe psoriasis in the national registries and estimate patients who are candidates for systemic therapy but not receiving this treatment.

Antitumor activity of Xiaoaiping injection on human gastric cancer SGC-7901 cells

Djelassem Ferdinand¹, Koumtebaye Elysee²

¹Association of Chadian Researchers for Health and Development, Chad,

²Association des Chercheurs en Science pour la Santé au Tchad, N'Djamena, Chad

Xiaoaiping, extracted from *Marsdenia tenacissima* (Asclepiadaceae), is a Chinese medicine used to treat cough and asthma. Previous studies have shown that its active ingredients possess anti-inflammatory and anticancer effects. The aim of this study was to investigate the antitumor activities of Xiaoaiping through apoptosis induction in human gastric cancer SGC-7901 cells. The MTT assay was used to assess cell growth and cell viability. SGC-7901 cells were treated with Xiaoaiping injection [(20–40)mg·mL⁻¹] for 24 and 48 h. The apoptotic cells and the cell cycle distribution were analyzed by flow cytometry. The in vivo activity

of Xiaoaiping was determined by the growth inhibition of the established tumor xenografts in nude mice. Caspase-3 activity, Bax, and Bcl-2 proteins in tumor tissue were measured by immunohistochemistry, and apoptosis was assayed by the terminal deoxynucleotidyl transferase-mediated deoxyuridine triphosphate-biotin nick end labeling (TUNEL) method. Xiaoaiping inhibited SGC-7901 cell growth in a time and dose dependent-manner and the estimated IC50 was (38.20 ± 0.27) mg·mL⁻¹ after 24 h of treatment. The body weight and the tumor volume were significantly reduced in nude mice bearing human gastric tumor treated with Xiaoaiping. The inhibition rate of tumor growth in the mid-dose (200 mg·kg⁻¹) group and high-dose (400 mg·kg⁻¹) group were 61.19% and 69.07%, respectively. Immunohistochemical staining showed an increase in caspase-3 and Bax expression whereas Bcl-2 expression decreased gradually. Xiaoaiping exerted potent antitumor activity in vitro and in vivo against human SGC-7901 cells; induced apoptosis and G1 cell cycle arrest. These Results suggest that Xiaoaiping is a promising antitumor agent for the treatment of human gastric cancer. Keywords: antitumor, Xiaoaiping, apoptosis, SGC-7901 cells

Food literacy, food environments and monitoring and surveillance in public health

Courtney Thompson¹, Jean Adams², Helen Vidgen³

¹Queensland University of Technology, Kelvin Grove, Australia, ²University of Cambridge, United Kingdom, ³Queensland University of Technology, Australia

Background and Objective: While many aspects of the food environment, such as affordability, accessibility and availability have been extensively explored and evaluated, there is still a limited understanding of the relationship between these aspects and consumer behaviours; such as food literacy. While 66 measures exist to assess aspects of food literacy, only one used cognitive interview methods and all varied in their ability to capture totality of eating. This study aimed to determine items for inclusion in a food literacy item pool and capture general public's Interpretation of everyday food literacy practices to develop a comprehensive questionnaire.

Methods: Beginning with an item pool from previous studies, cognitive interviews were conducted using think-aloud and verbal probing Methods. Data were first analysed for applicability, clarity, ambiguity, and logic, then for emergent themes to ensure items captured the totality of the participant's eating. Australian residents over 18 years of age recruited via Facebook residential groups (n=20).

Results: Of the original 116-items, 11 items had limited applicability; 13 items had unclear references; 32 items had lexical problems and 11 items had logical problems. In total, 29 items were deleted, 31 retained and 56 revised. Thematic analysis revealed participants limited their responses to consider only conventional practices such as grocery shopping, cooking and planned meals rather than the totality of their eating. An additional 84 items were developed to address eating out, incidental eating occasions and inconsistencies between participants assumed correct knowledge and that of public health guidelines. This Resulted in a refined 171-item pool.

Conclusions: This study identified important elements of people's Interpretations of food and eating that should be considered when evaluating and monitoring in public health nutrition and progressed development of a comprehensive food literacy questionnaire.

Positionality, reflexivity and ethics in global public health research

Chloe Tuck¹, Isaac Boadu², Robert Akparibo¹, Laura Gray¹, Richmond

Aryeetey³, Richard Cooper¹

¹School of Health and Related Research, University of Sheffield, United Kingdom, ²School of Public Health, University of Ghana, Ghana, ³School of Public Health, University of Ghana

Background and Objectives: As global public health researchers, we strive to increase health system efficiency and reduce inequity due to factors associated with healthcare access and societal wellbeing. Many of the areas of greatest health need are in low-income contexts. However, the majority of funding remains tied to institutions and individuals in high-income settings. Poorly considered research across settings can create disconnect between the researcher and research, further instils colonialist attitudes, and enforces power hierarchies. Yet, the neglect of major health-related challenges facing other environments is ethically more problematic. The Objective of this research was to critically reflect on levels of discordance to foster more ethical and collaborative research.

Methods: Reflectivity and positionality were applied to better understand the role of the researcher, their social experiences, position and power hierarchies

influence knowledge generation. This involved sharing researchers' experience following an exchange between the Universities of Ghana and Sheffield and in fostering a collaboration to conduct mixed methods data collection and analysis with a teaching hospital in northern Ghana.

Results: Numerous aspects of person and place influenced research experience, how the research was conducted and knowledge generation. However, power dynamics can be fluid and change with the environment. This required what geographers have called 'radical humility' in research – an integral openness for researchers to learn, be wrong, change, and acknowledge they are unaware how they are unaware.

Conclusions: Reflexivity and positionality are vital to consider in ethical global health research.

Times trends of atopic dermatitis among the Chinese population, 1990-2019: a joinpoint and Bayesian age-period-cohort analysis

Jingjing Zhou¹, Huijing Chen¹, Shanshan Liang², Ailing Liu¹, Chengcheng Li¹, Shangcheng Zhou¹

¹Guangzhou University of Chinese Medicine, China, ²Department of Mathematics - Science Studies, Guangzhou University of Chinese Medicine, China

Background: Atopic dermatitis (AD) is a chronic inflammatory skin condition, which has become a serious public health problem and has the highest disease burden among skin diseases. Objectives: This study investigates the independent effects of age, period, and cohort on the AD prevalence from 1990 to 2019 in China, compares these effects by gender, and then predicts the future burden over the next decade.

Methods: Data were obtained from the Global Burden of Disease, Injuries, and Risk Factors Study 2019 (GBD 2019). We used Joinpoint regression model to calculate the annual percentage change (APC) in AD prevalence, the age-period-cohort analysis (APC) to estimate the independent effects of age, period, and cohort, the Bayesian age-period-cohort model to predict the epidemic of AD in 2020-2030.

Results: In 2019, there were 35.58 million cases of AD in China, with an age-standardized prevalence rate (ASPR) of 2460.183 (per 100,000 population), 1847.290 (per 100,000 population), and 3097.672 (per 100,000 population) in both sex, men, and women, respectively. From 1990 to 2019, the ASPR of AD fluctuant. The periods of 2017-2019 were "joinpoint" for men and women (APC: 7.1% and 4.0%). The age-period-cohort analyses showed that the prevalence of AD was associated with age, being higher in the 1 to 4 years old, 90 to 94 years old, and 95 + years age groups. The cohort effect generally peaked in the cohort born in 2015-2019. Within 2030, the age-standardized incidence rate of AD was projected to be 8.8 and 5.9 in men and women, respectively. Conclusions: Substantial variations exist in AD burden between males and females, and in age groups. Given the increasing AD burden in China, researchers should pay attention to AD, and help policymakers identify modifiable risk factors to take targeted measures to reduce the AD burden, particularly in children and older adults.

Identifying predictors of frequency of 1-year readmission in adult patients with diabetes using count data regression models

Jade Soh¹, Amartya Mukhopadhyay², Bhuvaneshwari Mohankumar³, Swee Chye Quek³, Bee Tai¹

¹Saw Swee Hock School of Public Health, National University of Singapore, Singapore, ²Respiratory and Critical Care Medicine, National University Hospital, Singapore, ³Medical Affairs - Clinical Governance, National University Hospital, Singapore

Background: Diabetes mellitus is the third most common chronic condition associated with frequent hospital readmission. Predictors of the number of readmissions within one year among patients with diabetes are less often studied compared with those of 30-day readmission.

Objective: This study Aims to identify predictors of number of readmissions within one year amongst adult patients with diabetes and compare different count regression models with respect to model fit. Research methods: Data from 2008-2015 were extracted from the electronic medical record system of the National University Hospital, Singapore. Inpatients aged ≥ 18 years at the time of index admission with a hospital stay > 24 hours who survived until discharge were included. The zero-inflated negative binomial (ZINB) model was fitted and compared with three other count models (Poisson, zero-inflated Poisson and negative binomial) in terms of predicted probabilities, misclassification proportions and model fit.

Results: Adjusted for other variables in the model, the odds ratio for expected number of readmissions was 1.42 (95% confidence interval [CI] 1.07 to 1.90) for peripheral vascular disease, 1.60 (95% CI 1.34 to 1.92) for renal disease and 2.37 (95% CI 1.67 to 3.35) for Singapore residency. Other predictors included number of emergency visits, number of drugs and age, with length of stay fitted as a zero-inflated component. Model comparisons suggested that ZINB provides better prediction than the other three count models.

Conclusions: The ZINB model outperformed other count regression models but should be validated in prospective studies before clinical adoption.

Biased, wrong and counterfeited evidences published during the COVID-19 pandemic, a systematic review of retracted COVID-19 papers

Angelo Capodici¹, Aurelia Salussolia¹, Francesco Sanmarchi¹, Davide Gori¹, Davide Golinelli¹

¹Department of Biomedical and Neuromotor Science, University of Bologna, Italy

Background and Objective: In 2020 COVID-19 led to an unprecedented stream of papers being submitted to journals. Scientists and physicians all around the globe were in need for information about this new disease. In this climate, many articles were accepted after extremely fast peer-reviews to provide the scientific community with the latest discoveries and knowledge. This also led to articles retraction due to authors' misconduct or errors in Methodology/Conclusions. The aim of this study is to investigate the number and characteristics of retracted papers, and to explore the main causes that led to retraction. Methods: We conducted a systematic review on retracted articles, using PubMed as data source. The inclusion criteria were the following: English-language retracted articles reporting original data, results, opinions/hypotheses on COVID-19, and the article being published between December 1, 2019 and December 31, 2021.

Results: 69 records were identified, 66 full-text articles matched our inclusion criteria and were assessed and included in the review. 38 studies were published in 2020 and 28 in 2021. The majority of retracted articles were either observational studies (n = 34, 52%) or opinion papers (n = 11, 17%), followed by reviews articles (n = 9, 14%), experimental (n = 7, 11%), meta-analysis (n = 4, 6%), study protocol (n = 1, 1%). Twenty-seven retracted articles were identified, mainly reporting observational studies and opinion pieces.

Conclusions: Many articles published during the first year of the pandemic have been retracted, mainly due to the authors scientific misconduct. Duplications, plagiarism, frauds and absence of consent, were the main reasons for retractions. In modern medicine, researchers are required to publish frequently, and, especially during situations like the COVID-19 pandemic, when articles were rapidly published, gaps in peer-reviews system and in the path to scientific publication arose.

The use of anthropology, ethnography and cognitive sciences for understanding the influence of online communities on public health: measles outbreak and anti-vaccination movement - lesson not learned

Milica Vucurovic¹, Verica Jovanovic²

¹Institute of Public Health of Serbia "Dr Milan Jovanovic Batut", Belgrade, Serbia, ²Institute of Public Health of Serbia Dr Milan Jovanovic Batut, Belgrade, Serbia

Background and Objective: The past several years have been pivotal in revealing how much of an impact social groups on the internet have on the public health in general. Understanding that such groups comprise of relatively stable sets of links that have specific structure and include resource exchange depends on using the methods of medical anthropology, cyber ethnography, and cognitive sciences for recognition and full analysis of the virtual communities. The application of the methodologies is demonstrated by an analysis of the anti-vaccination movements actions in relation to the measles outbreak and the effects of those actions on the general public health. Methods: Qualitative research is conducted using the observation of 12 social groups on the internet chosen by the criteria of existing anti-vaccine narrative, analysis of people interactions within and between those groups, 5 structured interviews in vivo, Roy DAndrades folk model of the mind, and systematical analysis of the topic-related literature from PubMed and Google Scholar.

Results: Processing the example of social groups it was confirmed that the lack of trust in conventional medicine directly correlates to the belief in conspiracy theories, miraculous properties of alternative medicine, and even magic. The

study has determined the cognitive schemes and culture models explaining the principles and providing the information on the cultural thought that lies behind the Interpretation of public health on the internet. Conclusions: The multidisciplinary approach made it possible not just to recognize the existence of the influence of virtual communities on public health, but to determine its source, analyze its development, discover prospective branching, and predict its outcomes, directly affecting the planning of future public health interventions, in order to avoid further repetition of the same mistakes like the difficulties during coronavirus disease 2019 (COVID-19) vaccination process.

High risk of death from multiple causes following release from incarceration: an individual participant data meta-analysis of 1,471,526 adults in eight countries

Rohan Borschmann¹, Claire Keen², Matthew Spittal³, Jane Pirkis¹, David Preen⁴, David Rosen⁵, Sarah Larney⁶, Jesse Young², Stuart Kinner⁷

¹University Of Melbourne, Australia, ²University of Melbourne, Australia,

³University of Melbourne, Melbourne, Australia, ⁴University of Western Australia, Australia, ⁵University of North Carolina, United States, ⁶University of Montreal, Canada, ⁷Curtin University, Australia

Background: Formerly incarcerated people have exceptionally poor health profiles and are at increased risk of adverse health outcomes when compared to their general population peers. However, not enough is currently known about the epidemiology of preventable mortality in this population to inform the development of targeted, evidence-informed responses.

Methods: We analyzed mortality data relating to 1,471,526 people released from incarceration in eight countries from 1980-2018, across 10,534,441 person-years of follow-up time (range: 0-24 years). We used individual participant data meta-analysis to estimate pooled all-cause and cause-specific crude mortality rates (CMRs) with 95% confidence intervals (95%CI) for specific time periods after release, overall and stratified by age, sex, and region.

Results: 75427 deaths were recorded. The all-cause mortality rate was highest during days 2-7 following release, with the highest cause-specific rates during this period due to alcohol and other drug poisoning (CMR: 657; 95%CI: 332-1,076), suicide (CMR: 135; 95%CI: 36-277), and cardiovascular disease (CMR: 71; 95%CI: 16-153). We observed considerable variation in cause-specific CMRs over time and across regions, yet little difference in pooled all-cause CMRs between males (731; 95%CI: 630-839) and females (660; 95%CI: 560-767). Pooled all-cause CMRs were higher in older age groups.

Conclusions: The markedly elevated rate of death in the first week post-release underscores an urgent need for coordinated transitional healthcare, including pre-release treatment for mental and substance use disorders to prevent post-release deaths suicide and overdose deaths. Variations in causes of death according to time since release highlights the need for routine monitoring of post-release mortality.

Modelling HIV/AIDS epidemiological complexity: a scoping review of Agent-Based Model and their application

Felipe Rubio¹, Rodrigo Anderle², Robson Oliveira³, Davide Rasella³

¹Institute of Collective Health at the Federal University of Bahia (ISC-UFBA), Brazil, ²Instituto de Saúde Coletiva (ISC) - UFBA, Brazil, ³Instituto de Saúde Coletiva (ISC) da UFBA, Brazil

Objective: To end AIDS epidemic by 2030 despite the new challenges brought by COVID-19, such as increasing poverty rates and inequalities, policies should be designed to deal with population heterogeneity and environmental changes. Bottom-up designs, such Agent-Based Model (ABM), have the potential to deal with such complexity by explicitly model these features. HIV/AIDS have a complex dynamic by structural factors, risk behaviors, biomedical characteristics, and interventions. All this embedded into a social structure with inequalities, stigma, and prejudice. To understand how this complexity is faced with ABMs, we performed a scoping review of its applications for HIV to highlight the gaps and potentialities of such approach.

Methods: We search PubMed, Web of Science and Scopus repositories, following the PRISMA extension for scoping reviews. We identified the main articles by a co-citation network, and categorize the literature Aims, (sub)populations, and countries/regions under study.

Results: We found 73 articles that applied ABM to HIV. From them, we identified 16 main articles. Most of the studies model Transmission Dynamics (23/78 – relate to aim categories) into specific key populations (19/73 – related to papers) of US

and South Africa (50/66 – related to country appearances). More recent studies applied ABM to model PrEP interventions (10/78 – related to aim categories) and Racial Disparities (9/101 – related to populations appearances).

Conclusions: Availability of data, computational power and specific know-how are the major barriers to its diffusion. We also identified the literature is highly concentrate on researchers located on the United States with low levels of outsiders collaboration. This reveals how infant is the applications yet. Overall, ABMs are still underused considering their potentialities, and should be applied more broadly to support the implementation of HIV/AIDS control interventions aimed to end AIDS epidemic by 2030.

Prevalence and profile of Tinnitus in Brazilian primary health care

Carla Chamouton¹, Helenice Nakamura¹

¹University of Campinas (UNICAMP), Brazil

Background and Objective: Tinnitus is an auditory symptom characterized by the perception of a sound without an external sound source. The literature shows a prevalence from 10-15% in the general population and a relation with the occurrence of insomnia, depression, substance addiction and suicidal ideation, among other health conditions. Due to its high prevalence and negative impact on the quality of life, tinnitus can be considered as a public health issue. The objective of the study was to estimate the prevalence and characterize the health profile, and tinnitus complaint, of the adult and elderly population of a health district in a large Brazilian city. **Methods:** An in-service survey was conducted in all primary health centers in the district with a random approach to the adult and elderly population. The sample consisted of 1720 people and the data collection included a questionnaire about general health and tinnitus. Three regression models were performed according to the variables and a 5% significance level was adopted for the statistical analysis.

Results: 1569 people answered the questionnaire, with 496 reporting tinnitus, which represented a prevalence of 31.6%. Most of the sample was female, had at least one chronic disease and made continuous use of some medication. The regression models showed a higher chance of tinnitus with advancing age and with the occurrence of diabetes and hormone disorder. **Conclusions:** Tinnitus is related to the occurrence of chronic diseases and advancing age, may cause discomfort and is a reason for seeking treatment. Therefore, it needs to be considered in the health services and the quality of life of these people must be guaranteed by the health professionals.

Supporting the achievement of global goals for health and wellbeing through social prescribing: defining the concept

Caitlin Muhl¹, Kate Mulligan², Imaan Bayoumi¹, Rachelle Ashcroft², Christina Godfrey¹

¹Queen's University, Canada, ²University of Toronto, Canada

Background and Objective: With the social prescribing movement rapidly spreading across the globe, there is a need for an agreed definition of social prescribing. As there are two types of definitions – conceptual and operational, agreement on both types of definitions is needed. The aim of this study was to establish internationally accepted conceptual and operational definitions of social prescribing.

Methods: A three-round Delphi study was conducted with an international, multidisciplinary panel of experts. The expert panel (n=48) represented 26 different countries across five continents, numerous expert groups, and a variety of years of experience with social prescribing. Consensus was defined a priori as ≥80% agreement. In Round 1, participants were asked to list key elements that are essential to the conceptual definition of social prescribing and to provide corresponding statements that operationalize each of the key elements. In Round 2, participants were asked to rate their agreement with items from the first round for inclusion in the conceptual and/or operational definitions of social prescribing. Based on the findings from this round, the conceptual and operational definitions of social prescribing were developed, including long and short versions of the conceptual definition. In Round 3, participants were asked to rate their agreement with the conceptual and operational definitions of social prescribing.

Results: Internationally accepted conceptual and operational definitions of social prescribing were established. The Common Understanding of Social Prescribing (CUSP) conceptual framework was developed from the definitions. The CUSP acronym reflects the potential of this foundational work to bring about a point of transition in the social prescribing movement through the advancement of common understanding.

Conclusions: This foundational work offers a common thread – a shared sense of what social prescribing is, which may be woven into social prescribing research, policy, and practice to foster common understanding of this concept.

Student involvement in implementation and evaluation of a school-based health promotion program in upper secondary school: a participatory research approach

Vibeke Krane¹, Sabrina Schmidt², Solfrid Bratland-Sanda², Lise Trangsrud²

¹Department of Health Social and Welfare Studies, University of South-Eastern Norway, Oslo, Norway, ²Department of Sports, Physical Education and Outdoor Studies, University of South-Eastern Norway, Norway

Background and Objective: School is a core setting for health promotion in children and adolescents. However, several large school-based health promotion programs fail to succeed, often because of a top-down approach. The aim of this study was therefore to explore involvement of students in the evaluation and implementation of a school-based, health promotion program in a vocational study program in a Norwegian upper secondary school. The program aimed to increase school-based physical activity, improve quality of the school meal, and the psychosocial school environment.

Methods: The study had a participatory research design where students were involved in the knowledge development. A student competence group (SCG, n=8) collaborated with the researchers in the evaluation of implementation of the school-based health promotion program. Data were collected in three waves (spring 2021, autumn 2021, and spring 2022), the SCG met with the researchers twice per data collection. The empirical data for this study is based on a total of these six meetings.

Results: The involvement of SCG was crucial for the ability to identify important topics for the data collection. The SCG influenced the study by contributing to the development of the interview guide for the qualitative study. Moreover, the SCG modified questions for the survey. The SCG contributed and nuanced the interpretation of the quantitative and qualitative data.

Conclusions: The study showed how participatory research can influence different stages of an evaluation and implementation process for health programs in school settings. The involvement of students in SCG provided wider perspectives and pointed out practical implications of the study. There is a need for further research to explore power dynamics and new methods of youth participation in public health research.

Heller's concept of needs: a theoretical approach to analyze health management practices

Cristian Figueroa¹, Ana Vilasbôas², Nília Prado³

¹Instituto de Saúde Coletiva, Universidade Federal da Bahia, Guatemala,

²Instituto de Saúde Coletiva, Universidade Federal da Bahia, Brazil, ³Instituto Multidisciplinar em Saúde, Universidade Federal da Bahia, Brazil

Background and Objective: Recently, the world experienced a major health crisis and social inequities exacerbated. In response of the ongoing crises, recent scholarly work addresses the urge of modifying current healthcare models through health management practices focused on social determination of health. Rooted in the Latin American collective health thought, this study aims to search in the work of the philosopher Agnes Heller answers to study health management practices.

Methods: We conducted a theoretical-reflective study. We focused on Agnes Heller's thought on needs and everyday life. Particularly, in Heller's "The Theory of Need in Marx", "A Theory of Needs Revisited" and "Alltag und Geschichte: zur sozialistischer Gesellschaftslehre".

Results: Needs in Heller's work is not an alienated category or restricted to possessing goods. Rather, appears as material, intangible, and effective demands, qualitatively different and socially constructed. Heller aims to promote social change through emancipation, since it is impossible to satisfy needs within the capitalist system. This requires collective subjects carrying radical needs. These subjects disrupt the individualistic and narcissistic approach on everyday life, without denying their singular experience. Heller proposes to analyze the characteristics of everyday life to determine the alienation of needs. Three elements are important for understanding needs: the ontological element denies the needs' naturalistic character and recognizes its historicity. The ethical element states that satisfying needs should not invert the relation between means-ends, and quantity-quality. Finally, the political element centers on social institutions and a democratic culture to satisfy needs.

Conclusions: Health management practices focused on social needs allow avoiding the reductionism of health care models limited to medical-assistance services. Heller's concept of needs is useful for overcoming the fragmentation of social demands into numerous individual needs. Permitting us to think about democratic governance mechanisms to capture needs. New ways of satisfying needs outside the capitalist system pends.

Holism vs. Individualism in public health methodology: a case study of capitalism and infant mortality

Agasthya Vedre-Kyanam¹

¹School of Public Health, Department of Sociology, University of Alabama at Birmingham, Birmingham, United States

The development of American capitalism facilitated the dominance of a bioessentialist paradigm in public health research. This has resulted in a systematic individualization of health problems that is financially beneficial for the corporate leaders and funders in health research- exacerbating health inequity and degrading research ethics and scientific integrity. The US has the highest rate of infant mortality of the OECD countries. This study investigates the link between capitalism and infant mortality in this context. There has not yet been a systematic analysis of the effect of capitalism on infant mortality research Methodology and how both affect infant mortality. Mixed-method synthesis of 40 studies was conducted to study infant mortality in the US and countries with lower wealth stratification. Thematic analysis of infant mortality calls to action/initiatives from the UN, WHO, and other major centers/organizations was conducted to understand the academic predispositions guiding infant mortality research methodology. Conflict-theoretical and critical-theoretical frameworks were used to guide investigation. Infant mortality is significantly higher in countries with higher levels of wealth stratification. Research attitudes attributing infant mortality to the individual behavior of the mother rather than social factors was also higher in countries with higher wealth stratification. Capitalism is increasingly becoming a determinant of both health and knowledge. This research is important to guide future inquiry into how power affects the nature of public health epistemologies, and subsequently population health. New avenues of research could study how capitalism affects the outcomes and epistemologies of other diseases, such as mental illnesses.

Linking 1.7 million non-EU migrants and refugees to hospital data in England: linkage process and quality

Rachel Burns¹

¹University College London, London, United Kingdom

Background and Objective: Difficulties identifying migrants in national data sources such as hospital records has limited large-scale evaluation of migrant healthcare needs and use of health services in European countries like the UK. We aim to describe the novel linkage process and quality of linkage of 1.7 million non-EU migrants and resettled refugees within national health service (NHS) hospital care enabling research into the relationship between migration and health for a large cohort of international migrants in England.

Methods: We use stepwise deterministic linkage algorithms to link longitudinal records from non-EU migrants and refugees to records in the NHS personal demographics services (PDS; linkage stage 1), and HES-ONS (linkage stage 2). We calculated linkage rates and compared migrant characteristics in linked and unlinked samples for each stage of linkage. Results of the 1,799,307 unique migrant records, 1,134,007 (63%) linked to an NHS number and 451,916 (25%) linked to a hospital record in England. Individuals on settlement and dependent visas and refugees had the highest odds of having linked to a hospital record, compared to those on work, student, or working holiday visas. Migrants from the middle east and north Africa and South Asia had four times the odds of having at least one hospital record, compared to those from East Asia and the Pacific. Differences in migrant characteristics between linked and unlinked samples were moderate to small.

Conclusions: We linked over half of the migrants to an NHS number and one fourth to a hospital record. This linked dataset represents a unique opportunity to explore hospitalization rates in migrants. However, missed links disproportionately affected individuals on shorter-term visas and could be mitigated by increasing the quality and completeness of identifiers recorded in administrative data.

Integratedness of qualitative research Results into public health measures and policies in the Republic of Serbia

Milica Vučurović¹, Sofija Jovanović²

¹Institute of Public Health of Serbia "Dr Milan Jovanovic Batut", Serbia,

²Faculty of Medicine, University of Belgrade, Serbia

Background and Objectives: Besides quantitative research, the Introduction of qualitative research into the inquiry of challenges in the field of public health was conditioned by the multidisciplinary of public health itself. It was recognized that qualitative research delivers better contextualization of the challenge, along with providing depth and breadth to the statistical data, a new dimension – three-dimensionality. This study aims to realize the place and the role of qualitative research in the practice of forming public health measures and policies from the perspective of 10 interviews with the decision makers that defined the public health strategy in the Republic of Serbia.

Methods: Semi-structured interviews on the topic of qualitative and quantitative research were conducted with the 10 people on positions responsible for forming the public health strategy and policies in the Republic of Serbia. The narrative analysis was used for the Interpretation of the findings. **Results** Despite the fact that the value of the qualitative research was recognized at academic level, their use in practice is limited. Of the 10 interviewees, all 10 give priority to quantitative research studies, since they are easier to navigate, provide the number of occurrences, are easier to use for perceiving the scope of the challenge and risk factors and allow the generalization of the Findings beyond the participant group. **Conclusions:** Despite being recognized as a part of the public health curriculum, qualitative research does not bear the strength of the statistical evidence used for defining public health measures and policies. The formed public health measures and policies often lack depth and they neither contextualize the challenge nor do they adjust towards the intended population. For this reason, many measures in public health don't have the desired or even expected level of efficiency.

Reaching and targeting more effectively: a local experimentation of segmentation to improve access to preventive health examinations

Emilie Labbe-Lobertreau¹, Damien Viillard², Sophie Labarre³, Camille Rondelart², Audrey Bérard⁴, Louis Giberson⁵, Chrystelle Marchand⁵, Armelle Cotte⁶, Bienvenu Bongue⁷

¹Centre Technique d'appui et de Formation des Centres d'Examens de Santé (CETAF), France, ²CPAM de la Loire (Caisse Primaire d'Assurance Maladie), France, ³Centre Technique d'Appui et de Formation des Centres d'Examens de santé (CETAF), France, ⁴Centres d'Examens de Santé de Saint-Etienne, France, ⁵CETAF (centre technique d'appui et de formation des centres d'examen de santé), France, ⁶Centres d'examen de santé de Saint-Etienne, France, ⁷CETAF (centre technique d'appui et de formation des centres d'examen de santé), SAINBIOSE, INSERM, U1059, University of Lyon, France

Background and Objective: The adherence to prevention actions remains a major public health issue. French Health Examination Centres (HEC) provide preventive health examinations. However, it is difficult to get people to attend these prevention consultations. The aim of this study is to test different strategies related to the promotion of preventive health examinations based on social marketing techniques, including the use of segmentation.

Methods: Intervention research with a mixed approach was conducted using medical and administrative databases from the local health insurance system in 2019. The study's population consist of 124.377 people +18 years, living in the Loire department and already targeted to a preventive examination. Multiple correspondence analyses were performed to summarize information from 31 variables related to sociodemographic and medical characteristics into a set of continuous principal components (PCs). The population was segmented into eight clusters based on a hierarchical cluster analysis applied to the 10 first PCs. 34 individual interviews were hereafter conducted to explore barriers and facilitating factors related to health examination invitations.

Results: We focused on 3 clusters with social vulnerability criteria: cluster 3 (14%) had a higher frequency of young people without health insurance and with poor adherence to health examinations; cluster 4 (15%) was represented by low-income families with better adherence to the healthcare system; cluster 7 (10%) grouped people aged 40-70 years old not affiliated to the general healthcare system and with a lower frequency of health examinations. The qualitative study showed barriers such as 'misunderstanding the content', 'not concerned' by health examinations, and 'intended to people who don't care about health'.

Conclusions: Social marketing campaigns have been implemented with carefully selected messages that communicate the most relevant information

to the segments. The next step will be to assess whether the strategies improve adherence to the preventive health examinations.

DOI: 10.18332/popmed/165467

Analysis of burnout and fulfillment levels in rehabilitation health professionals

Natasha Cepparulo¹, Pierpaolo Vittorini¹

¹Università degli Studi dell'Aquila, Italy

Background and Objective: The study presented in this abstract aimed to analyze burnout and professional fulfillment levels within a sample of rehabilitation health professionals. **Methods:** With this objective in mind, the Professional Fulfillment Index (PFI), a validated test composed of 16 items and measuring these aspects, was selected. The test was translated from its original language, English, to Italian, and it was administered to a small sample of rehabilitators in order to validate the translated version: we calculated a Chronbach's alpha equal to 0.805, that suggested its adoption also in the Italian context. Then, it was administered to 79 rehabilitators. We also collected information about gender, age, educational qualification, place of work, work structure, years of work, work composition.

Results: The results showed moderate level of job satisfaction and medium level of burnout. A marginally significant statistical difference was found between the fulfillment values and the years of work: it was observed that the rehabilitators who had been employed since 6-11 years had a medium-to-low job satisfaction level, unlike those employed for more than 20 years, who showed a medium-to-high job satisfaction level. Moreover, a medium burnout value was observed among rehabilitators with a Bachelor's degree, and a no-burnout level among those with a Master's degree. **Conclusions:** The study investigated burnout and professional fulfillment levels, showing ups and downs. These results pave the way for future research on the subject, which could provide better results by including a larger sample of rehabilitators.

Is Vitamin supplementation effective in the prevention and management of SARS-CoV-2 infection and in Long COVID? A systematic review of randomized clinical trials

Claudia Isonne¹, Alessandra Sinopoli², Valentina Baccolini¹, Antonio Sciurti¹, Maria Santoro³

¹Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy, ²Department of Prevention, Local Health Authority Roma 1, Rome, Italy, ³Department of Experimental Medicine, University of Rome Tor Vergata, Rome, Italy

Background and Objective: SARS-CoV-2 plays with an individual's immunity and the severity of the infection depends on patient's immuno-competence. While it is well known that nutritional deficiencies can impair the immune system, making it particularly susceptible to infections, evidence on the efficacy of Vitamin supplementation in the prevention and management of viral infections is still fragmented. Therefore, we conducted a systematic review aimed at summarizing the clinical effects of vitamin supplementation against SARS-CoV-2 infections.

Methods: PubMed, Scopus, and Web of Science were searched. RCTs comparing the effects of any vitamin supplementation in any form vs. placebo or standard of care in the prevention and/or management of confirmed SARS-CoV-2 infection in people of any age were included. A narrative synthesis of the Results was conducted. The revised Cochrane Risk-Of-Bias tool was used to assess quality.

Results: A total of 10684 records resulted from the initial search, of which 30 RCTs were included. Two studies investigated the administration of multivitamin complexes, 20 the administration of vitamin D, whereas eight the administration of vitamin C. Four studies evaluated the prevention of SARS-CoV-2 infection in high-risk individuals. Prevention of Long COVID was studied by only one author. The populations under investigation were mainly hospitalized. Preliminary results indicated that findings were heterogeneous in relation to the clinical management of patients included, whereas no significant results were found in the prevention area. Individuals supplemented with vitamin D had a better prognosis. The most studied outcome was mortality, which appeared significantly reduced especially in the case of vitamin D supplementation.

Conclusions: Despite the initial stage, we found that differences in populations considered, as well as variety in recruitment and treatment protocols, highlight the need to conduct further investigations to estimate the clinical benefits of vitamin administration in COVID-19 patients.

Nanoparticle concentration in Exhaled Breath Condensate as a novel biomarker for assessing exposure to nanomaterials in occupational environment

Marco Panizzolo¹, Francesco Barbero², Giulia Squillacioti¹, Valeria Bellisario¹, Federica Ghelli¹, Ivana Fenoglio², Enrico Bergamaschi¹, Roberto Bono¹

¹Department of Public Health and Pediatrics, University of Turin, Italy,

²Department of Chemistry, University of Turin, Italy

Background & Objective: The rapid growth of the technological use of nanomaterials (NMs) has led to a consequent increase in their aero dispersion. This exposure may represent a risky condition for a large number of workers. The study aimed to assess the relationship between the chronic exposition of workers exposed to NMs and the biological response, quantified using some internal-dose and early biological effect biomarkers measured in a non-invasive way. **Methods:** 59 subjects were recruited as exposed to NMs, 26 working with "EPC" paints and coatings, and 33 with "ECC" construction chemicals. 41 unexposed subjects were enrolled as controls. At the end of the working shift, each subject provided a spot of urine, for metal quantification by ICP-MS, and an Exhaled Breath Condensate (EBC) sample, to quantify nanoparticles and local inflammation by Nanoparticles Tracking Analysis (NTA) and ELISA technique, respectively. Differences between groups and companies were tested by Kruskal-Wallis tests, according to the data distribution.

Results: workers exposed to EPC and ECC demonstrated significantly higher nanoparticles concentration in EBC ($p < 0.0001$) when compared with unexposed. Regarding inflammation, high sensitivity-CRP, interleukin (IL)-1 β , and TNF- α showed significantly higher levels ($p < 0.0001$) in EPC and ECC, when compared to unexposed. Conversely, IL-10 was significantly higher only in ECC compared to unexposed ($p < 0.001$). Metals in urine revealed the same trend for 29Si, 47Ti, and 118Sn, with higher significant levels in both EPC and ECC when compared to unexposed ($p < 0.0001$, $p < 0.0001$, and $p = 0.001$, respectively). 52Cr and 27Al proved no differences between workers from different companies. **Conclusions:** The results support a possible relationship between nanoparticle exposure and particle load in the airways, which in turn may cause both sustained inflammation and higher levels of metal in urine. Further investigations on these biomarkers in other occupational scenarios could be useful to devise new preventive strategies.

Bayesian approaches in public health: a cross-campus comparison of sexual violence victimization

Kamilla Bonnesen¹, Kevin Swartout¹

¹Georgia State University, United States

Bayesian statistics have recently become computationally possible for more complex public health research questions. Bayesian method offer a novel approach to public health research, they account for non-normally distributed variables, and provide a probabilistic approach to testing null hypotheses. In this worked example, we compare sexual violence victimization (SV) rates on two- and four-year campuses and test whether contextual alcohol-related factors impact risk of victimization. We chose campus SV and heavy episodic drinking (HED) for this example due to the global public health significance; SV is endemic on college campuses and HED is a robust risk factor of victimization. We hypothesized that 1) students at four-year campuses experience more SV than their two-year campus peers, 2) HED predicts victimization across both campus types, and 3) students who engage in HED experience the same amount of SV risk, regardless of campus type. We found reliable differences in SV and HED across two- and four-year campuses: four-year campus students were twice as likely to have experienced SV (OR=1.98, 90% CI=1.61-2.46) and 2.5 times as likely to engage in HED (OR=2.63 90 CI=2.24-3.10) compared with two-year campus students. Finally, the results suggest campus type does not impact the association between SV and HED; therefore, students who drink heavily experience similar SV risk regardless of the campus type they attend. In addition to understanding how institution type and heavy drinking affect students SV experiences, this study presents a novel statistical approach to violence research and elucidates the experiences of violence for an understudied group of college students (i.e., those who attend a two-year campus). This example highlights how Bayesian approaches are valuable in public health. A Bayesian perspective provides a quantitative approach to establishing similarity across groups, which is of clear value to public health evaluations.

A territorial turn in research on health inequities

Elis Borde¹, Elis Borde¹

¹Federal University of Minas Gerais (UFMG), Brazil

Background: Research on health inequities mostly focuses on describing different levels of exposure to (social) factors that influence health outcomes. While this overcomes still dominant biomedical and lifestyle approaches, it does not sufficiently engage with the processes that (re)produce health inequities and shape processes of embodiment. Territory and its correlates are increasingly being considered to explore such processes. Nonetheless, there remains a problematic ambivalence between notions of territory that broadly correspond to localization and an acknowledgement of territory as a relational, dynamic, and inherently conflictual appropriation of space. We make a case for a critical territorial turn in health inequity research.

Methods: On the basis of theoretical insights from Critical Geography, Ecosocial Theory and Latin American Social Medicine and Collective Health, case studies on processes of health-disease and death in territories shaped by urban violence in Bogotá and Rio de Janeiro are analyzed with a territorial lens, revealing ways in which territorial dynamics shape processes of embodiment and health inequities. **Results:** The case examples underline the importance of understanding and systematically integrating a territorial lens in health inequity research as the territorial dynamics provide insights and reveal pathways of embodiment that results from direct and indirect territorial (un)making of both emancipatory and dominating, state-centered and bottom-up political projects that shape unequal exposure, susceptibility, experience and impact of what compromises health and wellbeing at multiple levels. In the case examples this is illustrated by mostly violent territorial (dis)ordering imposed by militarization of urban space, state violence, militias and globalized drug trade and its implications for well-being, ill-being and death in urban Latin America.

Conclusions: A territorial turn is necessary to inform more sensitive and complex readings of health inequities and to reveal pathways of embodiment that challenge essentialist and individualistic approaches to population health (inequities), including urban violence and violent death.

Small-area deprivation index does not improve the capability of multisource comorbidity score in mortality prediction

Federico Rea¹, Mauro Ferrante², Salvatore Scondotto³, Giovanni Corrao¹

¹University of Milano-Bicocca Italy, ²University of Palermo, ³Sicily Regional Health Service Italy

Background and objective: The stratification of the general population according to health needs allows to provide better-tailored services. A simple score called Multisource Comorbidity Score (MCS) has been developed and validated for predicting several outcomes. The aim of this study was to evaluate whether the predictive ability of the MCS improves by incorporating socioeconomic data (as measured by a deprivation index).

Methods: Beneficiaries of the Italian National Health Service who in the index year (2018) were aged 50–85 years and were resident in the Sicily region for at least 2 years were identified. The 1-year mortality was the outcome of interest. For each individual, the MCS was calculated according to his/her clinical profile, and the deprivation index of the census unit level of the individual's residence was collected. Akaike information criterion and Bayesian information criterion statistics were used to compare the goodness of fit of the model that included only MCS and the model that also contained the deprivation index. The models were further compared by means of the area under the receiver operating characteristic curve (AUC).

Results: The final cohort included 1,062,221 individuals, with a mortality rate of 15.6 deaths per 1,000 person-years. Both MCS and deprivation index were positively associated with mortality.

The goodness of fit statistics of the two models were very similar. For MCS only and MCS plus deprivation index models, Akaike information criterion were 19,566 and 19,578, respectively, whereas Bayesian information criterion were 19,528 and 19,516, respectively. The AUC values were 0.78 for both models.

Conclusion: The present study shows that socioeconomic features as measured by the deprivation index did not improve the capability of MCS in predicting 1-year risk of death. Future studies are needed to investigate other sources of data to enhance the risk stratification of populations.

The impact of COVID-19 pandemic on HIV screening scientific production

Irene Gintoli¹, Fabrizio Bert¹, Valerio Brescia¹, Giacomo Scaioli¹, Giuseppina

Lo Moro¹, Roberta Siliquini¹

¹University of Torino Department of Public Health Sciences, University of Torino Italy

Background and Objective: The COVID-19 pandemic has had a significant impact on many areas of preventive, diagnostic and therapeutic assistance. Some preventive activities may have been neglected in terms of implementation or research. These include the accessibility to HIV screening and the cost-effectiveness of this preventive measure. This study aimed to investigate the attention of the scientific community on the cost-effectiveness of HIV screening through a bibliometric analysis referring to the period 2020-2022. The aim was to evaluate publication and citation related metrics, identify major keywords and topics, and assess geographic distribution of published articles.

Methods: A list of all publications containing specific keywords and Mesh terms related to HIV screening and its cost-effectiveness in all fields was extracted from Scopus on date 2022/11/23. Bibliometric analysis was then conducted using the bibliometrix and biblioshiny packages on RStudio.

Results: Total publications (TP) were 155 with an annual growth rate of -7,58%. Contributing authors were 1442, with an average of 2,923 citations per paper. The origin of TP is heterogeneous; 67,1% of them were produced by International co-authorships. The countries with the most conspicuous literary production were the USA, UK, South Africa, China and Switzerland. The United States and South Africa were the countries with the highest number of mutual collaborations. Trending topics about HIV screening cost-effectiveness include "Cost-effectiveness analysis", "Controlled study" and "Mass screening".

Conclusions: The covid 19 pandemic has caused a setback to primary health care and secondary prevention services such as screenings, and related research. The study demonstrates a reduction of scientific production on this topic and the need to focus again both in research and in public health services implementation on other important pandemics that could accelerate their expansion such as HIV.

The use of artificial intelligence and natural language processing for visualizing social media discussions surrounding the repeal of Roe v. Wade in the United States of America

Rodina Bizri-Baryak¹, Lana Ivanitskaya¹, Elina Erzikova², Lisa Gandy²

¹Central Michigan University, 122 Falling Rock Way, United States, ²Central Michigan University, 1200 S. Franklin St., Mount Pleasant, Mich. 48859, United States

Background and Objective: We present a novel method of network visualization with computer-assisted processing of text. We leverage human and computer collaboration to develop and validate algorithms. We apply a network analysis and natural language processing to the corpus of 28,693 YouTube comments surrounding the repeal of Roe v. Wade. In addition, we connect visualizations to qualitative study, to deepen our exploration of social media users' understanding of policy and implications for women's health.

Methods: We analyzed comments to nine most watched YouTube newscasts about the repeal of Roe v. Wade by ABC, CBS, CNN, Fox News, MSNBC and Vice News. We applied a Gender API through google and computer-scored social and psychological states from Linguistic Inquiry Word Count (LIWC-22). VOSviewer visualizations of Roe v. Wade relevant terms extracted from YouTube comments are overlayed with computer-generated LIWC scores.

Results: Our colorful map – a network of 256 interconnected terms extracted from 28,693 comments has 4 thematic clusters of terms: 1) overturning of Roe v. Wade/states' rights/political debate/Supreme Court rulings/abortion rights; 2) Consequences of eliminating the right to choose/possible solutions; and 3) Argument for determining when life begins/fetal development/health complications; 4) Religion and morality. Clusters 2 and 3 score high on female usernames (Gender API), in-text references to females (LIWC), and health related concerns. In contrast, male usernames are more prevalent in Clusters 1 and 4 with discussions on religion, policy, and the political implications of the Supreme Court decision.

Conclusion: Eye-catching term networks and LIWC overlays help researchers visualize and communicate about policy issues, as they are deliberated in social media. Overlayed with gender-specific information, networks of co-occurring terms can assist in audience segmentation. To make data analysis more efficient, some human validation and curation is needed with automated text scoring to identify discussion areas with specific linguistic features.

Nutrition literacy assessment in oncology informal caregivers:

preliminary data of a cross-sectional study

Daniele Nucci¹, Erica Manzan², Marta Tesolin³, Cristiana Zordan³, Leda Lo Mauro², Valentina Moretto³, Caterina Bardazzi⁴, Letizia Fattorini⁴, Daniela Costardi⁵, Heather Gibbs⁶, Chiara Lorini⁷, Guglielmo Bonaccorsi⁷, Mariateresa Nardi¹

¹Veneto Institute of Oncology IOV-IRCCS, Dietetics and Clinical Nutrition Unit, Via Gattamelata, 64, 35128 Padua, Italy, ²Veneto Institute of Oncology IOV-IRCCS, ³Veneto Institute of Oncology IOV-IRCCS, Dietetics and Clinical Nutrition Unit, Italy, ⁴University of Florence, Medical Specialization School in Hygiene and Preventive Medicine, viale GB Morgagni, 48, 50134 Florence, Italy, ⁵Veneto Institute of Oncology IOV-IRCCS, Patient Education and Empowerment Unit, Via Gattamelata, 64, 35128, Padua, Italy, ⁶University of Kansas Medical Center, Department of Dietetics and Nutrition, 3901 Rainbow Blvd, MS, 4013, Kansas City, KS, 66160, USA, United States, ⁷University of Florence, Department of Health Science, viale GB Morgagni 48, 50134, Florence, Italy

Background and Objective: Malnutrition with weight loss in cancer patients (CPs) represents one of the most important problems to prevent and treat. Cancer-associated malnutrition is mainly due to the tumor itself and/or to treatments, and can lead to cachexia, which is responsible for up to 20% of cancer deaths. The informal caregivers (ICs) play a key role in the management of CPs. In particular, a good level of ICs' nutritional literacy (NL) is essential to help CPs in facing malnutrition and improve their quality of life. The aim of our study is to measure NL level of ICs of CPs.

Methods: We designed a 12-month cross-sectional study that will include 400 ICs of CPs of the Veneto Institute of Oncology in Padua. The Italian version of the Nutrition Literacy Assessment Instrument (NLit-IT) was used to measure the NL level of ICs. NLit-IT allow identifying three levels of NL: i)probability of low NL; ii)possibility of low NL; iii)possibility of good NL. The study included ICs of both sexes, aged 18- 80, responsible for the diet of the assisted cancer patient.

Results: Currently a sample of, 103 ICs (M=35; F=68) aged 54 (±14.5) participated in the study. Almost half of the participants (48%) were overweight (35%) or obese (13%). After the analysis of the NLit-IT score, 56% (n=58) and 42% (n=43) of the ICs participating in the study showed a probability of low NL and a possibility of low NL, respectively. Significantly lower levels of NL were seen in subjects aged ≥50 (p=0.042) and with low educational level (p=0.039).

Conclusions: Our preliminary results highlighted the need for further investigation into the level of NL of ICs of CPs Furthermore, we argue that it is necessary to develop nutrition promotion interventions to adequately support ICs with limited NL in their care activities.

Use of quasi-experimental studies to evaluate causal effects of public health interventions in Portugal: a scoping review

Andreia Leite¹, Irina Kislaya¹, Ausenda Machado¹, Pedro Aguiar¹, Baltazar Nunes¹, Carlos Matias Dias¹

¹Departamento de Epidemiologia, Instituto Nacional de Saúde Doutor Ricardo Jorge, Lisbon, Portugal, NOVA National School of Public Health, Public Health Research Center, Universidade NOVA de Lisboa, Portugal, Comprehensive Health Research Center, Portugal

Background and Objective: Evaluating causal effects of public health interventions using traditional randomized controlled trials might not be feasible. Quasi-experimental designs are a valid option but still not widely used in Portugal. Knowing their application in real public health problems will support the development of this research area. We thus performed a scoping review aiming at identifying and characterising the use of quasi-experimental studies to evaluate causal effects of public health interventions in Portugal.

Methods: We included studies that used a quasi-experimental design to assess causal effects of one or more public health intervention in Portugal. PubMed, Scopus, Web of Science and CINAHL were searched from inception, combining free text and controlled vocabulary terms. Grey literature was identified through screening of tables of contents of non-indexed publications and institutional repositories of national Public Health PhD and MSc programmes theses. Studies were selected after title and abstract followed by full-text, double-screening. Searches were supplemented by reference mining and contact with authors of eligible studies. We extracted information on the intervention assessed, study design, statistical analysis approach and reporting guidelines followed using a standardised extraction form.

Results: This study is ongoing, we present preliminary results from the databases search. After deduplication we identified 500 studies, 38 were included for full-text screening, and 25 were eligible. Studies assessed interventions in various areas,

namely healthcare services (40.0%), tobacco and drugs control policy (20.0%), and pharmaceuticals policy (16.0%), among others. Study designs were mainly interrupted time series (44.0%), followed by difference-in-differences approaches (40.0%).

Conclusion: There is a paucity of studies in this area with interrupted time series and difference-in-differences approaches being the most often used study designs. Training in this area might promote the use and dissemination of quasi-experimental studies.

Popul. Med. 2023;5(Supplement):A1862

DOI: 10.18332/popmed/163887

The social determination of the health-disease process approach in dialogue with racial inequities in Indigenous peoples' oral health

Lucas dos Santos¹, Tainá Mafra², Herika Mauricio³, Rafael Moreira⁴

¹Fiocruz Pernambuco, PhD Student, Brazil, ²Fiocruz Pernambuco, MSc Student, Brazil, ³Universidade de Pernambuco, Brazil, ⁴Fiocruz Pernambuco, Brazil

Background/Objective: The social determination of the health-disease process (SDHP) approach, differing from the widespread approach on social determinants of health, understands health articulated with social/historical processes. It takes social formation and organization, and their consequences on the population as fundamental for reality analysis. SDHP approach leads to the questioning of the need for social/systemic change for health promotion, aiming at a society without unjust and avoidable inequalities. The objective of this study is to produce reflections on racial inequities in indigenous peoples oral health from the perspective of the SDHP approach.

Methods: A critical essay on the themes of oral health of indigenous peoples, racial inequities in health, and the SDHP approach was conducted. Notes on the articulation of the themes are presented and debated.

Results: Several countries built on colonial legacies of slavery, exploitation, and racialization present an intense and violent profile of racial inequalities in health, framed as health inequities, intrinsically linked to the inability to treat the avoidable, unjust, and oppressive historical-political process denominated by racism. It overcomes discrimination at the individual level, reaching institutional and structural expressions. Oral health inequities among indigenous peoples are high in several countries, with a solid relationship between the implementation of neoliberal policies, racism, and the increase in social inequalities, with more indigenous communities living in poverty.

Conclusion: Discussions on the racialized/indigenous peoples health need to incorporate the impacts of a colonialist legacy that acts via political/social processes. Racism impacts general and oral health. It is essential to overcome the methodological approach to racism as a simple risk factor, moving to understand it as a multilevel oppression system with structural, institutional, and cultural dimensions. The oral health field allows a distinct look at social injustices since it reflects unequal material circumstances and healthcare access, and structural inequities throughout life.

Experiences in the application of logic models in the context of workplace health promotion - a focus group study

Madeleine Gernert¹, André Schubert¹, Andrea Schaller¹

¹Working Group Physical Activity-Related Prevention Research, Institute of Movement Therapy and Movement-oriented Prevention and Rehabilitation, German Sport University Cologne, Germany

Background and Objective: Researchers gathering evidence on complex workplace health promotion interventions face various challenges. Applying logic models as a theory of change might support the outcome and process evaluation of such application-oriented interventions. The present study explores the challenges and opportunities of logic models in application-oriented intervention research on workplace health promotion.

Methods: A focus group (5 females and 1 male) consisting of scientists and external workplace health promotion consultants who had worked with a logic model, was conducted along a semi-structured interview guide. The recorded qualitative data were transcribed and analysed using the structuring content analysis method.

Results: According to the focus group, logic models provide several opportunities for the planning and evaluation of complex interventions in workplace health promotion. Furthermore, logic models support the communication between science and practice, and also have benefits for the provider of workplace health promotion interventions. However, the focus group identified challenges of the

logic model in the working process and the applicability in practice, which was especially related to the evaluation aspects. Finally, the focus group highlighted experience in the application of logic models and certain framework conditions regarding the working environment as prerequisites for working with logic models. Conclusion: Working with logic models shows great potential to increase the quality regarding evidence development in workplace health promotion interventions. At the science-practice interface, in application-oriented studies, logic models could support the communication between all stakeholders involved to enhance the integrative understanding and the further development of evidence-based workplace health promotion.

Early Assessment of expansion of New Born Screening panel in the Italian context

Marco Marchetti¹, Simona Paone¹, Matteo Ruggeri², Donatella Mandolini², Paolo Roazzi², Alessandra Lo Scalzo¹, Antonio Russo¹, Emanuela Tagliente¹, Silvia Vainieri¹, Michela Santurri¹

¹Agenzia Nazionale per i Servizi Sanitari Regionali, Italy, ²Istituto Superiore di Sanità, Italy

Background and Objective: Newborn screening (NBS) is the test that detects potential fatal or disabling conditions during the first days of neonatal life. As the number of conditions assessable by NBS is increasing it is necessary to identify criteria which can inform health decision-maker. Under the Italian legislation, which in 2016 established the extended NBS as an Essential Level of Care and a periodic update of screened diseases, we piloted an early assessment model on which conditions to add to screening panels for decision making process.

Methods: Eight diseases were included in the early assessment model according to the MoH request. A Strengths/Weaknesses, Opportunities/Threats (SWOT) and a Multicriteria Decision (MCDA) analysis were performed. Two expert panel groups were established. The former identified the issues from a predefined list that were relevant to the four categories according to the SWOT, the latter assigned the score according to SWOT results. Scores were weighted according to different perspectives (health professionals, decision-makers, and citizens/patients) represented in the second panel and presented in a scatter plot-type graph showing the positioning of technology according to the potential value and the perceived risk associated with the screening of the single proposed disease.

Results: All the eight diseases resulted in the area associated with a low risk and a high value (defined as a Comfort Zone). Two out of the eight had all the SWOT issues marked as strengths and opportunities. Over the remain six diseases, some weakness and threats issues were associated to effectiveness and costs domain due to the specific disease characteristics.

Conclusion: The proposed model is a useful tool to support the Italian MoH in decision making process on the early assessment of introduction of proposed diseases in the NBS panel and related coverage.

Professional health literacy - first results of a pilot study in Austria, Germany, and Switzerland

Saskia De Gani¹, Doris Schaeffer², Robert Griebler³, Rebecca Jaks⁴, Alexander Haarmann⁵, Lennert Griese², Denise Schütze³, Christa Straßmayr³

¹Careum Center for Health Literacy Switzerland, ²University of Bielefeld, Germany, ³Gesundheit Österreich GmbH, Austria, ⁴Careum Center for Health Literacy, ⁵Hertie School Berlin Germany

Background: Population's health literacy (HL) is low in many countries, including Austria, Germany, and Switzerland. To improve HL of the population, health professionals (HP) play an essential role. However, there is a lack of a clear definition, concept, and reliable data on professional HL of HP so far.

Methods: A new concept of professional HL and a survey instrument were developed and applied in a quantitative pilot study in all three countries. The four defined key tasks of professional HL are knowledge and information management, knowledge and information explanation, communication, and professional digital HL. Data on corresponding items were collected in 2022 by online surveys. 921 nurses and physicians in Germany, 3,876 nurses, physicians, and physiotherapists in Austria, and 1,613 nurses, physicians, physiotherapists, and pharmacists in Switzerland were surveyed. Based on the answers, 4 dimensions and 6 sub-dimensions of professional HL were found and related to aspects linked to training and job.

Results: In all three countries HP report greatest difficulties in strengthening digital HL of patients, while enabling patient-centred conversation and explaining information are considered less challenging. Even though difficulties vary between

HP, in Switzerland, physicians report less difficulties in most of the four key tasks. In Austria this is mostly the case for physiotherapists. In Germany, differences between the professions are mostly small. The results indicate that HP are generally unfamiliar with the concept of HL and communication techniques are unfamiliar accordingly. Moreover, most HP reported inadequate education in communication and information explanation.

Conclusion: Professional HL is essential to improve patients' HL. The results show a need for action as well as for further research in this field. Efforts in supporting HP should be taken to adequately address patients' HL and enable them to improve their health and well-being by including key tasks in the education of HP.

Audit & feedback design and implementation in emergency care: a regional level experience within the easy net program

Anna Acampora¹, Carmen Angioletti², Nera Agabiti¹, Laura Angelici³, Luigi Pinnarelli¹, Paola Colais¹, Francesca Mataloni³, Egidio de Mattia⁴, Antonio de Belvis⁴, Marina Davoli¹

¹Department of Epidemiology, Regional Health Service - Lazio, Via Cristoforo Colombo, 112, 00147, Rome, Italy, ²Sant'Anna School of Advanced Studies, Piazza Martiri della Libertà, 33 - 56127 Pisa, Italy, ³Department of Epidemiology, Regional Health Service - Lazio, Via Cristoforo Colombo, 112, 00147, Rome, Italy, ⁴Catholic University of Sacred Heart, Largo Francesco Vito, 1, 00168 Roma, Italy.

Background and Objective: Due to the complexity in management of acute myocardial infarction (AMI) and ischemic stroke, the Lazio region (Italy) realized an emergency network, involving different hospitals and emergency care providers. Although Audit&Feedback (A&F) is often the foundation of multidimensional quality improvement activities, the optimal design is still unknown. This work reports the dynamics in development and implementation of an A&F intervention to improve appropriateness and timeliness of emergency care for AMI and stroke, within the EASY-NET research program (NET-2016-02364191).

Methods: All the emergency network hospitals were invited to participate. An expert team was involved in a two rounds Delphi survey to identify a set of indicators to evaluate AMI and stroke care pathways. The way for feedback reporting was defined through a web-based survey including objective and subjective assessment of clarity, completeness, and comprehensibility of different proposals. Starting from literature, a form to collect information on Audit conduction and provide a guide was developed. In the end, a controlled pre-post study will be performed. The control group has public access to a regional web platform that periodically updates the same indicators.

Results: A total of 18 hospitals have joined the intervention group. The Delphi procedure validated the final set of indicators (11 for AMI and 16 for stroke). Two feedback reports were delivered. Additionally, an evidence-based Audit form was developed and disseminated to collect information on Audit characteristics (team composition, main audit process activities, improvement action proposed and timing for the implementation). Several hospitals organized the audit and returned the form to the research group.

Conclusion: At this point, we learned that sharing methods and instruments with the target increases the acceptability of the intervention. Strong collaboration with the stakeholders keeps the interest high and reduces drop-outs. Staying informed about audits conducted at hospitals remains an open challenge.

Characterization of complex multimorbidity patterns through network models: epidemiology and impact on mortality and health services use

Javier Alvarez-Galvez¹, Jesus Carretero-Bravo¹, Begoña Ramos-Fiol¹, Esther Ortega-Martin¹

¹University of Cadiz Spain

Background: Multimorbidity has been defined as the presence of two or more chronic diseases, and is associated with reduced quality of life, increased disability, greater functional impairment, increased health care utilization, and increased mortality. Thus, understanding its epidemiology and inherent complexity is essential to improve the quality of life of patients and to reduce the costs associated with this condition. Through this study we aim to characterize multimorbidity patterns and later describe their impact on mortality and health service use through a network science approach.

Methods: Using a large dataset of 1.5 million health records on chronic diseases from 2014 to 2021, and combined with mortality and use of health care services data, we explore the application of mixed graphical models and its combination

with social network analysis techniques for the detection and profiling of complex multimorbidity patterns.

Results: We found large age differences between multimorbidity patterns, with respiratory, mental and addiction patterns in the younger groups, while in the older groups the chronic disease profiles identified were mainly muscular, cardiovascular, and complex. Mental health patterns presented a higher prevalence among women. Geographic differences were also observed by county and in the use of services and mortality, with cardiovascular and complex patterns being the more prevalent in poorer neighborhoods.

Conclusion: Our initial findings demonstrate the suitability and usefulness of this approach for the study of multimorbidity based on the use of disease networks, which offer both the researcher and health professionals a holistic and organic view of the relational structure of chronic disease. This analytical approach offers methodological advantages for working with complex data sets and with high dimensionality, as well as a better measurement of the impact of multimorbidity on mortality and health services.

The View of the Approaches of Health Professionals and Patient Relatives to Stem Cell Treatments

Selin Dal¹

¹Ankara University Faculty of Language and History-Geography Turkey

There is a sub-project of the medicine project, which aims to develop innovations related to stem cell treatments and is supported by the "Scientific and Technological Research Council of Turkey". The sub-project is named as "Socio-Cultural, Economic, Mental Health, Ethical and Legal Impact Assessment Study of Regenerative and Restorative Medicine Practices in Turkey". The project aims to determine the level of awareness that exists in society about stem cell studies. For the field study, 'Izmir' was selected from the west of Turkey, 'Erzurum' from the east and 'Ankara' from the point of view of being the capital of the country and 'Istanbul' from the point of view of being the largest province of the country. It is planned to conduct interviews with patient relatives and health workers (doctor, nurse, technician) at the designated public hospital and private hospital in these four provinces. In the field studies in Erzurum and Ankara, where I took part as a researcher, I observed the tendencies of the interviewed people towards research. The perspective of the patients relatives on the study and the questions, the level of awareness differed from each other in Ankara and Erzurum. The socio-economic situation and educational level of the participants in Ankara have a different view than those in Erzurum formed this result. In the context of the professional experiences of health professionals, their unique perspectives and suggestions were also noteworthy. The fact that the working environment is a hospital and the research group has a sensitive structure made it necessary for me to develop an appropriate approach to the individuals I was interviewing as a researcher. As a result, this study has created a valuable experience in terms of observing why the social approach to stem cell, which is a medical field, may differ in which regions in Turkey.

Conducting rapid reviews for health policy makers during the pandemic in an evolving evidence ecosystem: New synthesis methods and dissemination plans

Maureen Dobbins¹, Nayab Choudhry¹, Leah Hagerman¹, Robyn Traynor¹, Sophie Neumann¹, Alyssa Kostopoulos¹, Emily Clark¹, Sarah Neil-Sztramko¹, Stephanie Hopkins¹

¹National Collaborating Centre for Methods and Tools Canada

Background and Objective: As the COVID-19 pandemic continues, public health decision makers' need to easily access high-quality synthesized evidence for policy and programming decisions remains paramount. In response, the National Collaborating Centre for Methods and Tools (NCCMT) developed the Rapid Evidence Service (RES). The RES synthesizes the best available evidence on priority COVID-19 public health questions.

Methods: Our process involves: developing focused questions; conducting a search; screening; critically appraising evidence using validated tools; summarizing key findings; GRADE-ing the evidence; and synthesizing the findings into a final report. The summary includes the certainty of the findings and an overview of knowledge gaps. Evaluation on the uptake, use and impact of the RES rapid reviews on public health decisions at regional and national levels in Canada is also conducted. Evaluation findings are synthesized with findings from a parallel study by partners at the Monash Sustainable Development Institute (MSDI) Evidence Review Service in Australia to inform improvements to the reach,

usefulness and accessibility of rapid reviews.

Results: We have conducted 80 rapid reviews since the onset of the COVID-19 pandemic. We continue to update reviews as new evidence emerges through both updates and maintaining living rapid reviews. Our reviews and review updates are proactive and responsive to the current public health climate. We have answered questions from and worked collaboratively with regional, national, and international organizations. Webpage analytics demonstrate the impact of the RES; reviews are highly accessed across Canada and supported by positive feedback from users.

Conclusion: Our rapid review process is a real-world example of how review-level evidence can be mobilized rapidly and rigorously in response to decision-makers' needs. These evidence syntheses can be used by public health decision-makers at all levels of governance as they plan for pandemic recovery.

Congenital anomalies and environmental exposure - susceptibility to atmospheric pollution

Carlos Aniceto¹, Paula Braz¹, Carlos Matias Dias¹, Ausenda Machado¹

¹Department of Epidemiology, National Institute of Health Doutor Ricardo Jorge, Lisbon, Portugal

Background and Objectives: Environmental exposure to teratogenic factors during pregnancy has been associated with some congenital anomalies (CA). In 2015, a cluster of CA in newborns (NB) was detected in an area with high industrial density. We developed an epidemiological study to analyse the association of CA and atmospheric pollution (AP) in this area in Portugal.

Methods: A case-control study was developed between 2016 and 2021. A multicriteria spatial analysis using Geographic Information System software was adopted to identify the AP susceptibility map. The variables included: (i) Euclidean distance to industrial units, (high(H)moderate(M)4000m); (ii) kernel estimation of industrial units density; (iii) land occupation: H susceptibility - industrial areas, roads, landfills and dumps; M susceptibility - residential areas; L susceptibility - natural, forest and agricultural areas; (iv) Euclidean distance to the main roads (H M300m); (v) areas of fog, modelled by the digital terrain model using Jenks Natural Break method. The map of AP susceptibility (High, Moderate and Low) derived from previous variables normalization, weighting and crossed in raster matrices using the weighted linear combination.

Results: Three areas of AP susceptibility were identified, a consolidated urban, a peri-urban area and a southern zone of an urban zone. 21 cases (21%) and 53 controls (25%) were observed in high susceptibility area; 77 cases (75%) and 146 controls (70%) located in areas of moderate susceptibility and 4 cases (9%) and 9 controls (5%) referred to areas of low susceptibility.

Conclusion: The creation of a map of susceptibility to AP proved to be useful to assess the possible environmental exposure of NB to AP agents during pregnancy. The results, integrated into a more complex analysis, may contribute to the evaluation of potential causal links in NBs with CA.

Conspiracy theories about vaccines in Portugal: Using the vaccine conspiracy beliefs scale to study the association between conspiracy beliefs and behaviours/attitudes towards vaccination against COVID-19

Ana Santos¹, Afonso Moreira², Andreia Leite³, Mariana Neto⁴

¹National Health Institute Doutor Ricardo Jorge Centro de Saúde Pública Doutor Gonçalves Ferreira Rua Alexandre Herculano, 321 | 4000-055 Porto | Portugal, ²Public Health Unit of the Community Health Center Group of

North Lisbon Largo Professor Arnaldo Sampaio, 1549-010 Lisboa Portugal, ³National School of Public Health, ⁴National Health Institute Doutor Ricardo Jorge Portugal

Conspiracy theories contribute to vaccine hesitancy and pose a serious challenge to vaccination campaigns. The Vaccine Conspiracy Beliefs Scale (VCBS) is a short 7-item scale to assess adherence to conspiracy ideation about vaccines. This scale has not been validated to the Portuguese setting. This work intended to explore the applicability of the VCBS in this population, study conspiracy beliefs and its association with behaviours/attitudes towards vaccination against COVID-19. A cross-sectional study was conducted, using data from a representative sample of the national population ("At home we observe health" - ECOS panel). Reliability and structural validity of the scale were assessed, using confirmatory factor analysis. Five outcome variables were defined, regarding to behaviours/attitudes towards vaccination against COVID-19. We estimated odds ratios adjusted (ORa) for sociodemographic variables, and corresponding 95% confidence intervals (95%CI),

through logistic regression. We included 767 individuals. The VCBS scale showed good internal consistency (Cronbach's alpha value=0.912). Principal component analysis identified only one component, explaining 66.4% of the variance. The average VCBS score was 17.4 (95%CI=16.24-18.56). Items with the highest scores referred to conspiracy theories about the pharmaceutical industry and the safety/security of vaccines. Negative associations were observed between VCBS scores and two outcome variables: taking the vaccine (ORa=0.958; 95%CI=0.925-0.992; p<0.05) and vaccination adherence (ORa=0.916; 95%CI=0.872-0.961; p<0.001). A positive association was observed between VCBS scored values and vaccine hesitancy (ORa=1.044; 95%CI=1.008-1.081; p<0.05). VCBS has shown to be a unidimensional scale, have high internal consistency and good structural validity. The level of conspiracy theories in Portugal seems to be lower than in other countries. Higher values of conspiracy beliefs were associated with lower vaccine intake and with a lower adherence to vaccination, but associated with greater vaccine hesitancy. This study may contribute to better strategies and policies directed at tackling conspiracy theories and aimed at achieving high levels of vaccination.

A framework for implementing pilot studies on medical deserts in Cyprus, Finland, France, Hungary, Italy, the Republic of Moldova and Romania

Monica Georgiana¹, Marius Ungureanu², Răzvan Cherecheș³, Federica Vitello⁴, Paolo Michelutti⁵, Cătălin Baba³

¹Brinzac Babeș-Bolyai University Babeș-Bolyai University Romania, ²Babeș-Bolyai University, ³Babeș-Bolyai University Romania, ⁴AGENAS AGENAS Italy, ⁵AGENAS

The OASES project will implement pilot studies to mitigate medical deserts in Cyprus, Finland, France, Hungary, Italy, the Republic of Moldova, and Romania.

The objectives of the pilot studies are:- To create a national overview of medical deserts in the seven countries;- To assess and characterize medical desert in the seven countries and the current and future mitigation strategies;- To facilitate consensus regarding mitigation strategies targeting medical deserts among stakeholders in each of the seven countries;- To provide evidence-based recommendations to mitigate medical deserts in the seven countries.

The pilot studies undertake a consensus-building exercise, the Delphi modified methodology, consisting of several rounds of online disseminated questionnaires and virtual or in-person meeting(s) per country with the relevant stakeholders. Each country identified a series of indicator to measure the medical deserts and will identify the stakeholders relevant to the discussion on medical deserts. The mapping of the stakeholders shall be done using the snowball technique until saturation is reached, with no minimum or a maximum number of stakeholders. The stakeholders should be pooled both from the local/regional level – from the implementation site – and from the national level – to offer a more comprehensive picture and aid the translation of the results from particular to general. The results of the consensus-building exercise will be translated from the level of the identified medical desert at the local or regional level to national policy recommendations. The translation will be done based on the characteristics of the implementation site in terms of demographics of the health workforce, geographic and socio-economic characteristics, and particularities of the area. The pilot studies will make it possible to develop a set of indicators that will be measured, and through the contribution of the identified stakeholders, strategies to mitigate medical deserts can be developed.

Investigating the impacts of an alcohol outlet zoning policy on substance misuse and violent crimes : A spatial agent-based simulation

Tingting Ji¹, Ji Tingting¹, Ivana Stankov², Takeru Igusa, Zhixi Chen, Pamela Matson³

¹Johns Hopkins University; Hong Kong Polytechnic University Department of Civil and Systems Engineering, Johns Hopkins University Whiting School of Engineering, Baltimore, Maryland, USA; Department of Building and Real Estate, Hong Kong Polytechnic University, Kowloon, Hong Kong, China Hong Kong, ²Johns Hopkins University Department of Civil and Systems Engineering, Johns Hopkins University Whiting School of Engineering, Baltimore, Maryland, USA United States, ³Johns Hopkins University

Background and Objective: Associations between off-premise alcohol outlet density and violent crime have been well established and explained partly by availability theory, which posits that greater access to alcohol leads to greater

intoxication-related violence. However, few studies have investigated the effectiveness of alcohol outlet zoning policies in reducing alcohol misuse and violent crime in low-income neighborhoods. By adopting a systems approach, this study aimed to 1) model the interconnected individual, social, and environmental factors shaping substance misuse and violent crime; and 2) simulate the potential impacts of alcohol outlet zoning policies on these outcomes.

Methods: We developed a spatial agent-based model representing a low-income, predominantly black neighborhood in Baltimore City, which was impacted by a recent amendment to the city's alcohol zoning code. Informed by a conceptual framework developed using a community-based participatory approach, we characterized residents' routine activities (e.g., alcohol and drug use, purchasing behavior) and social interactions. The model was calibrated and validated using empirical data and used to simulate various policy scenarios. **RESULTS:** Most simulated policy scenarios appeared ineffective in reducing alcohol consumption, even with the closure of over half the neighborhood alcohol outlets. In contrast, our findings suggest that illicit drug use could increase as some alcohol misusers may turn to illicit substances for self-medication. Consequently, the policies could have the unintended consequence of increasing both alcohol and drug-related crimes by driving residents to purchase and gather at alternate stores and outside of their neighborhoods.

Conclusions: Our modelling shows the possible limitations of using alcohol availability theory to support reductions in alcohol outlet density and thereby crime. It also highlights the need for community engagement to understand the complex and multi-level dynamics that shape patterns of alcohol misuse and violent crime in neighborhoods, to minimize the potential for unintended consequences.

Developing health research impact assessment in Italy: The case of piedmont region

Erica Picasso¹, Anna Odone¹, Guido Resani², Erica Picasso², Guglielmo Pacileo³

¹University of Pavia Italy, ²University of Pavia - ASL AL Italy, ³Health Management Research Center (CeSIM) - Department of Integrative Activities to Research and Innovation (DAIRI) - ASL AL Italy

Background and Objective: Research Impact Assessment (RIA) is complex to analyze, but there are not internationally validated standards and procedures. The actual challenge is experimenting with RIA approaches and sharing findings with scientific community.

Alessandria Local Health Authority and Alessandria Hospital together created DAIRI (Department of Integrative Activities to Research and Innovation) that receive from Italian Piedmont Region mandate to establish the IRCCS for "Environmental Diseases and Mesothelioma" and to monitor regional health research.

This work aims to identify a RIA framework to be applied to health research organizations in Piedmont.

Methods: We pursued the objective in two steps: carrying out a literature review to identify a pool of frameworks suitable for DAIRI reality needs and using a focus group (composed by DAIRI board) to identify the most appropriate one to use.

Results: Considering that adopting an existing framework requires adapting it to the needs of the research organization, DAIRI focus group decided to select the framework proposed by Banzi et al. in "Conceptual frameworks and empirical approaches used to assess the impact of health research: an overview of reviews" for RIA on research organizations in Alessandria province and to shape it to the reality in which DAIRI operates.

Conclusions: Since Regional Health Directorate set up a working group with regional health organizations' research referents, the aim is to share with them both the RIA literature review and the results of first RIA activity carried out by DAIRI in Alessandria Province in order to adapt and apply the framework at the regional level in the future.

We aim to be able to disseminate the results of these evaluations to contribute to the growth of RIA process within the scientific community and start a continuous RIA process.

A comprehensive one-year correlation analysis between prevalence and number of sars-cov-2 rna copies detected in wastewater from 8 sicilian cities in Italy

Carmelo Maida¹, Walter Priano¹, Roberta Palermo¹, Giuseppa Purpari², Arianna Russo³, Viviana Giangreco³, Gina Andolina³, Giorgio Graziano³, Francesco Vitale¹, Annalisa Guercio², Francesca Gucciardi², Fabio Tramuto¹,

Walter Mazzucco¹

¹University of Palermo Department of Health Promotion, Mother and Child Care, Internal Medicine, and Medical Specialties "G. D'Alessandro" (PROMISE) Via del Vespro, 133, 90127 Palermo Italy, ²Istituto Zooprofilattico Sperimentale della Sicilia Area diagnostica virologica Via Gino Marinuzzi, 3, 90129 Palermo Italy, ³University Hospital "P. Giaccone." Clinical Epidemiology Unit and Regional Reference Laboratory of Western Sicily for the Emergence of COVID-19 Via del Vespro 133, 90127 Palermo Italy

Background and objectives: Several authors have reported positive correlations between wastewater SARS-CoV-2 concentrations and the community's burden of infection, providing information about the disease's epidemiological trend. This pre-post study evaluated – within a year of active surveillance, from October 1st, 2021, to September 30th, 2022 – the relation between daily SARS-CoV-2 prevalence and the number of genome copies/L detected in West Sicily wastewater samples. This study is part of a national framework coordinated by Istituto Superiore di Sanità.

Methods: Quantitative data from analysing 486 wastewater samples collected from 9 purification plants in 8 Sicilian cities (Agrigento, Bagheria, Caltanissetta, Enna, Marsala, Mazara del Vallo, Palermo, and Trapani) were obtained. Correlation and logistic regression analysis were performed between the communal-based aggregated prevalence of daily SARS-CoV-2 cases obtained from the integrated national surveillance system and the number of genomic copies/L derived from wastewater analysis for different times (day-prevalence t0, t7, t14) and different periods (0- to 6-, 6- to 12- and comprehensive 12 months).

Results: A moderate-high correlation index was retrieved for 0- to 6- months (October 2021–March 2022, t0: r=0.75, R2=0.57; t7 r=0.76, R2=0.58, t14 r=0.76, R2=0.58) and overall analyses (October 2021–October 2022, t0 r=0.63, R2=0.40; t7 r=0.62, R2=0.38; t14 r=0.59, R2=0.35). On the other hand, 6- to 12- months analysis displayed a relevant decline in correlation (March 2022–October 2022, t0 r=0.19, R2=0.04; t7 r=0.17, R2=0.03, p=0.004; t14 r=0.11, R2=0.01). All data except t14 were statistically significant (p<0.0001).

Conclusions: Significance results were displayed for 0- to 6- and overall analysis at 0,7 and 14 days. Despite 6- to 12- months samples tested positive for RNA copies, a progressive loss of significance was found probably mainly attributable to a progressive loss of function in prevalence estimation of the swab-related SARS-CoV-2 positivity detecting system due to underreporting of cases.

Popul. Med. 2023;5(Supplement):A1876

A multi-step methodology to identify the food biodiversity that underlies Brazilian diets

Fernanda Leite¹, Neha Khandpur², Giovanna Andrade¹, Euridice Steele¹, Josefa Garzillo³, Renata Levy³, Carlos Monteiro³

¹Center of Epidemiological Research in Nutrition and Health, School of Public Health, University of São Paulo, São Paulo, Brazil, ²Department of Nutrition, Wageningen University, Wageningen, The Netherlands, ³Center of Epidemiological Research in Nutrition and Health, School of Public Health, University of São Paulo, São Paulo, Brazil

Background and objective: Food biodiversity has intrinsic potential to underpin diverse, healthy diets and improve Earth system resilience. However, there is limited work on methods that capture the diversity of species in human diets through national surveys. This study presents a multi-step approach for identifying the food biodiversity that underlies Brazilian diets.

Methods: A sequential, five-step approach, determined a priori, was followed to identify the plant and animal species that underlie Brazilian diets: 1 - Household data retrieval, 2 - Unique food item identification and compilation, 3 - Classification of food items according to the Nova food classification system, 4 - Identification of species (single- and multi-ingredient items), 5 - Linking identified species back to household data. Data from the 2017-18 Household Budget Survey were used to identify all foods and beverages purchased by household aggregates (n=575). Food items were classified according to the Nova classification system into four groups: 1) unprocessed or minimally processed foods, 2) processed culinary ingredients, 3) processed foods, 4) ultra-processed foods. Food items classified as Nova groups 1 and 2 were identified at the species level by using taxonomical classification from four data sources. Ingredient lists from the UNC/IDEC/NUPENS national food label database were used to determine the composition of processed and ultra-processed foods.

Results: Brazilian households acquired 1,866 unique food items: 49.8% unprocessed/minimally processed foods, 4.2% culinary ingredients, 10.2% processed foods and 35.8% ultra-processed foods. A total of 234 plant and 127 animal species were identified. The number of plant and animal species underlying the Nova food groups were: G1=227, G2=21, G3=19, G4=26; and G1=125, G2=4,

G3=6, G4=5, respectively.

Conclusion: This study adds new evidence on methods to operationalise and measure the food biodiversity in diets, as well as an approach to measure the impacts of foods purchased/consumed at the household level on biodiversity.

The case for a socio-ecological approaches in the evaluation of mosquito larval source management for malaria control in Haiti

Vena Joseph¹

¹Université de Montréal PhD Student "7101 Ave du Parc, Suite 3091 Montréal QC H3N 1X9 "Canada

Background and Objective: Larval source management is a malaria control strategy which relies on the reduction of immature stages of the mosquitoes transmitting malaria through the mechanical, chemical, or biological modification of the environments where mosquitoes breed. In Haiti, LSM is used in conjunction with other malaria control strategies. However, there is limited evidence on the effectiveness of LSM. A qualitative evaluation of the LSM program in Haiti was performed to identify opportunities to optimize the program's functioning.

Methods: This article is based on a single qualitative case study. The unit of analysis was the larval source management program of Haiti's national malaria control program. A documentary analysis was performed based on multiple data sources including historical documents, policy documentation, training materials, meeting notes, work plans and evaluation reports. The data was analyzed using thematic analysis.

Results: Multiple factors and processes interact synergistically and across different levels (interpersonal, organizational, environmental, social) to influence the implementation of LSM in Haiti. For this reason, the LSM strategy within Haiti's national malaria control program can be viewed as a complex adaptive system. Emerging tools and frameworks in the complexity sciences are viable strategies to tackle the complexity of LSM program implementation and evaluation research. Socio-ecological models can help understand and improve the effectiveness sustainability of LSM efforts. Larval source management research and practice in Haiti should make use socio-ecological models. Different approaches to socio-ecological models can help create an in-depth understanding of how the LSM program is operationalized in Haiti, to document the mechanisms and contextual factors which impact the efficiency and effectiveness of the program.

Conclusion: Larval source management research and practice in Haiti should make use socio-ecological models. These models can help shape research goals, policy approaches, governance frameworks, and the operationalization of the LSM program in Haiti and similar contexts.

Title- exploring the experiences of black, asian, and minority ethnic family members living with black, asian, and minority health care workers in the UK during the covid-19 pandemic: an interpretative phenomenological analysis

Ufuomane Jones¹

¹University of Wolverhampton Wulfruna Road Wolverhampton WV1 1LY United Kingdom

Background and objective: As COVID-19 has spread globally, evidence suggests that the disease disproportionately affects people from the Black, Asian, and Minority Ethnic (BAME) population, with the risk of death among people diagnosed with COVID-19 higher in those living in more deprived areas and BAME groups than in White ethnic groups. The disproportionate deaths in BAME groups may also be attributable to risk factors, including unemployment and working in lower-skilled jobs, older age, hypertension, and diabetes. Furthermore, people from BAME populations are more likely to be employed in frontline jobs leading to increased exposure to the risks of contracting COVID-19. There is evidence that healthcare staff experiences stress and anxiety during the pandemic; specifically, this is about their own risk or risk to their families. It is crucial to explore the experiences of BAME family members living with BAME healthcare workers because they are a vulnerable group, and their experiences are unknown.

Methods: Interpretative Phenomenological Analysis (IPA) was used to analyze their data, eliciting the meanings this group of people gives to their experiences of living with BAME healthcare workers during the pandemic. Six participants were recruited using a snowball technique, and one-to-one semi-structured interviews were conducted.

Results: The cross-case comparison of idiographic accounts of the participants revealed that external influences, including living with healthcare workers, had an emotional and mental impact on this group. Participants said they felt vulnerable,

hopeless, and helpless due to being from a BAME background, subsequently seeking coping strategies/reassurance.

Conclusion: The findings illuminate the participants experiences in the UK during COVID-19 Pandemic, providing an original contribution to knowledge and insight into the nature of support and services needed by this group.

Challenges and facilitators to conduct community-based participatory research to improve health equity among homeless people in Switzerland: an ethnographic fieldwork

Evelyn Hangartner¹, Colin Ballif¹, Ariane Clot², Justin Nikles¹, Luana Schaad¹, Patrick Bodenmann¹, Véronique Grazioli¹, Chantal Berna³

¹University Center for Primary Care and Public Health (Unisanté), Switzerland, ²Sleep-in Association (ASI), Switzerland, ³University Hospital of Vaud (CHUV), Switzerland

Background and Objective: Emerging findings indicate that community-based participatory research is well positioned to improve health equity among populations with social and medical vulnerabilities, such as homeless people. However, less is known about the articulations needed to conduct research projects with and for homeless people in the complex contexts of low-threshold structures. In response, this case study aimed to describe the challenges and facilitators experienced during the data collection period (April to August 2022) of a larger participatory research project. This larger study called "Homeless people in French-speaking Switzerland and integrative medicine: Desirable? Feasible?" Aims to understand the health needs and inequities among homeless people in Switzerland.

Methods: The analysis was based on field observation notes taken during 38 data collection visits to homeless people structures. This ethnographic data were analyzed through thematic analysis.

Results: This study highlighted three areas of challenges: a) logistics of collecting data in structures for homeless people; b) participants' recruitment planning; c) collecting health-related data in collective environments; and two areas of facilitators: a) iteration throughout the field experiences; b) feedback from homeless people and social workers. Findings showed that the difficulties were mainly related to the functioning of the data collection sites. To overcome these barriers and adapt strategies to successfully approach participants, it was necessary to continuously learn from experience in the field and rely on involved people's feedback and recommendations.

Conclusions: Findings suggest that ethnographic fieldwork coupled with participatory paradigm are well positioned to help face encountered challenges in this field of research. Whereas ethnographic fieldwork allowed us to achieve a deep understanding of the homeless people structure' functioning and to identify potential problems with data collection, the participatory paradigm enabled a reliance on the expert knowledge of involved individuals and adjust strategies accordingly when necessary.

Thirty years of global research on transgender-related topics: a bibliometric analysis and visualization

Kathleen Riselay¹, Lana Ivanitskaya², Salma Haidar²

¹Advanced Wellbeing Research Centre, Central Michigan University, Freeland, United States, ²Central Michigan University, United States

Background: The interdisciplinary nature of transgender-related studies, coupled with the complexity of transgender people's experiences with family dynamics, violence, discrimination, inequality, and health systems, make it hard for researchers to develop a holistic view of the transgender research landscape.

Objective: We use natural language processing to visualize many strands of research into transgender people's issues to reveal scientific terminology, research directions, and historic evolution of transgender scholarship.

Methods: This study is based on 20033 Web of Science records of transgender-related studies. Inclusion criteria was the word "transgender" in the titles, abstracts, or Keywords of documents published over the past 30 years. The VOSviewer software for bibliometric analysis was used to map clusters of journals and Keywords used to index transgender studies.

Results: The number of transgender-related publications increased dramatically from 162 articles in 1994-2002 (there were no publications in 1992-1993) to 1,970 in 2002-2012, followed by a 9-fold increase to 17651 publications in 2012-2022. Journal of Homosexuality (10.6% of all publications), AIDS and Behavior (7.7%) and LGBTQ Health (7.5%) contributed the most publications. Transgender research was authored by scientists from 147 countries but the United States

contributed the most (N = 12,578, 62.8%). We mapped a co-occurrence network of 1000 keywords. It is a multidisciplinary network with 6 clusters that represent research on transgender health and gender dysphoria; LGBTQ experiences; mental health; HIV prevention and STDs; and healthcare access and inequities. The citation map of journals replicates these research directions and offers additional insights, for example, a strong focus on youth and adolescents.

Conclusions: In sum, we offer bibliometric evidence that transgender studies are a rapidly developing field with established terminology, dedicated journals, and a global research community involved in the knowledge construction from the perspective of many disciplines such as public health, medicine, social sciences, education, and law.

Toxicological assistance in the context of a public and universal health system: a normative evaluation

Ana da Rocha¹, Maren Rocha Farias², Luana Gabriele Nilson², Marlene Zannin², Jaqueline Weber³, Rita Franz Vieira⁴, Maria Boucinha Marques¹

¹Universidade Federal de Santa Catarina (UFSC), 1977 Rodovia Francisco

Magno Vieira, Brazil, ²Universidade Federal de Santa Catarina (UFSC),

Brazil, ³Associação Brasileira de Centros de Informação e Assistência

Toxicológica, ⁴Secretaria de Saúde de Santa Catarina, Brazil

Objective: To normatively evaluate CIATox in the context of toxicological assistance and surveillance in the SUS to seek the integrality of what the National Policy for Emergency Care and Ordinance proposes.

Methodology: Semi-structured interviews on the axes of structure, processes and results of the CIATox for data collection and computation using SurveyMonkey® software.

Results: CIATox are often in the media, in health surveillance and education activities. All carry out the classification and follow-up of the cases until the outcome, 85% of the CIATox attend 24 hours a week and multiprofessionally, 48% recognize themselves inserted in the RUE, 36% pass on data to the Epidemiological Surveillance for notification and none received the funding provided for in the Ordinance.

Conclusions: Different points of the axes analyzed are in normative non-compliance, such as the different formalizations in the RUE and the lack of funding, which compromise the CIATox. There is a need to structure and qualify the service so that assistance and toxicological surveillance fully meet the objectives of the Policy and principles of the SUS.

Effects of selenium supplementation on blood lipids: a systematic review and a dose-response meta-analysis

Gianluca Fiore¹, Gianluca Fiore¹, Marco Vinceti², Tommaso Filippini¹

¹University of Modena and Reggio Emilia, Environmental, Genetic and Nutritional Epidemiology Research Center (CREAGEN), Department of Biomedical, Metabolic and Neural Sciences, Medical School - University of Modena and Reggio Emilia, Modena, Italy, ²University of Modena and Reggio Emilia

Background and Objective: Selenium is a trace element with both nutritional and toxicological properties, depending on the dose and the chemical species. Several studies have shown an association between selenium exposure and cardiovascular risk, focusing on lipid profile and blood pressure. In particular, there is an indication that selenium overexposure may raise the risk of dyslipidemia, but uncertainties still apply to such evidence. The aim of our study is to assess the relation between selenium exposure and the effects on lipid profile in experimental human studies.

Material and Methods: The protocol registration in PROSPERO has been submitted for publication. We conducted a preliminary literature search in the following databases: PubMed, Web of Science, Embase and Cochrane Library with no language restrictions. We used MeSH terms and keywords related to "selenium", "lipid profile", "LDL", "VLDL", "HDL", "cholesterol", and "randomized clinical trials". We defined the following inclusion criteria according the PICOS statement: adult population, exposure to selenium through supplementation as specific difference between intervention and control groups and evaluation of internal exposure using blood biomarker (e.g. serum/plasma levels), assessment of lipid profile as outcome, randomized clinical controlled trials as study design.

Results: In the preliminary search, we found 865 records. After duplicate removal, 622 articles were screened by title and abstract. At this stage, we discarded 565 articles, and we reviewed the full-texts of the remaining 56 records to confirm eligibility. Five articles were additionally found through citation chasing

techniques and added to the review. We excluded 29 articles due to missing data about outcome of interest. In total, 27 studies met the inclusion criteria and were could be included.

Conclusions: The study is currently ongoing and results will be presented during the Congress.

Analysis of a historical series of oral health care provided by the Odontosc project in Rio de Janeiro state in the period between 2015 and 2019

Taís Feris¹, Rafaela Souza¹, Katia Andrade¹

¹SESC - SOCIAL OF COMMERCE IN RIO DE JANEIRO, Health Management, 1100, Av prefeito Dulcilio Cardoso, Barra da Tijuca apt 201-1, RJ 22620-311, Brazil

Objective: This study aims to evaluate oral health education programme and ambulatory dental care service activities of the Mobile Health Units: OdontoSesc-RJ Project, of the Social Service of Commerce in the Regional Department of Rio de Janeiro from 2015 to 2019.

Methods: An exploratory study was conducted using a historical analysis of the dental procedures, obtained from OdontoSesc-RJ database, in the period 2015-2019. The database included the number of patients seen at the Ambulatory Dental Care (AC) and at the Clinical Session (CS) as well as the total number of appointments provided at AC and CS. The evolution of ambulatory dental care services and health education programmes was evaluated. The data was analyzed in a descriptive manner, using Microsoft Excel 365 software.

Results: Between 2015 and 2019, a total of 533,603 people were seen and 1,012,126 dental appointments were provided at the OdontoSesc-RJ Project when combining both types of services. An average of five appointments per patient was observed, which maintained constant throughout the four years (2015-2019). The number of appointments at the AC remained constant throughout the four years but a drop was observed at the CS between 2015 and 2016, followed by an increase on the following years, becoming considerable high from 2018 through 2019.

Conclusion: Between 2015 and 2019, around 500,000 people were seen at the OdontoSesc-RJ Project and more than one million of dental appointments were provided in primary care dentistry. Thus, the importance of this project in providing dental care was observed.

Visualizing social media discussions of policy-relevant issues surrounding the opioid crisis in the United States

Lana Ivanitskaya¹, Leeza Bacon², Elina Erzikova¹, Lisa Gandy¹

¹Central Michigan University, United States, ²Northwood University, United States

Background and Objective: We present a novel method of network visualization with computer-assisted text processing. What do visualizations add, above and beyond a qualitative study, to our understanding of social media users' policy discussions?

Methods: We apply a network analysis and natural language processing to the corpus of 8,761 manually-coded social media user comments on opioid crisis-related videos (N=20) on CNN and Fox News YouTube channels. Manual codes on pain patients' experiences and crisis solutions are combined with computer-scored social and psychological states from Linguistic Inquiry Word Count (LIWC-22). VOSviewer visualizations of opioid-relevant terms extracted from YouTube comments are overlaid with manual codes and computer-generated LIWC scores.

Results: Our colorful map – a network of 196 interconnected terms extracted from 8,761 comments included three thematic clusters of terms: 1) patients' stories of pain management/relief/addiction; 2) cannabis legalization; and 3) organizations/entities involved in the opioid crisis. Manually-coded and computer-generated overlays indicate some overlap. Cluster 1 has manually-coded pain patients' stories and stigma and also scores high on several LIWC dimensions: 1st person pronouns, feeling, and emotion. User-proposed solutions to the opioid crisis (represented by such terms as kratom, insurance, and suboxone) are concentrated around cluster 2. Cluster 2 has high audience engagement (counts of likes/comments per view) and above average LIWC scores for negation, cause-and-effect cognition, and discrepancy cognition. Legal solutions (manually-coded) and power drive (LIWC scores) are high for terms in Cluster 3.

Conclusion: Networks of terms that frequently occur across multiple comments add value to the manual codes from content analyses. To make data analysis

more efficient, some human coding may be substituted for automated text scoring to identify discussion areas with specific linguistic features. Most important, eye-catching term networks and LIWC overlays help researchers visualize and communicate about policy issues, as they are deliberated in social media.

Development and validity evidence of a questionnaire to assess the risk of hypertension in primary health care

Raíssa Ferreira¹, Luiz Junior², Karine Correa¹, Marília Alvares¹, Raquel Mendonça¹, Renata Vieira¹, Julia Carraro¹

¹Universidade Federal de Ouro Preto Brazil, ²luiz.menezes@aluno.ufop.edu.br Brazil

Background and objective: Arterial hypertension (AH) is the greatest risk factor for global mortality, however, many patients hospitalized for its complications were never correctly diagnosed or even had their blood pressure measured. Therefore, this study aims to develop and validate a screening protocol to assess the risk of SAH in Primary Health Care (PHC).

Methods: Questions related to the etiology of SAH were elaborated, based on national guidelines and literature review. A panel of experts assessed the questionnaires content validity in terms of clarity, relevance, and pertinence. From the responses, the item content validity index (CVI) was obtained by averaging the items and indexes >0.8 were considered adequate. The instrument was applied to 200 PHC users and exploratory and confirmatory factor analysis were performed, adopting the following cut-off points: RMSEA < 0.09; CFI and TLI > 0.90; H index >0.80; and Cronbachs α >0.70.

Results: 23 experts responded to the content analysis. The CVI for clarity was 0.81, and relevance and pertinence, 0.94. Of the 21 initial items, one was excluded and eight reformulated. After exploratory factor analysis, only ten items remained, being grouped into two dimensions (sociodemographic factors and health and lifestyle conditions), explaining 52.15% of the variation. The factorial structure presented adequate adjustment indices, except for CFI/TLI (RMSEA: 0.068; CFI: 0.893; TLI: 0.818; H index: 0.890). Reliability analysis showed Cronbachs α of 0.535, indicating poor reliability and validity.

Conclusion: The questionnaire proved to be adequate in the content analysis and in the factorial analyses, however, regarding the reliability assessment, the data were not adequate, so that it is necessary to adapt the instrument so that it meets its objective. Financial support: CNPq; UFOP.

Respondent-driven sampling, methodological developments and applications to public health

Michael Rotondi¹, Nooshin Rotondi²

¹School of Kinesiology and Health Science, York University, Canada, ²Faculty of Health Sciences, Ontario Tech University, Canada

Respondent-Driven Sampling (RDS) is an increasingly common sampling and analysis strategy for studies that recruit hidden, often socially excluded populations. That is, populations that cannot be reached using traditional sampling methods. Similar to snow-ball sampling, RDS relies on peer recruitment. Initial study participants, called seeds, are selected by the research team from the desired population. Each seed is then asked to recruit k (typically between three and five) individuals, who are then asked to recruit up to k individuals, and so on, until the desired sample size is reached. Through leveraging information about participants' social networks, including adjustments for homophily and unequal probability of recruitment, RDS provides statistically valid and robust estimators of population traits of interest, such as the percentage of individuals who tested positive for COVID-19, or the proportion of individuals with diabetes in the population. RDS has been successfully applied in a variety of public health settings, including persons who inject drugs (PWIDs), transgendered people, and home-care workers. This interactive workshop will present an overview of the appropriate use of rds and highlight some of our recent methodological efforts to determine which analysis strategy is optimal depending on the research question and population of interest. Key questions that the workshop will address: At the end of the workshop, participants will be able to: -Identify research questions and populations for which RDS methods are best suited. -Recognize the methodological strengths, limitations and unique challenges of RDS. -Apply the RDS estimator that is most appropriate for their research context. -Develop a basic understanding of how to analyze RDS data using appropriately adjusted descriptive and inferential methods.

The impact of health systems and health services on inequalities in population health

Peter Groenewegen¹, Alastair Leyland², Ilmo Keskimäki^{3,4}, Alastair Leyland⁵

¹Netherlands Institute for Health Services Research NIVEL, NIVEL, Otterstraat 118 - 124, 3513 CR Utrecht, PB 1568, 3500 BN Utrecht, Netherlands, ²MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, United Kingdom, ³Finnish Institute for Health and Welfare (THL), Helsinki, Finland, ⁴Finnish Institute for Health and Welfare, THL, P.O. Box 30, FI-00271, Helsinki, Finland, Finland, ⁵MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Berkeley Square, 99 Berkeley Street, Glasgow G3 7HR, Scotland, United Kingdom

Outline: Health inequalities are unjust and avoidable and, as a focus of health policy in many governments, are widely studied in public health research. But studies of health inequalities too often ignore the role that health systems and health services play in population health and, as a consequence, their potential to create or reduce inequalities in health. As experts in public health, health services research and health systems research our belief is that the reason for this is that these areas have become siloed as academic disciplines; researchers tend to specialise in their own disciplines with interaction between the three hampered by specialist journals and conferences serving each separately.

Health services research, in a well-known definition, 'is the multidisciplinary field of scientific investigation that studies how social factors, financing systems, organizational structures and processes, health technologies, and personal behaviors affect access to health care, the quality and cost of health care, and ultimately our health and well-being' (Lohr and Steinwachs 2002). Health systems research covers two broad areas: the first addresses questions about how health systems are organised and how they develop, while the second focuses on the effects of health systems, such as improvement of health of the population. Both health services research and health systems research can be seen to include the impact on population health. However, the impacts on population level health and inequalities are not often studied.

Studies of inequalities in health often incorporate the social determinants of health: the conditions in which people are born, grow, work, live, age and die. The same societal structures that form the social determinants of health determine the health system structure and impact on access to and the provision of health services and the benefits of health service use to patients with different socioeconomic background. This means that attempts to reduce health inequalities by addressing the social determinants of health must also consider the potential pathway through the health system and the provision of health services.

Aims: The aim of the workshop is to understand the contribution that health services research and health systems research may have to offer public health research in general and the study of inequalities in health in particular. We will achieve this aim with a structured discussion based on the key questions listed below. Each of the questions will be introduced by short presentations covering (i) health services research and its relationship to public health; (ii) health systems research and its relationship to public health; and (iii) the development of an agenda for the better integration of the three disciplines.

Key Questions: As a discipline, how can public health be strengthened by including health services research?

What contribution can health systems research make to public health?

What are the barriers and facilitators to bringing these disciplines into the public health arena?

Popul. Med. 2023;5(Supplement):A1888

Methodological innovations in climate change research applied to communicable and non-communicable human diseases

Piotr Wilk¹, Kelachi Nsitem, Ngianga-Bakwin Kandala¹, Saverio Stranges¹

¹Western University, Department of Epidemiology and Biostatistics, Schulich School of Medicine & Dentistry, Western University, Rm. 3134, Western Centre for Public Health and Family Medicine, 1465 Richmond Street, London, ON N6G 2M1, Canada

Background: Several human diseases are often observed in some seasons and specific geographic locations, and it has been suggested that climate change may represent a major contributing factor. Climate change may increase the risk of communicable diseases and exacerbate the burden of chronic illnesses. Climate alterations may interplay with geographic areas and demographic factors, as well as behavioral and social habits. Changes in temperature, rain precipitation, relative humidity, and air pollution may influence viral activity and transmission of respiratory infections especially in infants and elderly.

Objectives and Key Questions: Our objective is to develop participants knowledge and facilitate discussion in: 1) emerging data and statistical methodologies to

investigate the link between climate change and human diseases, 2) how these methodologies have been applied in climatology and public health to date, and 3) how public health practitioners view the potential impact of these new approaches on public health policy and practice.

Brief Overview

Introduction (10 min), 3 case studies (each 10 min), and discussion (20 min):

Brief Introduction (Kandala and Saverio Stranges) The availability of high-quality granular data from multiple sources offer unique platforms for modelling the interactions between the climatic and non-climatic factors on disease burden. For better evidence in public health, evaluating methodological challenges for model-based disease surveillance for forecasting outbreaks will enhance preparedness to the impacts of climate change on human health. **Case Study 1: Forecast of Malaria Morbidity and Mortality using Climatic and non-climatic Data (Kandala)** Mathematical malaria transmission models are increasingly used for evaluating the effects of control interventions on disease dynamics. However, our knowledge about their forecasting potentials for early warning systems compared to purely statistical models is limited. We discuss spatio-temporal statistical models to forecast malaria; and project future malaria burden based on scenarios driven by climatic and non-climatic factors. **Case Study 2: Extreme Ambient Temperature and Cardiovascular-Related Emergency Visits (PIOTR WILK)** Extreme ambient temperatures have been found to be associated with cardiovascular health. However, few studies have assessed whether neighbourhood-level factors related to social, built, and natural environments moderate this relationship. This study aims to evaluate the associations between short-term variations in outdoor ambient temperatures and cardiovascular-related emergency department (ED) visits in Alberta and Ontario, Canada between 2004-2020 using gridded data at a 1 km x 1 km spatial resolution and conditional logistic regression. Findings provide evidence that the impacts of heat on cardiovascular ED visits may be modified by neighbourhood-level risk factors. **Case Study 3: Spatial Distribution Of Asthma and its Effect on Marginalized Communities in Canada (Kelachi NSITEM)** Marginalized communities are disproportionately affected by communicable and non-communicable diseases, including asthma. Although asthma is a result of both genetic and environmental factors, significant contributors include spatial displacement and disproportionate exposure to pollutants. Using geographic Informational System techniques and population-based data, the connection between traffic and industrial proximity, environmental pollutants, and disproportionate asthma prevalence is supported. **Discussion**

Using a systems thinking approach to support healthy and sustainable food systems

Miranda Blake¹, Cedric Middel², Joreintje Mackenbach³, Tari Forrester-Bowling¹

¹Deakin University, Australia, ²UMC Amsterdam, The Netherlands, ³UMC Amsterdam, Australia

Outline of Workshop: Public health interventions and policies are often implemented outside the health care system. These interventions and policies require the involvement of a diverse range of stakeholders, many without a health background. Additionally, while some interventions and policies may be implemented in a single setting (for example, a school), they often need to be implemented in multiple, interacting settings in order to achieve the desired results. Systems thinking offers opportunities to deepen our understanding of complex environments, stakeholder perspectives, causal structures driving organisational behaviour, and potential unintended consequences of policy decisions and interventions.

This workshop will introduce participants to the potential of systems thinking approaches applied to healthy, equitable and sustainable food systems. It will present methodology and a range of simple tools that can be used to address complex problems and help map the dynamics of a system (e.g. feedback loops, systems pyramids). Feedback loops are an important tool within systems thinking to help people better understand how a system may respond to interventions and policies. Participants will also be introduced to a specific framework used in food retail environments - Systems Thinking Approach to Retail Transformation map (START map), how it might be used to advance research and practice, and examples of how systems thinking concepts can guide stakeholder engagement, identification of leverage points, and implementation planning. This workshop will be building on workshops delivered across Australia and the Netherlands to public health practitioners, policy makers, and researchers.

Aim: To increase the capacity of participants to apply a systems lens to complex public health problems through practical application of systems thinking tools to engage stakeholders, identify leverage points, and plan implementation

approaches, by drawing on a case study of healthy food retail change.

Components: Introduction to systems thinking (10 min)

What do we mean by 'systems thinking'? Introduction to feedback loops Benefits of using systems thinking when planning and implementing interventions to tackle complex problems Overview of some of the main 'tools' used Systems thinking concepts in healthy food systems (25 min)

Deep dive into systems pyramid as a tool (15 min) Practical application of systems pyramid using case studies – participants apply their learnings through provided worksheets (10 min) Case study of healthy food retail tool (10 min)

Overview of the START map and its potential use by researchers and practitioners Discussion (10 min) Close (5 min)

Key Questions Workshop Will Address

What are practical systems thinking tools that can be applied to better understand complex problems and identify dynamic solutions within healthy and sustainable food systems? What are the benefits of using systems thinking when planning and implementing healthy food retail interventions or policies?

Popul. Med. 2023;5(Supplement):A1890

Research methods for global public health oriented health services research - what can we learn from each other?

Lorena Dini¹, Daniel Maceira², Jaqueline Alcalde Rabanal³, Stefania Boccia⁴, Angelo Pezzullo⁵, Saverio Stranges⁶, Chiara de Waure⁷, Lyazzat Koscherbayeva⁸, Shehzad Ali⁹, Sumiko Ogawa¹⁰, Lorena Dini¹

¹Charité Universitätsmedizin Berlin Germany, ²Center for the Study of State and Society, Argentina, ³Health Systems Research Center, National Institute of Public Health Mexico, Mexico, ⁴Università Cattolica del Sacro Cuore (UCSC) and IRCCS "Fondazione Policlinico A. Gemelli" (FPG) in Rome Italy, ⁵Università Cattolica del Sacro Cuore in Rome Department of Public Health Italy, ⁶Schulich School of Medicine & Dentistry, Western University, Canada, Canada, ⁷Public Health at the University of Perugia Italy, ⁸Kazakh National Medical University, Kasakstan Kazakhstan, ⁹Western University Canada, ¹⁰Meio University, Okinawa, Japan

This workshop is designed as a global and interdisciplinary international dialogue on current and innovative methodological approaches relevant to the field of public health on the basis of focused presentations by the thematic sections of the European Public Health Association (EUPHA-Sections) health service research (EUPHA-HSR), epidemiology (EUPHA-EPI) health technology assessment (EUPHA-HIA), health impact assessment (EUPHA-HTA), economic evaluations (EUPHA-ECO) and public policy and practice (EUPHA-PHPP). The presidents and vice-presidents of the EUPHA Sections will present in the form of a panel an overview of the diversity of each methodology. Each theme will be commented by a colleague from other regions in particular from non-European regions of the Global South i.e., Latin-America, Japan and Central Asia who will share their views and perspectives on innovations based on case examples from their countries. The line-up of the workshop covers the following topics: 1. Introduction and framing from the perspective of health systems research applied to primary care, Lorena Dini, (EUPHA-HSR), invited panelist Daniel Maceira (Argentina) and Jacqueline Alcalde (Mexico) 2. Methodologies and techniques applied in Public Health Epidemiology and how they contribute to decision-making and evidence-informed policymaking by Stefania Boccia and Angelo Pezzullo, (EUPHA-EPI), invited panelist Saverio Stranges (Canada) 3. Overview of methods used for the quantification of health impacts, both following a risk assessment approach or an epidemiological approach. (Piedad Martin-Olmedo and Odile Mekel (EUPHA-HIA) invited panelist Jaqueline Alcalde (Mexico) 4. Methodologies and techniques applied in Health Technology Assessment and how they contribute to decision-making and evidence-informed policymaking (Chiara De Waure and Elena Petelos, EUPHA-HTA), invited panelist Lyazzat Koscherbayeva (Kazakhstan) 5. Health Systems Performance Assessment (HSPA) and Economic evaluations (Lyazzat Koscherbayeva, invited panelist Daniel Maceira (Argentina) and Shehzad Ali (Canada) 6. Evidence-based approach for feasible public health policy for community: case study in Okinawa by Jacqueline Alcalde (Mexico), invited panelist Sumiko Ogawa (Japan) Each topic will be covered in 10 minutes starting with a 5 min focused key input from the European Region followed by comments from the invited panelists from another region and option for a dialogue with the audience. Target audience: young and old professionals interested in updating their methods skills discussing and sharing their own experiences on innovation in methods for a stronger public health research. Message 1 A Global Dialogue on research methods in public health is crucial to share knowledge as methods evolve sharing knowledge amongst different regions and across fields is key to contribute to a stronger health systems, better health policy decisions and a better health for all including expanding perspective on fairness and equity. Message

2 That one size does not fit all is true as well for methods in public health and are no better or worse research methods. Research methods are just a tool, that when applied properly support evidence and action for a stronger public health at global scale.

Bagasse dust exposure and chronic respiratory health symptoms among workers in the sugar factories in Ethiopia: a longitudinal study design

Mitiku Debela¹

¹School of Public Health, College of Medicine and Health Sciences, Bahir Dar University, Bahir Dar, Ethiopia

Background: Ethiopias sugar plants are growing to help the countrys economy prosper. However, there is inconclusive evidence on the level of bagasse dust exposure and its respiratory health impacts among workers in sugar plants. This study assessed the degree of bagasse dust exposure and its effect on the respiratory health of workers.

Methods: A longitudinal study was conducted among randomly selected samples of 1,043 participants in the sugar factories in Ethiopia. We measured the dust intensity using a calibrated hand-held real-time dust monitor once a month for five months, totaling 50 dust samples. Chronic respiratory symptoms were assessed using the American Thoracic Society respiratory symptoms questionnaire. Statistical analyses were done by SPSS version 26 software.

Results: In the boiler and power turbine sections, the geometric means of the dust concentrations were 9.55 and 7.89 mg/m³, respectively. This represented an exposure level to bagasse dust of 85.52% (95 % CI: 83.2 % -87.6 %). The extent of chronic respiratory symptoms was 60.6%, with wheezing (96.8%), cough (89.7%), and breathlessness (80.9%). Lack of dust control technology (β = 0.64, 95% CI: 0.53–0.75), and not practicing of wet spray (β = 0.27, 95% CI: 0.21–0.41) were factors associated with dust exposure. Chronic respiratory symptoms were associated with not wearing respiratory protection devices (β = 0.12, 95% CI: 0.30–0.56) and being exposed to bagasse (β = 0.56, 95% CI: 0.14–0.98).

Conclusions: Occupational dust exposure and respiratory health abnormalities were worrying concerns for sugar factory workers. The absence of dust control technologies and the practice of wet spray increased the level of exposure. Also, being exposed to bagasse dust and not wearing the correct respiratory protection gear increased the odds of having respiratory abnormalities. Thus, use of mechanical solutions to stop dust emissions at their sources and the wearing of respiratory protection gear is highly advised.

Knowledge, attitudes, and practices regarding ergonomic hazards among healthcare workers in a Saudi Government hospital

Nawal Herzallah¹

¹Imam Abdulrahman Bin Faisal University, Dammam, Saudi Arabia

Background: Musculoskeletal disorders (MSDs) affecting healthcare workers (HCWs) must be considered and addressed as a serious issue. Thus, it is important to incorporate ergonomics into clinical practice to prevent MSDs. The Objectives of this study were to investigate HCWs' knowledge, attitudes, and practices regarding ergonomics in a large governmental healthcare facility. **Methods:** A cross-sectional study was conducted in which the participants were interviewed to complete a validated four-section questionnaire (demographic data, knowledge, attitudes, and practice information related to ergonomics). The questionnaire was newly self-developed based on a literature review and was pilot tested after development.

Results: This study included 273 HCWs. Their average knowledge score regarding ergonomics was 2.6, or "fair to good." Overall, the participants reported good attitude scores, with a total average score of 1 and 2, or "agree to strongly agree." The findings also indicated that appropriate ergonomics practices were often not implemented, as the average practice score was 1 to 2, or "always to sometimes engaging in bad practice." The risk factors of being Saudi, being a woman, and having low academic achievement were associated with poor knowledge, attitudes, and practices related to ergonomics among HCWs. **Conclusions:** This study showed that the majority of the participants had fair knowledge and good attitudes toward ergonomics at work while practicing. However, the practice of ergonomics at work was not implemented. It is important to apply ergonomics at work to prevent MSDs; therefore, ergonomic principles should be included in the undergraduate health curriculum for all HCWs, with emphasis on practicing ergonomics in their routine clinical work.

Have work-related accidents and ill-health in Brazil declined since the introduction of the accident prevention factor?

Helena Shimizu¹, Josierton Bezerra², Luciano Arantes³, Edgar Merchán-Hamann¹, Walter Ramalho¹

¹Universidade de Brasília, Brazil, ²Potiguar University, Brazil, ³Unai Municipal Department of Health, Minas Gerais, Brazil

Background: Since 2004, Brazil has had a national policy for occupational health and safety. This study was designed to investigate the incidence of work-related accidents and ill-health in Brazil according to their causes, their severity, and the economic activity in which they occur, and to compare the data before and after the Introduction of the Accident Prevention Factor.

Methods: An ecological study was conducted by analyzing the time series of work-related accidents/ill-health between 2008 and 2014 from the Brazilian social security system (Previdência Social) statistical yearbooks. Incidences were calculated per cause, economic activity, and severity of the accident/ill-health. Data from before and after the Introduction of the Accident Prevention Factor were compared using the Mann-Whitney test per cause and per economic activity. Statistical analyses were made using the SPSS software, with significance set at 5%.

Results: A reduction in the incidence of work-related accidents/ill-health was found across all the groups of causes analyzed, except for the groups "external causes of morbidity and mortality" and "factors influencing health status or contact with health services." Greater reductions were found for diseases of the musculoskeletal system and connective tissue and diseases of the nervous system. Reductions in work-related accidents/ill-health were found in the different economic activities and in the different severity groups. The highest reduction after the Introduction of the Accident Prevention Factor was in manufacturing and production ($p < 0.05$).

Conclusions: Overall, the incidence of accidents/ill-health was found to be on decline, except those with external causes of morbidity and mortality and those involving factors influencing health status or contact with health services. The biggest reduction was found in manufacturing and production. However, generally speaking progress still needs to be made in accident prevention and occupational health across a whole range of work environments.

Knowledge and adherence to the Mediterranean Diet in subjects who practice regular physical activity

Miriam Belluzzo¹, Walter Mazzucc², Francesco Balsamo³, Nicole Bonaccorso³, Alessandro Carubia³, Luciano D'azzo⁴, Tania Vitello⁴, Maria Poto⁴, Luigi Zaga⁴, Santi Fruscione⁴, Angelo Fertitta⁴, Martina Sciortino⁴, Francesco Vitale⁴, Claudio Constantino⁴

¹Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties, G. D'Alessandro University of Palermo, Italy,

²Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties "G. D'Alessandro", University of Palermo, Italy,

³Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties, "G. D' Alessandro" University of Palermo, Italy,

⁴Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties "G. D'Alessandro", University of Palermo, Italy

Background and Objective: The Mediterranean Diet (MD) is a universal model of nutrition based on the balanced intake of micro and macronutrients which, in synergy with regular physical activity, can prevent metabolic, cardiovascular and oncological diseases and promoting longevity. Although numerous promotion campaigns, MD isn't adequately valued. The Objective of this study was to analyze the adherence to MD of amateur athletes [1] in the Metropolitan Area of Palermo. **Methods:** A cross-sectional study was conducted between October 2020 and 2021 in the metropolitan Area of Palermo. An anonymous questionnaire previously validated and approved by the Ethical Committee of the University Hospital of Palermo, was administered through both paper and mobile devices, in 10 Palermo Sports Centers (Gyms, Swimming Pools, Tennis or Padel Clubs, etc...). The questionnaire was divided in 5 sections and 74 items (general information, physical activity, eating habits, adherence to MD, knowledge of correct eating habits).

Results: 337 subjects replied to the questionnaire, 57.3% were under or equal to 40 years of age, 73% had normal weight, 57.9% reported knowing MD and 82.8% were busy working. Only 42.1% of the sample adhere to the main principles of MD. Multivariable analysis showed that adhere more to MD non-employed athletes [Adj-OR 2.15(1.05 - 4.41)] and those who better known MD [Adj-OR 11.9(6.55

-21.61)].

Conclusions: Based on the analysis conducted, the knowledge of MD represents a key factor to follow it better. The data reported on better adherence on non-employed athletes could be related to having for preparing healthier meals. In future Public Health Authorities should favour the accessibility to principles of MD based meals on workplaces and the formation, already since the school age, about MD to make it clear how a healthy diet combined with regular physical activity is necessary to a better quality of life. Assessment of knowledge, attitude and practice and associated factors on the prevention of occupational health risks among solid waste collectors in Lideta Subcity

Fikrom Girmay¹

¹Addis Ababa City Administration Health Bureau, Ethiopia

Introduction: Municipal waste includes nonhazardous wastes from households, commercial establishments, institutions, markets, and industries. Municipal solid waste handling and disposal is a growing environmental and public health concern. There is no adequate credible evidence on workers occupational health practices and factors affecting the practice of waste handlers in Addis Ababa which help for designing strategies to address the problem for both government and non-government organizations.

Objective: The Objective of this study is to assess knowledge, attitude and practice on prevention of occupational risks and associated factors among solid waste collectors in Lideta sub-city, A.A.

Methods: A cross sectional quantitative study was employed to assess knowledge, attitude, and practice and associated factors on occupational health risks among solid waste collectors in Lideta sub-city Addis Ababa from March to April 2013. All 427 solid waste collectors found in Lideta sub-city are included in the study. Structured pretested questionnaire and observational checklist has been used for data collection. The data was entered, cleaned, edited and analyzed by using epi info 3.5.1 and spss 16 version statistics software.

Results: The response rate of this study was 94.4% and female respondents accounted 69.7%. The median age of the study subjects was 35 years (ranging from 17 to 65 years). 64% of study participants had good knowledge on preventing occupational health risks. 76.4% of solid waste collectors had good attitude and only 8.9% had good practice on preventing occupational health risks. Job dissatisfaction is statistically significant factor for failing to have good practice among Lideta sub-city solid waste collectors.

Conclusions: The magnitude of having good practice on preventing occupational health risks among solid waste collectors in Lideta sub city is very low. So, implementation of basic occupational health services with provision of personal protective equipments and supervising solid waste collectors on appropriate utilization is advisable.

Study of the viability of community-based mutual health insurances in the Department of Vélingara in 2019 in Senegal

Cheikh Diop¹

¹Université Alioune DIOP Bambey, Senegal

Introduction: Access to basic healthcare services for the whole population has been a priority the successive governments in senegal since independence. Mutual health insurance has been the driving force behind health coverage since the 2000s. This policy aimed to reach 75% coverage of the population by 2019. This study aims to describe the characteristics and also analyze the viability of mutual health insurances in vélingara. Methodology: The mixed method was used to evaluate both the viability of mutual health insurances and the perception of the communities. Viability was evaluated in its four technical, functional, financial and institutional aspects. For the population's perception, interviews were conducted with beneficiaries, non-beneficiaries, community leaders and UHC officials.

Results: At the institutional level, all of the mutual health insurances were viable and had internal regulations, a statute, a license and a bank account. On the technical level, they were exposed to the risk of adverse selection. On the other hand, from a functional point of view, none of mutual health insurances was viable, with a very low rate of retention. Finally, from a financial point of view, none of the mutual health insurances had the capacity to honor their medium- and long-term debts without resorting to external resources. In addition, the results of the survey showed a lack of information and a high cost of membership. Conclusions: All the mutual health insurances were experiencing difficulties and required urgent

corrective measures and support from the state and local authorities.

The role of local health and community actors in delivering social protection during the COVID-19 pandemic in Gujarat, India

Sanjana Rajasekar¹

¹Center for Development Research, Germany

The objective of this study is to find out how different local-level health and community actors are engaged in the last-mile delivery of social protection in Gujarat, India. During the COVID-19 pandemic, the Government of India introduced several new social protection instruments such as the Garib Kalyan Ann Yojana and the Atma Nirbar Bharat Package for health and food security. However, due to the national lockdown, strict social distancing regulations and curfew, the last-mile delivery of these new instruments was a challenge. Additionally, the last-mile delivery of existing social protection programmes or schemes was also complicated. In this situation, several local-level health and community actors such as Anganwadi workers, ASHA workers, ration shop workers, heads of dairy cooperatives, and heads of women's collectives had to collaborate for targeting households, disseminating information and ensuring that the benefits from social protection had been availed. This qualitative study was carried out through in-depth Key Informant Interviews with local women's groups, community health workers, heads of dairy cooperatives, and ration-shop workers (n=40). The study was carried out in Ahmedabad and Gandhinagar districts of Gujarat. Areas of inquiry included the implementation of social protection during the COVID-19 pandemic, information dissemination, participation in social networks, linkages between different implementation actors, and their role in preventive health. The recordings of the interviews were transcribed and coded in English, and common themes were subsequently identified and analyzed. The primary findings were that while there is no formal protocol for communication and coordination between these different local-level actors, they relied on personal social networks between themselves to coordinate the implementation of social protection that did not necessarily fall in their jurisdiction. Additionally, women's groups and social networks played a crucial role in information dissemination.

Equity in mobility: an intersectional policy analysis from India

Jagnoor Jagnoor¹, Inayat Singh¹, Margie Peden²

¹The George Institute for Global Health, India, ²The George Institute for Global Health, ICL, UK, United Kingdom

Background: Sustainable Development Goal Target 11.2 states that by 2030 countries should provide access to safe, affordable, accessible and sustainable transport systems for all. Transportation inequities have serious implications for public health, and thus transport policy becomes an important social determinant of health. The social circumstances affecting under-served populations are influenced by societal constructs and complex hierarchies, including policy and implementation of transportation systems.

Objective: To explore how social equity considerations can be more effectively incorporated and operationalised in transportation planning.

Methods: Guided by intersectional lens and domains of PROGRESS- Plus, policy at the national and subnational level (Delhi) were analysed. Further in-depth interviews were conducted for 30 participants and were anchored for non-binary gender participants, differently-abled people, and adolescents in an urban setting. Findings: Policy documents were found to stigmatise groups based on disability and gender. The policymaking process was found to be exclusionary and 'expert-driven'. Voices of vulnerable groups and civil society were left out of the policymaking process. Policies did not detail what evidence was relied upon. The challenges faced by "vulnerable groups" ranged from accessibility, affordability, availability and quality/safety. Softer infrastructure- such as attitudes of service providers were identified as a major limitation to an equitable access of transportation.

Conclusion: Adopting an intersectional lens for understanding transport experiences and analysing policies allows for a deeper understanding of the impact of multi-level interacting social locations and structures of domination that shape human experience

Access to healthcare among the elderly suffering from COVID-19 and catastrophic health expenditure in West Bengal, India

Arista Lahiri¹, Sweetly Jha², Sweetly Jha¹, Madhumita Dobe³

¹Indian Institute of Technology Kharagpur, Dr. B. C. Roy Multi-Specialty Medical Research Centre, Room no. 735, Life Science Building, IIT Kharagpur, India, ²Dr. B. C. Roy Multi-Specialty Medical Research Centre, Indian Institute of Technology Kharagpur, India, ³Foundation for Actions and Innovations Towards Health Promotion, India

Background and Objective: Access to healthcare among the elderly is an important issue, particularly in low-and middle-income countries like India because of the devastating effect of the COVID-19 pandemic. To curb inequity, home-based care of the elderly through family caregivers is noted to be a cost-effective strategy with need-based institutionalization in the resource constraint settings. Against this backdrop, this study explored the socio-economic inequities in COVID-19-related healthcare access among the elderly and determined the factors associated with catastrophic health expenditure (CHE).

Methods: This community-based study recruited age and gender-matched cohorts of elderly (≥ 60 years) first-time COVID-19-positive patients in home-based care ($n=1392$) or institutional care ($n=1412$) during the first and second waves of the pandemic in Kolkata, India. During follow-up, information was obtained regarding monthly per capita income (PCI) and monthly out-of-pocket expenditure on health (OOPEH) in view of COVID-19 illness. CHE was considered for OOPEH $\geq 40\%$ of non-food monthly spending. The contribution of different factors in CHE was assessed through generalized linear models.

Results: The majority of the participants were in the median income quantile with an average monthly per capita income (PCI) of Rs. 5040.09 (± 182.36) and an average monthly OOPEH of Rs. 4994.39 (± 1602.07). Among initially home-isolated and immediately institutionalized patients, respectively, 38.45% and 15.80% had health insurance (HI), while 84.91% and 94.40% of respective families sustained CHE. HI did not have an effect on CHE. Lower PCI was associated with CHE. During the 1st and the 2nd waves, hospital-based care had a relative risk (95% Confidence Interval) of 1.31 (1.20–1.43) and 1.25 (1.20–1.31), respectively, for CHE in the families.

Conclusion: Insurance of health was not a prevalent practice in the case of elderly patients. Income inequity contributed to CHE. Independently, institutional care among the elderly further increased the inequity through a higher risk of CHE.

The mediating effect of sleep quality and psychological distress on the relationship between precarious employment and physical health

Saeed Jaydarifard¹, Simon Smith¹, Kalina Rossa¹, Dwayne Mann¹, Elahe Nikooharf Salehi¹, Shamsi Shekari Soleimanloo¹

¹The University of Queensland, Institute for Social Science Research, The University of Queensland, Australia

Background: Precarious work is characterised by high job insecurity, low income, and reduced rights and social protections. Current evidence suggests that precarious work is a risk factor for self-rated physical health. It has also been demonstrated that precarious workers are vulnerable to sleep disturbances and psychological distress. This study explored the hypothesis that the relationship between precarious employment and physical health is mediated by poor sleep and psychological distress.

Methods: Data were obtained from the Household, Income and Labour Dynamics in Australia (HILDA) survey (2017). A novel precarious employment score (PES) was developed using exploratory factor analysis and confirmatory factor analysis in 8,127 workers. Structural equation modelling was used to evaluate the mediating effect of sleep quality and psychological distress on the relationship between precarious employment and physical health (SF-36 physical health subscale), after controlling for age, sex, marital status, educational attainment, and tenure. **Results:** The PES identified 648 workers in high precariousness and 7,431 workers in a low or moderate level of precariousness. There was a significant direct association between precarious employment and physical health ($P<0.001$). We also observed a significant change due to sleep quality (Indirect path coefficient=0.14, 95% CI: 0.06-0.22, $P<0.001$) and psychological distress (Indirect path coefficient=0.23, 95% CI: 0.11-0.35, $P<0.001$) in the association between precarious employment and physical health. **Conclusion:** Sleep quality and psychological stress play a mediating role in the association between precarity and physical health. Encouraging precarious employees to prioritise sleep and well-being may mitigate the adverse effects of precarious work on their physical health. Effective measures should be developed to reduce the role of precarity in psychological distress.

Evaluation of the number of accesses with "codice rosa" to the emergency department of Azienda Ospedaliero-Universitaria Pisana (A.O.U.P.): a care path for victims of violence/abuse

Niccolò Grassi¹, Marzia Pellegrini¹, Milena Pasquale², Lucia Rago³, Mojgan Azadegan³, Federica Marchetti⁴, Carola Martino⁴, Chiara Toni⁴, Francesca Frassi⁴, Francesca Baroncini⁴, Francesca Foltran⁴, Sonia Susini⁴, Michele Cristofano⁴, Andrea Porretta¹, Cterina Rizzo¹, Angelo Baggiani¹

¹University of Pisa - School of Hygiene and Preventive Medicine University of Pisa - Department of Translational Research - School of Hygiene and Preventive Medicine Via San Zeno 35-37, 56127 Pisa (PI) Italy, ²University of Pisa - School of Hygiene and Preventive Medicine, ³Azienda Ospedaliero Universitaria Pisana, ⁴Azienda Ospedaliero Universitaria Pisana University Hospital of Pisa Via Roma 67, 56126 Pisa (PI) Italy

Introduction: Since 2014 the "codice rosa" care path, formalized throughout the regional network in 2016, has been active in the University Hospital of Pisa (A.O.U.P.). Emergency Department (ED) personnel are trained on how to recognize the signs of violence suffered, whether declared or not, to place the victim within a multidisciplinary and territorial assistance network. The aim of our study is to analyze the number of accesses with "codice rosa" in ED before and during the pandemic, to identify the characteristics and the trend of accesses.

Materials and methods: A retrospective study was carried out from 2018 to 2021 by analyzing data from the "codice rosa" medical records stored in a dedicated archive at the Organizzazione dei Servizi Ospedalieri (UO OSO) and by cross-checking using the application in use in the ED. Accesses to ED by "codice rosa" were collected by: age range, gender, citizenship, type of violence and period (pre-pandemic=2018-19 and pandemic=2020-21). The processing was carried out using Excel®.

Results: A total of 620 accesses were reported during the study period. 289 in the pre-pandemic and 311 in the pandemic period. Females were the most affected in both periods ($n=208,72\%$, 2018-19; $n=265,80\%$, 2020-21). During the pandemic period the percentage of minors decreased slightly (from 9.5% to 7.5%); while the percentage of males increased (from 15.5% to 20%) as for the foreigners (from 28.5% to 33.5%). The type of violence most frequently recorded in both periods was ill-treatment.

Conclusions: The analysis highlights how accesses with "codice rosa" have been steadily increasing over the years with a slight increase during the pandemic. Victims of abuse are generally adults, females and Italians. The analysis carried out can provide useful tools for identifying the most fragile categories and the trend of the phenomenon, in order to plan specific interventions for the prevention of violence.

Effects of smart working on productivity and personal and job wellbeing in a sample of employees of the university of l'aquila: analysis two years after the COVID-19 Emergency

Loreta Tobia, Simona D'onofrio, Pierpaolo Vittorini, Giada Mastrangeli, Pietro di Benedetto, Leila Fabiani

Introduction: Since March 2020, the University of LAquila, has adopted different measures against COVID-19, including the introduction of distance learning for students and smart working for almost all of its employees. The possibility to opt for smart working, albeit partial, and on individual basis, was left possible also after the end of the emergency period.

Aim: The aim of this study is to investigate the impact of smart working on job productivity and on personal and professional well-being of workers, in two different periods: April 2022 and December 2022.

Materials and Methods: A questionnaire consisting of 29 multiple-choice questions was sent by mail to all workers of the University of LAquila in two different periods: April 2022 and December 2022. Participation was free and voluntary. Data obtained were processed through software R4.2.1.

Results: A total of 118 and 157 office workers participated respectively on April and December 2022 to the study. The most represented age group was 50-59 years. The GHQ-12 items score showed a reduction - even though non statistically significant - between the two periods. The analysis of the individual items showed a significant difference between items 6 and 9 of GHQ (9 not being able to overcome difficulties and 6 to feel unhappy or depressed), marginally significant in items 5 and 10 (5: constantly under pressure and 10: as if he as lost faith in himself). There was no significant difference in terms of sleep quality and duration. Statistically significant difference was instead in energy levels and ability to concentrate.

Discussion: Our results show that the use of smart working is well accepted by office workers and seems to determine an improvement of the wellbeing of the workers, in terms of energy levels and ability to concentrate mainly between those

that freely choose this kind of work.

Assessing perceptions on the burden and health systems preparedness for snakebite in Odisha, India: a qualitative study

Deepti Beri¹, Sucharita Panigrahi¹, Jaya Kshatri², Jagnoor Jagnoor¹, Sanghamitra Pati², Soumyadeep Bhaumik¹

¹The George Institute for Global Health, India 308, Third Floor, Elegance Tower Plot No. 8, Jasola District Centre, New Delhi 110025 India,

²Regional Medical Research Centre - Indian Council of Medical Research (RMRC-ICMR), Bhubaneswar, Odisha NALCO Nagar, Chandrasekharpur,, Bhubaneswar, Odisha 751023 India

Background and Objective: Snakebite kills 64,100 people in India annually. Odisha, a state in eastern India, is one of the high burden states for snakebite. In 2015, the Government of Odisha declared snakebite a 'state-specific disaster'. We aimed to explore stakeholder perceptions on the burden and systems preparedness for addressing the issue and suggest areas for future research and funding to reduce snakebite burden in Odisha.

Methods: We conducted 21 in-depth interviews with key stakeholders, including clinicians, academicians, community health workers, wildlife workers and snake rescuers. We anonymised interview data, developed coding framework and conducted thematic analysis using NVivo 12 software.

Results: The following four themes emerged based on interim results of 17 interviews– 1) There is discordance on the status of availability of snake anti-venom between clinicians, healthcare workers and the wildlife workers and snake rescuers. 2) There is a strong felt need, across all stakeholders, for community-based interventions for promoting use of formal healthcare system, increasing awareness about decreasing snake-human conflict and awareness on government scheme for snakebite death compensation. 3) Clinicians and health workers identified the need for training and support to address hesitancy to treat snakebite patients at the primary health centers. 4) Lack of funding, partnerships, and coordination between government, community-based organisations, and advocacy groups was identified as a key challenge in Odisha.

Conclusion: There are multiple challenges at different levels for addressing snakebite burden in Odisha. There is a need for conducting more policy and systems research in the domain along with active involvement of policy makers and government stakeholders to develop and implement a dedicated state-specific strategy for snakebite. Such a strategy should focus on awareness and education of communities, training of healthcare workers, and strengthening of formal primary healthcare system of the state, which is first point of seeking care for snakebite.

Return to work after total hip arthroplasty

Nicky Wouters¹, Nina Wijndans², Martijn Schotanus³, Bert Boonen³, Jasper Most³, Chantal Gielen¹

¹Dutch National Institute for Employee Benefits Schemes (UWV), Heerlen, The Netherlands. ²Netherlands, ³Care and Public Health Research Institute (CAPHRI) Netherlands, ³Department of Orthopaedic Surgery, Zuyderland Medical Center Sittard-Geleen, The Netherlands

Background and objective: Worldwide, enhance numbers of patients receive total hip arthroplasty (THA), primarily due to arthrosis. In addition, the number of patients of working age is rising, partially due to decreasing age at surgery. As a result, a wider and diverse range of outcome goals including daily participation an return to work (RTW) are gaining interest. As for the Netherlands, implementing the gatekeeper improvement act requires a minimum of two years of sick-leave payment by the employer, which makes early RTW of primary importance for society. Thus far, studies on RTW have only focused on the first year after surgery. In this study, the aim is to gain insight into factors influencing RTW two years after receiving THA.

Methods: In this single-center retrospective cohort study, performed at Zuyderland Medical center, Sittard-Geleen, all primary THA patients aged under 65 (n=398), operated between January 2016 and February 2018, received a questionnaire including qualitative and quantitative questions addressing RTW and factors influencing this process. Descriptive statistics were used to analyze.

Results: In total, 182 patients responded (response rate 45.7%), of which 145 patients (mean age 58.6 ± 5.6 years; female: n=74) completed the questionnaire. Prior to surgery, 112 patients were employed; 9 patients were self-employed. Within 12 weeks after surgery, 52% returned to work, 14% within 104 weeks. (pre)Retirement took place in 32 patients. In 19 cases, adjustments were made

to working- hours or activities. For patients, who had an occupational physician involved, RTW was 85%. Contributing factors to early RTW were personal and social support, whereas physically demanding work conditions delayed or inhibited RTW Conclusion: Overall, the majority of patients returned to work within 12 weeks after surgery. After two years, all of them were still at work. They were satisfied with the guidance of their specialist and occupational physician.

Implementation integrated total worker health approaches for promoting worker safety and health, and well-being in southern Thailand

Phayong Thepaksorn¹, Wiphawan Kaewlai², Elizabeth Thepaksorn¹, Suthat Siammai¹, Manopporn Pedmetha³, Prakrit Prapa-Inthara⁴, Jammaree Sornboot⁵

¹Trang Research Center for Occupational Health, Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute Thailand, ²Trang Research Center for Occupational Health, Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute, ³Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute Sukhumaporn Sriwisit Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute Thailand, ⁴Sirindhorn College of Public Health, Phitsanulok, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute Thailand, ⁵Sirindhorn College of Public Health, Yala, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute Thailand

In the South, there were top 5 provinces with high accidents and injuries, including Satun, Trang, Songkhla, Phatthalung and Surat Thani provinces, respectively, with the highest rate of injury at 17.37 per thousand. Preventive actions, promoting safety, occupational health and working environment are therefore important in order to foster worker health and safety working environment. The main concept of Integrated Total Worker Health (ITWH) is aspects linked as an integrated operation, promotion and prevention work-related safety and health hazards, reducing injuries and illnesses for better workers well-being. ITWHs focus is on the safety and good health of workers. However, little research has examined the impact of ITWH interventions in Southern enterprises. The aim of this study was to explore and characterize health and safety practices, working conditions, occupational health and safety policies, and programs in Southern enterprises from an ITWH perspectives (n=6). Engaging science studies and approaches, site visits, walk-through surveys, questionnaires interviews (n=660), group discussion were conducted with enterprises, between 150 and 1,250 employees in 2022. Qualitative data from 54 interviews and tracking documents were coded and thematically analyzed. By assessing the context of the enterprise settings in which the intervention was situated, we explored factors preventing and facilitating the working conditions and improvement, including organizational factors and atmosphere, engaging employees, low-cost strategies, evaluation, and integration. The enterprises have fewer resources and financial supports for occupational health and safety, are more likely ITWH precarious, and have higher rates of occupational injury and illness compared with larger enterprises. Interventions that address the promotion of health and well-being in addition to conventional occupational intervention and health hazards are crucial supports for improving ITWH. These themes overlapped with both the different governmental agencies and fundamentals. As ITWH expands to organizations of all sizes, it is necessary to address the needs of the enterprises.

What are the attributes of a household vulnerable to catastrophic health expenditure? using national survey data to analyse health expenditure for non-communicable diseases in India

Piyush Kumar¹

¹Sambodhi Research and Communications India

Background and objectives: Precise identification of households vulnerable to catastrophic health expenditure (CHE) is crucial in the efforts towards Universal Health Coverage. This paper has two main objectives. Firstly, to map the household-level determinants of CHE for people who have required medical care (hospitalization or ambulatory) due to non-communicable diseases (NCDs). Secondly, estimation of proportion of households that have been pushed into poverty due to the incurring of catastrophic health expenditure as a result of NCDs. Methods: Data from the 71st and 75th Rounds of NSSO morbidity and healthcare surveys was used for analysis, encompassing a sample of over 179,755 households. Key information on expenditure for hospitalization (inpatient) and ambulatory care (outpatient) was collected pertaining to NCDs. An array of household level socio-economic, demographic and need-based correlates embedded in the Anderson and Newman model were incorporated in the study. Incidence and intensity of CHE was calculated using overshoot and mean positive overshoot measures. Probit regression was undertaken to estimate the impact of correlates on the probability of incurring catastrophic expenses (out-of-pocket expenditure as share of monthly per capita expenditure greater than 10%) due to health shocks. Adjustment of monthly per capita expenditure was done using OECD equivalence scale.

Results: Household income level, location (rural/urban), type of facility where care was sought (public or private), availability of insurance cover and number of household members with chronic ailments influence the likelihood of incurring CHE for both inpatients and outpatients. Roughly 60% of all households with members affected by NCDs incurred CHE, with 24% of them pushed into poverty (World Bank poverty line).

Conclusion: This highlights the urgent need for schemes like the National Health Protection Mission to identify vulnerabilities at the household level that go beyond income or occupation-based classifications and also expand the coverage to include outpatient services.

The impact of covid-19 on child drowning prevention activities in rural Bangladesh

Md Bhuiyan¹, Rehana Parveen², Zobaer Alam¹, Md Borkat¹, Aminur Rahman², AKM Rahman¹

¹Centre For Injury Prevention And Research, Bangladesh (CIPRB) Centre For Injury Prevention And Research, Bangladesh (CIPRB) House# B-120, Mosque Road, New DOHS, Mohakhali, Dhaka-1206, Bangladesh Bangladesh, ²Centre For Injury Prevention And Research, Bangladesh (CIPRB)

Background: Drowning is the major cause of mortality among children aged 1-4 years in Bangladesh. The COVID-19 pandemic impacted personal and family practices, which may have an influence on drowning prevention measures either directly or indirectly. To prevent child drowning in rural Bangladesh, the CIPRB is intervening with a package that includes Anchals (community-daycare facilities), family education, community sensitization, and stakeholder awareness. Approximately 32,202 rural children were unable to access Anchal supervision services due to the shutdown of over 1,775 Anchals during the pandemic. The purpose of the study was to explore the COVID-19 impact of child drowning in rural Bangladesh before and during the pandemic.

Methodology: Passive surveillance was carried out in 45 unions in rural Bangladesh between March 2019 and February 2021, encompassing approximately one million inhabitants. A pre-tested, structured questionnaire was used to collect information on fatal drowning events.

Findings: Before COVID-19 (March 22, 2019–March 21, 2020), the fatal drowning rate among children who attended creches was 72.1/100,000 per year. The fatal

drowning rate increased to 108.7/100,000 people per year during COVID-19 (March 22, 2020–March 21, 2021). The fatal drowning rates among creche children increased over 1.5 times, and the majority of drownings happened near dwellers homes. As per government instruction, all creche-enrolled children could not participate in the creches activities, and the parents or primary caregivers also could not supervise them. Boys had higher rates, and the majority of drownings happened near dwellers homes. Ponds and ditches were the most common drowning locations (73.7%), and nearly all drownings (86%) happened throughout the day between 9:00 a.m. and 18:00 p.m.

Conclusion: Comparing rates in the intervening areas prior to the pandemic, the fatal drowning rate during the pandemic was consistently higher. Higher rates of child drowning may have resulted from a lack of child supervision services. The methodology used in this study may allow researchers to differentiate between COVID-19s pre- and post-impact on child drowning in Bangladesh and other similar settings.

Recommendations: Future approaches to prevent child drowning should concentrate on providing intervention, especially through ECCD-integrated supervision services, to increase child safety and reduce the fatality rate from drowning among young children.

Authors of sexual violence: a scope review

Sheila Lindner¹

¹Universidade Federal de Santa Catarina (UFSC), Brazil

Considering sexual violence as a complex, multifaceted, endemic and underreported public health problem, as well as its consequences for victims and society, in this review we look at the perpetrator of sexual violence in order to identify his characteristics based on national and international literature. The NCBI/PubMed, APA PsycInfo, CINAHL, Web of Science, Scopus and LILACS databases were used, including studies about perpetrators of sexual violence published in Portuguese, English and Spanish, without year of publication or methodological type restriction. Forty-six studies were included. The results show the profile of the men and women author in relation to life cycle, marital status, education, skin color/ethnicity, work, if they had suffered violence in childhood, if they had used alcohol and drugs, as well as behaviors related to violence. It is concluded that men are the main perpetrators of sexual violence against women in all life cycles, but children who suffer violence from family members of both sexes demand special attention.

Occupational exposure to chemical pollutants among warehouse workers at logistics companies

Szabolcs Lovas¹

¹Department of Public Health and Epidemiology, Faculty of Medicine, University of Debrecen, Hungary

Introduction: During intercontinental shipping, freight containers and closed transport devices are applied. These ambiances can be polluted with harmful chemicals that may accumulate in poorly ventilated environments. The major pollutants are fumigants as well as volatile organic compounds. While handling cargos, workers can be exposed to these chemicals, frequently without adequate occupational health and safety precautions. Aim of the study: To investigate presumed occupational chemical exposures and their experienced health impacts, as well as the related KAP among workers at Hungarian logistics companies.

Methods: A cross-sectional questionnaire survey was conducted among potentially exposed warehouse workers and office workers as controls at Hungarian logistics companies (1) to investigate the health effects of chemical pollutants occurring in closed environments of warehousing and (2) to collect information about the knowledge of workplace chemical exposures as well as the occupational health and safety precautions applied.

Results: Pre-existing medical conditions did not show significant differences between the working groups. Numbness or heaviness in the arms and legs (AOR = 3.99; 95% CI = 1.72–9.26) and dry cough (AOR = 2.32; 95% CI = 1.09–4.93) were significantly associated with working in closed environments of transportation and storage, while forgetfulness (AOR = 0.40; 95% CI = 0.18–0.87) and sleep disturbances (AOR = 0.36; 95% CI = 0.17–0.78) were significantly associated with employment in office. Warehouse workers who completed specific workplace health and safety training had more detailed knowledge related to this workplace chemical issue, and they were significantly more likely to use certain preventive measures against the pollutants.

Conclusions: Warehouse workers at logistics companies may be exposed to

different chemical pollutants and the related health risks may remain unknown. Applied occupational health and safety measures at logistics companies are not adequate enough to manage this workplace chemical issue, which warrants effective preventive strategies to protect workers' health.

Community member perspectives on gun violence intervention in the Southeast United States

Sarah Maness¹

¹College of Charleston, United States

Introduction: South Carolina ranks 8th in the United States for its firearm death rates. Black non-Hispanic residents have the highest firearm death rates and when combined with sex, Black non-Hispanic men have a firearm death rate that is nearly nine times the rate of White non-Hispanic women. The rate of murders in South Carolina increased by 22.1% in 2020, the highest rate since 1993, identifying an urgent need for intervention. The purpose of this research was to learn more from community members regarding the necessary steps to achieve a reduction in local gun violence.

Methods: We conducted an online survey of community members, law enforcement and local government in the tri-county Charleston area regarding steps to reduce local gun violence (n=90). Participants were recruited to the study based on advertisements at local gun violence events, email and targeted social media ads. The survey was conducted through Qualtrics and took approximately 30 minutes to complete.

Results: A majority of participants identified as white (n=79) and having at least a bachelor's degree (n=48). The political affiliation of participants included a wide mix of those identifying as liberal and conservative. Over half of participants identified as concerned community members, with 29% being medical professionals (n=26). Participants ranked the most important initiative to focus on as offer youth at risk for gun violence social resources and mentor services.

Discussion: The greatest consensus on gun violence areas to focus on included mentorship, resources, and programming for at-risk youth. This strategy aligns with reducing community gun violence in that those most affected are young adults. Despite collaborating with a grassroots community organization for recruitment, the demographics of participants indicate that this sample was overrepresented by white community members with college degrees. Future research should examine the specific needs of communities most affected by gun violence.

A case report: Erythema Pernio or Perniosis, with SARS-CoV 02;

Patrícia Maluly^{1,2}, Patrícia Maluly^{3,4}, Valéria Petri⁵, Adriana Schwartz⁶

¹Instituto de Assistência Médica ao Servidor Público Estadual (IAMSPE), São Paulo, Brasil, ²Universidade Federal de São Paulo (UNIFESP), São Paulo, Brasil, ³IAMSPE, Brasil, ⁴Universidade Federal de São Paulo, Brasil, ⁵Instituto da Pele, UNIFESP, Brasil, ⁶Family Medicine, UNIFESP, United States

During the COVID-19 pandemic, many pathological cutaneous manifestations occurred before, during or after the viral infection. But many cases are complicated by systemic inflammatory response and its vascular complications. The evolution to vascular conditions such as livedo, purpura and necrosis, associated with thromboembolic phenomenon, is late, more severe and has a worst prognosis. Patient T.B., female, 30 years old, on January 15, 2020, we assisted a woman with violaceous erythema on the ends of her fingers. Her pathological historic was her mother had hospitalized in October 2019, with severe lung disease, which was not explained. And her 23 years old sister presented with exuberant urticaria in October 2019, during the hospitalization of her mother and grandmother about severe lung disease nonspecific. Everything happened before it was declared a pandemic COVID-19 in Brazil which the similar infections had happened endemic a long time ago without notification assertive specific in Brazil and the world and were underreported or not reported by the Ministry of Health and WHO. The patient was not treated immediately diagnoses with Sars-cov 02 infection, and the severity of the skin lesions was evaluated by the dermatologist examination. The patient had a systemic inflammatory evolution with the worst erythema lesions on the hands and feet. She presented an increase in the time of illness and treatment. In this period of little information about the COVID-19 disease in Brazil, the pathophysiology of symptoms and many different clinical manifestations prevailed to guide diagnosis and treatment, with some pathological and epidemiological features not yet explained by more specific tests. Differential clinical diagnosis and subjective medical experience were essential in this practice to provide medical attention to define

therapeutic solutions for healing and better clinical evolution about Erythema pernio with individual and collective quality of life.

Predisposing factors affecting the psychomotor vigilance of nurses working night shift

Merve Colak¹, Melek Esin²

¹Uskudar University, Nursing Department, Turkey, ²Istanbul University-Cerrahpasa, Public Health Nursing, Turkey

Background: Shifts and long working hours decrease the psychomotor vigilance of healthcare workers during night shifts and adversely impact the health of nurses and patient safety in particular.

Aim: The aim of this study is to determine the predisposing factors affecting the psychomotor vigilance of nurses working night shift.

Methods: This descriptive cross-sectional study was conducted with 83 nurses working in a private hospital in Istanbul and voluntarily participating in the study between 25 April and 30 May 2022. Data were collected using descriptive characteristics form, psychomotor vigilance task, Pittsburgh Sleep Quality Index, and Epworth Sleepiness Scale. SPSS version 24.0 was used to analyze the data. Independent sample t-test and one-way ANOVA were used to compare nurses' PVT test results with their descriptive characteristics, and Scheffé's test, a Post-Hoc test, was used for pairwise comparisons. In order to determine the factors affecting the PVT test, meaningful models were created using multiple linear regression.

Results: When the time-dependent variation of the nurses' PVT performances during the night shift was examined, it was observed that there was a significant difference, and the nurses' mean reaction time and number of lapses of attention increased at the end of the night shift. It was found that 88% of the nurses had poor sleep quality and 38.55% had daytime sleepiness.

Conclusion: Factors affecting nurses' PVT performance were found to be associated with age, smoking, physical activity, daily water consumption, daytime sleepiness, and sleep quality. Suggestions for health policy include the need to determine the attention levels of nurses working night shift for ensuring employee and patient health and safety and creating a healthy working environment, and to implement workplace health promotion programs in order to increase the attention level of nurses.

Mortality due to motorcycle accidents in Mexico

Maria Vega-Lopez¹, Guillermo Gonzalez-Perez¹

¹University of Guadalajara, Mexico

Background/Objectives: In Mexico, mortality from motor vehicle traffic accidents (MVTA) is one of the main causes of death in the country; Coincidentally, the number of registered motorcycles has increased in recent years. While the increased risk of injuries faced by users of this type of vehicle has been documented, this study aims to analyze the evolution of mortality from motorcycle accidents (MA) by sex and age in Mexico in the last two decades and its association with the number of registered vehicles of this type.

Methods: This study is based on official sources of information. MVTA and MA were classified according to the Tenth International Classification of Diseases. Age-standardized rates were calculated for each sex between 1998 and 2020. Through a regression analysis, both the rate behavior trend and the association between the rate and the number of motorcycles in Mexico were calculated. Likewise, the proportional weight of deaths from MA in the total number of deaths from MVTA was calculated.

Results: The study reveals that the mortality rate from MA increased in Mexico by more than 800% in both sexes in the period analyzed. The highest rates are observed between the ages of 15 and 29 in men and between the ages of 15 and 19 in women. A strong correlation is observed between the registered number of motorcycles and mortality from MA. On the other hand, deaths from MA represented only 1% of deaths from MVTA in Mexico at the beginning of the period, but around 20% in 2020.

Conclusions: Thus, it is necessary to implement specific actions to reduce this cause of death, especially in younger ages, given the growing number of motorcycles that circulate in the streets of Mexico and the few existing regulations.

Jet fuel and hearing loss: a systematic review of impacts to the auditory system

Helen Wu¹, Hugh Davies¹

¹University of British Columbia, Canada

Background and Objective: Globally, millions of people are exposed to ototoxic solvents at work, which can permanently damage their hearing. Jet fuel is a chemical mixture containing ototoxic solvents, and the exposure to jet fuel alone or with noise is associated with negative impacts to the auditory system. The International Ototoxicity Management Group's (IOMG's) Environmental and Occupational Exposures Focus Group is conducting a series of systematic reviews on solvent ototoxicity. IOMG plans to issue international occupational health guidance to facilitate improved protections and hearing health management for ototoxic exposures. The objective of this systematic review is to synthesize observed ototoxic effects of jet fuel exposures and discuss the translation of these findings to occupational health.

Methods: A systematic review on auditory outcomes of animals following jet fuel exposures was conducted using the Medline and Embase databases. All available articles were screened, then full text reviews were conducted in those matching the inclusion criteria.

Results: A total of 952 abstracts were screened and reviewed to synthesize relevant findings. Significant impairment of auditory outer hair cell function was demonstrated in three key studies. Further, two key studies also found that jet fuel exposures caused central auditory processing disorder (CAPD). One study suggested oxidative stress as a potential mechanism for hearing loss caused by jet fuel, with findings demonstrating significant increases in liver glutathione concentrations.

Conclusion: This review summarizes evidence demonstrating jet fuel as a potential hazard to worker's hearing. Those exposed to jet fuel may exhibit normal auditory sensitivity, yet develop brainstem dysfunctions resulting in auditory or non-auditory symptoms, such as CAPD, which may be missed during routine occupational audiometric assessments. Ultimately, more research is needed on hearing outcomes following jet fuel exposure, in both animals and humans, to improve guidance for protecting worker's auditory health.

Quadbike Injury Risk Clusters - A Cluster Analysis of Emergency Records in Dubai, United Arab Emirates

Preetha Menon¹, Mohamed

El-Sadig¹, Ibrahim Abdalla Alfaki¹, Omar Al Sakka², Rashad Gamar², Rami Al-Rifai¹, Michal Grivna¹

¹United Arab Emirates University, United Arab Emirates, ²Dubai Corporation Ambulatory Services

Background and Objective: Desert recreational sports in the middle east, especially Dubai is an integral part of tourism, and local winter recreation. Quadbike riders in this region ride in different terrain with varying degree of riding competency. This study tries to identify unique riding habits and risk clusters among quadbike riders that lead to different injury outcomes in Dubai. Identifying these rider clusters with unique risk habits could help in optimizing resources with tailored intervention strategies. This study aims to identify and describe the different clusters of quadbike riders in Dubai.

Methods: Two-step cluster analysis helped identify clusters from incident reports of injured patients who availed Dubai Corporation for Ambulatory Services (DCAS)] between 2017 and 2021. The variables for cluster analysis were identified by Principal Component Analysis and ANOVA helped quantify the dissimilarities between the four clusters.

Results: Our study showed four risk clusters among quadbike riders in Dubai. They are grouped as Night collisions, Night rollover, Daytime mild rollover and Daytime severe rollover. Emirati riders of younger age groups were more likely to ride at night and get a severe injury due to collision and rollover. Non-nationals appear much older, more likely to stick to daytime driving and more likely to get mild skin abrasions due to rollovers.

Conclusion: Distinct injury mechanism in different demographic groups of quadbike riders help identify targeted interventions among rider groups. Younger nationals at risk of night collisions and rollovers would benefit from increased guardianship, vehicle modification and crowd control. Resources can be conserved among the mildly injured tourists and non-nationals through first aid posts at tour companies.

The acceptability of implementing an ongoing surveillance tool of behavioral risk factors for noncommunicable diseases in the Republic of Moldova

Elena Raevschii¹

¹Nicolae Testemitanu State University of Medicine and Pharmacy, Chişinău, Republic of Moldova

Background and Objective: Noncommunicable Diseases (NCDs) are a main challenge for health systems. Monitoring and evaluating modifiable behavioral risk factors are essential for managing NCDs. Deploying a risk factor management tool is essential to successfully address the crisis of NCDs in the Republic of Moldova. The study Objective was to evaluate the acceptability of implementing an ongoing risk factor surveillance tool which should enable timely collection and processing of detailed behavioral data to inform health decision makers and strengthen NCDs strategies.

Methods: We performed a cross-sectional landline telephone survey in the Republic of Moldova based on systematic random sampling of 800 adult respondents (aged 18-69 years) using the US Behavioral Risk Factors Surveillance System (BRFSS) Methodology. Four main calling-outcome measures were used to assess population acceptability: (1) interview completion rate; (2) cooperation rate; (3) refusal rate; and (4) resolution rate.

Results: Final disposition categories were assigned after all calling attempts were exhausted: 248 (31.0%) fully completed interview; 5 (0.6%) partially completed interview; 13 (1.6%) eligible respondent refusal; 222 (27.8%) no answer; 180 (22.5%) answering device, unknown whether eligible; 96 (12.0%) telecommunication barrier; 2 (0.3%) physical impairment; and 34 (4.2%) non-eligible participants. The calling-outcome rates based on final disposition codes were: (1) interview completion rate 95.1% (95% CI 91.8% to 97.1%); (2) interview cooperation rate 95.1% (95% CI 91.8% to 97.1%); (3) refusal rate 1.8% (95% CI 1.1% to 3.1%); and (4) resolution rate 37.5% (95% CI 34.2% to 40.9%).

Conclusions: High interview completion and cooperation rates, along with low refusal rates, indicate that adult Moldovans are likely to accept a landline telephone survey for the purpose of assessing behavioral risk factors. However, the low resolution rate indicates that response rates could increase significantly if alternate communication methods(e.g., mobile phones) were used.

Assessment of sterilization services in Mongolia from public health perspective

Oyun Chimeddamba¹, Bayan-Undur Dagvadorj^{2,3}, Batsaikhan Batsuuri⁴, Sarnai Erdene⁵

¹Global Leadership University, Mongolia, ²Urology and Andrology Centre, State Clinical First Hospital, Mongolia, ³Mongolian Surgeons' Association, Mongolia, ⁴Mongolian Surgeons Association, State Clinical First Hospital, Mongolia, ⁵Mongolian National University of Medical Sciences, Mongolia

Background: Sterilization services are the basis of all safe and affordable surgery—as well as infection prevention and control activities to prevent surgical site infections (SSIs), sepsis and other health care associated infections (HAIs). Sterilization quality improvement rarely included in public health programs. Therefore, we aimed to assess the current state of sterilization services as a first step of foundational importance to safe surgical care and infection prevention and control at primary and referral level in Mongolia. **Methods:** One national and 4 sub-national facilities were identified for the first sterilization assessment and planning in Mongolia using checklists of the WHO/WPRO guideline: Making Hospitals Safe: Sterilization Services. Data were collected in 6 key areas: sterilization environments, sterilization practices for cleaning and disinfection, inspection and packing, sterilization, sterilizer review and sterilization function tests and sterilization system supports and quality mechanisms.

Results: All sterilizers were functional and met temperature, pressure and time parameters. Wet packs at the end of the sterilizer cycle were noted in 17% of test packs observed. 52% cleaning and disinfection sinks observed met standards. 86% staff protection standards were met. 28% of inspection and function testing tasks were completed. Common gaps in inspection and function testing were instruments not all inspected separately, joints, serrations and crevices not all inspected for cleanliness (no magnifiers used). 26% packing standards were met. 52% sterilizer loading standards were met. 60% unloading standards were met. 88% of central sterilization rooms met wall, floor and work surface standards. **Conclusions:** Improving cleaning, inspection and packaging, sterilization, sterile storage, infection prevention and control measures and SOPs for sterilization processes to maximize outcomes with current resources is needed. Many can be addressed by practice changes that require little additional equipment or resources.

An epidemiological early warning system for COVID-19 dynamics

Bernhard Pfeifer^{1,2}, Werner Hackl³, Marco Schweitzer⁴, Patrick Raudaschl⁵, Bernhard Tilg⁶, Andreas Huber², Herbert Oberacher⁷, Harald Schennach⁸, Anita Siller⁸, Heinz Zoller⁹, Sabrina Neururer¹⁰

¹Division for Digital Medicine and Telehealth, UMIT Tirol - Private University for Health Sciences and Health Technology, Tyrol, Austria, ²Tyrolean Federal Institute for Integrated Care, Tirol Kliniken GmbH, Innsbruck, Austria, ³Division for Digital Medicine and Telehealth, Private University for Health Sciences and Health Technology (UMIT Tirol), Hall, Austria, ⁴Division for Digital Medicine and Telehealth, UMIT TIROL - Private University for Health Sciences and Health Technology, Hall (Tyrol), Austria, ⁵Division for Digital Medicine and Telehealth, UMIT TIROL, Private University for Health Sciences and Health Technology, Tyrol, Austria, ⁶(UMIT TIROL), Private University for Health Sciences and Health Technology, Tyrol, Austria, ⁷Institute of Legal Medicine and Core Facility Metabolomics, Medical University of Innsbruck, Innsbruck, Austria, ⁸Central Institute for Blood Transfusion and Immunology, Tirol Kliniken GmbH, Innsbruck, Austria, ⁹Department of Internal Medicine I, Medical University of Innsbruck, Innsbruck, Austria, ¹⁰Division for Digital Medicine and Telehealth, UMIT TIROL, Private University for Health Sciences and Health Technology, Hall (Tyrol), Austria and Tyrolean Federal Institute for Integrated Care, Tirol Kliniken GmbH, Innsbruck, Austria

Background and Objective: Infectious diseases as well as infectious disease control measures have a huge impact on healthcare, social life and economy. Therefore, measures have to be adopted in a very considerate manner. In order to support COVID-19 control management in the Austrian province Tyrol the Epidemiological Early Warning System (EEWS) was implemented and is presented in this abstract.

Methods: The EEWS of the Austrian province Tyrol is based on three pillars: (1) An agent-based simulation package named "survival" was developed. (2) Wastewater from all Tyrolean wastewater treatment plants is analyzed. (2) COVID-19 antibodies of healthy blood donors are determined.

Results: The Austrian province Tyrol implemented an EEWS in order to adopt control measures, such as social distancing, quarantines, curfews or lockdowns based on an accurate model. The model integrates parameters including number of known infections, number of vaccinations, circulating virus variants to provide a 10-day forecast of hospitalization rates (standard and intensive care) for Tyrol and South Tyrol. Additionally, the model is parametrized using information regarding the wastewater virus load and blood donor antibodies. The overall accuracy was about 1.5% average error. However, EEWS does not only simulate the dynamics of the COVID-19 pandemic on the federal state level, but also on the district and municipal level. Thus, disease control measures can be adopted exactly where needed instead of affecting the entire province.

Conclusions: The crisis team of the Austrian province of Tyrol uses the Tyrolean EEWS, which is a very accurate model. It supports decision-makers with a solid information base regarding the dynamics of the pandemic. In future, the EEWS can be used for various infectious diseases and thus be a basis for infectious disease monitoring.

Popul. Med. 2023;5(Supplement):A1920

DOI: 10.18332/popmed/165172

Ten years of surveillance of Surgical Site Infections (SSIs) in Piedmont: trends and burden for hip prosthesis and colon surgery

Alessandro Cornio¹, Costanza Vicentini¹, Valerio Bordino¹, Carla Zotti¹

¹Department of Public Health and Pediatric Sciences, University of Turin, Italy

Surveillance programs have proven effective in reducing rates of surgical site infections (SSIs). The aim of this study was to evaluate rates and trends of SSIs following hip arthroplasty (HPR) and colon surgery procedures (COLO) in Piedmont, a region in North-Western Italy, from 2010 to 2019. Further, we aimed to assess the burden of SSIs in terms of Disability-Adjusted Life-Years (DALYs). A prospective cohort study was conducted among 42 hospitals participating in the surveillance system. Procedure-specific SSI rates were calculated and 10-year trend was assessed using chi-squared test for trends, using Epi InfoTM. Patients were stratified according to age, sex and IRI index according to life expectancy in order to calculate DALYs, using a modified version of the ECDC's BCoDE toolkit: disease models for both surgeries were altered to incorporate long-term disability associated with SSIs. 20356 HPR and 11011 COLO procedures were monitored over 10 years, all of which were included in the analyses. HPR and COLO cumulative SSIs rates were 1.5% and 8% respectively. Chi-squared test showed a significant trend: 2019 patients undergoing HPR surgery is 17.7% less likely to contract SSIs than 2010 patients (OR: 0.823; p<0.001), whilst 2019 patients undergoing COLO surgery is 35.7% less likely to contract SSIs than 2010 patients (OR: 0.643; p<0.001). Regarding disease burden, a total of 955.3 (95%CI

837.7-1102.98) and 208.65 (95%CI 180.87-240.90) DALYs were calculated for SSIs following HPR, whilst 76.58 (95%CI 67.15-90.71) and 38.62 (95% CI 33.09-45.36) DALYs for SSIs in COLO, in 2010 and 2019, respectively. The significant decreasing trends found in this study support of the effectiveness of surveillance networks in reducing SSI rates and improving quality of care. Despite the smaller SSI rate, the burden associated with SSIs following HPR was higher, which is important to consider in light of the ageing population in Italy.

DOI: 10.18332/popmed/165182

Mycobacterium chimaera surveillance: lessons learned over 5 years of samplings

Michele Nicoletti¹, Giulia Tremolada¹, Vincenzo Baldo¹, Cristina Contessa²

¹Università degli Studi di Padova, Italy, ²Azienda Ospedale, Università di Padova, Italy

Background: Mycobacterium chimaera is a slow-growing non-tuberculous mycobacterium that is previously known to be able to colonize the heater-cooler units (HCUs). Over 120 human confirmed cases have been reported worldwide but the real magnitude seems to be critically underestimated

Methods: We provide the description and the results of a longitudinal surveillance for M. chimaera we adopted since the 6th of December 2016 and its going on to nowadays on 35 HCUs of different brands. On these devices we provided the routine disinfection as recommended by the manufacturer and, when we found a contamination in the periodical samples, we performed the deep disinfection or we sent the HCU to the home factory to provide it, as required by the manufacturer. **Results** In the period 01/01/2017-23/05/2022 we performed 1191 samplings on 35 HCUs, of which 16 were the 3T of LivaNova company (type 1), 2 were HCU40 and 17 were HU35 both of Maquet (type 2). Overall, 118 positivity to M. chimaera (10.3%) were identified, specifically 83 on HCU of the type 1 (21.6%) and 35 on the type 2 (4.6%). Respectively for type 1 and 2, we found positive 41.4% and 2.9% of the tests performed in pre-disinfection samples and 15.9% and 6.3% in post disinfection.

Conclusions: We ask engineers to work on new solutions to produce a new generation of heater-cooler units to simplify the cleaning and disinfection procedures, to reduce the patient risks and to increase the efficiency of cryosurgery. We suggest identifying water-free technologies that can be sanitized with enzymatic detergent in order to reduce the amount of toxic components used in the routine and deep-disinfection procedures. In any case, the "zero risk" is an impossible achievement but a detailed bio-surveillance system must be adopted for a rapid identification of rare events.

Popul. Med. 2023;5(Supplement):A1922

DOI: 10.18332/popmed/165206

Surgical site infections during and after the pandemic: a retrospective cohort study on outcomes after abdominal surgery in Italy

Heba Elhadidy¹, Costanza Vicentini¹, Giovanni Paladini¹, Elettra Uglicione², Alessandro Cornio¹, Carla Zotti¹

¹Department of Public Health, University of Turin, Italy, ²Department of Surgical Sciences, University of Turin, Italy

Background and Objective: COVID-19 pandemic led to major disruptions in surgical activity in 2020, with the exception of oncological and urgent procedures. Then, starting from 2021 there was a progressive return to routine. The Italian National Surgical Site Infection Surveillance (SNICH) continued. Therefore, the aim of this study was to assess the impact of the pandemic on abdominal surgery outcomes in Piedmont, a region in northern Italy. **Methods:** Data on abdominal surgery, divided into oncological and non-oncological procedures, were collected from 42 hospitals participating in the regional surveillance network from 2018 to 2021. Predicted surgical site infection (SSI) rates for 2020 and 2021 were estimated on pre-pandemic (2018-2019) data and compared with the observed rates, using Mantel-Haenszel corrected chi-squared tests. The expected SSI rates were predicted on the basis of pre-pandemic data stratified by Infection Risk Index (IRI). To avoid competing risk bias, patients deceased within the 30-day follow-up period were excluded. Analyses were performed using Epi Info V7.2.

Results: In the pre-pandemic period 5268 procedures and 307 SSIs were recorded. In 2020 there were 1031 interventions and 44 SSIs, while in 2021 there were 1490 interventions and 112 SSIs. In 2020, the observed SSI rate for oncological procedures (6.07) was significantly lower (p<0.001) than the expected (7.33). However, in 2021 the observed SSI rate for non-oncological procedures (7.86) was significantly higher (p=0.03) than the expected (5.13). The other results did not reach statistical significance. **Conclusions:** The lower SSI rate for oncological procedures during the pandemic (2020) may highlight an increased attention to

infection prevention and control practices. On the other hand, it seems that the delay in the interventions affected the risk of SSI after the pandemic peak (2021), but only for procedures that have actually been delayed such as non-oncological ones.

Prevalence of healthcare-associated infections and antimicrobial use in Italian long-term care facilities: results from a national cross-sectional study (2022)

Antonino Russotto¹, Costanza Vicentini¹, Stefano Bazzolo², Edoardo Rolfini¹, Valentina Blengini¹, Dario Gamba¹, Antonella Agodi³, Martina Barchitta³, Stefania Bellio⁴, Elisa Fabbri⁵, Silvia Forni⁶, Enrico Ricchizzi⁵, Giancarlo Ripabelli⁷, Camilla Sticchi⁸, Fortunato D'Ancona⁹, Carla Zotti¹

¹Department of Public Health, University of Turin, Italy, ²Department of Environment, Land and Infrastructure Engineering (DIATI), Politecnico of Turin, Italy, ³Department of Medical and Surgical Sciences and Advanced Technologies "GF Ingrassia", University of Catania, Italy, ⁴Azienda Zero, Veneto Region, Italy, ⁵Agenzia sanitaria e sociale regionale Emilia-Romagna, Emilia-Romagna Region, Italy, ⁶Agenzia Regionale di Sanità della Regione Toscana, Toscana Region, Italy, ⁷Department of Medicine and Health Sciences Vincenzo Tiberio, University of Molise, Italy, ⁸A.Li.Sa, Liguria Region, Italy, ⁹Italian National Institute of Health, Ministry of Health, Italy
 Background and Objective: Healthcare-associated infections (HAIs) have a significant burden, particularly in long-term care facilities (LTCFs). Moreover, LTCFs were disproportionately affected by the COVID-19 pandemic. In preparation for the 2023 European Centre for Disease Prevention and Control (ECDC) "Point prevalence survey (PPS) of HAIs and antimicrobial use (AMU) in European long-term care facilities" (HALT), the Italian national coordinating team conducted a pilot PPS, with the Objective of establishing a regional surveillance network and assess the potential COVID-19 pandemic impact on HAIs.

Methods: A PPS was conducted between May-June 2022. The protocol of this study is an updated version of the ECDC HALT-3. Seven Italian regions participated voluntarily enrolling a minimum of two LTCFs with at least 50 residents each, using convenience sampling. Data were collected in a single day in each LTCF, at the LTCF, ward, and resident levels. Resident data were collected for each resident with a HAI and/or AMU on the survey day. HAI and AMU prevalence were calculated as the mean number of residents with at least one HAI and/or AMU divided by the total number of eligible residents. Spearman's correlational analysis was conducted between LTCF-level HAI and AMU prevalence.

Results: 15 LTCFs with 1025 residents were included in the survey. HAI prevalence was 2.54% (95% CI 1.66%-3.69%) considering all HAIs and 1.56% (95% CI 0.89%-2.52%) not considering SARS-CoV-2 infections. The most frequent HAI was COVID-19 (30.3%). AMU prevalence was 3.02% (95% CI 0.21%-4.27%). The most prescribed agent was Ceftriaxone (48.4%). A positive correlation was found between LTCF-level HAI and AMU prevalence (Spearman's ρ 0.395, p 0.0253).

Conclusions: A national surveillance network was established. HAI prevalence was around one-third compared to 2017 Italian data, suggesting infection control activities could have improved following COVID-19 pandemic. Results will be useful to inform the 2023 ECDC HALT survey.

Healthy Finland survey as the latest uptake for 50 years' of population health monitoring in Finland

Annamari Lundqvist¹, Hanna Tolonen¹, Healthy Group²

¹Finnish Institute for Health and Welfare (THL), Finland, ²National Institute for Health and Welfare (THL), Finland

Background and Objective: Up-to-date, representative, and high-quality health information is needed to support evidence-informed policy making and innovative research. In Finland, population-based health examination surveys (HESs) have been conducted in regular phase since early 1960's to obtain information on population health and health determinants. This information has been widely used for policy making, planning of prevention programmes and evaluation of the prevention programmes, as epidemiological Background: for clinical treatment guidelines of several diseases, and for research.

Methods: The latest HES called Healthy Finland is ongoing and will run until June 2023. Survey planning was started already in early 2021 with a multidisciplinary group including representatives from different stakeholders. The Finnish Institute for Health and Welfare (THL) had the responsibility of the coordination of the preparation phase as well as conducting the survey.

Results: Survey sample includes 66.000 randomly selected adults aged 18+ years

living in Finland. In the 1st phase, they all receive a questionnaire to be filled in. Questionnaire covers topics such as quality of life, health, use of health care services, lifestyles, background information, work ability and functional capacity, wellbeing, accidents, and sexual and reproductive health. In the 2nd phase, 10.000 of those selected to the survey will be invited to health examination including for example anthropometric measurements, blood pressure, spirometry test, collection of biological samples and for a sub-sample, a dental examination. Information from national registries (e.g. socioeconomic status, use of medications and diagnosis) will be linked to the data.

Conclusions: Information obtained from the Healthy Finland survey will be used for the evaluation of wellbeing service counties which are responsible for the organization of social and health care services in Finland. Survey will generate new information about health inequalities by providing information not only by age and sex but also by education and other socio-economic indicators.

Integrated surveillance of foodborne diseases: the organization of the Piemonte region (Italy)

Sofia Filippetti¹, Silvia Bonetta², Cristina Pignata¹, Teresa Zaccaria³, Alessandro Bondi³, Silvia Marro⁴, Giuseppe Sattano⁴, Bartolomeo Griglio⁵, Elisabetta Carraro¹

¹Department of Public Health and Pediatrics, University of Turin, Turin, Italy,

²Department of Life Sciences and Systems Biology, University of Turin, Turin, Italy, ³Microbiology Unit, University Hospital Città della Salute e della Scienza, Turin, Italy, ⁴Local Health Unit ASL TO5 - Ce.I.R.S.A., Turin, Italy,

⁵Prevention, Veterinary Public Health and Food Safety Department, Public Health & Welfare Directorate, Piedmont Region, Italy

Foodborne Diseases (FDs) are a complex and relevant problem for global Public Health. World Health Organization highlighted the importance of FDs surveillance as a crucial instrument to guarantee health and food safety. Against this background European Union made investigation and reporting of foodborne outbreaks mandatory with Directive 2003/99/EC, which was transposed in Italy by D.Lgs n.191/2006. The "Surveillance system of foodborne disease" of Piemonte Region, active since 2002, through the years has been integrated with a One Health perspective. Nowadays, this surveillance system is based on the integrated analysis of information periodically collected from several institutions: FDs cases or outbreaks notifications from Hospitals and Local Health Services; alerts from general practitioners and private citizens; Results of analyses and serotyping of food samples (by Experimental Zooprophyllactic Institute) and human biological specimens reported by the laboratory active surveillance. This surveillance system allows to monitor in Piemonte FDs' outbreaks and single cases, as well as the pathogens circulating in the population. As observed in Europe, the data collected in 20 years show that the causative agents more common in Piemonte are *Campylobacter* spp. and *Salmonella* spp., and the most frequent risk factor is the consumption of raw or not properly preserved food. The main critical concerns of this surveillance system included some management difficulties, sometimes the lack of detection timeliness and the under-notification of FDs by the epidemiologic surveillance highlighted by the laboratory active surveillance. The Surveillance system of FDs in Piemonte is an important tool for monitoring, evaluating and reporting this challenging issue. To solve critical aspects of this system and enhance its effectiveness, all the participant institutions are currently cooperating for implementation measures. Indeed, thanks to cross-sectorial collaboration, it is possible to have an all-embracing perspective, fundamental for the prevention and improvement of public health and useful for policy makers.

EASY-NET program: methods and preliminary results of an audit and feedback intervention in the emergency care for Acute Myocardial Infarction in the Lazio region, Italy

Anna Acampora¹, Laura Angelici², Carmen Angioletti^{1,3}, Egidio Mattia⁴, Luigi Pinnarelli⁵, Paola Colais⁵, Marina Davoli², Nera Agabiti²

¹Department of Epidemiology, Regional Health Service of the Lazio Region, Rome, Italy, ²Department of Epidemiology, Regional Health Service, Rome, Italy, ³UOC Percorsi e Valutazione Outcome Clinici - Fondazione Policlinico Universitario A. Gemelli-IRCCS, Rome, Italy, ⁴UOC Percorsi e Valutazione Outcome Clinici, Fondazione Policlinico Universitario A. Gemelli-IRCCS, Rome, Italy, ⁵Department of Epidemiology, Regional Health Service - Lazio, Rome, Italy

Background and Objective: Within the EASY-NET Network Programme (NET-2016-02364191) Effectiveness of Audit and Feedback strategies to improve healthcare

practice and equity in various clinical and organisational settings, Work Package 1 (WP1-Lazio) compares the effectiveness between a more intensive A&F strategy and the periodic publication of indicators alone in improving the appropriateness and timeliness of emergency health interventions for acute myocardial infarction (AMI). This work describes the new A&F Methodology and presents the Results of the first feedback delivered.

Methods: The intervention involves sending periodic reports via e-mail to participating hospitals. The feedback includes a set of volume, process and outcome indicators calculated through the Health Information System of the Lazio Region. Indicators are calculated by facility and compared with regional mean, standard values and values calculated for hospitals with similar volumes of activity. Feedback recipients are invited to organize clinical and organizational audit meetings aimed to identify possible critical indicators and define, where necessary, improvement actions.

Results: The results presented are included in the first report (2021) delivered in September 2022. A total of 16 facilities of the Lazio region participate to the project for the AMI pathway evaluation. Twelve facilities present high volumes in all volume indicators, while 3 facilities present low volumes for each indicator presented. Concerning the quality indicators, 4 facilities do not present critical indicators or average Results, 3 facilities do not present critical indicators but average Results in at least one of the indicators, 6 facilities present for at least one of the indicators a critical value.

Conclusions: The first report highlighted some critical issues in some facilities on several indicators. During the clinical-organizational audit meetings, each facility will analyse these issues defining appropriate improvement actions. The outcome of these actions will be monitored through subsequent reporting to support the continuous care quality improvement process.

Point prevalence survey of healthcare associated infections in acute-care hospitals: a validation study in Italy, 2022

Roberta Bussolino¹, Roberta Bussolino¹, Heba Elhadidy¹, Elisabeth Marino², Paola Toselli², Cesare Bolla², Costanza Vicentini¹, Carla Zotti¹

¹Department of Public Health and Pediatrics, University of Turin, Italy, ²Unit of Infectious Diseases, ASO SS. Antonio e Biagio e Cesare Arrigo, Italy

Background and Objective: Italy has been participating since 2011 in European point prevalence surveys (PPS) of health-care associated infections (HAI) and antimicrobial use in acute-care hospitals, which are promoted by the European Centre for Disease Prevention and Control (ECDC) every five years. Growing evidence suggest the COVID-19 pandemic has increased awareness towards infectious diseases, and has led to improvements in infection prevention and control (IPC) practices. In this study, we investigated whether there was an improvement in terms of accuracy in recognizing HAIs comparing results of the current PPS (2022) with the previous PPS (2017) in Italy.

Methods: The third Italian PPS was conducted in November 2022, applying ECDC definitions for HAIs and using the PPS protocol v.6.1. A validation survey was conducted in a hospital part of the representative sample. The study involved 50 patients belonging to geriatric, oncology, and psychiatry wards. Data for the validation study were collected during the same day as the primary PPS by an external validation team not involved in primary data collection, which was performed by hospital staff.

Results: Both the primary and validation surveys identified the same 9 patients with at least an HAI, therefore sensitivity and specificity were 100%, which was an improvement compared to the previous PPS (sensitivity 80.6%, specificity 98.7%). HAI prevalence among included wards was 18% (95% confidence interval, CI 8.58-31.44). Excluding HAIs caused by SARS-CoV-2, a prevalence of 10% (95% CI 3.33-21.81) was measured.

Conclusions: Results of this study suggest that there has in fact been an improvement in HAI detection accuracy, which could be due to staff being more aware of HAIs. However, not considering SARS-CoV-2 infections, the prevalence of HAIs in included wards was higher than the mean prevalence measured in the previous PPS.

Digital platform for surveillance of COVID-19 in primary health care services in Brazil

Inês Dourado¹, Carlos Santos^{2,3}, Fabiane Soares¹, Valdiléa Veloso^{4,5}, Nathalia Suzart¹, Osiyallê Rodrigues¹, Suelen Seixas¹, Thais Aranha-Rossi⁶, Laio Magno⁶

¹Instituto de Saúde Coletiva, Universidade Federal da Bahia, Brazil, ²Instituto

de Saúde Coletiva, Brazil, ³Universidade Federal da Bahia, Brazil, ⁴Fiocruz, ⁵Instituto Nacional de Infectologia, Brazil, ⁶Departamento de Ciências da Vida, Universidade do Estado da Bahia, Brazil

Background and Objective: To describe a digital platform to support the epidemiological surveillance of COVID-19 (C19) in primary health care (PHC) services, in two large Brazilian capitals.

Methods: The study "Expansion of testing, quarantine, e-health and telemonitoring strategies to fight against the C19 pandemic in Brazil (TQT-C19 Study)", developed in the 1st semester of 2022 a digital platform based on epidemiological surveillance actions, normative from international organizations and Brazilian organizations, to be incorporated into the Brazilian National Health System. The design of the platforms scope and tests were carried out with the participation of researchers, health professionals, managers, and the information technology team.

Results: The digital platform has been used by PHC clients, health professionals, and managers of health units and the central level to support C19 epidemiological surveillance in the PHC territory. The platform provides information management and access levels according to the users registered profile. This tool was created with a global model and can be used by other PHC services across the country, as well as for other diseases such as Zika, influenza, dengue, monkeypox, etc. It is divided into modules: a panel of indicators for epidemiological surveillance and real-time mapping of the situation in the territory; electronic medical record with test results, telemonitoring, and contact tracing; communication, providing reliable information; and logistics for controlling the stock and receipt of samples.

Conclusions: The development of the digital platform is focused on the testing needs of C19 in the PHC, jointly defined by the researchers and professionals from the municipal health departments. In this way, the TQT-C19 platform could be another instrument in the response of C19 in PHC services, as well as in health surveillance and management. With adaptations of other protocols and the development of specific modules, the system can be a legacy for other diseases.

Social support and medication compliance among myasthenia gravis patients in China: mediating role of mental health and self-efficacy

Jiazhou Yu¹, Huanyu Zhang², Zhilan Fang¹, Richard Xu³, Liling Zhu⁴, Dong Dong⁴

¹The Chinese University of Hong Kong, Hong Kong, China, ²Shenzhen Research Institute, The Chinese University of Hong Kong, China, ³The Hong Kong Polytechnic University, Hong Kong, ⁴The Chinese University of Hong Kong, Hong Kong

Background and Objectives: Myasthenia gravis (MG), a rare chronic neuromuscular disorder, is characterized by progressive physical decline and requires long-term pharmacological treatment. Due to the decline of physical and social abilities, MG patients are in great need of social support, including tangible and emotional support. This study aims to examine the association between social support and medication compliance and the possible mediating effects of mental distress and self-efficacy among MG patients. **Methods:** A cross-sectional analysis of a nationwide MG registry was conducted on 865 patients under oral medication treatment in China between June and July 2022. Validated scales were used to measure the respondent's mental distress (Four-item Patient Health Questionnaire), social support (Modified Medical Outcomes Study Social Support Scale), self-efficacy for medication use (Self-efficacy for Appropriate Medication Use Scale), and medication compliance (Morisky Medication Adherence Scale, MMAS). The association between social support and medication compliance and possible mediating effects of mental health and self-efficacy were tested by structural equation model (SEM), with significant demographic and disease-related factors adjusted.

Results: The respondents showed a very low level of medication compliance (71.2% poor compliance; 1.4% high compliance; mean MMAS=4.65). SEM showed that the association between social support and medication compliance was fully mediated by two indirect paths, including through self-efficacy ($p<0.05$, proportion mediated=63.8%) and through mental distress and then self-efficacy ($p<0.05$, proportion mediated=6.7%). Self-efficacy may be an essential variable in explaining the relationship between social support and medication compliance. Patients with higher levels of social support may demonstrate better mental health and higher self-efficacy for medication use, which may be a driver of higher medication compliance. **Conclusions:** It is imperative to improve medication compliance among MG patients. In addition to meeting the need of social support, assessment of and interventions on self-efficacy for medication use and mental health may facilitate improvement in medication compliance.

Change in quality of life in adults with late-onset Pompe disease receiving under-dose of enzyme replacement therapy in a nationwide registry: a retrospective matched cohort study from China

Huanyu Zhang¹, Shanquan Chen², Richard Xu³, Jiazhou Yu⁴, Dong Dong⁴¹Shenzhen Research Institute, The Chinese University of Hong Kong, China, ²London School of Hygiene and Tropical Medicine, United Kingdom, ³The Hong Kong Polytechnic University, Hong Kong, China, ⁴The Chinese University of Hong Kong, Hong Kong, China

Background & objective Pompe disease is a rare inherited neuromuscular disorder. Due to the high cost of enzyme replacement therapy (ERT), most of adults with late-onset Pompe disease (LOPD) who received ERT used the medication with insufficient doses in China. This study aimed to compare the change in quality of life (QoL) between adults with LOPD receiving under-dose ERT and no ERT.

Methods A retrospective matched cohort study was conducted among adult patients with LOPD in a nationwide Pompe registry in China. Patients who were not using ERT at baseline and before were included. The case group were those who received under-dose ERT during the 14-month follow-up; the control group were those who received general care. Under-dose ERT was judged by the ratio of actual vitals patients used divided by the indicated vitals patients should use (<80%). Case and control patients were matched with a ratio of 1:2 based on age, sex, dependence on devices, and geographic location. QoL was assessed by the SF-12 and EQ-5D-5L.

Results Eleven cases with under-dose ERT and 22 controls without ERT were included. In paired sample analyses, patients with under-dose ERT had a significant improvement in an overall measure of health status, i.e. EQ-5D VAS (38.7 vs. 62.8, $p=0.018$). Using the changes of QoL scores between baseline and follow-up as outcomes, the multiple linear regression analyses indicated that under-dose ERT was not significantly associated with change in SF-12 physical or mental component score, and EQ-5D index score compared with the control group ($p>0.05$), while it was positively associated with change in EQ-5D VAS ($\beta=20.55$, $p=0.020$).

Conclusion Under-dose ERT significantly improved the overall health state among users, however, this improvement was not captured by the sub-dimension measure on physical or mental QoL. A Pompe disease-specific QoL tool is needed to better monitor change in QoL.

Assessment of the regional healthcare services' resilience during the COVID-19 pandemic: the Italian model

Marica Iommi¹, Federico Rea², Flavia Carle^{3,4}, Giovanni Corrao², Alessandra Allotta^{5,6}, Salvatore Scondotto^{5,6}, Adele Lallo⁷, Mirko Martino⁷, Marco Pompili⁸, Simona Carbone⁹, Cristina Giordani⁹¹Center of Epidemiology, Biostatistics and Medical Information Technology, Università Politecnica delle Marche, Italy, ²Department of Statistics and Quantitative Methods, University of Milano-Bicocca, Italy, ³Center of Epidemiology, Biostatistics and Medical Information Technology, Italy, ⁴Department of Biomedical Sciences and Public Health, Università Politecnica delle Marche, Italy, ⁵Department of Health Activities and Epidemiological Observatory, Italy, ⁶Regional Health Authority, Sicily Region, Italy, ⁷Department of Epidemiology, Lazio Regional Health Service, Italy, ⁸Regional Health Agency of Marche, Italy, ⁹Department of Health Planning, Italian Health Ministry, Italy

Background and Objective: The Italian Ministry of Health monitors the regional healthcare provided to citizens through annual indicators. The COVID-19 pandemic forced healthcare services to change to manage SARS-CoV-2 infections. A "dedicated system" is needed to monitor the healthcare provided by regions in 2020. The aim of the study is to experiment the "dedicated system" in three regions (R1, R2, R3).

Methods: Two process indicators were evaluated: PDTA-06.1 (% of new women operated for breast cancer with a mammography within 60 days prior to surgery), and PDTA-AMI (% of hospitalized subjects with an Acute Myocardial Infarction-STEMI diagnosis treated with PTCA within 2 days). For both indicators, the 2020 and 2017-2019 cohorts were identified through healthcare utilization databases and matched using propensity score. Four COVID-19 periods were compared: pre-pandemic (P1: January 1-February 19), first wave (P2: February 20-May 3), restrictions easing (P3: May 4-September 30), second wave (P4: October 1-December 31). The effect of the cohort (2020 vs. 2017-2020), periods (P1 vs. P2, P3, P4), and their interaction were estimated using multiple Cox (PDTA-

06.1) and logistic (PDTA-AMI) models. Hazard ratios (HR) and 95% Confidence Interval (95%CI) were reported. Results PDTA-06.1: The interaction term shows that in 2020 the timeliness of breast cancer surgery decreases as P2 exposure time increases (R1: HR=0.67, 95% CI 0.58-0.77), while it increases as P3 (R1: HR=1.52, 95%CI 1.36-1.70; R2: HR=1.76, 95%CI 1.18-2.64) and P4 exposure time (R2: HR=1.69, 95%CI 1.04-2.75) increases. PDTA-AMI: The probability of timely receiving PTCA treatment during 2020 periods did not change in any region.

Conclusions: The reduction in timeliness observed during the first wave was subsequently regained (PDTA-06.1), demonstrating the health service's resilience. The acute treatment (PDTA-AMI) was ensured as in previous years. The "dedicated system" is a useful tool to analyse the impact of the pandemic on healthcare service.

DOI: 10.18332/popmed/165734

Impacts to health equity from changes in ontario, Canada's regulation of alcohol, cannabis, and vaping product sales

Jason Gilliland¹, Alexander Wray¹, Shiran Zhong¹, Gina Martin², Jamie Seabrook³¹Western University Canada, ²Athabasca University Canada, ³Brescia University College Canada

Background: Changing government regulations in Ontario, Canada over the past two years have altered the accessibility to controlled substances like alcohol, cannabis, and vape liquids. In January 2020, the province banned exterior vaping-related advertising from all retailers, causing some retailers to discontinue their license. In March 2020, the province made changes to liquor license regulations allowing restaurants to sell sealed beer, wine, and mixed spirits for takeout and delivery. Additionally, over the past two years the number of licensed cannabis retail outlets has exponentially increased in the province. What are the health-equity implications from these changes to the retail landscape in accessing controlled substances?

Methods: Alcohol, cannabis, and vape retailers were mapped from January 2020 to January 2022, and changes were evaluated using a spatial accessibility model in a geographic information system. This change is evaluated at the dissemination area scale based on the sociodemographic characteristics of these areas, with a health equity lens.

Results: At the dissemination area scale, access to alcohol and cannabis has increased, while access to vape products has decreased. Socio-demographic characteristics such as visible minority status, household income, and education level of the most vulnerable dissemination areas provide insights into health equity implications from these changes.

Conclusion: The changes observed in accessibility to alcohol, cannabis, and vape retailers indicate a broad societal shift in access to controlled substances. Comprehensive representative population-level survey data is needed to evaluate if consumption patterns and related health outcomes have changed in relation to the observed changes in spatial accessibility to these substances. These changes are an emerging policy, practice, and research issue that requires more monitoring to inform potential interventions.

Popul. Med. 2023;5(Supplement):A1933

DOI: 10.18332/popmed/163639

Elective surgery in the time of COVID-19: a lesson learnt

Marzia Marcelli¹, Massimiliano Angelucci², Luca Provvidenti², Giacinto Di Gianfilippo², Alessandra Ferretti², Antonella Morgante², Marinella D'Innocenzo², Anna Petti², Assunta De Luca²¹ASL Rieti / Università degli studi dell'Aquila (scuola di specializzazione in Igiene e Medicina Preventiva), Italy, ²ASL Rieti, Italy

Background and Objective: The COVID-19 pandemic has placed a significant strain on the Italian healthcare system, in terms of backlogs and deferred elective surgery. The Rieti Hospital (Italy) intends to report how the use of Health Technology Assessments helped to address the problem.

Methods: On the basis of analysis conducted, a possibility emerged of placing elective surgeries with the highest priority classes (A and B) and skin-to-skin time < 60 minutes in Emergency Operating Room (EOR), occupying up to a maximum of 50% of the available time.

The executable procedures identified were:

Urology: trans-urethral bladder resection, trans-urethral prostatic resection, urethral stent, nephrostomy; Vascular surgery: carotid stent; Breast Surgery: quadrantectomy, biopsies; General Surgery: inguinal and umbilical hernioplasty, cholecystectomies; Orthopaedics: removal of means of synthesis; Otolaryngology: micro-laryngoscopy, turbinoplasty, septoplasty.

The interventions identified were carried out exclusively by professionals selected

on the basis of their performances in 2018 and 2019.

In case of concomitant urgency, the activation of the second EOR was scheduled, in order to guarantee urgent surgical treatments in the required time.

Results: Despite a reduction in the hours of availability of the EORs (from 144 hours in 2019 to 72 hours in 2020 and 96 hours in 2021), the number of surgeries switched from 4811 in 2019 to 3879 in 2020 and 4342 in 2021, thus increasing the index obtained by comparing the number of interventions on the hours of availability of the EOR.

Conclusion: The rational use of the EOR contained the reduction of interventions determined by the trend of the SARS-CoV-2 pandemic, guaranteeing the execution of class A and B interventions within the times required by the legislation.

DOI: 10.18332/popmed/163660

Impact of a benchmarking and feedback intervention on surgical site infections following hip arthroplasty and colon surgery procedures: an interrupted time series analysis

Federico Cusotto¹, Alessandro Cornio¹, Heba Elhadidy¹, Giovanni Paladini¹, Costanza Vicentini¹, Carla Zotti¹

¹Department of Public Health and Pediatrics University of Turin "Via Santena 5 bis 10126 Torino" Italy

Background and Objective: Surgical site infections (SSIs) are monitored in Piedmont, a Northern Italian region, through a surveillance system based on a European Centre for Disease Prevention and Control protocol. A benchmarking and feedback intervention was implemented in 2019: each participating hospital received a yearly report summarizing local data in comparison to the regional benchmark, which was based on cumulative 5-year data, stratified by procedure type. Our aim was to evaluate the effect of the intervention on SSI rates.

Methods: We included data collected from 42 hospitals on procedures monitored from 2017 to 2021, classified according to National Healthcare Safety Network (NHSN) categories. The two most frequently monitored categories were considered: colon surgery (COLO) and hip arthroplasty (HPRO). Procedures were stratified into 2 groups by their Infection Risk Index (IRI, calculated according to NHSN methodology). Monthly SSI ratios were calculated, by pooling data according to procedure month. Segmented regression of an interrupted time series was modeled to assess the intervention's impact. Significance level was set at $p < 0.05$.

Results: We analysed 3962 low-IRI COLO procedures (2751 preintervention, 1211 post), 1995 high-IRI COLO procedures (1413 pre, 582 post) and 12686 low-IRI HPRO procedures (8081 pre, 4605 post); insufficient data was available in the high-IRI HPRO group due to the low number of cases. In all groups we identified a downward level change at the breakpoint and a subsequent upward change in trend; no result reached statistical significance. The largest effects were detected in the high-IRI COLO group: -11% in level ($p = 0.094$, $SE = 6.4\%$) and +0.29%/month in trend ($p = 0.054$, $SE = 0.15\%/month$).

Conclusions: Our analysis suggests that the intervention could be effective in decreasing SSI rates, particularly in the high-IRI COLO group, however further efforts should be targeted towards maintaining results. In particular, further attention should be aimed towards ensuring feedback reaches surgical and nursing staff.

DOI: 10.18332/popmed/163672

Acute respiratory virus emergency department admissions in a tertiary care hospital in Central Italy and the relative impact on bed occupancy, January 2017-May 2022

Francesca Di Serafino¹, Nunzio Zotti¹, Luca Carmisciano², Elena Lucaccini³, Giulia Gemignani³, Francesca Foltran³, Matteo Filippi³, Angelo Baggiani¹, Andrea Porretta¹, Laura Baglietto², Michele Cristofano³, Caterina Rizzo¹

¹Department of Translational Research and New Technologies in Medicine and Surgery, University of Pisa, Pisa, Italy, ²Department of Clinical and Experimental Medicine, University of Pisa, Pisa, Italy, ³Azienda Ospedaliero-Universitaria Pisana Italy

Background and Objective: Acute Respiratory Infections (ARIs) have a relevant impact on public health in terms of prevalence and costs associated with the diseases. This concern highlighted the need to adopt accurate surveillance systems to respond to new emergencies and meet the demand for access to care. The objective of our work is to set up, at the Azienda Ospedaliero-Universitaria Pisana (AOUP), an automated syndromic surveillance for ARI.

Methods: The trend of the AOUP Emergency Department (ED) accesses from January 2017 to May 2022 was analyzed, using ICD9-CM disease codes that define syndromes associated with ARI (except SARS-CoV-2 infection codes). The data

obtained were analysed by week and by 6 age groups, as well as by outcome type, with a focus on inpatient ward admissions to define the impact on bed occupancy. Results: During the period, ARI admissions were 33,101 (annual average 5,520), resulting in 7,426 admissions (22.8%, annual average 1,163). A seasonal pattern is observed between week 42 of each year and the week 17 of the following year, that represent the winter season period. The reduction in ED accesses from week 10-2020 (from a weekly average of 144.3 to 78.2) is due to the and the public health measures implemented for the emergence of the COVID19 pandemic. Nevertheless, the average weekly admission rate was 30.8%, compared with 21.7% in 2017-2019. Analysis by age group showed a peak of accesses in the last weeks of 2021 for the <1 and 1-4 years old age group considered.

CONCLUSIONS: Data on ARI admissions provide useful information to direct health policies to identify indicators of next epidemic waves. By this way, we can act early in terms of emergency preparedness and response, preventing overloading of health facilities and ensuring the most appropriate and targeted access to care for the entire population.

Background: Respiratory syncytial virus (RSV) is the main cause of hospitalization for acute respiratory infection (ARI; WHO case definition) in children under 5 years and the third viral cause of hospital admission in over 65.

The main objective of this study is to evaluate the burden of RSV-related disease in the primary care setting, to support future prevention strategies. Secondary objectives are 1) to describe the epidemiological trend of ARIs, 2) to identify the predictive parameters of the clinical presentation severity, complications, socio-economic and healthcare impact.

Methods: As part of the RSVComNet project, in 2019/20 and 2021/22 winter seasons, in Lazio, Puglia, Liguria and Lombardia regions (representing 40% of the Italian population), children under 5 years with ARI were enrolled and subjected to a nasopharyngeal swab for the differential diagnosis of the main respiratory infectious agents. Parents of RSV-positive children completed a 14-day and 30-day follow-up questionnaire. In 2022/23, Tuscany will also participate in the study, also enrolling adults over 65.

RESULTS: In 2019/20 and 2021/22, 493 children were diagnosed with ARI and 187 (37.9%) were positive for RSV. The median disease duration was 9.5 days (IQR 7-14), with a median of 1 extra visit by their pediatrician (IQR: 1-2). 12 children (6.6%) were hospitalized (10 <1 years old) with a median stay of 5.5 days (IQR: 3-7). 176/183 (96.2%) received a drug prescription and 74 (42.1%) an antibiotic. RSV type B and the region of residence were significant predictors for increased healthcare utilization. Children with dyspnea had a significantly higher risk (30%) of a longer duration of illness. The 2022/23 results will be available in May 2023.

CONCLUSIONS: The study highlights the importance of monitoring ARI cases in primary care, to implement prevention strategies and allow the reduction of the disease burden at a primary care and hospital level.

Food price trends during COVID-19 pandemic in Brazil

Giovanna Andrade¹, Thais Caldeira², Laís Amaral Mais³, Ana Martins¹, Rafael Claro²

¹Center for Epidemiological Research in Nutrition and Health, University of São Paulo (USP), Brazil, ²Surveillance and Monitoring in Nutrition and Health Laboratory, Nutrition Department, Federal University of Minas Gerais (UFMG), Brazil, ³Brazilian Institute for Consumer Defense (Idec), Brazil

The present study aims to analyze the trends in food price in Brazil in the recent past, with an emphasis on the period of the COVID-19 pandemic (2020 and March

2022) and to project price scenarios until 2025. To analyze trends in food price data from the Household Budget Survey and from the National System of Consumer Price Indexes were used to create a novel data set containing monthly prices (R\$/kg) for the foods and beverages most consumed in the country between January 2018 and March 2022. The 95 foods or beverages items included in the present study were divided according to the NOVA food classification into 4 groups: Unprocessed or minimally processed foods, Processed culinary ingredients, Processed foods, and Ultra-processed food. The mean price of each group and subgroup were estimated for each year of study and for the entire period. The monthly price of each group was then plotted to analyze changes in prices for the period from 2018 to 2022. Fractional polynomial models were used to synthesize price changes up to 2025. Results of the present study show that in Brazil unprocessed or minimally processed foods and processed culinary ingredients were less expensive than processed and ultra-processed foods. However, the analyses suggest the reversal of this price pattern. This change in the price trends initially predicted for Brazil seems to reflect the impact of the COVID-19 pandemic on the global economy. These results are worrying because the increase in the price of health foods exacerbates the food insecurity in Brazil. Additionally, this trend encourages even further the replacement of traditional meals for the consumption of unhealthy foods, increasing a health risk to the population.

Feasibility and validity of a semi-automated system for the surveillance of surgical site infections in an Italian acute healthcare setting

Alessandro Catalini^{1,2}, Alberto Masiero^{1,2}, Giorgia Acquaviva^{1,2}, Vincenzo Montagna^{1,2}, Francesca Diotallevi^{1,2}, Pamela Barbadoro^{1,2}

¹Università Politecnica delle Marche, Ancona, Italy, ²Department of Biomedical Sciences and Public Health, Università Politecnica delle Marche, Ancona, Italy

Background and Objective: Surveillance of surgical site infections (SSIs) is an essential component of infection prevention and control activities. The standard method is manual review of medical records, although time-consuming and requiring relevant resources. Technological progress allows the use of standardized, semi-automated systems. The purpose of this study is to evaluate validity and feasibility of a semi-automated surveillance for the detection of SSIs in an acute hospital setting and to quantify the workload reduction.

Methods: To assess SSIs probability, an algorithm based on surgical, microbiological and discharge datasets was designed to identify low-risk procedures (LRP) and high-risk procedures (HRP).

Its validity was tested on 1,138 surgical procedures performed in the University Hospital of Ancona in pre-COVID period, between October 1st and December 31st, 2019 and already manually reviewed.

We compared semi-automated algorithm performance to the manual routine surveillance by assessing sensitivity, specificity, positive and negative predictive values with 95% confidence intervals (CI). Since the algorithm requires that LRP are not manually reviewed, workload reduction was calculated as the percentage of LRP on the total number of procedures.

Stata 15 was used for data analysis.

Results: Among 81 HRP, 7 had already been identified as SSIs applying the manual method. Among the 1,057 LRP, only one had been identified as SSI. The sensitivity of the semi-automated method was 87.5% (CI 47.3-99.7); specificity was 93.5% (CI 91.8-94.8). Positive and negative predictive values were respectively 8.64% (CI 3.5-17) and 99.9% (CI 99.5-99.9). Workload reduction was 92.9% (CI 91.4-94.4).

Conclusion: These results are comparable to those of other studies evaluating the performance of algorithms for semi-automated surveillance. Given the workload reduction, our semi-automated surveillance turned out to be feasible in our setting. Validity of our method could be strengthened by applying it to other hospitals and broadly to the surveillance of other healthcare associated infections.

Frequency of provincial custodial involvement and its relationship with illicit drug poisoning events, mental illness and substance use disorder diagnoses in British Columbia, Canada

Roshni Desai¹, Amanda Slaunwhite¹, Kevin Hu², Chloe Xavier¹, Nelson Luk², Pamela Young³, Glenn Young³, Chas Coutlee², Patricka Keating², Marnie Scow², Mo Korchinski³, Heather Palis²

¹BC Centre for Disease Control, Canada, ²University of British Columbia,

³Unlocking the Gates Services Society

Background: The ongoing unregulated drug poisoning (overdose) public health

emergency in North America is the second leading cause of years of life lost in British Columbia (BC), Canada. There is growing interest in the intersections of overdose and the criminal legal system. The purpose of this analysis was to describe the frequency and composition of charges for people who have and have not had an illicit drug poisoning event.

Methods: Population-based health and corrections data were retrieved from a 20% random population sample of BC residents (N=878,246), and from people with healthcare records for drug poisoning (N=33,882). Charging data represented persons who spent at least one day in custody with a release date between January 1, 2016 - December 31, 2020. The total number of charges and the most common charges (i.e. drug-related, crimes against person, traffic, property, and other) were reported among people with 10+ charges in a calendar year, by year and overall.

Results: People with 10+ charges in a calendar year make up a very small proportion of the Reference Sample (<0.01%) (N=1044) and Overdose Cohort (<5%) (n=1652). Drug-related charges were uncommon. Charges for crimes against person were similar in the Overdose Cohort and Reference Sample, 17% and 20% of all charges, respectively. Property-related charges, which likely reflect survival crime, were the most common in both groups; however, the Overdose Cohort (52%) had a higher frequency than the Reference Sample (38%).

Conclusions: Few people who had an illicit drug poisoning event have been charged with an offense and fewer were charged 10+ times in a calendar year. In the context of growing media and public concern about public safety, efforts must focus on increasing access to social supports and reducing stigma for people with living experience of substance use, incarceration, and criminalization.

Assessment the capacity of whatman filter papers as support for storing stools for molecular diagnostic of soil-transmitted helminth infections

Cyrille Kamdem Nguemngang¹, Pythagore Fogue Soubgwi², Auvaker Tiofack Zebaze¹, Estelle Mewamba Mezajou¹, Edmond Tekeu Mengoue², Hilaire Womeni³, Gustave Simo¹

¹University of Dschang, Molecular Parasitology and Entomology Unit, Department of Biochemistry, Faculty of Science, University of Dschang, PO Box 67, Dschang, Cameroon, ²University of Dschang, ³University of Dschang, "Unité de Recherche de Biochimie, des plantes Médicinales, des Sciences alimentaires et Nutrition", University of Dschang, Dschang, Cameroon

Background: Storage of stool samples for molecular detection of soil-transmitted helminth (STH) species remains a challenge for the molecular diagnostic of STH infections. This study was designed to assess the capacity of whatman filter papers for the storage of stool samples for molecular detection of STH species.

Methods: Stool samples from school-aged children with and without eggs of soil-transmitted helminths as results of Kato-Katz were used. From each sample, 10, 20, 40 and 80 mg of stool were spread on 6 types of filter paper that were stored at room temperature for one to ten weeks. DNA was extracted from stored stool using a cetyltrimethylammonium bromide-based method. The amount of stool and appropriate filter paper to use for the storage of stool sample was determined by amplifying specific DNA fragment of *Ascaris lumbricoides*. The capacity of filter paper for short and long-term storage of stool was assessed by amplifying specific DNA fragment of STH.

Results: Amplification rates were significantly higher for 10 and 20 mg of stools compared to 40 and 80 mg. the whatman filter paper grade 2 yielded the highest amplification rate of 100%. For either *A. lumbricoides* or *Trichuris trichiura* or hookworm, the amplification rates of stored stools on this whatman filter paper were 100%. DNA fragments of *A. lumbricoides* and *T. trichiura* were detected in 5 (12.5%) and 9 (22.5%) stools without soil-transmitted helminth egg. From the first to 8th weeks, the amplification rates of different soil-transmitted helminth species remained constant at 100%. It decreased to 86.7% after 10 weeks of storage.

Conclusions: This study highlighted the capacity of whatman filter papers for long-term storage of stools for molecular diagnostic of STH. Storage of stool samples on filter paper is of great interest for the monitoring of STH control programs and for the post-elimination surveillance.

Improving public health surveillance systems for acute post-streptococcal glomerulonephritis in Far North Queensland, Australia

Letitia Graham¹, Johanna Neville¹, Ann Richards¹, Valmay Fisher¹, Caroline Taunton¹, Allison Hempenstall¹

¹Torres and Cape Hospital and Health Service, Australia

Background and Objective: Acute post-streptococcal glomerulonephritis (APSGN) is an immune-mediated inflammatory disease of the kidneys that occurs approximately three weeks after a skin or throat infection with Group A Streptococcus. In Australia it is predominately a disease of socio-economic disadvantage with high rates in First Nations children. This disease is not currently notifiable within the Australian state of Queensland making it challenging to ensure an appropriate public health response to cases, identify outbreaks and monitor epidemiological trends. The aim of this abstract is to describe the results of a locally implemented APSGN surveillance system.

Methods: In 2022, public health surveillance of APSGN in the Torres and Cape was augmented by a digital health alert system to which automatically notifies the public health team of suspected cases. APSGN cases in the one year following implementation were compared to annual case estimates from a retrospective, de-identified internal audit of electronic medical records between 2005 and 2021. Incidence rates were calculated and stratified by case definition (confirmed or probable cases) and location.

Results: Between 2005 and 2021 there were 172 reported APSGN cases across the Torres and Cape region (141 confirmed and 31 probable), suggested a mean of 10.1 cases per year. There have been seven outbreaks during the audit period. There were 15 cases identified across the region during the one-year following implementation of the APSGN digital health alert system (8 confirmed and 7 probable), with no outbreaks declared.

Conclusion: The extent to which these data suggest an increase in APSGN incidence across the region or an increase in case ascertainment is not clear. Although this simple surveillance system has improved the local public health response, mandating notification of APSGN under Queensland public health legislation will help raise the profile of this disease of disadvantage and stimulate better public health policy.

Arboviruses and leptospirosis among non-malarial outpatients with acute febrile illness in areas affected by Cyclones Idai and Kenneth in Mozambique

Oswaldo Inlamea¹

¹Instituto Nacional de Saúde - Mozambique, Instituto Nacional de Saúde, EN1, Bairro da Vila, Marracuene, Mozambique

The floods associated with the landfall of cyclones Idai and Kenneth in Mozambique between March and April 2019 had a major impact on the country's public health, and placed the affected population at risk for vector- and rodent-borne diseases. Aiming to improve the diagnostic capacity, yield information to guide public health responses, and assess the potential short-term effects of cyclones Idai and Kenneth on arboviruses and leptospirosis, we established a clinical and laboratory surveillance for non-malarial acute febrile illness in six health units located in different districts within the two provinces most affected by the cyclones. Patients were tested by qRT-PCR for dengue, Zika, and chikungunya viruses and by ELISA to detect nonstructural DENV protein 1 (NS1) and DENV, ZIKV, CHIKV, and Leptospira IgM antibodies. From April to September 2019, we enrolled 305 patients aged ≥15 years, of which 58.4% were women and the median age was 30 years. All patients were qRT-PCR negative for arboviruses. Three (1.0%) patients were positive by DENV NS1 ELISA, and one of them also had positive IgM against DENV and CHIKV. In addition, specific IgM antibodies against DENV, ZIKV, CHIKV, or Leptospira were found in the serum of 104 (34.1%) patients. Of them, 73 (23.9%) had evidence of a recent single infection, 19 (6.2%) had evidence of a recent infection by more than one arbovirus, and 12 (3.9%) had a dual recent infection by an arbovirus and Leptospira. Our results indicate that vector- and rodent-borne disease transmission occurred in all districts in the wake of cyclones Idai and Kenneth, including some regions of the country where cases had not been previously detected. Although the absence of baseline long-term surveillance data hampered assessing the impact of cyclones Idai and Kenneth on vector- and rodent-borne transmission, the investigation provided useful information for post-cyclone emergency response purposes.

An equity-focused health impact assessment of the COVID-19 pandemic and associated response

Fiona Haigh¹, Esther Alloun², Christopher Standen¹, Miriam Olliek³, Marilyn Wise¹

¹University of New South Wales and Sydney Local Health District, Australia,

²University of New South Wales, Australia, ³Sydney Local Health District,

Australia

Background: A local health district in Sydney, Australia undertook a concurrent, equity-focused health impact assessment (EFHIA) of the potential health equity impacts resulting from COVID-19 and associated responses. The EFHIA took as its starting point, the time at which the first evidence emerged that the COVID-19 virus had reached Australia, and focused on the health and health equity impacts of the virus and of the government and health responses (in particular) over the following two years.

Methods: Following standard HIA steps, the EFHIA focused on three areas: risks and consequences of COVID-19 infection, changes to health services and changes to work.

Data collection involved: developing a community profile; using local data analysing how the risks and consequences of COVID-19 infection varied across population groups within the area; 18 semi-structured interviews; five focus groups with a mix of health professionals and service users; five literature reviews; six evidence briefs/checks; and a grey literature and policy review. We triangulated, synthesised and critically assessed the evidence to describe health equity impacts. Impacts were characterised according to direction of impact, likelihood, severity, level, and timeframes of impact. Findings were reviewed and validated by topic specialists, participants and steering group, as well as experts on HIA and health equity.

Results: The EFHIA identified multiple health and health equity impacts arising from the pandemic and associated responses. This EFHIA report concludes with 22 equity-focussed recommendations directed at what worked well, what the health district needs to do more of and what to do differently to support health equity within the health district and more widely.

Conclusion: This case study demonstrates how utilising a concurrent HIA approach using evidence and data as it emerged to predict future health equity consequences can inform response and planning processes.

Informing suicide prevention strategies through completed coronial files: an Irish example

Katerina Kavalidou¹, Anita Munnelly², Gemma Cox³

¹National Office for Suicide Prevention HSE and UCC ²National Suicide Research Foundation WHO Collaborating Centre for Surveillance and Research in Suicide Prevention 4.28 Western Gateway Building University College Cork Cork, Ireland ³National Office for Suicide Prevention, Palmerstown, Dublin 20 Ireland

Background: In Ireland, the assessment of whether a death is a suicide is determined by a coroner's inquest; it is based on legal guidance surrounding the weight of evidence that a person intended to take their life 'beyond reasonable doubt'. However, 'undetermined' deaths as well as deaths by intentional self-harm, viewed through the established methodology 'on the balance of probabilities' may help to minimise the underreporting of suicide. Thus, the Irish Probable Suicide Death Study (IPSDS), based on the balance of probabilities methodology, was developed. This is a collaborative project involving the HSE National Office for Suicide Prevention (NOSP), Irish coroners and the Health Research Board (HRB; a statutory agency under the aegis of the Department of Health).

Objective: To present: a) how to use death-investigation and administrative data collected as part of the coronial process, and b) the differences between those who received a suicide verdict by coroners in Ireland and those who did not.

Methods: Flow chart presentation of the development and process of the IPSDS methodology and backward multivariate logistic regression to identify the factors which distinguish between suicide and non-suicide coronial verdicts, were used. The probability for stepwise removal was set at 0.01 and odds ratio with 95% confidence intervals CIs are presented,

Results: The IPSDS presents information of 2,349 deaths by probable suicide for a four-year period from 2015 to 2018. The factors which distinguished between receiving a suicide verdict and a non-suicide verdict, were mainly: leaving a suicide note and lethality of the suicide method (hanging and shooting).

Conclusions: Reviewing Completed coronial files through a wider lens has considerable potential to enhance our understanding of deaths by probable suicide and support the development of effective suicide prevention interventions for the most vulnerable populations.

Factors associated with tuberculosis preventive treatment incompleteness: a retrospective Cohort.

Maciel Ethel¹, Jose Silva², João Cola³, Thiago Prado⁴, Kleydson Alves⁵, Anete

Trajman⁶, Jonathan Golub⁷, Richard Chaisson⁷, Ethel Maciel¹

¹Universidade Federal do Espírito Santo, Post-graduate Program in Saúde Coletiva Brazil, ²Federal University of Rio de Janeiro, Brazil, ³Universidade Federal do Espírito Santo Brazil, ⁴Universidade Federal do Espírito Santo Brazil, ⁵Pan American Health Organization - Brazil Brazil, ⁶Universidade Federal do Rio de Janeiro Brazil, ⁷Johns Hopkins University United States

Background: Among Brazilian initiatives to scale up preventive treatment of tuberculosis (TPT) are the adoption of the 3HP regimen in 2021 and the implementation in 2018 of the TPT surveillance information system. Since then, among 76,000 TPT were notified, 63% completed. Recommended regimens in this period were 6H, 9H and 4R. The objective was to analyze the factors associated with TPT non-completion.

Methods: We analyzed the cohort of TPT notifications from 2018 to 2020. Individuals with current or past TB disease, deaths and transferred to another country were excluded. Robust variance Poisson regression model was used to verify the association of TPT non-completion with sociodemographic, clinical and epidemiological variables. Results of the multivariate analysis were interpreted as relative risk (RR) with a 95% confidence interval (95%CI).

Results: Out of 39,973 TPT notified in the study period, 8,534 (21.5%) were non-completed, of which 7,858 (92.08%) were loss to follow up. Age 15-60 (RR=1.27, 1.20-1.35), TPT with isoniazid (RR=1.40, 1.19-1.64) and black/mixed race (RR=1.17, 1.09-1.25) were associated with a higher risk of non68 completion. 69

Conclusion: Individuals in social and financial vulnerability such as 70 black/pardo race and young adults and longer TPT regimens are more likely to TPT incompletion.

DOI: 10.18332/popmed/164111

Burden of road traffic crashes in the middle east and north africa: an ecological study

Karima Chaabna¹, Sathyanarayanan Doraiswamy¹, Ravinder Mamtani¹, Sohaila Cheema¹

¹Institute for Population Health, Weill Cornell Medicine - Qatar

Background and objective: Road traffic injuries (RTIs) and deaths constitute a serious preventable global public health problem. Our objective is to analyze time trends of age-standardized mortality rates and disability-adjusted life years (DALYs) due to RTIs in 23 Middle East and North Africa (MENA) countries; and to assess the correlation between countries' implementation of best practices for road safety recommended by the World Health Organization, their income-level, and RTI burden.

Methods: Time trend analysis over 17 years (2000–2016) was conducted using Joinpoint regression. An overall score was computed for each country to assess the implementation of best practices for road safety.

Results: Mortality significantly decreased (p -values<0.05) in Qatar, Oman, Kuwait, Morocco, Iran, Lebanon, Tunisia, and Jordan. In most MENA countries, DALYs increased; however, they significantly decreased in Iran. Overall, the computed score varied widely among the MENA countries. In 2016, no correlation was identified between the computed overall score and mortality and DALYs. Furthermore, the country-income level was not associated with RTI mortality or the computed overall score.

Conclusion: Countries in the MENA region are at varying levels of success in reducing the burden of RTIs. During this Decade of Action for Road Safety 2021–2030, MENA countries can achieve optimal road safety by implementing road safety measures that are customized for the local context such as law enforcement and public education. Other focus areas for improving road safety in the region are building capacity in sustainable safety management and leadership, improving vehicle standards, and addressing gaps in areas such as child restraint use.

Difficulties in accessing health services and the avoidance of medical care during covid-19 pandemic: The experience on italian the elderly population

Benedetta Contoli¹, Valentina Minardi¹, Maria Masocco¹, Valentina Possenti¹, Rosaria Gallo²

¹National Institute of health, Rome Italy, ²Primary Healthcare Unit, Health District 9, Local Health Unit Roma 2, 00159 Rome, Italy

Background and objective: Aging represents a relevant issue in Italy and it is strongly associated with the growth of noncommunicable diseases. Data from PASSI d'Argento (PdA) 2016-2021, an ongoing national surveillance system of Italian aged 65+, are used to detect the association between accessing health

services and the WHO 25x25 strategies' risk factors (at-risk alcohol consumption, sedentary behavior, current tobacco use, raised blood pressure, diabetes and obesity) with three health outcomes, hospitalization and comorbidity. The effect of COVID-19 emergency on accessing to health services were analyzed.

Methods: Among the several health-related aspects, access to basic healthcare services and the avoidance to medical care during pandemic are investigated by PdA using a sample randomly selected from the local health unit (LHU) list of beneficiaries of health services, stratified by sex and age. The association between outcomes and behavioral risk factor is presented in terms of the adjusted prevalence ratio (aPR).

Results: Elderly hospitalized at least once for 2+ days in the last year had greater risk to have difficulties in accessing health services, whereas the model included health conditions such as obesity (aPR = 1.95 95% CI 1.75-2.17), smoking (aPR = 1.95 95% CI 1.76-2.16), alcohol use (aPR = 1.93 95% CI 1.73-2.14), hypertension (aPR = 1.92 95% CI 1.73-2.13) and diabetes (aPR = 1.91 95% CI 1.73-2.12). During pandemic 40% of elderly have foregone a medical care. Being female (aPR 1.31 95% CI 1.04-1.67), having a high level of education (aPR 1.35 95% CI 1.02-1.79), and many economic difficulties (aPR 2.64 95% CI 1.74-4.02) were associated with higher avoidance due to service disruption.

Conclusion: Living environment barriers which prevent access to care among elderly and delay of care during the pandemic may impact morbidity and health outcomes in the long term which are important to monitor with PdA surveillance system

Popul. Med. 2023;5(Supplement):A1948

DOI: 10.18332/popmed/164649

Associations between not performing in the recommended timeframe cervical, breast and colorectal cancer screening and socioeconomic characteristics and behavioural risk factors: data from the italian passi nationwide surveillance

Daniela Marotta¹, Valentina Minardi², Giuliano Carrozzi³, Letizia Sampaolo⁴, Massimo Trinito⁵, Benedetta Contoli², Valentina Possenti², Maria Masocco², Valentina Pettinichio⁵

¹Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy, ²National Centre for Disease Prevention and Health Promotion, Istituto Superiore di Sanità, Rome, Italy, ³Epidemiology Unit, AUSL of Modena, Modena, Italy, ⁴Epidemiology Unit, AUSL of Modena, Strada Martiniana, 21, 41126 Modena, Italy, ⁵Prevention Department, Asl Roma 2, Italy, Italy

Prevention and health promotion are strictly linked to the health literacy of population and to the theme of equity and social determinants. The aim of this study is to assess the associations between socioeconomic determinants and behavioural risk factors and cervical, breast and colorectal cancer screening non-execution.

A representative sample of the adult population residing in Italy was interviewed by the PASSI surveillance (19,774 women aged 50-69 years, 38,138 women aged 25-64 years and 34,593 people aged 50-69 years about breast, cervical and colorectal cancer screening respectively) in 2017-2019. The associations between non-execution of cancer screening in the recommended timeframe and socioeconomic characteristics were estimated using logistic regression models. Prevalence of not performing screening tests within the timeframe was calculated according to the presence/absence of behavioural risk factors. All percentages report 95% confidence intervals (95% IC).

Screening non-execution was 24.9% (24.2-25.7 95% IC), 20.1% (19.6-20.6 95% IC), and 52.3% (51.7-52.9 95% IC) for breast, cervical and colorectal cancer, respectively. In the three regression models, those who had the lowest educational level, many economic difficulties, foreign citizenship and those who lived in the southern Italy were significantly associated with no performing screening tests in the recommended timeframe. For all cancer screening, among those who had never performed a test, less than 10% had high-risk drinking behaviour, more than 20% was smokers and almost 50% had insufficient physical activity.

In conclusion, not performing screening tests within the timeframe is associated with unfavourable socioeconomic characteristics and unhealthy behaviours that are also risk factors for breast and colorectal cancer incidence. Our data agree with previous long-standing findings, showing that more interventions have to be done in order to improve health promotion and to construct a stronger culture of prevention including the development of a comprehensive and global approach.

DOI: 10.18332/popmed/164668

Antibiotic use in surgical wards: how long does prophylaxis last?

Corinna Fortunato¹, Davide Rinaldini¹, Giulia Paolrossi¹, Jacopo Dolcini¹,

Pamela Barbadoro¹

¹Department of Biomedical Science and Public Health, Università Politecnica delle Marche, Ancona, Italy

Background and objective: Antibiotic resistance has been identified by the European Center for Disease Prevention and Control (ECDC) as a public health emergency and by the World Health Organization in 2019 as one of the ten threats to global health. The aim of our research was to assess the use of antibiotics in surgical wards.

Methods: The study was conducted in November 2022 in the Azienda Ospedaliera Universitaria delle Marche, according to the protocol proposed by the ECDC (PPS3). All patients admitted to the wards at or before 8 a.m. and not discharged at the time of the survey have been included. For the surgical area all following departments have been included: Cardiac Surgery, Neurosurgery, Otorhinolaryngology, Breast Surgery, Transplant Surgery, Maxillofacial Surgery, Hand Surgery, Thoracic Surgery, Plastic Surgery, Vascular Surgery, General and Emergency Surgery, Orthopedics, Urology, Gynecology and Pediatric Surgery.

Results: Of the 239 patients included, 53.6% were females and 46.4% males. The 60.7% (N=145) of the total, had already undergone invasive surgery and 45.2% (N=108) were taking antibiotics. The most commonly used antibiotics were cefazolin (25.4%, N=34), amoxicillin/clavulanic acid (13.4%, N=18) and piperacillin/tazobactam (11.9%, N=16). Among the patients on antibiotic therapy, 22.2% (N=24) were being treated for a hospital acquired infection, 11.1% (N=12) for a community infection, 11.1% (N=12) for medical prophylaxis and 55.6% (N=60) for surgical prophylaxis; in 58.3% (N=35) of these patients, prophylaxis had been prolonged for more than one day.

Conclusions: Overall, the significant use of antibiotics is consistent, as 45.2% (N=108) of patients were taking at least one antibiotic at the time of the survey. Although surgical prophylaxis depends on the type of surgery, given the high percentage of prophylaxis lasting for more than one day, we can conclude that further development is necessary to implement additional strategies to promote surgical antibiotic stewardship at hospitals.

Background and objective: Eight to 12% of patients admitted to hospitals in the European Union (EU) experience adverse events. Surgical-related adverse effects are among the most common in-hospital adverse events, with most surgical errors occurring outside the operating room. Although no set of outcomes has yet been defined for a comprehensive analysis of this phenomenon, it is crucial to standardise a minimum set of outcomes, a Core Outcome Set (COS), to allow for benchmarking across EU countries. This study aims to develop a relevant and feasible COS for patient safety in perioperative care, including patient-relevant

data.

Methods: We will follow a multimethod approach based on COS-STAD recommendations. First, an initial list of outcomes (ILO) will be developed by conducting an umbrella review of outcomes on patient safety in perioperative care in surgical adult patients. Next, this umbrella review will be complemented by outcomes identified in a systematic review of Clinical Practice Guidelines and an umbrella review of non-clinical interventions to improve perioperative patient safety. Then, the ILO will be prioritised by healthcare professionals and patient representatives according to the importance and feasibility of each outcome in a two-round eDelphi process by April 2023. The final list of outcomes (FLO) will be defined in a consensus conference by the same stakeholders.

Results: As this study is still undergoing, the results are not yet available. The FLO will be presented in a summary of findings table, containing, for each of the up to 50 prioritised outcomes, the outcome name, definition, and domain.

Conclusion: This COS will contribute to improving the monitoring and evaluation of patient safety practices in perioperative care and, thus, the quality of care and healthcare decision-making. Additionally, this COS will help standardise outcome reporting in perioperative patient safety and facilitate the comparison of data across studies.

Alert Microorganisms Procedure: Surveillance, Monitoring And Prevention Of Health Care Associated Infections

Riccardo Giorgio¹, Matilde Perillo², Biagio Santella³, Grazia Cioffi³, Francesco De Caro⁴, Gianluigi Franci¹, Anna De Chiara¹, Domenico Fornino¹, Luigi Fortino¹, Claudio Giordano¹, Elisa Palombo¹, Domenico Pecora¹, Emanuela Santoro¹, Giuliana Tremiteira³, Mario Capunzo⁴, Giovanni Boccia⁴

¹Department of Medicine, Surgery and Dentistry "Scuola Medica Salernitana", University of Salerno, 84081 Baronissi, Italy, ²Department of Medicine, Surgery and Dentistry "Scuola Medica Salernitana", University of Salerno, 84081 Baronissi, Italy, ³A.O.U. San Giovanni di Dio e Ruggi D'Aragona, Largo Città di Ippocrate, 84131 Salerno, Italy, ⁴Department of Medicine, Surgery and Dentistry "Scuola Medica Salernitana", University of Salerno, 84081 Baronissi, Italy; A.O.U. San Giovanni di Dio e Ruggi D'Aragona, Largo Città di Ippocrate, 84131 Salerno, Italy

Background and objective: Health care-associated infections (HCAIs) are infections developed in a hospital or other health care facility, that first appear 48 hours or more after hospital admission, or within 30 days after having received health care. It's estimated that among all hospitalized patients, about 7% for high-income countries and about 15% for low-middle income countries contract a HCAI. Among the main causes of HCAIs there are the so-called Alert Microorganisms, intended as different species with a high probability of diffusion in hospital settings, often combined with a problematic therapeutic approach or antibiotic resistance. The objective of our study was to describe the protocol applied in the setting of AOU "San Giovanni di Dio e Ruggi D'Aragona" of Salerno in order to evaluate its efficiency in reducing cases of infections.

Methods: Protocol "Alert Microorganisms Procedure: Surveillance, Monitoring And Prevention Of Health Care Associated Infections", applied in AOU "San Giovanni di Dio e Ruggi D'Aragona" of Salerno; Alert Microorganisms detection form, filled by the doctor and/or the head nurse of the interested Department; HCAI Surveillance evaluation form, filled by the HCAI-supervising doctor, in order to evaluate the progression and/or new cases of contamination/infection.

Results: Gram-negative and fungi were the most common identified pathogens. Patients have been isolated in a single room and treated with personal-use devices and specific therapy. When single room was not available, patients' bed were placed 1,5m away from other patients, even with screens or dividers

Conclusion: The Surveillance of Alert Microorganisms allowed us to define protocols to manage and monitor HCAIs and identify areas that need to be improved. The continuous and correct application of the protocol may lead in the future to a significant reduction of the risk for patients to contract HCAIs

The association between smoking and the development of diabetes type 2 - results from the Germany burden of disease study

Elena von der Lippe¹, Dietrich Plass², Michael Porst¹, Annelene Wengler¹, Janko Leddin³, Aline Anton¹, Alexander Rommel¹

¹Robert Koch Institute Germany, ²Germany Environment Agency, ³Koch Institute

Introduction: To better plan public health interventions, information on which

risk factors contribute most to the burden of disease is needed. The prevalence of diabetes type 2 (DT2) in Germany increased in the last years and causes a substantial disease burden. The aim of the study is to quantify the association between a set of risk factors (smoking, high body-mass index (BMI), diet low in fruits, risk alcohol consumption, high fasting plasma glucose and ambient particulate matter pollution) and the burden of DT2 in the German population.

Methods: To determine the risk-associated share of each risk factor on the burden of DT2, the population attributable fraction (PAF) is estimated using information on the relative risks and the distribution of the exposed population. The PAF is then applied to the total disease burden of DT2 to quantify the proportion of the DT2 burden that can be attributed to each single risk factor. To account for possible interactions of risk factors, a combined PAF for all risk factors is calculated using the multiplicative adjustment.

Results: The preliminary results show that more than 50 % of the burden due to DT2 is attributable to avoidable risk factors. In the younger age groups this share is higher and in the older population significantly lower. The highest share of the attributable burden is assigned to high BMI, followed by high fasting plasma glucose and smoking. The affect of risk alcohol consumption shows somewhat controversial picture.

Conclusion: The results reveal that a substantially high share of the burden due to DT2 is caused by modifiable risk factors. Appropriate interventions are needed aiming at reducing the high BMI, smoking and high fasting plasma glucose in the population. Improving the air pollution and the diet habits of people would be positively reflected in the burden due to DT2.

Assessment of sars cov-2 genomic surveillance in Tunisia, January 2021 to february 2022

Arwa Neffati¹, Mouna Safer¹, Hajer Letaief², Aicha Hechaichi¹, Sonia Dhaouadi¹, Nissaf Alaya²

¹National observatory of new and emerging diseases Tunisia, ²National observatory of new and emerging diseases

Background: Tunisia SARS-CoV-2 genomic surveillance strategy (SARS-CoV-2 GSS) is based on two approaches: randomized sampling and targeted sampling focusing on specific subsets of cases associated with public health risks.

Objective: To evaluate the implementation of the SARS-CoV-2 GSS in accordance with the national recommendations and guidelines.

Methodology: We initially performed a descriptive study to describe the components and operation of the strategy and to analyze data transmitted to the National observatory of new and emerging diseases from January 2021 to February 2022. An internal audit assessing the compliance to the national recommendations and guidelines was conducted covering 12 requirements related to sampling, data collection and analysis, notification, usefulness and ethical considerations.

Results: Among a total of 4819 samples only 4278 (88.8%) were sequenced with 3648 (80.92%) were classified VOC : Alpha 40.24%, Beta 0.24 %, Gamma 0.03%, Delta 45.26%, and Omicron 14.19%. The Alpha variant was already dominant from the ISO week 3-2021 to ISO week 25-2021. The Delta variant was predominant from the ISO week 26-2021 to the ISO week 2-2022 and the Omicron from the ISO week 3-2022 to the ISO week 6-2022. The levels of compliance were considered as 'not met' for 7 components; as 'partially met' for 4, and 'fully met' for one. The usefulness of the result of genomic surveillance is considered very low since the results are communicated after three weeks from the date of the sample.

Conclusion: Although the SARS-CoV-2 GSS in Tunisia has a relative advantage to draw up the profile and the dates of circulation of VOCs, the strategy suffers from several limitations related to the low level of compliance and delay to identify VOCs. This evaluation offered a trigger to revise the current strategy and enhance national capacities for early detection and rapid response to new VOCs.

Monkeypox's management in the lombardy region: data analysis and preparedness for future outbreaks

Sudwaric Sharma¹, Riccardo Vecchio², Sara Piccinelli¹, Giovanni Cicconi¹, Roberta Lattanzio¹, Chiara Marrocu¹, Gaia Ferraguzzi¹, Federica Attanasi³, Michela Viscardi³, Silvana Castaldi¹, Catia Borriello³, Danilo Cereda³

¹Department of Biomedical Sciences for Health, University of Milan Italy,

²Department of Public Health, Experimental and Forensic Medicine, University of Pavia, ³DG Welfare, Lombardy Region Italy

Background and objective: Monkeypox (MPX) is a zoonotic emerging disease caused by the Monkeypox virus (MPXV). Cases of MPX have been reported in several states including Italy, mainly among men having sex with men (MSM).

Lombardy Region has immediately introduced a surveillance program to describe the outbreak's epidemiology and support control measures. This study aims to analyze what happened in order to manage the next season at best.

Methods: The surveillance system comes into effect from physician reporting based on typical symptoms and suggestive history. This leads to a blood sample test managed by the two regional reference centers. In case of positivity, the quarantine of the patient and his close contacts is arranged. Depending on the clinical severity, the patient can be treated at home or hospitalized. Smallpox vaccine can be considered for the transgender and GBMSM population (gay, bisexual, and MSM).

Results: As of 05/12/2022, the confirmed cases are 386: 381 males and 5 females, average age 38 years. 95 cases are caused by a foreign infection and 265 cases are reported by Milan's local health authority. The symptom picture shows that: - 360 patients have rash; - 215 patients have hyperpyrexia; - 168 patients have lymphadenopathy. Time trend and epidemiological link highlight that peak periods correspond to two major event: Maspalomas and Milan's 2022 gay pride.

Conclusion: Data analysis shows that the disease is linked to some risky behavior. It will be necessary to take action by informing communities at risk (GBMSM and transgender) and by ensuring the regional healthcare system's readiness. Lastly, an adequate vaccine campaign will have to be organized in advance for the concerned population.

Spain's compliance with the dublin declaration on partnership to fight hiv/aids

Rafael Gómez-Coronado¹, Oriana Ramírez²

¹San Carlos Clinic Hospital Calle del Prof Martín Lagos, S/N, 28040 Madrid Spain, ²Ministry of Health

Background and objectives: HIV/AIDS remains a major public health problem. The Dublin Declaration on the Partnership to Fight HIV/AIDS in Europe and Central Asia and its annual questionnaire monitor the progress of the epidemic. The primary objective is to analyse to what extent Spain complies with the declaration from 2009 to 2022. The secondary objectives are: * describe how the information demanded has changed; * assess the completeness and quality of Spain's submission; * describe trends in the HIV epidemiology, prevention and treatment strategies; * describe Spain's compliance with the UNAIDS Global Goals.

Methods: Secondary data from the questionnaire was used. This data was grouped into 6 categories with a total of 19 indicators. These were the: * number and type of response indicators; * completion rate by year, category and key population; * calculation methodology used: a descriptive analysis, longitudinal analysis and/or a mixed methods analysis was carried out per indicator, whichever fit the data. * Continuum of care for people living with HIV (PLHIV) in Spain compared to UNAIDS targets.

Results: The information required has become increasingly complex and quantitative, requiring more sophisticated information systems. Consequently, the completion rate declined throughout the period 2009-2018, especially when more quantitative questions were introduced. Recently, completion rate has recovered as new information systems have been implemented. The COVID-19 pandemic had an impact on HIV services, resources and monitoring. The current system provides limited information about stigmatized key populations such as sex workers, migrants and transgender people. Improvement is needed in the implementation of PrEP as well as in continuum of care results for some key populations.

Conclusion: Spain is committed to monitoring the DD and the global HIV Goals, but there is still a long way to go.

Comparing estimates of intimate-partner violence against women across different data sources in Brazil

Caroline Stein¹, Caroline Stein¹, Carolina Coll², Jack Cagney¹, Cory Spencer¹, Emmanuela Gakidou¹

¹Institute for health metrics and evaluation/university of washington population Health Building/Hans Rosling Center 3980 15th Ave. NE, Seattle, WA 98195 USA UW Campus Box #351615 United States, ²Center for Epidemiological Research/Universidade Federal de Pelotas | UFPEL Center for Epidemiological Research Rua Marechal Deodoro, 1160 - 3° Piso Bairro Centro - Pelotas, RS Cep: 96020-220 - Caixa Postal 464 Tel/fax +55 (53) 3284 - 1300 Brazil

Background and objective: Intimate partner violence (ipv) is a global public health problem. Initial work suggests that ipv prevalence estimates vary by the type of

data used. This study aims to evaluate and compare ipv estimates from three national data sources in Brazil.

Methods: We compare estimates of ipv for 2019 from three data sources (violence and accident surveillance system-viva/sinan, national health survey-pns, and data senado research-dsr). We explored the similarities and differences among data sources. Then we estimated the proportion of total cases and prevalence by age group (16-29, 30-39, 40-49, 50-59, and 60+) and type of violence (physical, psychological, sexual) in the last 12 months.

Results: The data show the largest differences for the 16-29 age group: for physical ipv, viva/sinan had 43% proportion of total cases, and dsr and pns had 35% and 33%, respectively. For psychological ipv, 38% of total cases were in the 16-29 age group for viva/sinan, 27% for pns, and 32% for dsr. Other age groups were more similar across data sources, and the pattern for sexual ipv differed mainly for 30-39 year olds. Population prevalence estimates varied across all data sources. Physical ipv prevalence was higher in the 16-29 age group, ranging from 4% in the pns to 11% in dsr. Psychological ipv also showed large prevalence differences between pns (9%) and dsr (29%) for the 16-29 age group. Ipv prevalence estimates from viva/sinan were lowest across all age groups.

Conclusion: Comparing three national data sources showed differences in reporting ipv. This could be due to differences in questionnaires, privacy during the interview, stigma and safety concerns associated with reporting experiences of violence. Understanding the differences across types of data sources and survey instruments is critical to improving the measurement of ipv in Brazil and around the world.

Data completeness of medical records of patients with Hypertension and Diabetes in primary health care centers, Nabeul, Tunisia 2019

Hejer Letaief¹, Fatma Ben Youssef¹, Mouna Safer¹, Sonia Dhaouadi¹, Aicha Hechaichi¹, Emna Mziou¹, Soudes Derouiche¹, Souha Bougategi¹, Leila Bouabid¹, Nissaf Bouafif ép Ben Alaya²

¹National observatory of new and emerging diseases, Tunisia, ²T-Field epidemiology training program, Tunisia

The National program for chronic disease started in Tunisia in 1993. It aimed to ensure an effective and standardized management of these chronic diseases, in primary health care centers, based on standardized guidelines and structured medical records.

Aim: To assess the data completeness of the structured medical records of hypertension and diabetes patients in primary health care centers of the governorate of Nabeul (Tunisia)

Methodology: Our evaluative study enrolled medical records of chronic disease patients, followed for at least one year in the primary care centers of the governorate of Nabeul. The data of the 10 items regarding the first medical visit were assessed: patient identification, disease classification; personnel medical history, family medical history, disease history, signs and symptoms, initial physical examination, Cardiovascular risk evaluation, dietary and nutritional behavior, and the final medical examination. **Conclusions:** The completeness of data was measured considering if a patients' record contains all desired types of data in the different items. In each primary health care center, 15 records have been assessed.

Results: In total, 23 primary health care centers have been enrolled and 345 medical records have been assessed. Data for patient's identification (name, surname, gender) was available in 92.2% of medical records. Availability of data for disease classification was 81.8%, personnel medical history 66.5%, Family medical history 63.3%, Signs and symptoms 41.3%, Initial Physical examination 52.6%. Data regarding Cardio-vascular risk evaluation and the **Conclusions:** of the initial medical visit were missing respectively for 78.4% and 63% of medical records.

Conclusions: We found that the completeness of data in medical records was not satisfying. Assessment of the data quality is important not only for the patients but also for researchers and policymakers. Thus, sensibilization, medical record simplification and an evaluation of the national program is important at this step.

Instruments for surveillance and monitoring physical activity among the Brazilian population: a scoping review

Valter Filho¹, Rafael Costa², Marcus Lopes³, Bruno Oliveira³, Luís Malheiros³, Gabrielli Mello², Kelly Silva²

¹Ceará State University, Brazil, ²Research Center for Physical Activity and Health, Department of Physical Education, Federal University of Santa

Catarina, Brazil, ³Department of Physical Education, Research Center for Physical Activity and Health, Federal University of Santa Catarina, Brazil

Background and Objective: Understanding which and how instruments have been used to measure physical activity (PA) in different population groups (i.e., children, adolescents, adults, and older adults) in Brazil is a preliminary step for an effective national monitoring system. This review aimed to map the instruments of PA applied to the Brazilian population. **Methods:** A scoping review was conducted in July 2020 in six databases (Web of Science, MEDLINE/PubMed, LILACS, PsycInfo, Scopus, and SPORTDiscus). The selection criteria were: original articles published up to 2020 in English, Portuguese, or Spanish languages; studies that included data from the general Brazilian population using PA questionnaires. Extracted information included methodological aspects, validation, and feasibility of the instruments. Independent peers performed all processes. Data were summarized according to age group (children: <12 years-old; adolescents: 13–17 years-old; adults: 18–64 years-old; and older adults: 65+ years-old).

Results: A total of 9,177 were identified, and 765 articles met the inclusion criteria. They represented 390 different studies. A total of 17 (4.3%) studies were nationwide surveys, and 47 (12%) studies included users from the national healthcare system. Thirty-eight distinct instruments were identified. The "PA Questionnaire (PAQ-C/A)" was the most frequent in children (9/33), while the "International PA Questionnaire (IPAQ)" was the most frequent in adolescents (26/81), adults (152/189), and older adults (59/85). Information on reliability and validity varied largely according to the instrument and age group. **Conclusions:** This review showed that a large number of distinct instruments on PA have been used in the Brazilian population, and a small part of the PA instruments has been used in the national health system. This evidence supports a call for the development and validation of instruments on PA behavior in different age groups as part of the Brazilian health system.

Detection of bacillus anthracis rods in animal and human specimens, Uganda 2015-2020

Michael Omodo¹, Jaime Gardella², Michael Omodo¹, Musa Ssekamate³, Jean Gonzalez⁴

¹Disease control and Environmental Sciences, Department of disease control & Environmental sciences, "Kajjansi, Wakiso District, Entebbe road", Uganda, ²Department of Animal Health and Anatomy, Faculty of Veterinary Medicine, Universitat Autònoma de Barcelona, 08193 Bellaterra, Spain, ³Department of Animal Health & Anatomy, Barcelona Spain, Spain, ⁴National One Health Platform, ⁴Center of Excellence for Emerging & Zoonotic Animal Disease, CEEZAD, Kansas State University, Georgetown University, Kansas, USA, Public Health, USA, US Minor Outlying Isles

Background and Objective: Anthrax, caused by *Bacillus anthracis*, is a widespread zoonotic disease affecting humans and mammals. It is endemic in Uganda and has claimed huge losses of cattle and wildlife. The disease remains an endemic public, animal health, and economic threat. This study aimed to identify positive samples during the 2015-2020 Uganda anthrax outbreaks.

Materials and Methods: Following the anthrax outbreaks, sixteen (16) districts submitted biological specimens to the NADDEC laboratory for human and animal diagnosis. One hundred nineteen (119) specimens were submitted, including human and animal samples (Fig1 and 2). The rapid Active Anthrax Detect (AAD) kit was used for detecting *Bacillus anthracis* capsular polypeptide (polyglutamic acid). (Fig 3), gram staining method (Fig. 4) using the M'Fadyean test under BSL2 conditions with the microscopic examination (x100 + oil immersion). Human samples were from Kiruhura District (fig. 5).

Fig 1 and 2. Sample collection from displayed cattle skin and smoked meat

Fig 3 and 4: Active anthrax detect test result and gram stain showing numerous bacilli rods

Fig. 5: Human lesions linked to cutaneous anthrax

Results: Gram-positive square-ended rods with spores were detected (Fig 4). 70.5% of Human and animal tissues tested positive for anthrax (Table 1). Anthrax cases were localized in 13 of the 16 districts sampled (Fig 6). Our results show the current risk to human, domestic and wild animal populations that exist in the endemic areas.

Table 1 and Figure 6: Distribution of anthrax cases by district

Conclusion: Anthrax is still poorly managed due to numerous factors, including poor carcass disposal and biosecurity measures and the lack of a national anthrax control strategy. Further studies are required in the human and veterinary medicine (One Health) approach to understanding the transmission dynamics in the different risk environments to prevent and control the risk.

Assessment of cetyltrimethylammonium bromide-based method for the extraction of soil-transmitted helminths DNAs from stools for molecular diagnostic of soil-transmitted helminth infections

Cyrille Kamdem Nguemang¹, Pythagore Fogue Soubgwi¹, Auvaker Tiofack Zebaze², Estelle Mewamba Mezajou¹, Hilaire Womeni², Mathurin Koffi³, Gustave Simo¹

¹University of Dschang, Molecular Parasitology and Entomology Unit, Department of Biochemistry, Faculty of Science, University of Dschang, P.O. Box 67, Dschang, West Region, Cameroon, ²University of Dschang,

³University of Daloa, "Unité de Recherche en Génétique et Épidémiologie Moléculaire" Jean Lorougnon Guédé University, Daloa, "Region du Hautassandra", Ivory Coast, Ivory Coast (Cote D'Ivoire)

Background and Objective: Although several protocols have been developed to extract DNA for the diagnostic of soil-transmitted helminths (STHs), amplifying these extracts remains a challenge due to DNA polymerase inhibitors. This study aimed to determine stool mass, the type of DNA polymerase and assess a DNA extraction method for efficient molecular detection of STHs.

Methods: Stool samples were collected from school-aged children and Kato-Katz enabled to search for STH infections. DNA was extracted from 10, 20, 40 and 80 mg of stool using cetyltrimethylammonium bromide (CTAB)-based method. The amount of stool for STH diagnostic was determined by amplifying specific DNA fragments of *Ascaris lumbricoides*. Performance of three DNA polymerases as well as CTAB-based method were assessed by amplifying specific fragments of different STH species. The cost linked to each DNA extraction was estimated.

Results: DNA extracts from 97.9% of stools harbouring STH eggs revealed the presence of at least one STH species. The number of amplified DNA extracts from 10 and 20mg of stool was significantly higher than those of 40 and 80 mg. The "Q5 high fidelity DNA polymerase", the "One taq DNA polymerase" and "Standard DNA polymerase" amplified respectively 97.9%, 54.6% and 34.8% of infected stools. Whatever the STH species, the "Q5 high fidelity DNA polymerase" amplified significantly more stool samples than other polymerases. Single PCR confirmed co-infections of *A. lumbricoides* with either *T. trichiura* or *Necator americanus*. Amongst hookworm infections, 10 and 13 were respectively due to *N. americanus* and *Ancylostoma duodenale*. CTAB-based method (\$1.45) appeared less expensive than commercial kit.

Conclusion: The CTAB-based method appears cheap and reliable to extract from 10 or 20 mg of stool samples, the DNA from STHs' eggs. Its combination with the "Q5 high fidelity DNA polymerase" highlighted its ability for the molecular detection of different STH species in stool samples.

Early identification of Clostridium Difficile patients in the Emergency Department: Observational study in acute care hospital in Sicily

Chiara Di Benedetto¹, Vito Cavallaro², Adriana D'emilio², Sebastiano De maria la rosa²

¹Resident physician university of catania hygiene and medicine preventive - arnas garibaldi, Italy, ²Hospital arnas garibaldi, Italy

Background and Objective: Clostridioides Difficile Infection (CDI) is one of the most important healthcare-associated infections (HCAI) in industrialised countries, where *C. difficile* is the leading cause of diarrhoea in hospital settings. In the last few years, there has been an increase in the number of CDI cases and in the severity of these infections and the associated mortality, especially in elderly patients, with a consequent increase in the length of hospital stay and in direct and indirect healthcare costs.

The aim of our study is to analyse the impact of early identification of Clostridioides difficile (CDI) in reducing healthcare-associated infections in different in-patient units during 2019 – 2022.

Methods: We revised all the requests received by "The Hospital Garibaldi Centro" - Clinical Pathology - from all operating units from January 2019 to November 2022, which refers to CDI.

First, specimens were screened by a rapid chromatographic immunoassay for *C. difficile* glutamate dehydrogenase antigen (GDH) + Toxin A + Toxin B. Second, GDH- positive and toxin-negative specimens were subjected to real-time multiplex PCR assay.

Results: 199 CDI cases were identified out of 937 (21%). 54% were identified in the emergency unit, 18% in critical care medicine, 9% in internal medicine, 21% was identified in other operative units (Orthopaedics, Neurology, Neurosurgery, Pneumology, Cardiology, General Surgery, Intensive Care Units). The male/female

ratio was 1:1; 55% were adults over 80 years, 24 % were in the ages 70 to 80 years, 13 % were in the ages 60 to 70 years, and the remaining 8 % were patients under 60 years.

Conclusion: The early identification of CDI in the emergency unit, following the implementation of the procedures drawn up by Hospital, made it possible to take the appropriate control measures and immediate action to limit its spread in the operative units.

Background and objective: Healthcare-associated infections (HAIs) represent the most frequent adverse event in the hospital setting. As part of a surveillance study promoted by the European Centre for Disease Control and Prevention, a survey was carried out to estimate HAIs prevalence in an acute care hospital in central Italy.

Methods: The investigation was carried out in November 2022 through the anonymous consultation of clinical records, using a standardized protocol to collect data on patients, wards, HAIs, and antibiotic therapy.

Results: A total of 164 patients (51.2% males; aged 0-94 years) hospitalized in 17 different wards were included, and 57.3% were in medical wards. At time of the survey, 10.4% (n=17) patients had at least one HAI (53% female; mean age 68.4 years), and 94% were hospitalized in medical wards. 64.7% of infections were linked to inpatient hospital, 23.5% to a long-term care facility and 11.8% to another hospital. According to McCabe score, HAIs patients were mostly (47.1%) classified as with non-fatal disease, while 23.5% and 29.4% with fatal and rapidly fatal disease, respectively. 82.4% of HAIs patients had at least one device (central venous and bladder catheter, tracheal cannula), and 21.4% and 14.3% carried two and three devices, respectively. Furthermore, 82.4% were treated with at least one antibiotic, with two and three antibiotics used simultaneously in 21.4% and 14.3%. A microbiological isolation with antibiogram was present only in 41.2%.

Conclusion: HAIs prevalence was higher than 8.2% estimated for Italian hospitals in 2016-2017 survey and 7.5% assessed in the same hospital in 2019. A significant role for HAIs onset was associated with invasive devices, ward specialty, and severity of clinical conditions. These findings underline the need to strengthen programs for HAIs control through the definition of standardized protocols and availability of specialized team, also in terms of human resources and skills.

Oral Adverse Events of COVID-19 Vaccines in Europe: Analysis of EudraVigilance Database

Abanoub Riad¹, Sameh Attia², Arkadiusz Dziedzic³, Hans-Peter Howaldt²

¹Masaryk University Czech Republic, ²Justus-Liebig-University Germany,

³Dziedzic Poland

Background: The recent reports of oral adverse events (AEs) following COVID-19 vaccination warrant further investigation into their prevalence, severity and aetiology. This study was conducted to synthesise the first-ever population-level evidence about oral SEs of COVID-19 vaccines in Europe.

Methods: The European Union Drug Regulating Authorities Pharmacovigilance (EudraVigilance) database was accessed in August 2022 to extract summary data of all potential oral AEs reported after COVID-19 vaccination. The data were reported descriptively and cross-tabulated to facilitate sub-group analysis per vaccine type, sex, and age group.

Results: Dysgeusia was the most commonly reported oral AE (0.381 cases per each 100 received reports), followed by oral paraesthesia (0.315%), ageusia (0.296%), lip swelling (0.243%), dry mouth (0.215%), oral hypoaesthesia (0.210%), swollen tongue (0.207%) and taste disorder (0.173%). Females had significantly

(Sig. < 0.001) a higher prevalence of all most common (top twenty) oral AEs, except for salivary hypersecretion, which was equally prevalent among females and males.

Conclusion: The present study revealed a low prevalence of oral AEs, with taste-related, other sensory and anaphylactic AEs being the most common AEs in Europe, similar to what was found earlier among the US population. Future studies should explore the potential risk factors of oral sensory and anaphylactic AEs to verify whether they are causally linked to COVID-19 vaccines.

Wastewater surveillance of sars-cov-2 variants in Italy: a powerful tool for tracking the spread of sars-cov-2 variants/subvariants in the population

Giuseppina Rosa¹, David Brandtner², Giusy Ferraro¹, Elisabetta Suffredini³, Carolina Veneri¹, Pamela Mancini⁴, Marcello Iaconelli¹, Luca Lucentini¹

¹Istituto Superiore di Sanità Department of Environment and Health, Istituto Superiore di Sanità, Rome, Italy Viale Regina Elena 299, Rome, Italy, ²Italy,

³Istituto Superiore di Sanità Department of Food Safety, Nutrition and Veterinary public health, Istituto Superiore di Sanità, Rome, Italy Viale Regina Elena 299, Rome, Italy, ⁴Istituto Superior di Sanità Department of Environment and Health, Istituto Superiore di Sanità, Rome, Italy Viale Regina Elena 299, Rome, Italy

Background and objective: Three SARS-CoV-2 Variants of Concern (VoCs) are circulating in the European Union/European Economic Area (EU/EEA) countries as of December 2022: Omicron BA.2, BA.4, and BA.5. ECDC also currently recognizes three Variants of Interest (VOIs): Omicron BA.2.75, BQ.1, and XBB.1. This work analyses the occurrence and spread of VoCs and Vols in Italy in October and November 2022, by monitoring untreated wastewater.

Methods: During October and November 2022, 332 wastewater samples were collected from 167 Wastewater Treatment Plants throughout Italy. Variant characterization was performed by amplifying a ~1600 bp fragment of the spike protein, followed by Sanger (individual samples) and long-read nanopore sequencing (pooled samples by Regions/Autonomous Provinces).

Results: In October 2022, mutations characteristic of Omicron BA.4/BA.5 were detected in the vast majority of the samples. Amino acid substitutions characteristic of sub-lineages BQ.1 (K444T and N460K) or BQ.1.1 (BQ.1 + R346T) were detected for the first time in wastewater in four Regions/A.P. despite the low prevalence documented in clinical cases at the time of sampling. In November 2022, the positivity rate for BQ.1/BQ.1.1 almost quadrupled, and the number of Regions/A.P. positive for the new Omicron subvariant tripled compared to October. Moreover, in November there was the detection of two other Vols never observed before in sewage in Italy: BA.2.75 and XBB.1 (the latter found in a Region where no clinical cases associated with this variant had been documented).

Conclusions: Results suggest that BQ.1/BQ.1.1 is becoming dominant in late 2022, as predicted by the ECDC, and other minor subvariants are emerging, confirming environmental surveillance as a powerful tool for tracking the spread of SARS-CoV-2 variants/subvariants in the population.

DOI: 10.18332/popmed/164441

Seroprevalence of SARS-CoV-2 specific antibodies in Portugal May 2020 - June 2022: results of four serial seroepidemiological surveys

Marta Barreto¹, Irina Kislaya², Paulo Gonçalves³, Camila Henriques³, Ana Torres³, Rita Matos³, Vânia Gaio³, Rita de Sousa³, Raquel Guimar³, Ana Rodrigues³

¹Instituto Nacional de Saúde Doutor Ricardo Jorge Instituto Nacional de Saúde Doutor Ricardo Jorge, Av. Padre Cruz Portugal, ²Instituto Nacional de Saúde Doutor Ricardo Jorge Instituto Nacional de Saúde Doutor Ricardo Jorge Instituto Nacional de Saúde Doutor Ricardo Jorge, Av. Padre Cruz Portugal, ³Instituto Nacional de Saúde Doutor Ricardo Jorge, Av. Padre Cruz Portugal

Background and objective: Seroepidemiological surveys on SARS-CoV-2 are important to establish trends in population-level immunity. From May 2020 through June 2022, the National Health Institute Doutor Ricardo Jorge implemented four serial studies aimed to estimate post-infection and post-vaccination seroprevalence in Portugal.

Methods: Overall, surveys covered 19134 Portuguese residents aged 1 or more years old. In each survey, reminiscent blood samples were collected through nationwide network of 43 clinical pathology laboratories and 36 public hospitals to determine SARS-CoV-2 IgG antibody titers. Following vaccination campaign,

presence of IgG against nucleocapsid protein (anti-N), was used as a proxy of post-infection seroprevalence in vaccinated.

Results: Total SARS-CoV-2 seroprevalence varied between 2.9% [95CI: 2.0-4.2] (1st survey, May 21-July 8, 2020) and 95.8% [95CI:95.0-96.4] (4th survey, April 27-June 8, 2022). In the 3rd survey (September 28-November 19, 2021) the post-vaccination seroprevalence was higher than the post-infection 86.3% [95CI:85.1-87.5] vs. 7.5% [95CI:6.6-8.5]. Following the Omicron wave (4th survey), the post-infection seroprevalence increased to 27.3% [95CI:25.5-29.1] for overall population, and to 71.2% [95CI:64.4-77.2] for children aged less than 5 years old, not eligible for COVID-19 vaccination.

Conclusion

Observed trends in seroprevalence were in line with the evolution of the COVID-19 epidemic and vaccination coverage in Portugal, as well as with the results of studies on vaccine effectiveness, demonstrating the importance of seroepidemiological studies for decision making. Implemented infrastructure and acquired experience can be capitalized for the development of seroepidemiological studies in case of future public health emergencies in Portugal.

Prevalence study on healthcare-related infections and the use of antibiotics in humanitas mater domini

Céline Paudice¹, Simona Sancini², Davide Ghioldi³, Anna Odone¹

¹University of Pavia Department of Public Health, Experimental and Forensic Medicine, University of Pavia, Pavia, Italy, ²Humanitas Mater Domini Hospital clinical institute Mater Domini Castellanza Italy, ³Humanitas Mater Domini Hospital Italy

Introduction: A prevalence study of healthcare-associated infections (HAIs) and antibiotic use was conducted at Humanitas Mater Domini Clinical Institute on 04/26/2022. The study can be used as a monitoring's tool for both antibiotics' use and prevention and control of HAIs.

Materials

The study, used "Patient Questionnaire-Sheet A. EUROPEAN PREVALENCE STUDY ON ICA AND ANTIBIOTIC USE IN ACUTE HOSPITALS" by European Center for Disease Prevention and Control (ECDC). Patients present in all departments at or before 8 a.m. and not discharged at the time of the survey were recruited and patients in day hospital and day-surgery, patients seen as outpatients, and patients in the emergency department present for less than 24 hours were excluded. We collected Data on risk factors for each eligible patient, care-related infections and antibiotic use.

Results: The study involved 103 Patients of whom 58(56%) were eligible. The Distribution was: 65% medical area, 27.5% surgical, 7.5% intensive care. 98% of patients had a peripheral vascular catheter; 52% a urinary catheter; 3% a central venous catheter; 2% of patients intubated. 26% of the sample had an infection (respiratory 45%, urinary 33% bacteremia 22%); responsible pathogens: Pseudomonas aeruginosa 42%. Escherichia coli 33%, Klebsiella pneumoniae 16.6%.

62% of patients was undergoing an antibiotic therapy (prophylactic use 64%, therapeutic 26%, indeterminate 10%). More frequently prescribed Antibiotics: Cefazolin 60%, Ceftriaxone 20%, Piperacillin 7.5%, Meropenem 3%, Vaborem 0.3%, Linezolid 0.2%, Metrodinazole 9%.

Conclusions: The data collected allowed the identification of problems and priorities for intervention, to promote and strengthen skills, provide new recommendations and strategies for the management of HAIs, and to increase the focus on antibiotics' use to meet the criteria of cost-benefit, optimization of therapies, and eradicate the antibiotics' resistance.

The relationship between increased hospital length of stay and accessibility to care settings with lower levels of complexity in Italy

Ilenia Piras¹, Andrea Piana², Roberto Santoru³, Giovanna Deiana⁴, Dolores Soddu³, Antonio Azara⁵

¹Emergency Department SS. Trinità Hospital, ASL Cagliari Italy, ²Department of Medicine, Surgery and Pharmacy, University of Sassari Italy, ³University Hospital Company of Sassari (AOU Sassari) Italy, ⁴PhD School in Biomedical Sciences (Public Health), University of Sassari Italy, ⁵Paolo Castiglia

Background and objective: Hospital length of stay could be increased (outlier) where alternative beds that facilitate care at discharge from the acute care unit are lacking. This study aims to evaluate the potential relationship between hospital outlier and the accessibility to less complex care settings.

Methods: A correlational study was conducted on ordinary hospital admissions in the year 2019 (using the Ministry of Healths Hospital Discharge Records Report) and hospital post-acute (long-term care and rehabilitation) and territorial (residential, semi-residential and rehabilitation) beds in Italy. In respect to the national average outlier, the twenty Italian regions were classified into two groups: with higher and with lower percentages of outliers.

Results: Out of a total of 6.020.466 ordinary hospitalizations in Italy, the average outlier was 3.9%, with a range among regions between 2.7% and 4.7%. The national average of territorial beds per inhabitant was 0.60% (range 0.15%-0.99%). The relationships between outlier and territorial beds are always opposite between the two groups and mainly weak, except for semi-residential beds in the group with lower outlier rates where it is moderate (Pearsons $r = -0.583$; Spearmans $Rho = -0.766$, $p = 0.027$).

The national average of post-acute hospital beds was 0.06% (range 0.02%-0.10%). Correlations between outliers and post-acute hospital beds are always direct in the groups, except for long-term care hospital beds in the group with higher outlier rates (Pearsons $r = -0.306$). The strongest relationship is between outlier and hospital rehabilitation beds in the group with lower outlier percentages (Pearsons $r = -0.720$, $p = 0.044$).

Conclusion: These data show that the decrease in outlier correlates with the increase in territorial semi-residential beds and hospital rehabilitation beds, while the increase in outlier correlates with the decrease in hospital long-term care beds. Considering the inhomogeneous distribution of less complex care settings in Italy, further investigations are needed, especially on the deficient regions.

Agroecology versus agribusiness: An experience of popular health surveillance against the impacts of agribusiness in a region of Brazil

Ana Teixeira¹, Fernando Carneiro², Saulo Diógenes³, Flora da Silva¹, Aline Maia⁴, Reginaldo de Araújo⁵, Vanira Pessoa¹

¹Fundação Oswaldo Cruz Ceará Brazil, ²Fundação Oswaldo Cruz Ceará,

³Universidade Federal do Ceará Brazil, ⁴Cáritas Diocesana de Limoeiro do Norte, ⁵Movimento 21 Brazil

Background and objective: Brazil is one of the largest consumers of pesticides in the world due to the advance of agribusiness in its territory, causing numerous socio-environmental impacts and damage to health, not just human health. This research aims to describe the Popular Surveillance indicators referring to the impacts caused by agribusiness on the agroecological productive backyards of the farming families of Chapada do Apodi, Tabuleiro do Norte, Ceará, Northeast Brazil.

Methods: These families develop the experience "Community that Sustains Agriculture – My Backyard in your Basket", which was registered in the action research "Popular Surveillance of Health, Environment and Work: communities, the Unified Health System and researchers in the defense of the lives of vulnerable populations through a "Participatory"". The action research field activity took place on June 6 and 7, 2022. On the first day, a journey was made through the territory to get to know the families, their agroecological backyards and their social technologies for coexistence with the semi-arid region. On the second day, the communities analyzed the experience of popular surveillance, based on guiding questions in a workshop. **RESULTS:** Families identified as popular surveillance indicators related to the impacts of agribusiness: the death of bees by poison, speed of installation of enterprises, enclosure of areas used for beekeeping and rearing of loose animals, migration of labor from outside the territory, use of drones by agribusiness, strong odor of pesticides and other inputs used by agribusiness, deterritorialized families, large scale deforestation with chains and tractors, accentuation of lack of water.

Conclusion: The protagonism of families is observed in the construction of the experience of popular surveillance regarding the generation of data on the impacts of agribusiness through participatory monitoring with the use of accessible technologies.

Analysis of violence reports in the town of nova iguaçu/state of Rio de Janeiro/Brazil, from 2014 to 2020.

Tatiane Macedo¹, Cosme Silva², Liana Pinto³, Marcos Anjos⁴

¹National School of Public Health-Oswaldo Cruz Brazil National School of Public Health-Oswaldo Cruz Foundation Brazil, ²National School of Public Health-Oswaldo Cruz Foundation, ³National School of Public Health-Oswaldo Cruz Foundation Brazil, ⁴National Institute of Cancer Brazil

Purpose: To describe the epidemiological profile of cases of violence reported in the town of Nova Iguaçu "RJ/Brazil, from 2014 to 2020

Methodology: This is a cross-sectional, descriptive, population-based research, on violence records entered in sinan (national system of disease reports), in the town of nova iguaçu. We collected secondary data and made the exploratory analysis of the social-demographic characteristics of the reported cases (gender, race/skin color, education, age, marital status) and the characteristics of violence (nature, means of assault, and relationship with the assaulter). We used statistical software R to analyze the data.

Results: The total number of violence reports in the town of Nova Iguaçu was 39,587, in the period from 2014 to 2020. These were more prevalent in the age range of 0-9 (29.5%), then 20-29 (19.2%), and 10-19 (14.8%); in males (57.4%); in brown (56.6%) and black (6.2%) races. Variables education and marital status were completed with "Not applicable", since they are more prevalent in children under 7 years old. In relation to their nature, the field others prevailed (36.6%), followed by neglect (33.5%). As for the means of assault used, the most prevalent were others (60.8%), followed by body force (32.2%). In relation to the bond with the assaulter, mother and stepmother were the most prevalent (74.7%), followed by father and stepfather (39.6%).

Conclusions: The town of Nova Iguaçu, located only 35 km from the city of Rio de Janeiro, has a low-income population, where children and adolescents are abused and neglected by their parents. The challenge of reducing all types of violence; in addition to protecting all children and adolescents against abuse, exploitation, and other forms, in accordance with Section 16 of the Sustainable Development Goal, involves overcoming social inequalities, articulation by the government branches, and engagement of the civil society.

Household survey as a tool for detecting the determinants of health: de facto census survey in rural settlements of shamakhi region, azerbaijan

Halil Durak¹, Keyser Vatansever², Mehmet Akman¹, Hande Harmanci¹, Eray Öntaş³, Sekine Azizli⁴

¹WHO Azerbaijan Country Office Azerbaijan, ²WHO country office Azerbaijan,

³WHO Azerbaijan Country Office, ⁴The Administration of the Regional Medical Divisions Azerbaijan

Background and objective: Traditional electronic health records generally lack information on determinants of health, which is crucial for operationalizing the PHC system effectively. This study aimed to determine the demographic and housing characteristics of the rural population of Shamakhi, a mountainous region of Azerbaijan, where the WHO country office has implemented a PHC demonstration project.

Methods: A de facto census survey was carried out in 58 villages and 4 towns using a survey tool including demographic and housing characteristics. No sample selection was made and all residential dwellings were visited.

Results: According to the 2022 Azerbaijan Population Report, the registered population of Shamakhi is 108100 [rural population= 57300 (63,0%)]. The population calculated from the survey is 26854 [12630 (47,74%) females, 13826 (52,26%) males]. The age dependency ratio is 48% (34% young age, 15% old age dependency). The gender parity index for the 15-24 age literacy rate is 1.0, while higher education attainment of 25-64 ages is 4,5% (2,9% for women, 5,9% for men). The unemployment rate for 15-64 ages is 9,75%, which is higher than Azerbaijanians total (6,0%). Although Mandatory Health Insurance covers all citizens, 33,8% of the rural population is uninsured. In Shamakhi, safe drinking water is accessible at home in 19 villages and closed tanks are utilized for sewage disposal in 30 villages.

Conclusion: The difference between the official reports and the census is attributed to a lack of mandatory notification of address changes. The sharp decline in the 0-4 age population and a sharp increase in >80 ages indicate problems in birth and death registrations. These emphasize a demographic and health surveillance system need within PHC. Study results conjured up that PHC services are not only about patient care. Health promotion and disease prevention strategies including health education and intersectoral collaboration are of priorities in Shamakhi.

Popular surveillance of pesticides

Fernando Carneiro¹, Michele Meneses², da Diógenes³, Luiz Rons⁴, Reginaldo de Araújo⁵, Aline de Sousa Maia⁶, José de Almeida⁷, Vanira Pessoa⁸

¹Fundação Oswaldo Cruz Ceará Brazil, ²Federal University of Rio Grande do Sul Ana Cláudia de Araújo Teixeira Oswaldo Cruz Ceará Foundation Brazil

Saulo, ³Federal University of Ceara Brazil, ⁴Caúla Silva Secretariat of the Environment of Cascavel - CE Flora Viana Elizeu da Silva Oswaldo Cruz Ceará Foundation Brazil, ⁵ Movement Brazil, ⁶Limoeiro do Norte Diocesan Cráitas Brazil, ⁷Movement of Landless Rural Workers Brazil, ⁸Oswaldo Cruz Ceará Foundation Bouvet Island

Background and objective: Brazil became one of the largest consumers of pesticides in the world at the beginning of the 21st century. The production model based on the Green Revolution has as one of its highlights the abusive use of pesticides with severe impacts on human health and ecosystems. This study presents results of research on Popular Surveillance of pesticides in three regions of Brazil: South, Midwest and Northeast.

Methods: It is an action research based on Paulo Freires ideas and Ecology of Knowledge by Boaventura Santos. The research was carried out in 2022 in the states of Rio Grande do Sul, Mato Grosso and Ceará, in territories with vulnerable populations such as peasants and quilombolas. The territories were visited by the team of researchers and workshops were held to analyze the problems of each location and collectively produce action plans for each territory.

Results: The communities identified some qualitative indicators of Popular Surveillance, highlighting the following indicators of threat to life: the death of bees, groundwater with the odor of pesticides, animals with congenital malformations, plant mortality and families sprayed with pesticides from airplanes. On the other hand, life promotion indicators were identified such as agroecological productive backyards, organic production areas and collective organizations for monitoring the territory.

Conclusion: The Popular Surveillance of Pesticides is marked by popular protagonism in the defense of life and its development can contribute to the strengthening of institutional surveillance.

Excess mortality associated with voc-specific covid-19, flu and extreme temperatures: A comprehensive time-series analysis approach to estimate attributable mortality during the covid-19 pandemic in Portugal

Susana Silva¹, Álar Silva², Ana Torres³, Baltazar Nunes⁴, Carlos Dias⁵, Jens Nielson⁶, Ana Rodrigues³

¹Instituto Nacional de Saude Dr Ricardo Jorge Departamento de Epidemiologia; Avenida Padre Cruz Portugal, ²Instituto Português do Mar e da Atmosfera, ³Instituto Nacional de Saude Dr Ricardo Jorge Portugal, ⁴a.rita.torres@insa.min-saude.pt Portugal, ⁵Instituto Nacional de Saude Dr Ricardo Jorge, ⁶Statens Serum Institut Portugal

Background and objective: First COVID-19 case was detected in Portugal on March 2020. More than 25,000 COVID-19 deaths have been reported, but it may not reflect the burden of the pandemic, especially, when competing factors occur simultaneously. We aimed to estimate all-cause mortality attributable to COVID-19 by SARS-CoV2 variant of concern, influenza and extreme temperatures (ET) during pandemic period in Portugal.

Methods: To estimate mortality attributable to COVID-19, influenza and extreme temperatures, we used an adaptation of the FLUMOMO model. Considering the weekly number of all-cause deaths as the dependent variable, an additive Poisson regression model adjusted for overdispersion, trend and seasonality, was fitted with Influenza activity (Goldstein index), new COVID-19 hospitalizations adjusted for concern variants (Pre-Delta; Delta; Omicron BA 1 and 2; and Omicron BA 4 and 5), and ET as independent variables. We estimated the mortality attributable fraction of each independent variable between 2020-W10 and 2022-W38. We performed the analysis for all population and age groups.

Results: We estimated 43,766 deaths above the expected, 36,810 attributable to COVID-19, 544 to influenza and 6412 to ET. 60%, 15%, 11% and 15% of COVID-19 attributable mortality was due to, respectively, Pre-Delta, Delta, Omicron BA 1 and 2, and Omicron BA 4 and 5 variants.

The mortality estimated as attributable to COVID-19 is higher than the reported officially as COVID-19 specific mortality, which was expected because we estimate mortality directly and indirectly attributable to COVID. The highest mortality attributable to COVID-19 was estimated in the age group ≥ 80 years. These results are provisional.

Conclusion: This analytical approach allows a detailed assessment of the impact of the COVID-19 pandemic, direct and indirect factors, adjusting it for competing risks for excess deaths like influenza and ET. We were able to estimate the fraction of mortality attributable to SARS-CoV2 variant of concern.

DOI: 10.18332/popmed/164378

New incidence of lung cancer in Hanoi in the period 2015 - 2019

Pham Van¹

¹Institute of Preventive Medicine and Public Health, Viet Nam

Objectives: This study on the epidemiology of lung cancer in Hanoi from 2015 to 2019 offered crucial details on the situation of the disease and epidemiological characteristics of lung cancer. **Methods:** Data was collected retrospectively in a descriptive study with analysis.

Results: In Hanoi, 7389 new cases of lung cancer were diagnosed between 2015 and 2019. The highest age group was 60-69 years old, accounting for 36.2% of the population; the crude incidence rate was 20.3/100000; the age-standardized incidence rate was 19.6/100000 (with 31.6/100000 for men and 9.7/100000 for women); and the age-standardized incidence rate in the inner city is lower (13.7/100000) than that in the suburban area (19.4/100000). **Conclusions:** Lung cancer was still a public health issue that required special attention. Effective tobacco control initiatives, early detection screening, and improved treatment quality were the top priorities for reducing the negative effects of lung cancer in the community. **Keywords:** Incidence rate, lung cancer, Hanoi

The future of health impact assessment- setting the Research Agenda

Fiona Haigh^{1,2}, Margaret Douglas³, Odile Mekel⁴, Liz Green⁵, Katie Hiron⁶

¹University of New South Wales, Australia, ²Sydney Local Health District, Australia, ³Public Health Scotland and University of Glasgow, ⁴NRW Centre for Health, Germany, ⁵Wales Health Impact Assessment Support Unit (WHIASU), Public Health Wales (PHW), United Kingdom, ⁶RPS, United Kingdom

Health Impact Assessment (HIA) is a key approach to achieve Health in All Policies, by identifying impacts on health and equity and recommending changes to address these impacts. Since the Gothenburg Consensus Statement in 1999, HIA has been applied to policies, plans and projects in multiple sectors and settings across the world and researchers have demonstrated its effectiveness in influencing policies. However, its use is still variable globally with few jurisdictions using HIA systematically to maximise the potential of all policies and plans to improve health and legislation is generally aligned to environmental health impact assessment rather than the social determinants of health and equity. The COVID-19 pandemic has raised the importance of social determinants of health, as many indirect health effects arose from pandemic effects on social and environmental pathways. HIAs of pandemic responses have demonstrated its potential to identify and help address these impacts. The climate emergency will bring even more wide-ranging health impacts that need to be addressed in an integrated way, which HIA could support. Recovery and renewal from the pandemic presents a window of opportunity for public health and other sectors to consider what is needed to support the future evolution and development of HIA in different contexts. This workshop involving international HIA experts and leaders will draw on the findings of an international survey of 160 HIA practitioners views on the current opportunities for HIA; differing practice and perspectives on HIA; potential methodological innovation; and research gaps and needs in the field. The workshop will build on the survey Findings to develop a HIA research agenda for the next decade. Specific Aims/Objectives and Component Parts: The aim of the workshop is to develop a research agenda that we will share and publish. The workshop will include: 1. Presentation of findings of an international HIA survey, 2. Small group discussion with workshop participants to: 1) Discuss areas of research and gaps to address in the field of HIA over the next ten years, 2) Formulate these as specific research questions, 3) Identify mechanisms to build HIA research capacity, 4) Prioritisation of research questions identified by small groups, 5) Interactive panel with HIA experts/leaders to reflect and discuss next steps in how we can build and support a HIA research agenda. The key questions that the workshop will address: 1. What is the most important research needed in the field of HIA in the next ten years? 2. What are the most important unresolved research questions in HIA? 3. How can we build and support HIA research and capacity?

Public health surveillance: lessons from the pandemic

Stefano Tancredi¹, Tatjana Makovskij², Dritan Bejko³, Jason Gilliland⁴, Arnaud Chiolero¹, Saverio Stranges⁴

¹University of Fribourg Switzerland, ²French National Public Health Agency, France, ³Luxembourg Health Directorate, Luxembourg, ⁴Western University Canada

Background: What have we learned about surveillance during the pandemic? Surveillance systems drive policymakers' decisions, but it is not easy to transform data into useful information. Multiple surveillance methods are needed, and clear definitions of what is being monitored are fundamental.

Objectives and Key Questions

The objective of this workshop is to strengthen the culture of surveillance and discuss the strengths and weaknesses of various COVID-19 surveillance strategies. Key questions will be: 1) which information is needed for decision-making? 2) how can we monitor the pandemic and its impact? 3) how should we adapt the system at different stages of the pandemic?

Overview: We will have a short introduction and 4 case studies (each 10 min) followed by an active discussion.

Introduction (Chiolero and Stranges): Multiple challenges hampered COVID-19 surveillance (lack of common standards, different diagnostic strategies, infodemia). The pandemic has highlighted the advantages and disadvantages of different surveillance strategies and the importance of having a multilayer and highly adaptive health information system.

Case study 1: Seroprevalence studies for the surveillance of COVID-19: Corona Immunitas (Tancredi)

Population-based seroepidemiological studies are needed to understand SARS-CoV-2 spread. We will present the methods and results of Corona Immunitas, a Swiss national research project consisting of repeated population-based serological studies conducted with a common methodology. The project included a Digital Follow-Up eCohort to monitor health status changes, adherence to preventive measures, and the social impact of the pandemic.

Case study 2: Challenges in the definition of long COVID or Post-COVID-19 condition (Makovski)

We will present an operationalization of the WHO definition of the post-COVID-19 condition on a sample of the general adult population in France. We will describe the prevalence of each symptom at different time points after the infection and their correlation, and compare characteristics of post-COVID-19 condition subjects (as selected by WHO definition) with those not selected but who perceived experiencing Long COVID.

Case study 3: Electronic health records to assess vaccine effectiveness (Bejko)
Linked routinely collected electronic health records at the national level can help evaluate vaccine effectiveness. Using data from laboratory confirmed SARS-CoV-2 PCR tests linked with vaccination data and SARS-CoV-2 hospitalisations and deaths, we investigated severe outcomes (hospitalisation, death) in relation to variants, vaccination status, and prior infection and evaluated the effectiveness of a fourth bivalent Omicron-containing booster dose and natural immunity due to prior infection against laboratory confirmed SARS-CoV-2 infection.

Case study 4: A geospatial surveillance portal to monitor COVID-19 transmission (Gilliland and Stranges)

Based on a geospatial portal for real-time surveillance of COVID-19 transmission and detection of disease clusters, we demonstrated the use of emerging hot spot analysis techniques to map and analyze spatiotemporal changes in COVID-19 transmission in Middlesex County, Ontario, between July 2020 and January 2021. The project demonstrated that geospatial surveillance portals are valuable tools for helping public health decision makers to identify and respond to disease outbreaks.

Challenges in the surveillance of chronic diseases in an era of big data

Arnaud Chiolero¹, Cornelia Wagner¹, Stefano Tancredi¹, Piotr Wilk²

¹Population Health Laboratory (#PopHealthLab), University of Fribourg, Switzerland, ²Department of Epidemiology and Biostatistics in the Schulich School of Medicine & Dentistry, Western University, Canada

Background: Management and prevention of chronic diseases require high-quality surveillance. In an era of big data and infodemia, several challenges hamper efficient surveillance, such as the definition and measurement of chronic diseases and how to best use data that are not designed primarily for surveillance. Using three cases studies, we propose a workshop to discuss current challenges in the surveillance of chronic diseases.

Objectives and key questions

Our objective is to discuss current challenges in the surveillance of chronic diseases. Specifically, the workshop will address these key questions: 1) how to define chronic conditions? 2) how to prevent surveillance bias?

Brief overview

We will have one short (10 min) introduction and 3 case studies (each 10 min) presentations followed by an active discussion session (20 min):

Introduction (Arnaud Chiolero and Cornelia Wagner)

Public health surveillance is the ongoing collection and analysis of health-related data, followed by the timely dissemination of information useful for decision. In an era of big data and infodemia, it might appear easy to conduct the surveillance of chronic diseases. However, multiple challenges hamper efficient surveillance, notably related to changing definitions and diagnostic methods of chronic diseases and to the quality of data from multiple sources not designed primarily for surveillance.

Case Study 1: Defining Multimorbidity in High-Income Countries (Piotr Wilk and Saverio Strano)

In 2012, the Public Health Agency of Canada defined multimorbidity as having two or more of ten common chronic diseases, selected based on their duration, high prevalence, significant societal or economic impact, and amenability to primary prevention. In 2017, multimorbidity was defined as the co-occurrence of a least two of five groups of chronic diseases (cancer, diabetes, cardiovascular disease, chronic respiratory disease, mental illnesses). We will discuss the implications of the two definitions of multimorbidity on prevalence estimates and geographic distribution across Canada.

Case Study 2: Self-Reported data for the Surveillance of Chronic Diseases (Arnaud Chiolero)

Self reported data are commonly used for population health monitoring. Using data of a large school-based study and through a literature review, we will discuss strength and limitation of self-reported data for the surveillance of overweight. We will extend the discussion toward the pros and cons of surveillance of other chronic conditions based on self-reported data.

Case Study 3: Surveillance Bias of Cancer – when Appearances are Misleading (Stefano Tancredi)

Surveillance bias occurs when differences in the frequency of a condition are due to variations in the modalities of detection rather than to changes in the actual risk of the condition. This is of growing concern because surveillance activity is more and more often based on data not designed primarily for surveillance, notably from healthcare providers. We will show the impact of this bias on cancer surveillance.

Impact of the COVID-19 vaccination on the trend of COVID-19 in Ireland: a joinpoint regression analysis

Tochukwu Igboanugo¹

¹University College Cork, Ireland

Background: Public health interventions are organised efforts made to improve health at a population level. Vaccine impact can be assessed by comparing the trends in a targeted disease before and after the introduction of the vaccine. The study aimed to analyse the trend in incidence and mortality of COVID-19 in Ireland from March 2020 to February 2022. **Methods:** The age-standardized COVID-19 incidence and mortality rates in Ireland were calculated by direct standardization using the European Union standard population. Monthly percentage change (MPC) and the corresponding 95% confidence interval (CI) was computed for the trends using the joinpoint regression analysis. The data was obtained from the Central Statistics Office and Health Protection and Surveillance Centre, Ireland.

Results: The COVID-19 incident rate sustained an upward trend two years post-pandemic. The incidence rate increased by 1.5 % per month ($p < 0.05$) for both the male and female populations. The mortality rate showed a rise and fall trend. Among the female, deaths from COVID-19 fell in the periods of March 2020 to July 2020 (MPC = -43.6%; 95% CI, -77.6 – 42.0; $p = 0.197$), January 2021 to June 2021 (MPC = -54.7%; 95% CI, -81.5 – 11.0; $p = 0.077$) and December 2021 to February 2022 (MPC = -1.4%; 95% CI, -98.1 – 4487.1; $p = 0.994$). For the males, COVID-19 deaths decreased in the periods of March 2020 to August 2020 (MPC = 33.3%; 95% CI, -72.5 – 62.0%; $p = 0.333$), February 2021 to June 2021 (MPC = -70.0%; 95% CI, -94.7 – 71.6; $p = 0.155$) and December 2021 to February 2022 (MPC = -0.4%; 95% CI, -77.4 – 339.0; $p = 0.996$). **Conclusions:** The finding suggests that COVID-19 vaccination has no impact on the transmission of SARS-CoV-2. The impact of the vaccines in preventing deaths from COVID-19 requires further research.

Development of a road map to scale up the uptake and utilization of Influenza vaccine in 22 countries of Eastern Mediterranean Region

Abrar Chughtai¹

¹University of New South Wales Sydney, Sydney, Australia

Background: Eastern Mediterranean Region (EMR) of WHO comprises of 22 countries and many of them are experiencing humanitarian emergencies and disasters. The aim of this project was to develop a road map to support countries in EMR in developing and implementing seasonal influenza vaccination policy, strengthen influenza vaccination delivery program and address vaccine hesitancy. **Methods:** The road map was developed through consultative meetings with countries' focal points, review of relevant literature and policy documents and analysis of WHO/UNICEF Joint Reporting Form on immunization ((JRF 2015-2020) data. Countries were categorised into three groups, based on the existence of influenza vaccination policy and national regulatory authority, availability of influenza vaccine, socio-economic status and number of influenza vaccine doses distributed.

Results: The goal for next 5 years (2022-26) is to increase access to and use of utilization of seasonal influenza vaccine in EMR to reduce influenza-associated morbidity and mortality among priority groups for vaccination. Countries in the EMR are at different stages of implementation of the influenza vaccination program, so activities are planned under four strategic priority areas based on current situations in countries. Some countries were recommended to establish a new seasonal influenza vaccination programme and ensure the availability of vaccines, while other countries need to reduce vaccine hesitancy and enhance current seasonal influenza vaccination coverage, particularly in all high-risk groups. Countries are also encouraged to leverage COVID-19 adult vaccination programs to improve seasonal influenza vaccine uptake.

Conclusions: The road map proposes activities that should be adopted in the local context to develop/ update national policies and programs. Countries should learn from COVID-19 vaccination programs, and this may be an opportunity to strengthen adult immunization programme for influenza. The roadmap will not only increase seasonal influenza coverage in EMR but will also help in delivering a pandemic influenza vaccine when needed.

Human Papillomavirus vaccination delivery systems within National and Regional Immunization Programs: a systematic literature review

Meheret Shumet¹, Marisa Felsher¹, Cristinel Velicu²

¹MSD, United States, ²MSD (Merck, Sharp and Dohme), United States

Introduction: Human Papillomavirus (HPV) causes 4.5% of all new cancer cases. Efficient HPV vaccination programs are crucial to reduce the global burden of cancer. As of June 2020, 107/194 World Health Organization (WHO) Member States have introduced HPV vaccination, one-third of which are gender neutral whereby girls and boys receive vaccination. Globally, only 15% of girls and 4% of boys in the target age for HPV vaccination receive the full course. The Objective of this systematic literature review was to describe HPV delivery strategies within national and regional immunization programs in low- middle- and high-income countries to identify strategies to increase HPV vaccination coverage globally. **Methods:** We systematically reviewed studies within MEDLINE and EMBASE published between 2012-2022. Studies were included if they described immunization programs in which HPV had been included for >6 months. Key outcomes of interest were strategies utilized in the implementation of HPV delivery programs (e.g., vaccine delivery location, community awareness campaigns). Of the 2549 articles retrieved, 168 met inclusion criteria and were included for final synthesis.

Results: Most (n=78) articles were from North America, 31 from Europe and Central Asia, 15 from East Asia and Pacific, 8 from Africa, 5 from Latin America and Caribbean, 2 from South Asia, and 29 included multiple regions. While most articles (n=121) focused on high-income countries, 19 focused on low- or middle-income countries and 28 spanned multiple income levels. The most frequently described strategies that had a positive impact on HPV vaccine coverage included selecting optimal delivery locations for the local context, such as school-based programs (n=51), multi-sectoral collaboration (n=47), community-awareness campaigns (n=42), systematic vaccine invitations and reminders (n=37), immunization information systems (n=26) and vaccine provider education and training (n=11).

Conclusions: This review identified cross-cutting strategies across diverse countries that may improve HPV vaccine coverage.

Cape Verdean immigrant parents report very low knowledge of HPV: an urgent call for culturally grounded and sensitive education to reduce HPV-associated cancers and disparities

Ana Lindsay¹

¹Manning College of Nursing and Health Sciences, University of Massachusetts, Boston, United States

Racial/ethnic minoritized and immigrant parents have lower knowledge of human papillomavirus (HPV) and its cancer-related health consequences than Whites and United States (US)-born parents. Black women are disproportionately affected by HPV-associated morbidity and mortality, with the second-highest cervical cancer incidence rate compared to non-Hispanic Whites, and the highest cancer mortality rate. There is a lack of data for African ethnic minority subgroups in the US such as Cape Verdeans (CV). This exploratory cross-sectional study assessed HPV and HPV-associated cancer knowledge among CV parents of adolescents (11-17 years) in the US. A total of 109 parents, representing 109 unique families participated. About two-thirds were mothers (67%; n = 73); nearly all parents were foreign-born (96.3%, n=105) and the majority (86.2%, n=94) reported CV Creole as the primary language spoken at home. The mean HPV knowledge score was 3.5 out of 17 (SD = 3.9). Overall, mothers displayed higher knowledge of HPV transmission and cancer-related morbidity and mortality (4.4; SD = 4.1 vs. 1.7; SD = 2.8; P = 0.0001) than fathers. The knowledge item answered correctly by most parents (41.3%) was that HPV is a sexually transmitted disease. The link between genital HPV infection and cervical cancer was low with only 22% of parents correctly answering that HPV can cause cervical cancer. Though mothers were more likely than fathers (28.8%; n = 21 vs. 8.3%, n = 3; p = 0.02) to correctly identify the link between HPV and cervical cancer, it is noteworthy that less than 29% of mothers answered this knowledge item correctly. Moreover, knowledge that in women HPV can be detected by a Pap test (Pap smear) was quite low, with only 31.5% of mothers answering this item correctly. Findings highlight an urgent need for culturally grounded and sensitive HPV education program for Cape Verdeans in the US.

Children and young people's understanding of vaccines in the United Kingdom

Fernanda Perez¹, Philip Satherley¹, Jyotsna Vohra¹, William Roberts¹

¹Royal Society for Public Health, United Kingdom

Background and Objective: Previous research about children and young people's (CYP) perceptions of vaccines either involve only parents or a small sample of children. Given the lack of data on their understanding of vaccines, the Royal Society for Public Health (RSPH) surveyed CYP aged 12-15 years living in the United Kingdom (UK) about their awareness of what vaccinations are and how they work, views on who the decision maker should be and understanding of different vaccines including HPV and COVID-19. **Methods:** An online survey was distributed to CYP (N=1584, sample representative of the UK population) in October 2022. Data was analysed using standard descriptive statistics and independent samples t-test.

Results: Most CYP think vaccines are important for their health, trust them and know what they do, however less than 60% know there is a vaccine for HPV and Meningitis and 1 in 5 do not know that there is a vaccine for Polio. Around half the CYP did not know which vaccines are available for them and many of those who have already been offered an HPV vaccine do not know this vaccine is available. Awareness and trust vary according to CYP ethnicity, with the main concerns being side effects, safety and pain. **Conclusions:** Despite trusting and knowing what vaccines are, some CYP do not know which diseases have available vaccines or which they are entitled to have in the UK. Their lack of awareness could impact uptake now and in the future, therefore more must be done to raise awareness and understanding in this group, especially with the re-emergence of diseases such as measles and polio. More research is also needed to understand why CYP from Black, Asian and mixed background have lower levels of awareness and trust of vaccines than their white peers.

Immune responses to the adjuvanted recombinant zoster vaccine in immunocompromised patients

Alessandra Bruno¹, Luca Riggio², Francesco Vitale³, Vincenzo Restivo⁴, Rosalia Caldarella⁵

¹Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties (PROMISE), University of Palermo, Palermo, Italy,

²Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties, University of Palermo, Palermo, Italy, ³ProMISE, Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties, School of Specialty in Public Health, Hygiene and

Preventive Medicine, University of Palermo, Italy, ⁴School of Specialty in Public Health, Hygiene and Preventive Medicine, University of Palermo, ⁵U.O.C. Clinical Analysis CORLEAB, AOUN Paolo Giaccone, Palermo, Italy

Background and Objectives: Immunocompromised patients, who are at excess risk for herpes zoster compared to the general population, can have a lower response to vaccinations. The aim of this observational single-centre prospective study is to evaluate the immunogenicity and safety of the recombinant zoster vaccine (RZV) in adults with acquired immunodeficiency, including a subgroup of patients with Non-Hodgkin B-cell Lymphoma (NHBL) and Chronic Lymphocytic Leukaemia (CLL), who tend to develop a lower immune response. **Methods:** In this study, conducted at the University Hospital of Palermo, a heterogeneous population of 72 patients aged 18 years and older was enrolled. We assessed the vaccination-induced VZV anti-glycoprotein E production testing patients' blood serum pre-vaccination (T0), at month 1 (T1), one month after the second dose (T2), and at month 6 (T3). Participants were stratified according to underlying diseases and immunosuppression status: healthy controls (n=2), patients with NHBL and CLL (n=8), other immunocompromised patients (n=53), and patients with degenerative conditions (n=9). **Results:** The median age of the participants is 61 years (IQR 47-69) and the majority is female (57%); 15 of them (20%) were recruited at the time of the second dose. There was a statistically significant difference between time points in all participants, as determined by one-way ANOVA ($p < 0.001$) and in the immunocompromised group ($p < 0.001$). A Tukey post-hoc test revealed that antibodies response at T1 and T2 was significantly higher in comparison to baseline in all participants (T1 vs T0 and T2 vs T0; $p < .001$) and in the immunocompromised group (T1 vs T0 and T2 vs T0; $p < .001$). **Conclusions:** A complete RZV vaccination cycle significantly increased VZV gE-specific immunity in a group of patients with a wide variety of immunocompromising conditions, including those with NHBL and CLL.

Early Results on safety of monkeypox vaccine using active surveillance, a bicentric study in Italy

Marco Montalti¹, Zeno Valerio¹, Elena Bovolenta², Chiara Realì³, Federica Castellazzi³, Davide Resi², Davide Gori⁴

¹School of Hygiene and Preventive Medicine, University of Bologna, Italy,

²Department of Public Health, Bologna Local Health Authority, Italy,

³Department of Public Health, Romagna Local Health Authority, Italy,

⁴University of Bologna, Italy

Background: In August 2022, the vaccination campaign to counter the spread of monkeypox, defined by the WHO as a public health emergency, began in Italy, identifying laboratory personnel, and MSM with specific risk criteria as priority targets. In primary vaccinations, two doses of vaccine were administered intradermally while for booster vaccination, only one dose was administered. Our aim was to describe the adverse events following immunization (AEFIs) with this vaccine (MPXV) through participant-based active surveillance. **Methods:** From October 2022, the study was conducted in two Italian towns (Bologna and Forlì) population aged over 18 who received MPXV. E-questionnaire (Q1) dissemination occurred through QR-codes during the second vaccine dose appointment (or by e-mail one month after the booster dose). Participants will also be administered online questionnaires by e-mail at different points in time after the second dose: one month (Q2), and three months (Q3). A descriptive analysis was conducted to quantify AEFI incidence, stratifying Results by type and severity of symptoms. **Results:** Overall, 148 vaccine recipients were recruited in the first two months. Mean age was 36.2 ± 8.6 years. After the first dose, systemic reactions were reported by 32.8% of the participants (mostly asthenia), while local site reactions were reported by 97.1%. The most common local AEFIs were redness, swelling, and itching at the injection site. Grade 3 or 4 AEFIs were reported - for local AEFIs only - by 16.8% of the participants. Recipients of subcutaneous vaccines (n=12) reported fewer and lower-grade local AEFIs. **Conclusions:** Our preliminary results suggest that MPXV has a high tolerability profile in terms of short-term common systemic AEFIs. The study will help collect data about the persistence of the frequent local AEFIs following intradermal administration.

DOI: 10.18332/popmed/165095

Attitudes towards vaccinations in Italian cohort of IBD patients

Luciano D'Azzo¹, Andrea Constantino², Marco Michelson³, Maurizio Vecchi³, Flavio Caprioli³, Salvo Leone⁴, Miriam Belluzzo⁵, Alessadro Carubia⁵, Tania Vitelli⁵, Luigi Zagra⁵, Francesco Balsamo⁵, Martina Sciortino⁵, Nicole Bonaccorso⁵, Angelo Fertitta⁵, Francesco Vitale⁵, Claudio Constantino⁵

¹Scuola di Specializzazione in Igiene e Medicina Preventiva, Dipartimento PROMISE, Università degli Studi di Palermo, Italy, ²Department of Pathophysiology and Transplantation University of Milan, Italy, ³Department of Pathophysiology and Transplantation, University of Milan, Italy, ⁴AMICI ETS, Italy, ⁵Department of Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties, G. D'Alessandro University of Palermo, Italy

Background and Objectives: Patients affected by inflammatory bowel diseases (IBD) often require immunosuppressive treatments which may increase the risk of opportunistic infections. Several guidelines suggest to investigate patients' vaccination status before starting any treatment and perform vaccinations against vaccine preventable diseases (VPDs). Nevertheless, vaccination rates in IBD patients are not suboptimal and may also be lower than those in general population. Aim of the study was to investigate vaccination coverage against VPDs and its possible determinants among a cohort of IBD patients. **Methods:** An anonymous validated questionnaire was sent by the Italian IBD patients' association "AMICI-ETS" to their members through mailing lists and social media. Patients were asked to report their vaccination status and their attitude towards vaccinations between favorable, opposing, or uncaring. The factors influencing attitude towards vaccinations were examined calculating crude and adjusted odds-ratios (AdjORs) with 95% confidence-intervals (CIs).

Results: The questionnaire was sent to 4039 patients with a response rate of 25.3% (n=1252). Socio-demographic and clinical characteristics. Overall, 79% have referred to be vaccinated against most of VPDs while 252 (20.7%) did not remember any previous vaccination. 1152 of respondents (88.8%) stated a positive attitude towards vaccines, while the rest were uncaring or against vaccinations (7.3% and 3.9% respectively). The determinant influencing the positive attitude towards vaccinations was the belief of possible return of VPDs with decline of vaccination coverage rates (AdjOR 5.67, 95% CI 3.45-9.30, p-value <0.001). **Conclusions:** Despite the high percentage of patients showing a positive attitude towards vaccinations which was mainly influenced by the greater awareness of VPDs with the decline of vaccination rates, study confirmed a low vaccination rate among IBD population. This may suggest a central role of physicians in prescribing vaccinations since most patients have a positive attitude, even developing vaccination campaigns to increase vaccinations' rates in IBD patients.

Efficacy and safety of quadrivalent conjugate meningococcal vaccines: a systematic review and meta-analysis

Andrea Conti¹, Gaia Broglia¹, Chiara Sacchi¹, Fabrizia Risi¹, Francesco Barone-Adesi¹, Massimiliano Panella¹

¹Department of Translational Medicine, Università del Piemonte Orientale, Italy

Background and Objective: Over the last decades, different antimeningococcal quadrivalent (MenACWY) vaccines have been developed as different formulations (diphtheria toxoid conjugate, MenACWY-D; tetanus toxoid conjugate, MenACWY-TT; CRM197 protein conjugate, MenACWY-CRM). However, their availability varies worldwide, both in terms of authorized formulations and of inclusion in vaccination schedules. Furthermore, several countries include only the monovalent meningococcal C (MenC) vaccine in their immunization programmes. Finally, there is currently no updated systematic review that directly compares the MenACWY formulations. Thus, we systematically summarized the evidence on efficacy and safety of MenACWY vaccines. **Methods:** Four parallel, independent systematic literature searches were carried out to identify randomized controlled trials performed comparing the above-mentioned vaccines. Serum bactericidal activity and the proportion of adverse events were considered as outcome for efficacy and for safety, respectively. When possible, a random effect meta-analysis was performed, and Results were reported as risk ratios.

Results: A total of 16 studies have been included. In terms of efficacy, MenACWY-TT outperformed MenACWY-D (risk ratio (RR): 1.12; 95% confidence interval (CI): 1.06- 1.19) and MenACWY-CRM (RR: 1.12; 95% CI: 1.05-1.19) for A, W-135, and Y serogroups, while no significant difference was found for serogroup C. Furthermore, we did not find significant differences in efficacy between MenC and MenACWY-TT. Regarding the safety, we were able to perform a quantitative analysis only between MenACWY-TT and MenC, finding no significant differences in the occurrence of adverse events. Similarly, among the different MenACWY formulations no relevant differences were identified.

Conclusions: MenACWY-TT was found more effective than the other formulations, and its efficacy against serogroup C was comparable to the MenC. Safety profiles were similar among all the investigated vaccines. These findings suggest that MenACWY-TT could be preferable to other formulations to improve current

vaccination programs and to better develop future immunization policies.

Barriers and strength factors of adult immunization plans in seven countries of the European Region

Gaia Lombardi¹, Serena Tumelero², Teresa Lanza³, Andrea Paladini¹, Carolina Castagna¹, Chiara Cadeddu⁴

¹Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, ²Aix-Marseille Université, Marseille, France, ³Università Cattolica del Sacro Cuore, Italy, ⁴Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome

Background and Objective: Adult vaccinations are a core pillar of any preventive health strategy. Nevertheless, adults have far fewer vaccinations recommended in the schedule with respect to other age groups, as well as reduced funding, few registries for tracking and recall and fewer incentives. In the European context, the adult vaccination plans are not homogeneous and an increasing number of countries show very different vaccination coverage rates. Starting from these premises, the present systematic review analyzes existing strategies and policies used for adult vaccination of seven countries of the European region, emphasizing weaknesses and strengths of immunization schedules.

Methods: Selected countries were Germany, France, UK, Italy and Spain plus Sweden, as an example of a country implementing recognized best practices for vaccination, and Romania, for its difficulties due to widespread vaccine hesitancy. Three main scientific databases (PubMed, Scopus and web of science) were queried and the PRISMA guidelines were followed. Studies assessing weaknesses or strengths factors, facilitators and barriers related to the adult vaccination plans were considered eligible. Quality assessment of included studies was also conducted.

Results: We included ten studies with a medium/high score at the quality assessment. Main barriers and strength factors for vaccination can be divided into the following categories: financial aspects (e.g. If the vaccine has a funding mechanism); administrative/practical factors (e.g. Complex booking systems); geographical factors (e.g. Geographical proximity, places of vaccination); factors related to healthcare professionals (e.g. Availability of trained staff); factors related to vaccine supply.

Conclusions: Substantial improvement in adult vaccination uptake is urgently necessary in order to decrease the burden of infectious disease on healthcare systems. In order to achieve this goal, vaccination strategies and policies should leverage on the existing facilitators of immunization plans and try to remove local barriers to vaccine uptake.

Analyzing COVID-19 vaccine hesitancy among Nepalese people: a cross-sectional study at National level

Ghanshyam Bhatta¹, Sujit Sah², Tom Pignon³, Suman Rawal⁴, Josue Orellana⁵, Bibek Lal⁶, Sagar Dahal⁶, Ramesh Adhikari⁷

¹Adventist Development and Relief Agency (ADRA) Nepal, ²Adventist Development and Relief Agency (ADRA), Sanepa, Lalitpur, Nepal, ³Adventist Development and Relief Agency (ADRA), Sanepa, Nepal, ⁴Adventist Development and Relief Agency (ADRA), Lalitpur, Nepal, ⁵Adventist Development and Relief Agency (ADRA) International, United States, ⁶Family Welfare Division, DoHS, Ministry of Health and Population, Kathmandu Nepal, ⁷Center for Research on Education, Health and Social Science (CREHSS), Kathmandu Nepal

Background: The coronavirus disease 2019 (COVID-19) pandemic has caused massive disruption affecting the lives of billions of people worldwide. Vaccine hesitancy remains a barrier in the fight against COVID-19. The main objective was to assess COVID-19 vaccine hesitancy rate and its associated factors among the Nepalese people.

Methods: A cross-sectional study design was used to collect quantitative data from all seven provinces. A total of 728 community people aged ≥18 years were surveyed to gather information. Bivariate and multivariate analyses were performed.

Results: More than half of respondents (56%) were females whereas 34% belonged to age group 25-34 years. More than half of respondents (52%) lost their family income due to COVID-19. Overall, a fifth of the Nepalese people (19.6%) have COVID-19 vaccine hesitancy. The main reasons were fear of side effects (62%) and doubt on vaccine efficacy (50%). Bivariate analysis showed a significant association of vaccine hesitancy with province, age group, religion, ethnicity, level

of education and source of family income. Furthermore, multivariate analysis shows that respondents from province 2 were about three times (aOR=2.9, 95% CI=1.2-6.9) more likely to show vaccine hesitancy than respondents from province 1. Likewise, respondents who were Muslim were eight times (aOR=7.9, 95% CI=1.28-48), and respondents who were from a marginalized ethnic group were three times (aOR=2.5, 95% CI=1.3-5) more likely to show hesitancy. Those respondents who had completed basic education (aOR=0.3, 95% CI=0.16-0.59) and secondary (aOR=0.36, 95% CI=0.17-0.8) and above were less likely to show vaccine hesitancy than those who were illiterate.

Conclusions: The prevalence of COVID-19 vaccine hesitancy was high in Nepal. This hesitancy is driven by the peoples attitude towards the health system and vaccine. There is a need to increase the advocacy and awareness of the COVID-19 vaccine to eliminate the hesitancy and increase the vaccine acceptance rate.

Immunize BC's informed choice program

Lily Crist¹, Craig Thompson²

¹Public Health Association of British Columbia, Canada, ²Public Health Association of British Columbia, Victoria, Canada

On July 1, 2019 the BC ministry of health enacted a mandatory vaccination status reporting regulation (VSRR) under the public health act. Under the regulation, every student (excluding those attending schools in indigenous communities) from kindergarten to grade 12 attending public and independent schools, including those home schooled, are expected to have a completed immunization record in the provincial immunization registry. A secondary goal is to provide evidence-based information regarding the importance of immunization and the risks associated when choosing not to immunize. The public health association of BC (PHABC) was given the task to develop an evidence-based immunization education module. The module is intended for parents of children whose records have not been submitted/incomplete. The PHABC conducted an environmental scan to evaluate how other provinces and countries were managing vaccine-hesitant parents. The PHABC found most approaches limited to print materials. In cases where active measures were in place, the approach was ineffective. Under circumstances where a course was required to complete, participants were polarised further. We analyzed what the target audience believed. We concluded a one-size-fits-all approach was not effective because of the variety of reasons for vaccine hesitancy. We were able to summarize these into eight categories. We chose a different approach. The PHABC did not want to trivialize the concerns of vaccine-hesitant parents. We created a 'safe place' where parents could explore questions/answers that challenged their beliefs. Our approach took a straightforward and compassionate style adapted to their specific perspective. Our goal is to motivate hesitant parents, gently, to reflect on the sources of their information so they might move from vaccine-hesitancy towards immunization. We believe it is by establishing trust and respect that we can advance towards parents making an informed decision in the right direction.

Characteristics of effective educational interventions targeting healthcare workers to improve advising about vaccinations for older adults: a systematic review

Manuela Wennekes¹, Tímea Almási², Renske Eilers³, Fruzsina Mezei², Zsuzsanna Petykó², Aura Timen⁴, Zoltán Vokó²

¹National Institute of Public Health and the Environment (RIVM), Netherlands, ²Syreon Research Institute, Budapest, Hungary, ³National Coordination Centre for Communicable Disease Control, National Institute of Public Health and the Environment (RIVM), Bilthoven, The Netherlands, ⁴Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, The Netherlands

Background and Objective: Healthcare workers (HCW) play an important role in vaccine acceptance of older adults (OA). A systematic review was conducted to identify effective educational interventions targeting HCW to improve advising on vaccinations.

Methods: Medline, Scopus, Cochrane library and grey literature were searched for comparative studies on educational interventions targeting HCWs' advising on vaccines for OA. No restrictions were applied to language and publication year. Where possible, a sub-analysis on publication year was conducted. In total 48 studies were included. The quality of the included studies was assessed with the RoB 2 for RCTs and the GRADE checklist for non-randomized studies. Study outcomes were categorized according to the Kirkpatrick model for effectiveness, consisting of four levels: reaction, learning, behaviour, and results (Kirkpatrick,

1996).

Results: 17 Of the 27 RCTs and seven of the 21 non-randomized studies were at low to medium risk for bias, respectively. Most studies included reminder systems signalling patients due for vaccination. Other interventions were seminars, academic detailing and peer-comparison feedback. In the four articles reporting on the reaction-level, most HCWs were positive about the intervention. Moreover, two of five articles reporting on the learning-level, found positive changes in attitude or knowledge due to the intervention. Of fourteen studies reporting on the behaviour-level, those published after the year 2000 testing tailored reminders vs. usual care were most effective in increasing vaccination offering by HCWs. Of 34 studies reporting on the Results-level, those published prior to 2000 testing tailored reminders vs. usual care were most effective in increasing vaccination rates, followed by multicomponent interventions. Classic education only (e.g., lectures) was often ineffective, compared to other interventions.

Conclusions: Tailored reminders are effective in supporting HCWs to suggest vaccines to OA, while classic education seems ineffective. Multicomponent interventions often combined classic educational methods with reminders and proved also effective.

The use of test-negative case-control studies to determine the effectiveness of influenza vaccination in pregnancy: results from a systematic review and meta-analysis

Pietro Ferrara¹, Lorenzo Losa¹, Lorenzo Mantovani¹

¹Center for Public Health Research, University of Milan-Bicocca, Monza, Italy

Background and Objective: Real-world evidence (RWE) is essential for estimating influenza vaccine effectiveness (IVE) in wide-ranging high-risk groups by time, place and epidemic strain. Among high-risk groups, pregnant women are at increased risk for influenza-associated morbidity, hospitalization and mortality, and their vaccination is a highest public health priority. However, monitoring IVE among pregnant women remains challenging in nonrandomized studies. Since data from test-negative case-control designs (TND) are widely used for assessing IVE, this literature synthesis aims at synthesizing the existing evidence about their use in pregnant populations.

Methods: A structured literature search was conducted on PubMed/Medline, Scopus and grey literature through November 2022, following PRISMA guidelines. IVE – calculated as $1 - \text{odds ratio} \times 100\%$ – was pooled through meta-analysis. Risk of bias was assessed using the ROBINS-I tool.

Results: Nine studies conducted during the 2019/10–2017/18 influenza seasons were included, of which three were specifically designed to investigate IVE during pregnancy and were pooled in the meta-analysis. The pooled estimate of IVE from TND studies was 60% (95% confidence interval 45–75; I² = 64%) against medically-attended laboratory-confirmed influenza illness. The remaining six reports included 'pregnancy' in surveillance-based studies, and found that it was negatively associated with vaccination uptake and positively with hospitalization with confirmed influenza. Overall, studies were considered at low/moderate risk of bias using the ROBINS-I tool.

Conclusions: Pooling data from RWE to estimate IVE against severe outcomes in pregnant women is crucial to inform vaccination policy. While TND offers notable advantages in estimating IVE – such as minimizing outcome misclassification of the disease –, novel well-conducted TND are needed to provide reliable estimates of IVE according to influenza subtype and vaccine type. Finally, surveillance systems that incorporated TND should expand data collection to better account for pregnancy.

Understanding the barriers to HPV vaccine uptake: an exploration of the Canadian landscape on HPV immunization programming opportunities

Cordell Neudorf¹, Thilina Bandara², Mika Rathwell¹, Jaspreet Saini³

¹Urban Public Health Network, University of Saskatchewan, Ottawa, Canada,

²School of Public Health, University of Saskatchewan, Saskatchewan, Canada, ³Canadian Partnership Against Cancer, Canada

Background and Objectives: The Canadian partnership against cancer has provided funding to the urban public health network to assess the landscape of HPV immunization coverage, barriers, and opportunities at a sub-jurisdictional level, in order to achieve the target of 90% HPV immunization to support the work of the action plan to eliminate cervical cancer in Canada by 2040. This work has involved engaging local public health organizations across Canada to uncover high-resolution quality improvement targets of investment for underimmunized

populations.

Methods: This project uses a mixed-method design to understand barriers and facilitators to increasing HPV immunization uptake at a sub-provincial level. Stakeholders were engaged from across Canada and analysts were placed in four local public health units, to extract sub-provincial level HPV programming insights. HPV immunization data was collected at a sub-provincial level, and in some cases, down to a postal code or school level. Coverage rates were then linked to socio-demographic indicators where possible to identify pockets of under-immunization. To further determine barriers and facilitators, surveys, focus groups, and interviews took place with caregivers and providers.

Results: Preliminary results indicate the availability of HPV immunization data is highly variable across Canada, as is HPV immunization programming. Barriers to immunization have been identified at both individual (e.g. Lack of healthcare provider recommendation, misinformation) and systems-level (e.g. Absence of a national immunization registry) in participating regions to varying degrees.

Conclusions: Understanding how barriers and facilitators impact HPV immunization uptake at a local level is critical to implementing innovative policies and programming. Findings will be reported by region and/or subgroup, as well as aggregated nationally to inform recommendations made to CPAC on ways to address inequities in access and uptake.

Vaccination coverage in diabetic patients in the Lombardy region

Catia Borriello¹, Danilo Cereda¹, Sara Piccinelli², Giovanni Cicconi², Roberta Lattanzio², Chiara Marrocu², Sudwaric Sharma², Riccardo Vecchio³

¹Directorate General Welfare Region Lombardy, Milano, Italy, ²Department of Biomedical Sciences for Health, University of Milano Statale, Italy,

³Department of Public Health, Experimental and Forensic Medicine, University of Pavia, Italy

Background and Objective: Diabetes mellitus is associated with an increased incidence of infections and a greater severity and frequency of related complications. In particular, the risk of hospitalization and death from infectious causes in this category of patients is double compared to euglycemic subjects. The vaccinations provided for by the National Vaccine Prevention Plan and recommended by the Italian Diabetes companies are the anti-flu, the anti-pneumococcal, the new recombinant anti-zoster, the anti-diphtheria, tetanus, and pertussis and the anti-SARS-COV2 vaccine. The goal of this work is determining the vaccination coverage for the main recommended vaccinations and for COVID-19 in the Lombard diabetic population. Methods: A chi-square test has been used to assess: whether the presence of diabetes influenced the choice to get vaccinated or not; the test was used to verify if the observed frequencies in one or more categories correspond to the expected frequencies, if the null hypothesis were true, if there are differences in terms of vaccine doses made on the basis of the type of diabetes. A statistical significance level of p-value <0.05 (5%) was used initially and, later, more conservatively p-value <0.02 (2%) due to the practical application of the correction Bonferroni hypothesis.

Results: Of the total diabetic subjects, 264058 subjects (46.19%) received the influenza vaccine, 60980 (10.67%) patients received the pneumococcal vaccine, 15137 (26.25%) received the meningococcal vaccine, 4132 (0.72%) received a type of anti-Herpes Zoster vaccine. Conclusions: The vaccination coverage in diabetic population, excluding the recent anti-SARS-COV2 vaccination campaign, is currently insufficient. In general, this study has demonstrated a significant correlation between the presence of diabetes and adherence to vaccinations. Adherence is greater among patients with type 2 diabetes than in patients with type 1 diabetes: this is likely related to the presence of more comorbidities among patients with type 2 diabetes.

Determinants of vaccine hesitancy towards pediatric and adolescent vaccinations and interventions aimed at contrasting that issue in Europe: an overview of systematic reviews

Alessandro Durbano¹, Giuseppina Moro¹, Maria Ferrara², Elisa Langiano², Alessandra Sannella², Sonia Pinto¹, Alex Pivi¹, Sara Sbaragli², Maurizio Esposito², Elisabetta Vito², Roberta Siliquini^{3,4}

¹Department of Public Health Sciences, University of Turin, Turin, Italy,

²Department of Human, Social and Health Sciences, University of Cassino and Southern Lazio, Cassino, Italy, ³Department of Public Health Sciences, University of Turin, ⁴A.O.U. City of Health and Science of Turin, Italy

Background and Objective: Vaccine hesitancy represents a relevant threat to global health. Specifically, vaccine hesitancy has shown an increase in the last

two decades in Europe. The present overview aimed to describe determinants of vaccine hesitancy and interventions to reduce vaccine hesitancy or increase vaccine uptake among children and adolescents in Europe.

Methods: We developed a comprehensive search strategy to find the latest existing systematic reviews on the following databases: PubMed, Embase, and Epistemonikos, including only papers published in 2017 or after. The search was performed in 2022. Only papers about determinants or interventions addressed to parents, children, or adolescents were considered eligible. Each article was screened at least by two authors, blinded to each other's decisions. This overview has been conducted within the project "VAX-TRUST, addressing vaccine hesitancy in Europe" (This project has received funding from European Union's Horizon 2020 research and innovation program under Grant Agreement No. 965280).

Results: A total of 3363 records were screened. The final set of selected papers consisted of 28 systematic reviews. We examined the overlap of the systematic reviews within the overview using the CCA index obtaining the value of 1.39%, thus suggesting a low overlap. A total of 232 European primary studies contained in the systematic reviews were identified (212 observational studies and 20 experimental studies, including 15 RCTs and 5 quasi-experimental studies). Preliminary analyses showed that safety and trust concerns were the most frequently reported hesitancy determinants and the implementation of school programs involving nurses and general practitioners was the most frequently reported effective intervention.

Conclusions: This overview mainly highlighted issues in trust and safety concerns and suggested that school programs can be effective in the European context. It is essential to continue to study the reasons for vaccination hesitancy and to search for methods to decrease the phenomenon.

Vaccination hesitancy among parents of school children in the United Arab Emirates: a cross-sectional study

Anusha Sreejith¹, Aya Hassan², Anusha Sreejith¹

¹Department of Community Medicine, College of Medicine, Gulf Medical University, Ajman, United Arab Emirates, ²Abu Dhabi Vocational Education and Training Institute, Abu Dhabi, United Arab Emirates

Background and Objectives: Parental vaccine hesitancy may hinder routine vaccinations of children and increase the risk of vaccine-preventable infections. This study was conducted to assess the prevalence and determinants of parental vaccine hesitancy in the United Arab Emirates. **Methods and Materials:** This cross-sectional study was conducted among 446 the parents using a self-administered questionnaire. Parents Attitudes about Childhood Vaccines (PACV) survey tool was used to assess the vaccine hesitancy and WHO's Vaccine Hesitancy Survey Questions were used to seek information about the factors. Data analysis was done using SPSS version 28. Chi square test was used to find the association and binary logistic regression was used to determine the factors.

Results: The prevalence of vaccine hesitancy among parents was found to be 36%. Vaccine hesitancy was influenced by age, education, and gender. It was more common for mothers, parents with a bachelor's degree, and parents younger than 40 to express hesitation. The odds ratio showed that the variables: those who do not have enough knowledge about vaccines, those who do not trust the health system, those who do not think vaccine preventable diseases are serious, immunization not as a social norm, religion, culture, political decisions, cost, and negative motive of pharmaceutical companies in manufacturing vaccines were almost 4 times more likely to be vaccine hesitant.

Conclusions: Prevalence of vaccine hesitancy in the UAE is about 36% and is a major concern. Many factors have been identified from this study which make parents hesitant towards vaccines. Health care professionals are in an excellent position to provide parents with information regarding the potential benefits of immunizations.

The vaccination coverage rate in under-five children in Nasiriyah (Iraq) before and during the COVID-19 pandemic

Elham Ahmadnezhad¹, Ali Alhaddad², Akbar Fotouhi²

¹National Institute of Health Research, Tehran University of Medical Sciences, Iran, ²Tehran University of Medical Sciences, Iran

Background and Objectives: One of the essential services in health centers is vaccination programs for achieving universal health coverage. During COVID-19 pandemic, 90% of countries reported disruption in vaccination, especially in the earlier phases of the COVID-19. This is a trend study aimed to compare the vaccination coverage rate (VCR) in Under-5 children in Nasiriyah (Iraq) before

and during the COVID-19 pandemic. **Methods:** This cross-sectional study was conducted in the city of Nasiriyah in southeastern Iraq, with data collected from 79 primary health care facilities. This study evaluated the VCR in 3 periods (2018, 2019, and 2020) using multi-level random sampling. Pertinent data were extracted from the vaccination records of 598 children for Bacillus Calmette-Guérin (BCG); pentavalent 1, 2, and 3; measles; and activated oral poliovirus vaccine (OPV) 1 and 2. Missing data were completed by telephone calls to participants' parents. Logistic regression was applied to compare and estimate the odds ratios (ORs) with 95% confidence intervals (CIs) for the association between VCR and related factors.

Results: The early period of the COVID-19 pandemic (2019) showed the greatest decline in the studied vaccines. Among the vaccines studied, BCG had the highest rate in all 3 periods (100% VCR) and measles had the lowest rate (83.7%), reaching 63.6% in 2020 ($P < 0.001$). The highest OR among all types of vaccine were found for the pentavalent-2 vaccine among city dwellers and those born in 2020 (OR=2.67; 95% CI, 1.39-5.10 and OR=2.34; 95% CI, 1.28-4.28, respectively). **Conclusions:** The VCR for children decreased during the COVID-19 pandemic in Iraq, and new health policies are needed to increase the coverage rate. Improving the knowledge and attitudes of parents, as well as removing barriers or risk factors, can also be effective in improving the VCR.

Prevalence of observed BCG scar in a cohort of health care workers from three Lusophone sub-Saharan African countries: cross-sectional comparative study

Ines Fronteira¹, Frederik Scholtz-Buchholzer², Isabel Araújo³, Lídia Nhamussua⁴, Paulo Ferrinho⁵, Christine Benn⁶

¹Global Health and Tropical Medicine, Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Lisboa, Portugal, ²Odense Patient data Explorative Network (OPEN), Institute of Clinical Research, Odense University Hospital, University of Southern Denmark, Denmark, ³Faculdade de Ciências e Tecnologia, Universidade de Cabo Verde, Cape Verde, ⁴Manhica Health Research Center, Maputo, Mozambique, ⁵Global Health and Tropical Medicine, Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Portugal, ⁶OPEN, Odense Patient data Explorative Network, Institute of Clinical Research, Odense University Hospital, University of Southern Denmark, Denmark

Background and Objectives: The BCG vaccine scar is often used as a surrogate marker of adequate vaccination, indicating correctness of the technique and effective vaccination. This study reports the prevalence of observed BCG scars and studies potential determinants in Health Care Workers (HCW) from Cabo Verde, Guinea-Bissau, and Mozambique.

Methods: Observational cross-sectional study of baseline data collected within the BCG-COVID-RCT trial [1] in Cabo Verde, Guinea-Bissau, and Mozambique. Participants were HCW working in hospitals and health centres. Presence of BCG scar was by a physical assessment of BCG scars including number and location(s) of observed BCG scars and self-reported vaccinations with BCG. Prevalence rates adjusted for age, gender, occupation, number of times vaccinated with BCG, chronic disease, and time of birth in relation to BCG vaccination policy were computed using Poisson regression with robust variance for the outcome observed BCG scar. Analyses are presented by country, controlling for differences in local BCG vaccination strategies.

Results: The prevalence BCG scar was 85.5% in Mozambican HCW, 75.0% in Guineans and 70.0% in Cabo Verdean HCW. The prevalence of scars was not associated with any of the studied background characteristics: gender, age, morbidity and occupation. After controlling for gender, age and occupation, having a BCG scar was found to be associated with having been born after the implementation of universal BCG vaccine at birth, being vaccinated more than once and being overweight or obese only for Guinea-Bissau.

Conclusions: Results demonstrate a relatively high prevalence of BCG scar among HCW in Cabo Verde, Guinea-Bissau, and Mozambique. There seems to have been catch-up programs for people born before the Introduction of BCG at birth in Mozambique and CV. Between 15-30% of the studied HCW still do not have a BCG scar. The role of a BCG scar for subsequent health in adults should be investigated. Links: ———[1] <https://clinicaltrials.gov/ct2/show/NCT04641858>

Vaccination among HIV+ patients: an Italian cross-sectional survey

Alex Pivi¹, Antonino Russotto¹, Benedetta Mollero¹, Giancarlo Orofino²,

Gianluca Voglino³, Fabrizio Bert^{4,5}, Roberta Siliquini^{6,7}

¹Department of Public Health Sciences, University of Turin, Italy, ²Amedeo di Savoia Hospital, Turin, Italy, ³Ministry of Health, Rome, Italy, ⁴Health Local Unit ASL T03, Turin, Italy, ⁵University of Turin, Department of Sciences of Public Health and Pediatrics, Italy, ⁶Azienda Ospedaliero-Universitaria, City of Health and Science of Turin, Turin, Italy, ⁷Department of Sciences of Public Health and Pediatrics, University of Turin, Turin, Italy

Background: The purpose of this study was to assess knowledge, attitudes and practices (KAP) among people living with HIV (PLWH) about general vaccination and their trust on the Italian National Health Service (NHS). **Methods:** A cross-sectional study was conducted by administering questionnaires to 160 patients followed by Amedeo di Savoia Hospital in Turin. Statistical analyses were performed to describe the samples vaccination status, its willingness to get vaccinated, the perception of the risk and the severity of infections preventable with vaccination and its trust on the Italian NHS.

Results: Means for vaccination status, vaccination intention, perceived risk of infection, and disease severity were calculated by grouping infections into two sets: the first was formed by sexually transmitted infections and the second by the remaining. Percentages of the two groups do not differ in being already vaccinated, willingness to be vaccinated (if not already immune), and perceived low risk of infection (51,16%, 14,76%, 75,65% for the former and 48,58%, 20,61%, 76,33% for the latter, respectively) but in perceived high risk of severity (81,7% vs 65,25%). Regarding patients opinion of the Italian NHS, interesting results were that while 95.63% of the sample believe the information provided by healthcare professionals (HCPs) and 93.08% believe that they are up-to-date on vaccines, 33.33% of the sample believe that HCPs do not give enough information about the risks related to vaccination, 40.25% believe that patients are judged by HCPs in case of unwillingness to get vaccinated and 19.50% believe that HCPs have financial interests in vaccinating. **Conclusions:** Some HIV+ patients may be hesitant to be vaccinated or believe that some infectious diseases are not dangerous. Furthermore, there is some criticality about their trust on the Italian NHS.

Hospital-Territory Vaccination Center: pilot study on a multidisciplinary model for administration of recombinant zoster vaccine in fragile patients

Silvia Martinelli¹, Luca Regazzi², Chiara Cadeddu², Antonietta Spadea³, Enrica Tamburrini², Pierluigi Salvo¹, Silvia Bosello¹, Maria D'Agostino¹, Simona Sica¹, Francesco Landi¹, Rossella Mancini¹, Federica Rizzo¹, Domenico Pascucci¹, Patrizia Laurenti¹

¹Università Cattolica del Sacro Cuore, Italy, ²Università Cattolica del Sacro Cuore, Italy, ³ASL Roma 1, Italy

Background and Objectives: The literature indicates that target populations eligible for vaccinations are not comprehensively reached by out-of-hospital health services, particularly frail people with immunization deficits. The aim of this study was to evaluate the effectiveness of a model of shared management between hospital (IRCCS Fondazione Policlinico Universitario A. Gemelli) and out-of-hospital health services (ASL Roma 1) of fragile patients with an indication for herpes zoster (HZ) vaccination, based on counseling carried out by a multidisciplinary team in the hospital setting.

Methods: From June 2022 to November 2022, patients with congenital and/or acquired immunodepression, who were treated at the IRCCS Fondazione Policlinico Universitario A. Gemelli in the Units of Hematology, Geriatrics, Infectious Diseases, Rheumatology were selected and offered vaccination with the recombinant Zoster vaccine. At the time of enrollment, all patients completed the Vaccination Attitudes Examination (VAX-I) scale, for the purpose of assessing vaccine hesitancy. Patients received multidisciplinary counseling focusing on HZ and contrasting vaccine hesitancy. Multiple linear regression was used to analyze the impact of demographic and clinical characteristics on the VAX-I items.

Results: Thirty-five fragile patients were included. Mean vaccine hesitancy score was 2.3±1.0. A significant correlation between vaccine hesitancy and the age group of 45 to 64 years was demonstrated ($p=0.0001$). Patients with ages between 45 and 64 years had significantly higher score of "mistrust of vaccine benefits", "worries about unforeseen future effects", "concerns about commercial profiteering" and "preference for natural immunity". After counseling, all patients adhered to the vaccination with two doses of a recombinant zoster vaccine. No serious adverse events or breakthrough HZ infections were observed during a median follow-up of 62 days (IQR=23).

Conclusions: Although vaccine hesitancy in some age groups is high, hospital-based multidisciplinary counseling achieved full HZ vaccination compliance.

Human Papillomavirus (HPV) vaccination recovery campaign in Emilia-Romagna region, Italy: impact on vaccination coverage in women up to 25 years

Valentina Giampà¹, Stefania Paduano², Gabriella Frasca³, Giovanna Mattei³, Giuseppe Diegoli³, Annalisa Bargellini⁴, Christian Cintori³

¹Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy,

²Section of Public Health, Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, ³Regional Health Authority, Emilia Romagna Region, Bologna, Italy, ⁴Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy

Background: Vaccination is the main intervention for primary prevention against HPV-related cancers, such as cervical cancer. The most recent vaccine, used in Italy and Emilia-Romagna Region (RER), is a nine-valent vaccine that prevent more than 90% of precancerous lesions. In Italy, vaccination has been offered for 11-year-olds since 2008 (birth cohort 1997); RER, from June 2019, offers HPV-vaccination to all 25-year women, not previously vaccinated, by Regional Act 1045/2019 (RA). This study aims to evaluate the vaccination coverage in women up to 25 years-old, after 3 years from RA.

Methods: We analysed vaccination coverage data before and after RA with SAS-enterprise. We considered women of 1995, 1996, 1997 birth cohorts, with HPV-vaccination cycle started from July 2019, in the year of their 25th birthday. According to RA active call is at 25th birthday and the vaccination cycle should be started before 26 years-old to be entitled to free admission.

Results: From July 2019 to November 2022, 4025 women have started HPV-vaccination cycle in RER and 55.5% of them have already completed it. We found an increase of vaccination coverage for 1995-1996-1997 cohort of 7.7%, 7.6% and 4.6% for 1st dose, respectively, and 5.8%, 4.1% and 1.1% for completed cycle. The mean current coverage is 35.8%, 60.0%, 72.9% for 1st dose and 26.4%, 52.4%, 67.7% for a full course, for 1995-1996-1997 cohort respectively.

Conclusions: Preliminary data show increased vaccination coverage on all considered cohorts. The greatest increase was for 1995-1996 cohorts, while 1997 cohort may have been more affected by the delays due to the COVID-19 pandemic. Active call policies may be associated with this increased coverage. The first effects of HPV vaccination have already been visible on secondary prevention programs for the prevention of cervical cancer. Therefore, it is necessary to continue the implementation of policies for increasing vaccination coverage.

Routine immunization of older adults and frail people during the SARS-CoV2-pandemic in Italy: a national survey by Italia Longeva

Andrea Poscia¹, Daniel Fiacchini², Davide Vetrano³, Claudio Angelini², Daniela Cimmini², Claudio Costantino⁴, Giancarlo Icardi⁵, Rosa Prato⁶, Andrea Siddi⁷, Andrea Silenzi⁷, Antonietta Spadea⁸, Roberto Bernabei^{9,10}, Agnese Collamati¹¹

¹Public Health Department, Asur Marche AV2, Ancona, Italy, ²Public Health Department, Asur Marche, Ancona, Italy, ³Aging Research Center, Department of Neurobiology, Care Sciences and Society, Karolinska Institutet, Stockholm, Sweden, ⁴Department of Health Promotion Sciences, Maternal and Infant Care, Internal Medicine and Medical Specialties (PROMISE) "G. D'Alessandro", University of Palermo, Palermo, Italy, ⁵Department of Health Sciences, University of Genoa, Genoa, Italy, ⁶Hygiene Unit, Policlinico Foggia Hospital, Department of Medical and Surgical Sciences, University of Foggia, Foggia, Italy, ⁷General Directorate for Health Prevention, Ministry of Health, Rome, Italy, ⁸UOC Vaccinations, Department of Prevention, Local Health Authority Roma1, Rome, Italy, ⁹Department of Geriatrics and Orthopaedics, Università Cattolica del Sacro Cuore, Rome, Italy, ¹⁰Italia Longeva, Italy, ¹¹Asur Marche AV2, Ancona, Italy

Despite the availability of safe and effective vaccines, older adults and frail people (OAFs) remain far from accomplishing the recommended coverage targets. The SARS-CoV-2 pandemics strongly affected the supply and coverage of routine vaccines, especially for OAFs, but it also suggested innovative solutions to catch up with the immunization schedules we were late with. Italia Longeva, the National Association for Active Longevity established in 2011 by the Ministry of Health, realized this research aiming to collect and share local good practices for the routine immunization of OAFs implemented during the SARS-CoV-2 pandemic. We surveyed 12 local health directors from 9 Regions (with a potential covered

area of about 24 million inhabitants) between January and March 2021. Starting from the 2018 Thomas and Lorenzetti's Cochrane Review, a "snowball" search of scientific and grey literature was performed to create and validate a 27-items semi-structured questionnaire used to collect information during the interviews. Full methods are available online (<https://www.italialongeva.it/>). A wide range of organizational models and settings for immunization supply to OAFs were found across regions. The local implementation of the 27 interventions to increase vaccination coverage among OAFs identified through the literature review ranges from 0% to 100%, with higher rates for interventions targeting the professionals (i.e. audits), lower when aimed to increase the vaccine offer (i.e. active calls) or its accessibility (i.e. home vaccination). Seven good local practices have been identified and described: Mass Vaccination Centre; drive-through Vaccination; Mobile vaccination clinics; co-administration; collaboration within different organization; Electronic immunization registries; standardized immunization pathways. Literature suggests many effective interventions to improve immunization of OAFs, but their implementation at local level shows huge heterogeneity. Providers should combine several interventions adequate to the specific context (organizational models, interoperability, urban or rural context, etc) and share good practices.

Pediatric COVID-19 vaccine hesitancy based on parents' attitudes towards mandatory and recommended vaccination in Southern Italy

Luigi Angelis¹, Francesco Baglivo¹, Mariano Magri², Ingrid Nicola², Pietro Palco³, Caterina Rizzo¹, Alberto Fedele⁴

¹University of Pisa, Italy, ²Dipartimento di Prevenzione ASL Lecce, Italy,

³University of Salento, Italy, ⁴Dipartimento prevenzione ASL Lecce, Italy

Background and Objective: The Comirnaty-Pfizer anti-COVID19 vaccination for 5-11 years population was approved in Italy on 01/12/21. In this study, we investigate the anti-COVID19 vaccine hesitancy in eligible children in Lecce (Apulia, Italy) based on parents' attitudes towards mandatory and recommended vaccination, according to the National Immunization Plan (NIP) and the National Law Decree that introduced mandatory vaccinations in infants and adolescents in Italy. **Methods:** Using data collected within the vaccination registry of Apulia Region (Southern Italy) up to 15/11/2022 for birth cohorts 2011-2017, we evaluated for each subject the adherence to the NIP vaccine schedule. Since we wanted to investigate attitudes towards vaccination, we considered the first shot of each schedule relevant for our analysis, regardless of when it was administered. Multiple logistic regression was used to analyze associations between age, sex, adherence to mandatory vaccinations, number of recommended vaccinations and anti-COVID19 vaccination.

Results: A total of 42,173 subjects were included in the study, 21,361 (50.7%) of which received at least one dose of anti-COVID19 vaccine. The number of recommended vaccinations was found to be associated with anti-COVID19 vaccination (OR 1.50; 95%CI [1.46-1.53]; $p < 0.000001$). The compliance to mandatory vaccinations was a predictor for anti-COVID19 vaccination. (OR=1.46; 95%CI [1.23-1.75]; $p < 0.000001$). Probability of being vaccinated against COVID19 increased with age. (OR=1.33; 95%CI [1.31-1.34]; $p < 0.000001$). No significant relationship was found between sex and anti-COVID19 vaccination. **Conclusions:** Our results show a clear association between previous vaccinations and anti-COVID19 vaccination in a sample of around 42,000 infants in Southern Italy. Despite the same recommendation for anti-COVID19 vaccination for children from 5 to 11 years, we identified a lower vaccine coverage for younger children. The COVID19 pandemic had no positive impact on vaccine hesitancy as attitudes towards previous vaccinations were confirmed for the COVID19 vaccine.

The frequency of missed opportunities for simultaneous vaccination and their impact on vaccination of children in The Gambia

Aliou Sowe^{1,2}, Fredinah Namatovu², Bai Cham³, Per Gustafsson²

¹Expanded Program on Immunization, Ministry of Health, Banjul, The Gambia, ²Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden, ³Medical Research Council Unit The Gambia, London School of Hygiene and Tropical Medicine, Bakau, The Gambia

Background and Objective: The number of zero-dose and under-vaccinated children has passed 20 million following the COVID-19 pandemic. Reducing missed opportunities for vaccination is recommended as a key strategy for increasing coverage because it involves utilising existing vaccination sites. To

generate actionable evidence for coverage and equality improvement targeting, this study aimed to estimate the frequencies of missed opportunities for simultaneous vaccination (MOSVs) and their correction by residential area and assess the impact of MOSVs on full vaccination and coverage of vaccine doses in The Gambia.

Methods: Data of children with cards aged 12-23 months from The Gambia 2019/2020 demographic and health survey was used (weighted $n = 1355$). We measured the number of children who experienced at least 1 MOSV any time before the survey and the proportions of children who later 1) received all doses, 2) received some doses, and 3) never received any dose by residence. Finally, valid coverage with and without MOSVs was estimated for all eligible vaccine doses.

Results: More than half of the children surveyed experienced at least one MOSV, and more than half of the MOSVs were later corrected. A quarter of the children who experienced MOSVs did not have them corrected. Rural and urban residents had similar experiences in the proportion of MOSVs, but children in urban areas had their MOSVs not corrected more frequently. Seventeen of eighteen vaccine doses in the national schedule would have coverage gains without MOSVs, with some gaining as much as nine percentage points in coverage.

Conclusions: Missed opportunities for simultaneous vaccination are frequent, negatively affecting coverage and differentially impacting rural and urban areas, and should be targeted for vaccination improvement. Our study emphasizes the importance of MOSVs for vaccination coverage and the need to implement the WHO missed opportunities for vaccination strategy.

Kids boost immunity: inspiring learning through global citizenship Lily Crist¹

¹Public Health Association of British Columbia, Canada

Background and Objectives: Kids Boost Immunity (KBI) is Canadian digital education platform for schools administered by the Public Health Association of British Columbia (PHABC) with an objective to improve vaccine confidence among youth. KBI is the first digital platform in the world to pair vaccine literacy with global citizenship by enabling students to earn polio, tetanus and measles vaccines through a partnership with UNICEF.

Methods: KBI consists of 350 free online interactive lessons/quizzes in English and French linked to science, health and social studies curricula on a range of topics including germs and infections, vaccines/the immune system and critical thinking. After completing lesson, students use a computer or their own device (e.g. smart phone) to take a quiz that reinforces learning AND earns a vaccine to protect a child somewhere in the world through UNICEF.

Learning outcomes are assessed through gamified team/school leaderboards that track student achievement (questions answered/vaccines earned) and amplify student engagement by creating a friendly sense of competition in the classroom. **Results:** Over 30,000 students from 700 schools have answered 4 million quiz questions since 2018, earning 300,000 vaccines in support of UNICEF. Students from many countries including Canada, US, Australia, New Zealand, Columbia, Brazil, Lebanon, Malaysia, Thailand, Scotland and Ireland are active users of the platform. Students have consistently demonstrated significant positive changes in knowledge and vaccine confidence based on numerous pre/post measures (process/outcome evaluation).

Conclusion: KBI represents an innovative new approach to improving vaccine confidence by doing two things at once: connecting interactive learning with global disease prevention. This helps create intergenerational 'change agents' by inoculating youth against misinformation while empowering Generation Z to help others ('kids helping kids'). As KBI continues to expand to more countries, it has the potential to play an important role in helping reduce vaccine hesitancy over the long term.

Exploring waning COVID19 vaccine effectiveness against reinfections in the pediatric population: a retrospective population analysis

Francesco Baglivo¹, Luigi De Angelis¹, Valerio Aprile², Raffaele Stifini², Mariano Magri², Pietro Lo Palco³, Caterina Rizzo¹, Alberto Fedele²

¹University of Pisa, Italy, ²Dipartimento di prevenzione ASL Lecce, Italy,

³University of Salento

Background and Objective: The real-world effectiveness and duration of anti-COVID19 vaccine's protection from reinfections in the pediatric population (5-11 years) has yet to be determined. Groups with different primary immunization were compared, in terms of duration of immunity and effectiveness for COVID19

reinfections.

Methods: In this retrospective population analysis, we analyzed data from the vaccination registry and Infections Regional Information System of Apulia region (Southern Italy) for birth cohorts 2011-2017 from 31/12/2020 to 02/12/2022. We identified three groups based on the primary immunization schedule: subjects 5-11 years old vaccinated with two doses (vaccine immunity), not vaccinated with a history of SARS-CoV2 infection (natural immunity) and individuals with a combination of both (hybrid immunity). Subjects with a SARS-CoV2 infection occurring within the first 14 days from the primary immunization course were excluded. COVID19 reinfection was defined as a positive swab after 90 days from previous infection. Data were analyzed using R and compared using chi-square test.

Results: A total of 30,997 children were included (15,064 females, 15,933 males; mean age 8.3±1.9); 22,073 (71.2%) children were infected from SARS-CoV2 at least once and 1,533 (4.9%) had a COVID19 reinfection. Cases of reinfections and mean distance since COVID19 infection were in the vaccine immunity group 192 (1.12%) 87.8±55.8 days; in the natural immunity group 1,254 (9.5%) 214±95.9 days; and hybrid immunity group 87 (12.3%) 155.4±85.5 days. We observed a significant relationship between natural immunity group and COVID19 reinfections ($\chi^2 = 1142$; $p < 0.00001$).

Conclusion: In our study the mean time of protection from SARS-CoV2 reinfections (about 6 months) in children is in line with the available literature for adults. Our results show a significant lower rate of SARS-CoV2 reinfections in children with a completed vaccination cycle.

Potential side effects after paediatric anti-COVID19 vaccination in subjects with existing comorbidities, congenital and otherwise

Federica Denaro¹, Giuseppe Pantò¹, Federica Denaro¹, Anna Capra¹, Ioselita Giunta¹, Rosaria Cortese¹, Antonino Privitera¹, Roberto Venuto¹, Emanuela Esposito², Raffaele Squeri¹

¹Università degli Studi di Messina, Dipartimento di Scienze Biomediche, Odontoiatriche e delle Immagini morfologiche e funzionali, Italy,

²Università degli Studi di Messina, Dipartimento di Scienze Chimiche, Biologiche, Farmaceutiche ed Ambientali / Direttore U.O.S.D. Genetica e Farmacogenetica, Italy

Introduction: In children, COVID-19 disease presents asymptotically in 90% of cases, with a 0.6% risk of PIMS-TS; in addition, 5% of children who are also asymptotically infected develop Long COVID. Our weapon of defence for children under 12, as for adults, is the Pfizer-BioNTech paediatric vaccine.

- and long-term undesirable effects after the complete vaccine cycle and to assess the symptomatological picture of post-vaccine infections in subjects with existing comorbidities, congenital and otherwise.

Materials and Methods: Seventy subjects with a mean age of 8.41 years were recruited. At the time of the first vaccination session, a medical history was taken, assessing the presence of existing congenital comorbidities (cystic fibrosis, congenital heart disease, Downs syndrome, type 1 diabetes, congenital epilepsy, familial Mediterranean fever) and non congenital comorbidities. Then they were contacted by telephone at time T1 and at time T2 by submitting a questionnaire to investigate the development of undesirable effects; in addition, were assessed at four months interval T3, possible long-term undesirable effects and the acute and chronic clinical picture of those who had been infected after vaccination.

Results: a) There were no statistically significant differences between the undesirable effects reported after the 1st dose and after the 2nd dose. b) There was no statistically significant correlation between the anamnestic data collected (pre-existing comorbidities) and the development of undesirable effects. c) None of the study subjects who became infected after vaccination developed a severe clinical picture.

Conclusions: Following the results obtained in the cohort of affected subjects, it can be affirmed that the undesirable effects occurring after administration of the paediatric Pfizer-BioNTech vaccine are mild with a duration of no more than 24-48h and no serious reactions. The paediatric anti-COVID19 vaccine appears to be safe and effective.

Sustained effect of pneumococcal vaccination in the Stockholm area: a follow up between 2012 and 2016

Giulia Dallagiacoma¹, Tobias Alfven², Anna Odone³, Rutger Bennet⁴, Margareta Eriksson⁴

¹University of Pavia, School of Public Health, Department of Public Health,

Experimental and Forensic Medicine, University of Pavia, Pavia, Italy.

Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden, Italy, ²Karolinska Institutet, Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden; Sachs' Children and Youth Hospital, South General Hospital, Stockholm, Sweden, ³University of Pavia,

⁴Astrid Lindgren Children's Hospital, Stockholm, Sweden

Background and Objective: Streptococcus Pneumoniae is a leading cause of mild to severe respiratory infections worldwide, especially among children below 5 years of age. In Sweden, a pneumococcal conjugated vaccine (PCV) covering 7 serotypes of S. Pneumoniae (PCV7) was introduced in 2007, and was replaced by a thirteen-valent vaccine (PCV13) in 2011. A previous study, conducted between 2003 and 2012 reported a decrease in pneumonia and sinusitis among young children after the introduction of PCV7, in addition to the known effect of the vaccine on invasive pulmonary disease (IPD) burden. The aim of this study is to follow-up on the incidence of pneumonia, sinusitis and IPD in Stockholm between 2012 and 2016.

Methods: This is a population-based study of hospital registry data on hospitalization of children (aged 0-18 years) with a diagnosis of sinusitis, pneumonia, mastoiditis, bacterial meningitis, empyema, viral pneumonia and pyelonephritis. The setting is Stockholm County, Sweden. The analysis was carried out comparing three time periods: 2003-2007 (before PCV7), 2008-2012 (after PCV7) and 2012-2016 (follow up, with PCV13).

Results: Hospitalizations for bacterial pneumonia decreased in all age groups from 2003 to 2016 (from 449.7 to 339.7 /100.000 among 0-1 year old; from 250 to 170.8/100.000 among 2-4 year old; from 51.3 to 41.4 /100.000 among 5-17 year old). The incidence of sinusitis decreased significantly both among children aged 0-1 years (from 69.9 to 23/100.000) and among those aged 2-4 years (from 25.5 to 14.3/100.000). The incidence of mastoiditis and bacterial meningitis also decreased significantly among children younger than 2 years of age (mastoiditis: from 41 to 15/100.000; bacterial meningitis: from 29 to 7/100.000).

Conclusion: The effect of vaccination among children is therefore sustained even 8 years after the introduction of PCV7 and 5 years after the introduction of PCV13.

COVID-19 Pandemic and the increasing measles attack rate among under-five children in Gezira state, Sudan, 2020-2022

Samar Mohamed¹

¹Sudan Field Epidemiology Training Program, Gezira State, Sudan

Background: Measles is a leading cause of death among young children in Sudan. Coronavirus Disease 2019 (COVID-19) has increased the risk of vaccine-preventable disease outbreaks due to disruptions of Routine Immunization (RI) services, which leaves many children without protection against measles in Sudan. This study aimed to assess the impact of the COVID-19 pandemic on measles epidemiology in Gezira state, from January 2020 to October 2022.

Methods: We extracted variables of time, place, person, and vaccination status from measles surveillance records of all reported suspected cases and laboratory-confirmed cases (suspected measles cases with positive serum immunoglobulin M (IgM). suspected cases (Anyone with fever and maculopapular rash, at any age) and laboratory-confirmed cases (suspected measles cases with positive serum Immunoglobulin M (IgM). Missing or incomplete records were excluded. Data were analyzed using Epi info 7. A descriptive analysis informs of Attack Rates (AR), Case Fatality Rate (CFR) percentages, frequencies, and percentages were performed.

Results: A total of 273 suspected and 24 laboratory-confirmed measles cases were reported in the period. Overall, the measles AR has decreased from 0.20 per 100,000 population in 2020, to 0.09 per 100,000 population in 2022. However, Subgroup analysis by age showed around 67% increase in measles AR among children under five (6 per 100,000 in 2020 and 10 per 100,000 in 2022 respectively). 16% of confirmed measles cases died during 2020, compared to a 14% CFR in 2021 and zero death in 2022. RI coverage for the first and second doses of measles vaccine decreased by 5% and 21%, in 2020 and 2022 respectively.

Conclusions: The first year of the COVID-19 pandemic marked the highest measles morbidity among children under five years. Although the measles AR has decreased in 2022, a cohort of susceptible to measles infection has accumulated over the three years. Measles immunization coverage should be strengthened to prevent future outbreaks

A pilot experience of a clinic for the evaluation of contraindications to vaccine administration: results from the first

year of activities in Puglia, Italy

Lorenza Moscara¹, Chiara Trincherà², Giulia Zonno¹, Alessia Mangieri¹, Eleonora Valente², Paola De Petro¹, Felice Leone¹, Pasquale Stefanizzi³, Silvio Tafuri³

¹Public Health Post-Graduate School, University of Bari Aldo Moro, Italy,

²Public Health Post-Graduate School, ³University of Bari Aldo Moro, Italy

Background and Objectives: Since August 2021, Italian law provided limitations for subjects without SARS-CoV-2 vaccination, prohibiting attendance of restaurants, gyms, workplaces, and use of public transportation. Subjects with contraindications to vaccination needed certification by authorized physicians. Bari Policlinico General Hospital, in Puglia, has been providing a service for the evaluation of possible causes of contraindication, such as medical conditions and past adverse events following immunization.

Methods: This is a retrospective observational study. Patients evaluated from August 18, 2021, to August 13, 2022, were included. Subjects were interviewed about their medical history, and clinical documentation was reviewed.

Results: 168 patients were evaluated before anti-SARS-CoV-2 vaccination, with an average age of 46.5 ± 16.2 years (7-82). The male-to-female ratio was 64/104. 71 patients (42.3%) asked for evaluation after suffering from adverse events following previous vaccine administrations, 80 (47.6%) had previous medical conditions, and 9 (5.3%) reported both circumstances. Eight subjects (4.8%) underwent evaluation due to pregnancy. After anamnesis, 149 subjects (88.7%) were found to be affected by at least one medical condition; most conditions were classifiable as either cardiovascular (30.9%), allergies (30.2%) or endocrine/metabolic (28.2%). 41 patients required further specialistic evaluation; most evaluations were requested to allergologists (58.5%). Only 40 evaluations resulted in the release of a vaccination exemption, 39 of which were due to transitory conditions. 42.5% of all exemptions were due to a temporary clinical condition; 32.5% were due to ongoing therapy; 8 cases (20.0%) were related to a complicated pregnancy; in 2 cases (5.0%) the certificate was issued for hypersensitivity to vaccine components. 83 patients (49.4%) did receive at least one vaccine dose after evaluation. 84 (50.0%) still refused vaccination, and another (0.6%) is currently exempt from vaccination.

Conclusions: The pre-vaccination evaluation service helped strengthening the patients' trust towards vaccination and physicians and promotes the patients' empowerment and awareness.

Determinants of timely administration of the hepatitis B vaccine birth dose in Senegal in 2019: Secondary analysis of the demographic and health survey

Oumar Bassoum¹, Oumar Bassoum¹, Mouhamadou Ba¹, Adama Faye¹, Ibrahima Seck¹, Alioune Dieye¹

¹Université Cheikh Anta Diop, 1 Service de médecine préventive et santé publique, faculté de médecine, de pharmacie et d'odontologie, Université Cheikh Anta Diop, Dakar, Sénégal 2 Institut de santé et développement, Université Cheikh Anta Diop, Dakar, Sénégal, Dakar, Senegal

Background & Objective: In developing countries, hepatitis B is spread primarily through the perinatal or horizontal transmission. Thus, the Senegalese government recommends the administration of the hepatitis B vaccine birth dose (HepB-BD) within 24 hours of birth. The objective was to identify the determinants of timely administration of HepB-BD in Senegal in 2019.

Methods: A secondary analysis of the nationwide Demographic and Health Survey was conducted. The study population consisted of children aged 12 to 23 months whose vaccination status is documented. A two-stage cluster sampling, stratified in urban and rural areas, was carried out. Individual interviews were conducted. Vaccination coverage is estimated as a proportion. Logistic regression made it possible to identify the determinants of timely vaccination using the adjusted odds ratio (aOR) and its 95% confidence interval.

Results: A total of 747 children were included. Among them, 47.7% were born to mothers aged 25-34, 46.9% are male and 86.6% were born in health facilities. The mean time between birth and HepB-BD administration was 13.1 ± 46.6 days. Only 65.2% received HepB-BD within 24 hours of birth. The determinants were maternal age of at least 35 years (aOR= 2.03 [1.29 – 3.20]), belonging to central (aOR=0.22 [0.11 – 0.44]) regions and north regions (aOR= 0.18 [0.08 – 0.40]), mother's primary level of education (aOR=1.94 [1.13 – 3.35]), at least four prenatal consultations (aOR=1.74 [1.12 – 2.69]) and delivery in a health facility (aOR=3.42 [1.90 – 6.15]).

Conclusion: The education and retention of girls in school, community postnatal care in hard-to-reach areas, the promotion of prenatal consultations and delivery in a health facility should improve the timeliness of HepB-BD vaccination.

Reasons for non-uptake of Influenza Vaccination: comparison between high-risk and non-high risk groups in Portugal

Ana Santos¹, Irina Kislaya¹, Ausenda Machado¹, Carlos Matias-Dias¹, Sónia Namorado¹, Mariana Neto¹

¹National Health Institute Doutor Ricardo Jorge, Department of Epidemiology, Portugal

Reasons for non-uptake of Influenza Vaccination: comparison between high-risk and non-high risk groups in Portugal.

In Portugal, the Influenza Vaccine (IV) coverage remains below the coverage goals proposed by the European Union. Understanding motives for IV non-uptake, particularly for high-risk groups, is essential. One of the most used theoretical frameworks to understand vaccination is the Health Belief Model (HBM). This study aims to describe the Portuguese non-uptake and differences between HBM dimensions (susceptibility, severity, benefits, barriers and cues for action) for high-risk and non-high-risk groups.

A cross-sectional study was developed using a probabilistic dual-sampling frame telephone household panel of families in Portugal. The survey was conducted between June-September 2021, with data collected by questionnaire applied in mixed mode to one 18+ years element of each household unit (n=1050). Content thematic analysis was conducted in one open question about the reasons for IV non-uptake and included HBM dimensions. Statistical analysis focused on estimating non-adherence to IV and HBM categories' frequency stratified by target group. Results were weighted by sex, age group, region, and study design.

Of the total sample, 671 individuals did not uptake the IV (69.3%, CI95%:64.8-73.5). For the IV recommended population, non-uptake was 49.8% (CI95%:43.6-55.9). The perception of low Susceptibility was more common in individuals who didn't belong to the target group (74%, CI95%:63.4-82.3 vs. 26%, CI95%:17.7-36.6). The Barriers dimension was more frequently mentioned by the target population (45%, CI95%:32.4-58.2 vs. 55%, CI95%:41.8-67.6), namely due to unavailability of stock.

IV non-uptake was lower for high-risk group, compared to the general population. Differences between the reasons for non-uptake, suggest that the group to whom the IV is recommended, due to increased risk of complications, is aware of increased susceptibility. The vaccination campaign seems to be successfully targeting the high-risk group, even though efforts need to be maintain to decrease non-uptake.

DOI: 10.18332/popmed/163763

Impact of influenza vaccination strategy on medically attended influenza in Portugal in five pre-pandemic seasons (2015/16 to 2019/20)

Ausenda Machado¹, Irina Kislaya¹

¹Instituto Nacional de Saúde Doutor Ricardo Jorge, Portugal

Background: There is limited research on the impact of the yearly influenza vaccination programs in the eligible population. This study aimed to estimate the number of primary care medically attended influenza-confirmed cases (MAICC) among the population aged ≥ 65 years averted by influenza vaccination programme in Portugal during five seasons in the pre-COVID pandemic period (2015/16 to 2019/20).

Methods: We compared the number of observed MAICC to the estimated number that would have occurred in a population without seasonal influenza vaccination (N). To estimate N, we used: i) number of MAICC estimated from national influenza surveillance systems, ii) vaccine coverage (VC) collected in a national telephone survey, iii) influenza vaccine effectiveness (IVE) estimates weighted by the proportion of virus circulation each season in Portugal. We estimated the number of MAICC averted (NAE) by the influenza vaccination programme per 100.000 inhabitants and number needed to vaccinate to prevent one MAICC. We used Monte-Carlo simulations to estimate 95% uncertainty intervals (UI).

Results: Comparing with results from 2015/16 to 2017/18 (NAE ranged 24 to 44 per 100.000 inhab) the season 2018/19 showed the highest NAE (62.3 per 100.000 inhab) attributed to the influenza vaccination programme. In 2019/20 season the vaccination strategy averted approximately 11.7 per 100.000 inhab (95%UI: 6.0 to 20.9) events and it was necessary to vaccinate 549 (95%UI: 436 to 742) to prevent one MAICC in primary care.

Conclusion: The influenza vaccination strategy had consistent and positive benefit, with more pronounced impact in 2018/19 season. This results were mainly due to a combination of a higher vaccination coverage assumed for 2018/19 (60.8%) and one of the highest vaccine effectiveness (34.8% vs. previous study

range 8.5% to 40.6%). To maximize its impact, efforts should be conducted to increase the vaccine coverage. In addition, the surge for more effective vaccines should be maintained.

The “access to vaccination for newly arrived migrants” project: barriers and solutions in the vaccination offer among the consortium countries

Giulia Marchetti¹, Franca D’Angelo², Salvatore Scarso³, Susanna Caminada³, Maria Tosti², Maria Dente¹, Dara Giannini³, Anissa Jaljaa³, Elena Mazzalai³, Maria Russo³, Maurizio Marceca³, Silvia Declich^{1,4}

¹Italian National Institute of Health, National Centre for Global Health, Italian National Institute of Health, Italy, ²Italian National Institute of Health, ³Sapienza University of Rome, Department of Public Health and Infectious Diseases, Sapienza University of Rome, Italy, ⁴AcToVax4NAM Consortium Group, Greece

Background and Objective: The project “Access To Vaccination for Newly Arrived Migrants”-AcToVax4NAM (Grant n.101018349, 3rd EU Health Programme) intended to describe the vaccination offer and the critical issues that hinder the access to immunization services for Newly Arrived Migrants (NAMs).

Methods: The survey was conducted among the Consortium Countries (Greece, Italy, Spain, Cyprus, Malta, Germany, Poland and Romania) through a standardized data collection template to investigate the organization of National Health System (NHS), immunization services and vaccination offer. The representatives of all Countries, with the support of national experts in the field of migration and/or immunization offer, filled in the template.

Results: Regarding the NHS organization, migrants not registered with the NHS and those undocumented are guaranteed only for emergency care in most Countries. Migrants’ access to the NHS largely depends on their status (documented/undocumented) and the country of origin (EU countries/Third countries). Information collected on the vaccination offer identified that, unlike the general population, migrants are not always offered all the vaccinations included in the National Immunization Program (NIP) due to their legal status and the impossibility of assessing vaccination status and follow-up. The main barriers to vaccination collected are legal, economic, organizational, logistic/physical and linguistic/cultural. The solutions adopted by Countries to overcome the barriers include vaccination campaigns, communication strategies, training activities, free vaccinations to adults, collaboration with non-governmental organizations and flexibility of vaccination services. During COVID-19 pandemic, all Countries included undocumented migrants in the vaccination campaigns.

Conclusion: The survey collected information on main barriers to immunization of NAMs and possible solutions to overcome them. Indeed, assessing the differences within the consortium countries can help to identify strategies and ensure a better vaccination uptake. In the end, the experience of vaccination against COVID-19 organized with an inclusive approach, should be a starting point for including migrants in the NIP.

Adverse events following immunization with recombinant adjuvanted anti-herpes zoster vaccine: data from active surveillance in Puglia, Italy

Pasquale Stefanizzi¹, Pasquale Stefanizzi¹, Andrea Martinelli², Antonio Di Lorenzo², Federica Toro², Paola Berardi², Francesco Scazzzi², Sabrina Lattanzio¹, Francesco Bianchi¹, Silvio Tafuri¹

¹University of Bari Aldo Moro, Italy, ²Public Health Post-Graduate School, University of Bari Aldo Moro, Italy

Background and Objectives: Since 2021, a recombinant adjuvanted anti-Herpes Zoster (HZ) vaccine (RZV) is available in Italy, offered to immunocompromised subjects. In pre-marketing evaluation, the most reported adverse reaction following RZV were pain (78%), redness (38%), and swelling (26%). Due to the recent introduction, no real life data about safety profile of RZV are available. This study investigates AEFIs occurring after RZV administration to design its safety profile.

Methods: This is a cross-sectional observational study. The study population is represented by patients vaccinated with adjuvanted anti-HZ vaccine within Bari Policlinico General Hospital, from 01/10/2021 to 31/08/2022. Subjects were contacted via phone call two weeks after the first dose and two weeks after completing the vaccination cycle, and were asked about AEFIs they experienced. **Results:** Three-hundred-eighty-two people were vaccinated and 366 accepted to participate to the follow-up (response rate 95.8%). Two-hundred-five subjects

underwent both administrations; 571 doses were therefore administered. The male-to-female ratio was 189/177, with mean age of 58.6 ± 13.7 years.

Out of 571 follow-ups, 292 AEFI cases were reported (reporting rate 51.14 per 100 administered doses). One-hundred-ninety-four AEFIs happened after the first dose (53.01 per 100 doses), while 98 occurred after the second (47.80 per 100 doses). Most common symptoms were pain at site of injection (45.2 per 100 doses), asthenia (13.1 per 100 doses), redness at site of injection (9.5 per 100 doses) and fever (9.1 per 100 doses). No serious AEFIs were identified. Three subjects (0.82%) reported HZ after vaccination, of which only one case occurred more than two weeks after immunization, thus representing a vaccine failure. Risk of AEFIs was not influenced by sex, age, or dose number ($p > 0.05$).

Conclusions: The recombinant adjuvanted vaccine’s safety profile appears to be coherent with pre-marketing evidence. Vaccine failure was sporadic, suggesting high effectiveness even in immunocompromised subjects.

From birth to booster and beyond

Alberto Tozzi¹, Gary Marlowe¹, Gary Marlowe², Alberto Tozzi¹, Alex De Figueiredo³

¹Ospedale Pediatrico Bambin Gesù, Italy, ²British Medical Association, United Kingdom, ³Vaccine Confidence Project & Imperial college London, Dr, United Kingdom

Background and Objective: After clean water, vaccinations are recognized as one of the most cost-effective public health investments governments can make. [i]. [ii] Despite all European countries having national immunization programs, many children go unvaccinated and remain vulnerable to vaccine preventable diseases (VPDs). [iii] COVID-19 highlighted the risk of cross-border contamination of infectious diseases and evidenced the need to achieve immunity through a united approach. [iv] Pathway effectiveness is essential in improving uptake rates and increase population immunity.

This session will set out an implementable framework to strengthen routine immunization systems and build vaccine confidence.

Methods: The framework has been developed using insights from an advisory group comprised of diverse professionals with a range of experience and supplemented with secondary research.

Results: The framework outlines an optimum vaccination pathway, offering holistic recommendations including: HCP training, data, surveillance systems, accessibility; and underpinning factors such as: avoidance of vaccine complacency and fatigue, and building vaccine confidence.

Conclusion: European governments and health system leaders must develop clear and actionable plans that address all elements contributing to vaccine uptake to support 95% target rates in pediatric immunization, ensuring they’re met within all countries and regions. Policy makers should use the framework to implement cohesive pediatric routine immunization pathways, to improve confidence and increase population immunity against VPDs.

Authors: Dr Marlowe, Chair London BMA and Dr Tozzi, epidemiologist Ospedale Pediatrico Bambin Gesù et al.

Glossary on Essential Definitions related to vaccines: strengthening vaccine literacy and promoting a participatory approach

Igor Aloise¹, Maria Russo², Salvatore Scarso³, Chiara Bartolucci¹, Giulia Marchetti⁴, Franca D’Angelo⁵, Maria Tosti⁴, Angela Gatta¹, Chiara De Marchi¹, Arianna Bellini¹, Caterina Ferrari¹, Marise Sabato¹, Silvia Declich⁴, Maurizio Marceca¹, Consortium Group, AcToVax4NAM⁶

¹Sapienza University of Rome, Department of Public Health and Infectious

Diseases, Sapienza University of Rome, Italy, ²Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy, ³Sapienza University of Rome, ⁴Italian National Institute of Health, National Centre for Global Health, Italian National Institute of Health, Italy, ⁵Italian National Institute of Health, ⁶AcToVax4NAM Consortium Group, Greece

Background and Objective: The project Access To Vaccination For Newly Arrived Migrants-AcToVax4NAM (Grant No. 101018349, Third EU Health Programme) aims to ensure equal access to vaccination services for all migrants, without discrimination. It also aims to provide tools for vaccination services to be more accessible and less complex. A glossary was developed on the essential definitions of vaccines to be validated and tailored in each AcToVax4NAM consortium countries. The Glossary is intended to be a tool in the hands of non-health professionals for the promotion of NAM vaccination.

Methods: The essential glossary is structured in three different sections: vaccination related terminology; organisational/management related terminology; specific terms referring to the country context health care organization. Each country organised a workshop to consult local health and non-health professionals who work with migrants to make the tool as actionable as possible. The workshop was held on the basis of shared guidelines, while two evaluation tools were used to assess respectively the clarity, completeness and usability of the glossary and the participants satisfaction.

Results: A total of 8 workshops were organized in Greece, Italy, Spain, Germany, Cyprus, Malta, Poland and Romania with more than 62 participants. Cultural mediators were most represented following by NGO operators and Physicians. 90% reported that the glossary is clear and useful, 80% considers the tool relevant for migrants immunization promotion strategies, while 75% consider it easy to be used. Interestingly, the use of plain language could also help healthcare professionals to improve their communication with migrant patients.

Conclusion: With the glossary, we aim at informing and sharing, in an easily operable manner, essential information related to vaccines with the targeted professionals, to boost their ability to advocate for NAMs access to vaccination. The participatory approach adopted enhances the effectiveness and permeability of the instrument itself.

Knowledge and Attitude Towards the Tdap (Tetanus, diphtheria, acellular pertussis) Booster Vaccination in Healthcare Workers in a Large Academic Hospital in Southern Italy in 2022: a Cross-sectional Study

Michelangelo Mercogliano¹, Claudio Fiorilla¹, Federica Esposito¹, Michele Sorrentino¹, Pasquale Mirizzi¹, Antonio Parisi¹, Maria Triassi¹, Raffaele Palladino¹

¹Department of Public Health, University "Federico II" of Naples, Naples, Italy

Background and Objective: In Europe there is still a suboptimal Tdap (Tetanus, diphtheria, acellular pertussis) booster coverage, which might explain the increased incidence of Pertussis and, specifically in Italy, the relatively large proportion of Tetanus cases diagnosed. The aim of this study was to assess coverage status, knowledge, and attitudes on Tdap vaccination in health workers (HCWs) at the University Hospital "Federico II" in Naples, South of Italy, in 2022, to improve current vaccination strategies.

Methods: A cross-sectional study was conducted using a validated anonymous questionnaire. Knowledge and attitude were measured as scores (1-30). Multivariable logistic and linear regression models were employed to identify correlates of Tdap booster and knowledge and attitude towards the vaccination, as appropriate. Models were controlled for age, sex, job, Department, and years of employment.

Results: 206 questionnaires were administered among HCWs, 143 (69.4%) were medical doctors. 71 (34.47%) HCWs received the Tdap booster. Those who had worked 5-9 years at the hospital had a 78% lower likelihood of being vaccinated with the Tdap booster (5-9 years - OR: 0.22, CI: 0.06 | 0.85) as compared with newly hired HCWs. No other variable was significant in the model. Medical doctors had a greater attitude towards vaccination than non-medical HCWs (Other - Coef. -2.15 on 30; CI: -4.14 | -0.15). Compared with HCWs in clinical departments, those in diagnostic-therapeutic and public health organizational departments considered vaccination less useful as prevention tool (diagnostic-therapeutic - Coef. -3.12 on 30, CI: -5.13 | -1.12; public health - Coef. -1.98 on 30, CI: -3.41 | -0.56).

Conclusion: The study findings support the need to implement public health strategies to improve information and awareness toward vaccinations, and specifically the highlight importance of Tdap booster every 10 years as prevention tool to protect high-risk populations.

The public health challenge of addressing communities with sub-optimal uptake of routine childhood vaccinations in Israel

Chen Stein-Zamir¹

¹Jerusalem district health office, 86 Jaffa rd, Israel

Background and Objectives: Childhood vaccinations have considerably averted morbidity and mortality from Vaccine-Preventable Diseases (VPD) worldwide. Despite a high overall national vaccination coverage in Israel, there are communities with suboptimal coverage and recurrent VPD outbreaks (e.g. measles). These communities mainly reside in the Jerusalem district. We aimed to evaluate the vaccination coverage in the Jerusalem district compared to the national rates and describe the challenge of addressing these communities.

Methods: Childhood vaccinations are included in Israel's National Health Insurance Law. Community-based health clinics provide free vaccination to all children. Vaccinations are not mandatory. The vaccination coverage data for 2017-2022 were retrieved from the National Immunization Registry. The vaccines evaluated were Diphtheria, Tetanus, acellular Pertussis, polio, Haemophilus influenzae b (DTaP-IPV-Hib4: dose 4) and Measles-Mumps-Rubella/Measles-Mumps-Rubella-Varicella (MMR/MMRV1), both scheduled at age 12 months. The national population is 9.3 million, children (0-17 years) consist a third of the population. The national birth cohort is 185,000 with 35,000 in the Jerusalem district.

Results: The overall national vaccination coverage rates (%) were adequate and lower in the Jerusalem district. The mean vaccination coverage rates for DTaP-IPV-Hib4 and MMR/MMRV1 were 95.1±2.1 and 97.5±1.6 in the country overall, compared to 88.4±4.8 and 96.3±2.6 in the Jerusalem district, respectively. A trend of decline was observed during the COVID-19 pandemic years (2020-2022), nationally and prominently in Jerusalem. The decline was more noticeable in the DTaP-IPV-Hib4 (90.7% nationally and 78.8% in Jerusalem in 2022) than in MMR/MMRV1 (94.2% nationally and 91.5% in Jerusalem in 2022). Vaccination campaigns and supplemental immunization activities are carried out constantly in the Jerusalem district hard-to-vaccinate communities.

Conclusion: While aggregated vaccination coverage rates are nationally high, disaggregated data reveal gaps among population groups. Vaccination gaps have been reported globally and deepened during the COVID-19 pandemic. Sustainable public health programs and community-based campaigns are essential.

Systematic review and meta-analysis of the effectiveness of vaccine catch/mop/keep-up remind or recall interventions in comparison to standard vaccination offer

Walter Priano¹, Alessandra Fallucca², Patrizia Ferro¹, Alessandro Carubia¹, Vincenzo Pisciotto², Gaia Vitale², Alessandra Casuccio¹, Vincenzo Restivo¹

¹University of Palermo, Department of Health Promotion, Mother and Child Care, Internal Medicine, and Medical Specialties "G. D'Alessandro" (PROMISE), University of Palermo - 90133 Palermo, Italy, ²University of Palermo

Background and objective: Within the worldwide challenge of tackling vaccine hesitancy, the Strategic Advisory Group of Experts on Immunization (SAGE group) strongly fosters vaccination remind or recall interventions that, alongside new opportunities offered by scientific progress, represent key to successfully immunize target population classes. This systematic review with meta-analysis will provide an evaluation of the effectiveness of different remind or recall vaccination interventions in comparison to standard vaccination offer.

Methods: Two literature databases (PubMed/MEDLINE and Scopus) were consulted in February 2022, retrieving 1850 studies. PRISMA statement guidelines were adopted and 80 manuscripts (47 trial/RCTs, and 33 before-after studies) were included after the assessment phase. Meta-analysis with random-effects model was performed by using STATA software (ver.14.1.2). The selected outcome was the relative risk (RR) of vaccination coverage improvement effectiveness. Furthermore, meta-regression analyses and funnel plots were provided for the included manuscripts.

Results: The analyses displayed, for cumulatively considered interventions, an overall effectiveness of RR=1.22 (95% C.I.:1.18-1.25, p<0.001) for RCTs and RR=1.70 (95% C.I.:1.54-1.87, p<0.001) for before-after studies. Subgroup analyses allowed to identify "multicomponent" (RR=1.48, 95% C.I.:1.32-1.66, p<0.001) and "remind clinical" (RR=1.25, 95% C.I.:1.17-1.34, p<0.001) interventions as the most effective activities that increased vaccination coverage for RCTs. On the other hand, "education" (RR=2.13, 95% C.I.:1.60-2.83, p<0.001) and "multicomponent" (RR=1.61, 95% C.I.:1.43-1.82, p<0.001) interventions

granted highest increase levels for before–after studies. As showed in meta-regression analyses, more effective interventions were carried out among adult-middle-aged population (RCTs: $p=0.01$, 95% C.I.:0.09–0.61, coeff.:0.51; before–after: $p=0.01$, 95% C.I.:0.70–1.84, coeff.: 1.27).

Conclusion: Community, family, and healthcare-based multidimensional interventions, as well as education-based catch-up strategies, effectively improve vaccination coverage. Therefore, their systematic implementation could be utmost relevant to target under-vaccinated population classes, thus aligning with nationally scheduled coverage levels and, ultimately, trying to eliminate or eradicate vaccine-preventable diseases.

Retrospective multicenter study on 'real life' experience on the use of two different hexavalent vaccines in 5 local health authorities of the sicilian region from 2016 to 2019

Livia Cimino¹, Francesco Blangiardi², Claudio Costantino¹, Nicole Bonaccorso¹, Arianna Conforto¹, Martina Sciortino¹, Girolama Bosco³, Calogero Collura³, Nicolò Casuccio⁴, Maria Randazzo⁴, Gaspare Canzonieri⁵, Giuseppe Palermo⁵, Vincenzo Di Gaetano⁵, Gino Taranto², Mario Cuccia⁶, Roberto Furnari⁶, Mario Palermo⁷, Francesco Vitale¹

¹Department of Health Promotion, Maternal and Infant Care, Internal Medicine and Excellence Specialist Medicine, University of Palermo, Palermo, Italy, ²Prevention and Epidemiology Unit of the Local Health Authorities of Ragusa, Ragusa, Italy, ³Prevention and Epidemiology Unit of the Local Health Authorities of Agrigento, Agrigento, Italy, ⁴Prevention and Epidemiology Unit of the Local Health Authorities of Palermo, Palermo, Italy, ⁵Prevention and Epidemiology Unit of the Local Health Authorities of Trapani, Trapani, Italy, ⁶Prevention and Epidemiology Unit of the Local Health Authorities of Catania, Catania, Italy, ⁷Department for Health Activities and Epidemiological Observatory of the Sicilian Region Italy

Background and Objective: Hexavalent vaccination (HV) is a priority for protecting infants against six potentially deadly infectious diseases. In Italy, Europe and recently in the U.S. there are three commercially authorised vaccines. HV is currently used in a primary immunisation regimen with three doses (3-5-11 months). A retrospective clinical study was conducted in Sicily, Italys fourth-most populated region (10% of national population and 9% of all newborns), in order to evaluate real life data on HV during 2016-2019.

Methods: Data on the completion of the administration of HV, on interchangeability between the two vaccines that alternated between 2016 and 2019 (Infarix Hexa®- Vaxelis®), on use above the established age and on co-administration with Rotavirus and Pneumococcus vaccines were investigated in five Local Health Unit of the Sicilian Region. Scientific coordination was in charge to the Clinical Epidemiology Unit of the University Hospital (UH) of Palermo, through a questionnaire approved by the ethics committee of the same UH.

Results: Data collected from the LHUs of Agrigento, Catania, Palermo, Ragusa and Trapani, constituting 72.5% of the Sicilian population, showed an average of 91.5% completion of the HV cycle at 24 months of age. The average age of administration gradually increased in children who switched between the two vaccines compared to those who completed the vaccination cycle with the same product. Interchangeability with one or two doses of hexavalent was documented in 17.8% (2018) and 16% (2019) of infants. Co-administration was 93% with the 13-valent conjugate anti-pneumococcal vaccine and 70% with the anti-rotavirus vaccine.

Conclusions: This retrospective analysis could contribute to demonstrate safety and sustainability of the interchangeability between different types of the same HV, helping Public Health Authorities to manage potential disruptions due to missed routine immunization opportunities pandemic-related or change of vaccines due to National or Regional tender.

Popul. Med. 2023;5(Supplement):A2020

COVID-19 vaccination effectiveness: one year of observation

Domitilla Marconi¹, Chiara Guidoni², Enrico Simoncini³, Bruno Sposato⁴, Antonio Perrella⁵, Cesira Nencioni⁶, Nicola Nante⁷, Gabriele Messina⁷, Andrea Serafini³

¹University of Siena Post Graduate School of Public Health, University of Siena, Siena, Italy, ²Local Health Authority Toscana Sud-Est, ³Local Health Authority Toscana Sud-Est Health Management, Misericordia Hospital, Local Health Authority Toscana Sud-Est, Grosseto, Italy, ⁴Local Health Authority Toscana Sud-Est Pneumology Unit, Misericordia Hospital, Local Health Authority Toscana Sud-Est, Grosseto, Italy, ⁵Local Health Authority Toscana

Sud Est, ⁶Local Health Authority Toscana Sud-Est Infectious Diseases Unit, Misericordia Hospital, Local Health Authority Toscana Sud-Est, Grosseto, Italy, ⁷University of Siena Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy

Background and Objective: In 2020, Italy was one of the most affected countries in the world, counting over 70.000 deaths for covid-19. The Italian ministry of health led the nationwide vaccination campaign. On 1st september 2021, 72% of the population received at least one dose. We aimed to assess the effectiveness of COVID-19 vaccines regarding infection, admission, days of hospitalization, access to the intensive care unit (icu) and death for one year of observation; to the best of our knowledge, there are no studies with such a long study period.

Methods: We conducted an observational retrospective study on all the residents older than 18 of grosseto province (tuscany, Italy) from 1st september 2021 to 31 august 2022. We included who had completed the primary vaccination cycle at the begging of the study and who had never received either one dose by the end of the period. Moreover, all the people who contracted COVID-19 infection before 1 september 2021 were excluded. First, we extracted data regarding vaccine Administrations and reportable COVID-19 tests for all the residents; Then, we linked data of the COVID-19 hospitalizations (the main reason for the admission). We performed logistic and multiple linear regressions adjusting for age, sex, and charlson-comorbidity-index with statav17.

Results: We observed 213.895 residents and 44.236 COVID-19 cases, and 613 hospitalizations for COVID-19. Considering age, sex and charlson-comorbidity-index, the effectiveness of vaccination is high for all the outcomes: admission (adjor 0.22 95%ci 0.19-0.26), uci (adjor 0.49 95%ci 0.26-0.91), death (adjor 0.40 95%ci 0.25-0.65). Moreover, vaccination reduced days of hospitalization (coef. -3.11 95%ci -4.50 to -1.71). However, increasing age, male sex and comorbidities increased the risk of severe outcomes.

Conclusion: Our results confirm that vaccination prevents severe disease with hospitalization, admission to uci, and death and it is crucial especially for older male people with comorbidities.

DOI: 10.18332/popmed/164110

Exemption or hesitation? Analysis of COVID-19 vaccination exemption requests in a health district in marche region

Giulia Paolorossi¹, Federica Scaccia², Giorgia Mazzarini³, Daniel Fiacchini⁴, Patrizia Marcolini², Corinna Fotunato⁵, Davide Rinaldini⁵, Lidia Pascucci⁵, Daniela Cimini⁴, Andrea Poscia⁴

¹Università Politecnica delle Marche, Dipartimento Scienze Biomediche e Sanità Pubblica, Sezione di Igiene, Medicina Preventiva e Sanità Pubblica, Ancona, Italy, ²Public Health Department, Asur Marche AV2, Ancona, Italy, ³Dipartimento di Prevenzione U.O.C. ISP-Sorveglianza e Prevenzione delle Malattie Infettive e Cronico Degenerative - ASUR AV2, Jesi, Italy, ⁴Public Health Department, Asur Marche AV2, Ancona, Italy, ⁵Department of Biomedical Sciences and Public Health, Section of Hygiene, Preventive Medicine and Public Health, Polytechnic University of the Marche Region, Ancona, Italy, Italy

Background: SARS-CoV-2 vaccination represented a breakthrough against the pandemic, but sub-optimal coverage in Italy led to the introduction of obligatoriness for several workplaces and citizens over50. Exemptions have ensured when vaccination is contraindicated. In doubtful cases, physicians could refer to experts' committees. Aim of this work is to analyse the appropriateness of these kinds of requests received in a Local Health District.

Methods: In September 2021, the regional group for SARS-CoV-2 vaccination exemptions was established and the procedure for requesting advice defined. From 1/10/2021 to 15/06/2022, 53 requests were submitted in the Health District of Jesi (approximately 100.000 inhabitants). They were independently assessed by 2 physicians expert in vaccination and classified using a structured grid describing query, presence of specialist certification, response time and outcome. Results: 34 requests (66%) were motivated by known allergies or diseases, 34% by previous adverse reactions to vaccinations. The average response time was 40,3 days. Only 5 (9%) requests received a certificate of temporary unsuitability and 1 (2%) unsuitability for mRNA vaccine. Among these, only 33% carried out the vaccination as appropriate. The remaining 89% of the requests did not justify any contraindication, but only 17% proceeded with the vaccination. 51% of the requests were accompanied by a specialist certificate. Of these, 89% appeared in contrast with the vaccination guidelines and has been assessed as having no contraindications, but in no case did vaccination follow

Conclusion: This work highlights an excessive use of the specialist committees assessment, which was not justified by the complexity of the case history, but rather by a defensive medicine approach (for specialist certificates misaligned

with the guidelines or a lack of knowledge of the latter), with a consequent delay in vaccination suggesting the urgency of reconsider pathways for future mandatory vaccination.

Popul. Med. 2023;5(Supplement):A2022

Observatory of immunization programs of Ibero-America: Year 2020

Analia Urueña¹, Maria Rombini¹, Romina Mauas¹, Amos García Rojas²
¹Universidad Isalud Argentina, ²Dirección General de Salud Pública de Canarias Spain

Background and Objective: Iberia (Spain and Portugal, IB) implemented the Expanded Program on Immunization (EPI) in 1974 and Latin America (LA) in 1979. Calendars and management evolved with differences, and the implementation and achievement of goals between countries show inequalities. We aimed to conduct an observatory of the EPIs in Ibero-América (IA) and build a Ranking based on their indicators.

Methods: Descriptive study of 20 countries (2 from IB, 18 from LA). We searched public sites of the Ministries of Health, WHO, PAHO and UNICEF and conducted interviews with referents. We analyzed calendars of 2020, vaccination coverage rates (VCRs) of 2019 (LA) and 2020 (IB), and management variables. We defined 6 domains: vaccination of the 1st year; from 2 years to school entry; adolescents, pregnant women, adults, and elderly; against influenza; special populations; and programmatic aspects. The 149 variables analyzed, and their categories added up a maximum of 400 points. Country score is expressed as a percentage of the maximum possible.

Results: Different schedules, vaccine combinations, VCRs and programmatic aspects were observed between countries and regions. Spain, Chile, and Portugal led the global ranking reaching a score of 286 (72%), 271 (68%) and 262 (66%), respectively. The rest of LA countries ranged from 209 (52%, Uruguay) to 96 (24%, Bolivia). The countries positioned down in the ranking showed lower VCRs, shorter scope calendars, information, and programmatic gaps. However, when domains were analyzed independently, the order of countries changed and the same pattern was not repeated, highlighting the strengths and weaknesses of each EPI.

Conclusions: This first observatory of the IA EPIs shows large disparities between regions and countries. The ranking aims to encourage EPI leaders and decision-makers to identify remaining challenges and opportunities to improve outcomes. The periodicity of the analysis will allow to compare EPIs evolution over time.

DOI: 10.18332/popmed/164127

Evaluating the impact of COVID-19 vaccination and vaccine timing on SARS-COV2 infection in healthcare workers in the real-world healthcare practice

Edlira Skrami¹, Marica Iommi¹, Andrea Faragalli¹, Rosaria Gesuita¹, Luigi Ferrante¹, Marco Morbidoni², Cristina Mancini², Antonella Guidi², Annalisa Cardone², Pietro Serafini³, Remo Appignanesi³, Flavia Carle¹

¹Centre of Epidemiology, Biostatistics and Information technology, Università Politecnica delle Marche Via Tronto, 10A, Ancona Italy, ²ASUR Marche Area Vasta 2, UOC-ISP Environment and Health-UOS Epidemiology Ancona Italy, ³ASUR Marche, Health Management Ancona Italy

Background and Objective: The aim was to evaluate the impact and timelessness of vaccination on SARS-COV2 infections among healthcare workers (HWs), using healthcare utilisation databases in Marche Region, Italy.

Methods: The cohort comprised HWs of Marche Region Health Authority divided into five local units (LU), 18-70 years old, residing in the Region since 2018.

Follow-up began on December 27, 2020, or hiring date, or 90 days after a positive RT-PCR test for HWs with prior infection, if after this date.

Follow-up ended at the date of the SARS-CoV2 infection, employment termination, seven days after vaccination course completion for participants with post-vaccine follow-up < 21 days, first vaccine dose if partially vaccinated, death, study end (May 31, 2021), whichever occurred first.

Cox regression was performed to estimate the impact of vaccination, time to vaccination, occupational role, age, sex, health status on the infection risk, adjusted for vaccination velocity, the probability of being swabbed and the intensive care unit admissions monthly rate, in each LU. The latter two covariates and vaccination were considered time-dependent variables.

Results: Overall, 7967 HWs (28% males) with median age 47 years, 77% fully vaccinated by May 31, 2021, were evaluated.

Vaccination significantly reduced the risk of infection (HR=0.2, IC95%: 0.2; 0.3); the risk was higher for auxiliary nurses (HR=1.7, IC95%: 1.2-2.3) and for nurses/physiotherapists/technicians (HR=1.4, IC95%: 1.1-1.7) versus physicians, in

males versus females (HR=1.5, IC95%: 1.2; 1.8).

Infection probability increased with increasing time to vaccination, for example, in male physicians, from 6% (IC95%: 5; 6) to 11% (IC95%: 10; 12), at 40 and at 133 days after vaccine initiation, respectively.

Conclusion: Vaccination reduces infection risk regardless of occupational, health, demographic and territorial characteristics in HWs; the association between vaccine timelessness and risk reduction highlights the importance of appropriate actions to promote and ensure a rapid access to the vaccine offer.

DOI: 10.18332/popmed/164159

Refugees from ukraine in the pandemic context: the approach of a Public Health Unit in Tuscany, Italy

Linda Botarelli¹, Linda Botarelli¹, Nicola Nante², Mattia Fattorini³, Daniele Rosadini³, Nicola Vigiani⁴, Gabriele Messina⁵, Silvia Cappelli³

¹University of Siena Post Graduate School of Public Health Italy, ²University of Siena, ³Local Health Authority Toscana Sud-Est Department of Public Hygiene and Nutrition, Valdichiana Senese Area Italy, ⁴Local Health Authority Toscana Sud-Est, ⁵University of Siena Post Graduate School of Public Health and Department of Molecular and Developmental Medicine Italy

Background and Objective: In the last year, the conflict in ukraine has caused the arrival in Italy of more than 150.000 refugees. The tuscan region provided to verify the refugees general vaccination status, particularly for covid-19, through the prevention departments. The public health unit of zona valdichiana senese – ausl toscana sud est dedicated specific outpatient sessions to this mission. Refugees were invited via active call in collaboration with stakeholders. Vaccinations were offered for free according to the italian health system. Missing vaccinations were proposed and carried out after anamnesis and collection of informed consent. Cultural mediators took part in the sessions and guaranteed the service. The aim of our study was to assess the PRE – post intervention vaccination status of refugees of the zona valdichiana senese – ausl toscana sud est.

Methods: This descriptive study was conducted by collecting reports from stakeholders relating to arrivals from ukraine (299 refugees) in the asl tse zona valdichiana senese territory from 20 february 2022 to 13 april 2022. The extraction query was processed using ms excel software. We analyzed the id code, age, vaccination status and vaccines carried out (date of vaccination, type of vaccines). A descriptive analysis was therefore carried out on which vaccines were administered.

Results: During the study period, 70/299 refugees (23,4%) were managed by our unit. 52/70 (74,3%) have had at least one dose of the covid vaccine, 20 of which were booster. 19/70 had other vaccines, of which 7 for a,w,yc-meningitis, 5 for chickenpox, 4 for pneumococcus, 4 for b-hepatitis.

Conclusion: Although the number of reports is relatively modest, this work highlights that every initiative of public health is fundamental to improve the protection against infectious diseases vaccination and to ensure continuity and free health care access for migrants.

Popul. Med. 2023;5(Supplement):A2025

How to guarantee more dTpa boosters doses in Italy?

Domitilla Marconi¹, Mariachiara Gennari¹, Linda Botarelli¹, Alessandra Cartocci², Nicola Vigiani³, Gabriele Messina⁴, Nicola Nante⁴

¹University of Siena Post graduate School of Public Health, University of Siena Italy, ²University of Siena Department of Medical Biotechnology Italy, ³Local Health Authority Toscana Sud Est, ⁴University of Siena Post graduate School of Public Health and Department of Molecular and Developmental Medicine Italy

Background: Italy reported the highest number of tetanus cases in the EEA in 2014-2018. The most affected group are the elderly, particularly females, because of the low vaccination coverage. Sporadic diphtheria cases continue to occur in not properly vaccinated people, especially travellers from endemic countries. High vaccination coverage is required to ensure indirect and direct protection from pertussis in infants and the elderly, the most vulnerable groups to this disease. Booster dTpa doses are recommended in adults every 10 years for all life. We aimed to evaluate which factors may be associated with our country's immunisation rate decline.

Methods: In September 2021, we conducted a cross-sectional survey among the population of the Tuscany Region, Italy. We collected data on demographics, knowledge of dTpa vaccination, vaccine-preventable diseases and healthcare access knowledge. In addition, we performed a descriptive and inferential analysis with the software Rv4.0. The significance level was set at p<0.05.

Results: Of the sample (N=408), 57% received dTpa booster in 10 years, and 69%

it is free.

We observed an association between receiving dTpa and knowledge of diphtheria (OR 3.28 95%CI 1.27-8.46 $p=0.011$) and pertussis (OR 2.65 1.19-5.92 $p=0.015$). Moreover, people who know that dTpa booster is recommended every 10 years (OR 10.0 5.59-18 $p<0.001$), that it is free (OR 6.97 3.69-13.2 $p<0.001$), and have a healthcare service app on their phone (OR 2.29 1.38-3.80 $p<0.001$) are more likely to getting vaccinated.

Conclusion: In Italy, we must promote dTpa campaign to protect vulnerable people. Our study shows that health literacy increases the likelihood of getting vaccinated. Therefore, it is essential to encourage communication campaigns on dTpa and propose strategies to strengthen the vaccination coverage (e.g. offering vaccination during the driving license renewal visit or implementing co-administrations).

Moving the needle: Improving uptake of adult vaccination in Japan

Patrick Swain¹, Arun Himawan¹

¹International Longevity Centre UK United Kingdom

Background and objective: While Japan tops the charts in terms of healthy life expectancy across the world, uptake of vaccination remains surprisingly low. COVID-19 vaccination uptake has been high but other adult immunisations are trailing behind.

This innovative ethnographic project, led by the International Longevity Centre UK (ILC-UK) and Stripe Partners, has worked to identify, develop, and refine two implementation-ready interventions designed to increase the uptake of vaccinations for people aged 65 and over in Japan, with lessons for countries across the region.

Methods: ILC-UK and Stripe Partners conducted ethnographic research and face-to-face interviews with older adults, doctors, pharmacists, and health system actors in urban and rural Japan to understand the barriers to vaccination and develop innovative solutions to improve uptake.

Results: From healthy eating to exercise, older people in Japan engage in their health and want to stay independent for as long as possible. However, a combination of historical cautiousness from national and local government in promoting life course immunisation, practical barriers including supply issues, a lack of shared electronic health records and attitudinal barriers, push down uptake.

Conclusion: The success of the COVID vaccination rollout shows that people are willing to get vaccinated when there is urgency and systems are designed to integrate into people's lives. Heeding these lessons could create some easy wins in increasing uptake of other routine immunisations.

Widening disparities in teen hpv vaccinations during covid-19 pandemic: A case study Italy

Alessandra Dal Zotto¹

¹Local Health Unit 7, Veneto Region via Boldrini, 1 36016 Thiene (VI) Italy

Introduction: In Local Health Unit 7, human papillomavirus (HPV) vaccination campaigns for 12-year-olds have long been implemented by the vaccination services of the Department of Prevention. Due to the pressure of the COVID-19 pandemic on these services, an emergency vaccination campaign was directly managed by primary care pediatricians (PCPs). An initial evaluation of this experience was conducted.

Materials and methods

Data on 12-year-olds assisted by PCPs belonging to the 2006 (pre-pandemic) and 2008 (pandemic) birth cohorts were extracted, along with HPV vaccination data. Health district, gender, citizenship, socioeconomic status, and PCPs were evaluated as possible influencing factors in a two-level logistic regression (second level: single PCP).

Results: The HPV vaccination gap between males and females increased significantly for the 2008 compared to 2006 birth cohort (11 vs. 4 percentage points). As for PCPs, the vaccination uptake range was 4-71% for the 2008 birth cohort vs. 32-85% for the 2006 cohort. The proportion of variance explained at the second level was overall equal to 9.7% for the 2008 cohort vs. 3.6% for the 2006 cohort.

Conclusions: The vaccination campaign carried out during the peak of the COVID-19 pandemic increased the HPV vaccination gaps among Health Districts, genders, and individual PCPs, probably due to a lack of homogeneity in professional practices and attitudes toward HPV vaccination. Catch-up interventions are required in the immediate term, while an equity lens approach should be taken for

reprogramming the vaccination campaign. Greater involvement of schools and families could ensure a more equitable approach and better uptake.

Interventions to increase vaccine uptake in prisons: A global systematic scoping review

Babak Moazen¹, Emma Plugge², Heino Stöver³, Nisreen Agbaria⁴, Nasrul Ismail⁵, Sara Mazzilli⁶, Lara Tavošchi⁶

¹Heidelberg University Universitätsklinikum Heidelberg, Institute für Public Health, Bergheimer Str. 20, Raum 317 69115 Heidelberg, Germany,

²University of Southampton, ³Frankfurt University of Applied Sciences Germany, ⁴Heidelberg University Germany, ⁵Bristol University, ⁶Psa University Italy

Background And Objective: Lack of vaccine uptake is a key global challenge in controlling the spread of infectious diseases in prisons. Based on the international research project "Reaching the hard-to-reach: Increasing access and vaccine uptake among prison populations in Europe (RISE-Vac)" funded by the EU Health Program, we will report the implementation of interventions to increase vaccine uptake among people who live and work in prisons.

Methods: Operationalizing the "Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) extension for scoping reviews" criteria, we searched five databases of peer-reviewed literature—PubMed, ISI Web of Science, Cochrane library, Science Direct, and EBSCO—as well as 14 databases of grey literature to access publications between 2012 and 2022. Suitable publications were reviewed by two researchers independently and the quality of these publications was assessed through established quality assessment tools.

Results: Of the 11,281 publications identified and reviewed, 17 met the inclusion criteria. For people who live in prisons, the following interventions have been implemented to improve their vaccine uptake: 1) knowledge dissemination through educational courses and open focus group discussion; 2) distribution of learning materials, e.g., posters, factsheets, pamphlets; 3) implementing rapid-schedule vaccination services; 4) revision of the existing vaccination protocols; and 5) prioritizing these individuals in national vaccination programs. For juveniles, the development of virtual forums with youth, guardians, and community partners has been adopted to increase vaccine uptake in prisons. For people who work in prisons, e-learning courses and follow-up information through email communication are the main interventions implemented to increase their vaccination uptake.

Conclusion: Considering that most of the people who live in prisons will eventually return to their community and that those who work in prisons return to their community daily, increasing vaccination uptakes as per the measures above should be a key priority for public health investment.

Popul. Med. 2023;5(Supplement):A2029

DOI: 10.18332/popmed/164227

Co-administration of vaccines against rotavirus and group b meningococcus is associated with an increased rotavirus vaccination coverage: a 5-year retrospective population study

Andrea Vecchio¹, Sara Scarano¹, Giuseppina Affinito², Alessandro Scoppa³, Pietro Buono³, Raffaele Palladino², Alfredo Guarino²

¹Department of Translational Medical Sciences-Section of Paediatrics, University of Naples "Federico II", Naples, Italy. Italy, ²Department of Public Health, University of Naples "Federico II", Naples, Italy. Italy, ³Department of Maternal and Child Health, General Directorate for Health, Naples, Italy

Background: In Italy Rotavirus vaccination (RVV) is recommended and provided free of charge from 2018, however, the coverage is scattered and suboptimal. The narrow time frame to complete the schedule is a major barrier to vaccine uptake, and co-administration with other vaccines may potentially increase the coverage. Although the co-administration of RVV and Meningococcal Group B vaccines (MenB) is currently not included into product labels, we aimed at studying its impact on RVV coverage.

Methods: The Regional Vaccination Registry was used to conduct a retrospective cohort study in children born in Campania Region between January 1, 2016 and December 31, 2020, and receiving vaccines scheduled in the first year of life.

Results: A total of 224.110 children accessing the vaccination centers in the study period were included. Overall 60.614 (27.0%) completed the RVV schedule, with a progressive increase over time (from 1.15% in 2016 to 56.92% in 2020), in parallel with MenB/RVV co-administration (from 0.7% in 2016 to 46.85% in 2020). Monovalent RVV schedule (2-doses) was completed in 91.1% of children compared to pentavalent RVV Schedule (3-doses) in 81.3% ($p<0.00001$).

Children receiving RVV/MenB co-administration had a significant higher chance to complete RV schedule compared to those receiving RVV alone during a specific

appointment (94.78% vs 72.26%, Prevalence Ratio -PR- 1.275, 95%CI 1.245-1.295 p<0.00001). The positive effect of RVV/MenB co-administration was more evident for children receiving pentavalent RVV (PR 1.288) than monovalent RVV (PR 1.115), this evidence was confirmed when adjusted for confounding variables (i.e. year of vaccination, local health district, gender).

Conclusion: Although still far from the target, the RVV coverage has increased in recent years in Campania Region. Co-administration with MenB vaccine may aid in achieving this goal, especially for Rotateq. More data about safety and tolerability are needed to support co-administration as a key tool to increase coverage.

Real life experience of knowledge, attitudes and acceptance rate of covid-19 and influenza vaccine administration in one of the main vaccination hub of sicilian region at the university hospital of palermo, Italy

Arianna Conforto¹, Claudio Costantino², Livia Cimino¹, Sara Rusignuolo¹, Giorgio Graziano², Walter Mazzucco¹, Vincenzo Restivo¹, Francesco Vitale¹

¹Department of Health Promotion, Maternal and Infant Care, Internal Medicine and Excellence Specialties (PROMISE), University of Palermo, Palermo, Italy, ²Department of Health Promotion, Maternal and Infant Care, Internal Medicine and Excellence Specialties (PROMISE), University of Palermo, Palermo, Italy

Introduction: In temperate countries of the southern hemisphere, influenza surveillance showed an increase in influenza circulation in 2022 season, anticipating a peak of influenza cases in the Northern hemisphere during 2022/2023 season. The Italian Health Ministry strongly recommend coadministration of seasonal influenza vaccines with other vaccines, including bivalent COVID-19 vaccines. The Vaccination HUB of University Hospital (UH) of Palermo, since the beginning of the campaign, administered over 90,000 doses of COVID-19 vaccines and more than 900 influenza vaccines have been co-administered with COVID-19 vaccines in the 2021/2022 season.

Materials and methods

Data were collected from October to December 2022 at the Vaccination Hub of UH of Palermo, using a self-administered online questionnaire to subjects afferent to the Center, by Google® Forms platform. The research group had access and recorded all data on a password-protected Excel file (ver. 1997-2003). The questionnaire consisting in 15 items, the informative of the study and the consent form was approved by the Ethic Committee of the Palermo's UH. Results: Overall, 904 subjects answered the questionnaire. 74.5% of the respondents were willing to receive the co-administration with the COVID19 and seasonal influenza vaccines. The main reason reported for accepting the co-administration was confidence in the official recommendations (43.5%) whereas 46.6% were not willing to receive the co-administration for fear of side effects. At the multivariable analysis subject with age ≤59 years (AdjOR: 0.48;CI95%:0.31-0.75) and those who received the two vaccines co-administered during the last season (AdjOR: 87.1;CI95%:61.4-463.8) were significantly associated with coadministration during 2022/2023 season.

Conclusion: First data obtained from this study show that those who received COVID19 and seasonal influenza vaccination in the same session also in the 2021/2022 season are willing to receive the co-administration of the two vaccinations again for the current season, arguing for the absolute safety and efficacy of the co-administration.

Between compulsory vaccination and the COVID-19 pandemic: effects on the vaccination coverage trend in a province of Southern Italy

Miriam gorgone¹, Cristina genovese², Serena calderone³, Ilaria saia³, Francesco Ioddo², Irene faranda¹, Paola tripodi³, Isabella spina³, Raffaele squeri³

¹University of messina department of biomedical sciences and morphological and functional images, university of messina Italy, ²University of messina, ³University of messina department of biomedical sciences and morphological and functional images, university of messina Italy

Background and objective: The Italian immunisation schedule includes the main indications for the different types of vaccine, based on the most recent scientific evidences. The purpose of this study is to evaluate the trend of population compliance with mandatory and recommended vaccinations in 2019-2022 in the Messina area after the introduction of the Law 119/2017 and after COVID-19 pandemic.

Methods: This study analyses the data on the vaccination coverage in the Messina area between 2019-2022, and it compares them with the regional and national ones. The research was started on 1st October 2019 and the data were collected through the OnVac program at time 0, 12, 24, 36 months stratified according to the type of vaccine, age group and gender.

Results: Data shows an initial positive trend due to compulsory vaccination, as evidenced by the increased coverage for the hexavalent from one year after the introduction of the law until 2020-2021, followed by a drastic decrease to values below the cut-off. Regarding the flu vaccination, the study records an undulating trend, having an initial decrease in the percentages in 2020, followed by a rise to 80% in 2021 and a new decrease in 2022. It is evident that the maximum vaccination peak occurs thanks to the effect of the Law 119/2017 on compulsory vaccination, followed by a slight positive deflection in the initial phase of the COVID-19 pandemic, and a new collapse in the adhesion of the population, probably linked to the fear of contagion in the health sector.

Conclusion: In conclusion, considering the pandemic implications, we can state that the vaccination obligation is a valid tool for Public Health, but it reveals ineffective if not integrated with an adequate reorganization of the Regional Health System.

Monkeypox (mpox)-related knowledge and vaccine hesitancy among czech healthcare professionals

Abanoub Riad¹, Anton Drobov¹, Jana Rozmarinová¹, Pavla Drapáčová¹, Jitka Klugarová¹, Ladislav Dušek¹, Andrea Pokorná¹, Miloslav Klugar¹

¹Masaryk University Czech Republic

Background: The recent human monkeypox (MPOX) outbreak in non-endemic countries has raised concerns among public health authorities worldwide. Healthcare professionals (HCPs) play a decisive role during epidemics in transmitting accurate information to the public and motivating them to pursue protective behaviours, including immunisation.

Methods: A cross-sectional survey-based study was conducted in the Czech Republic in September 2022 to evaluate MPOX-related knowledge and vaccination perceptions among HCPs. The study utilised a digital self-administered questionnaire (SAQ) which inquired about participants' sociodemographic and anamnestic characteristics, perceived knowledge of MPOX, factual knowledge, and vaccination perceptions according to the health belief model (HBM).

Results: A total of 341 participants were included in this study; most of them were females (88.9%), allied HCPs (89.4%), heterosexuals (87.1%), married (61.9%), and vaccinated against COVID-19 (91.2%). Only 8.8% of the participants agreed to receive vaccination against MPOX; 44.9% rejected it, while 46.3% were hesitant. While digital news portals (47.5%) and social media (25.8%) were among the most utilised sources of information about MPOX, the scientific journals (5.6%), ECDC (5%), and the U.S. CDC (1.5%) were the least common sources. The participants demonstrated suboptimal levels of factual knowledge, especially regarding MPOX vaccines (1.5 ± 1.2 (0-4)) and treatments (0.9 ± 0.9 (0-4)). Additionally, several misconceptions were detectable among the participants regarding topics such as the availability of effective vaccines and antivirals against MPOX, the risk of vertical transmission, and homosexual stigmatisation. The HBM indicated that the cues to action and perceived susceptibility were the most important constructs to predict MPOX vaccine acceptance.

Conclusions: The findings of this study call upon public health practitioners and health policymakers in the Czech Republic to tailor dedicated educational campaigns should encounter the HCPs' misconceptions about MPOX, and future studies should explore the prevalence and drivers of MPOX vaccine hesitancy among the general population.

What is the difference between choosing to vaccinate for a mandatorily or recommended vaccine?

Aida Bianco¹, Francesca Ficara¹, Natascia Costantino¹, Silvia Angelillo¹, Francesca Licata¹

¹Department of Health Sciences, School of Medicine, University of Catanzaro "Magna Græcia", Catanzaro, Italy

Background and Objectives: The National Immunization Prevention Plan 2017-2019 (extended to 2021) states that Diphtheria, Tetanus, acellular Pertussis (dTap) and Inactivated Poliomyelitis vaccine (IPV) have to be boost between 11 and 18 years of age, mandatorily. Among other vaccines, conjugated quadrivalent meningococcus (Men ACWY) is recommended during adolescence. The present study aimed to investigate dTap-IPV and Men ACWY coverage and potential

predictors of the uptake among undergraduate university students in Southern Italy.

Methods: This cross-sectional survey was conducted through an anonymous online questionnaire that included socio-demographic characteristics, attitudes, and reasons for not having received vaccinations and willingness to receive vaccinations.

Results: Preliminary findings refer to a sample of 407 respondents with a mean age of 22.8 years (SD±2.9). During adolescence, 88.6% of respondents received dTap-IPV vaccine, 74% had received the Men ACWY and over two-third of the sample received both vaccinations. Among dTap-IPV unvaccinated students, 39.3% declared to be unwilling to receive the vaccine booster because they believed to be not at risk of contracting vaccine preventable infectious diseases (46%), vaccination was not offered to them (41%) and because they were afraid about potential serious side effects (13.6%). Furthermore, the reasons for not getting Men ACWY were the lack of vaccination proposal (59.4%), the fear of serious side effects (20.3%), believing to be not at risk of meningococcal infection (18.8%) and, lastly, because it was not mandatory (10.9%).

Conclusion: Preliminary results show low perception of the risk of acquiring vaccine-preventable diseases and this represent a key issue to address in order to keep high vaccines' coverage. Although it is preferable that public acceptance make compulsory vaccination programs unnecessary, the finding that some young adults did not get vaccinated against Men ACWY, since it is not mandatory, highlight the need of better understanding the impact on immunization coverage of different approaches.

Digital Assessment and Intervention based on HPV vaccination hesitancy and related cognitive biases

Dario Menicagli¹, Virginia Casigliani², Lara Tavoschi², Stefano Gandolfi³

¹IMT School for Advanced Studies Lucca Italy, ²University of Pisa, Italy

³Sant'Anna School of Advanced Studies

Background and Objective: The HPV vaccination is considered an essential prevention strategy by the World Health Organization (WHO). The Italian Ministry of Health set the goal to reach the 95% vaccinated female and male population susceptible by age. However, the coverage remains below 70%. Vaccine hesitancy (VH) is linked to the risks and benefits information of HPV immunization, but knowledge alone is insufficient to determine the vaccination choice. Individual decision-making is influenced by cognitive biases that distort severity and costs perception of vaccination behavior. This study aims to provide a characterization of the decision-making and cognitive biases in adolescents and design a promotional strategy targeting HPV VH.

Methods: The project is bounded into two phases. First, a sample size of 500 subjects aged 14-20 will be investigated through an online questionnaire regarding decision-making and related biases involved in HPV vaccination choice. Secondly, we will implement a promotional intervention in high school population to increase HPV knowledge and vaccine confidence. A before-after study with control will be proposed in different schools: specific web-based dissemination messages framed on HPV vaccination bias, resulted from the previous survey, will be created and distributed through dedicated channels. In the control group, the standard informative intervention will be maintained.

Results: It is expected an improvement in the understanding of the factors that determine HPV VH and the evaluation of the feasibility and effectiveness of a design-specific promotional campaign through channels suited for adolescents. The results of the campaign will be evaluated according to the vaccination intention of the participants in treatment and control group (Youth Attitudes about Vaccines scale), and through the local administrative data on vaccination rate.

Conclusion: A de-biasing approach is fundamental to improving health patterns and changing the level of VH. This will result in better vaccine uptake in line with WHO recommendations.

Delivery of international vaccinations at the territorial units (uts) of the air and maritime border health offices and seafarers' health services (usmaf-sasn) of the ministry of health in the period 2017-2022

Eleonora Tassone^{1,2,3}, Emanuela Frisicale⁴, Roberto Falvo³, Cosimo Trionfo⁴, Camilla Romano⁴, Marina Di Vona⁴, Ulrico Angeloni³, Giovanni Rezza³, Romina Sezzatini⁵, Anna Odone¹

¹University of Pavia Italy, ²General Directorate for Health Prevention, Ministry of Health, Rome, Italy, ³Ministry of Health, Rome, Italy General Directorate

for Health Prevention, Ministry of Health, Rome, Italy, ⁴Ministry of Health, Rome, Italy, ⁵Ministry of Health, Rome, Italy

Background: The USMAF-SASNs, which grouped several UTs, provide the mandatory and recommended vaccines for international travel at their outpatient clinics, which are recognised centres for the administration of yellow fever vaccination. During the COVID-19 emergency, the Italian Government issued legislative provisions and rules that affected and restricted the lives of citizens and their habits, also international travels. This works aims at describing the impact of COVID-19 pandemic on the delivery of international vaccinations at USMAF-SASNs.

Method: From the NSIS (New Health Information System) of the Ministry of Health, data about the number of vaccine doses administered specific to vaccine type and the UTs-USMAF of delivery were extrapolated. A pre-post time trend analysis was conducted.

Result: During the considered period, 28,868 doses of vaccine were administered in all Italian UTs. Out of these, 22,241 were delivered in the three-year period 2017-2019 and 6,627 in the three-year period 2020-2022. The main USMAF-SASN vaccine outpatient clinics delivered respectively 5,621 vaccines in Lazio and 8,927 vaccines in Lombardy in the six years considered. The pre-post analysis of delivery data showed the negative impact of the pandemic on the access to international vaccinations at USMAF-SASN outpatient clinics, quantifiable in a delivery decrease of 69% between the first and second three-year periods.

Conclusion: The decrease in vaccinations delivery is probably attributable to the decrease in international travel and the restrictive rules applied by Italy and Europe for travel from/to Third Countries. The USMAF-SASN outpatient clinics can represent a support to Local Health Authorities/Regional Health Services widening vaccination delivery as essential service for all citizens.

Building towards vaccine acceptance -community co-design framework

Shane Piper¹, Alison McCallum²

¹Health Protection Surveillance Centre, Health Service Executive ASPHER Young Professional Programme "HSE-Health Protection Surveillance Centre (HPSC), 25-27 Middle Gardiner Street, Dublin, D01 A4A3, Ireland FSS - Lárionad Faire um Chosaint Sláinte | 25- 27 Sráid Ghairdinéir, Baile Átha Cliath, D01A4A3, Éire" Ireland, ²Usher Institute

Background and objective: Vaccine hesitancy is a global public health threat. As the COVID-19 pandemic progressed, vaccines, particularly mRNA vaccines, have reduced overall disease severity and death but population coverage has fallen short and uncertainty about vaccination grown. Miscommunication, neglect of health inequities, failure to address vaccine access and other concerns sufficiently have affected trust between populations and healthcare systems. We built on existing models of increasing vaccine acceptance to develop a more comprehensive explanatory model for testing and evaluation.

Methods: We reviewed the literature on vaccine hesitancy/acceptance models in English and French from PUBMED, ScienceDirect and Google Scholar. We grouped search terms as disease (COVID-19), issue (Vaccine hesitancy) and timeline (COVID-19 pandemic). We explored their application using the Irish case study, including the Irish tailored communication model, and used the findings to build our model.

Results: Previous models had gaps in issues considered, planning and implementation. Many neglected wider determinants or health system responsibilities, treating vaccine acceptance as a one-dimensional issue not a continuum. While the need for vaccination programmes to be redesigned to counter known health inequities, gaps in health literacy, access difficulties, exclusionary practices and mistrust of authorities was recognised, few studies addressed these issues. Our analysis also identified the importance of co-creating delivery models with communities. The resulting model supports prioritisation of communities and individuals in line with need, exposure risk and barriers to immunisation, regardless of their nature or source. Ongoing communication provides space for people to move from vaccine hesitancy to shared understanding while authorities tackle barriers and concerns actively.

Conclusion: Emergency vaccination programmes require greater depth of shared communication and decision making between populations, practitioners, and policy makers. Our model, which incorporates tailored communication, provides a framework for building vaccine acceptance, widening and welcoming participation in development, design, delivery, and improvement.

COVID19 vaccine hesitancy among an urban population during lockdown in India

Joe braham¹, Serah Mamachan²

¹Pushpagiri Institute of Medical Sciences and Research Centre Department of Community Medicine ²Department of Community Medicine Pushpagiri Institute of Medical Sciences and Research Centre Tiruvalla, Kerala, India 689101 ¹India, ²SUT Academy of Medical Sciences

Background and objective: Sufficiently high uptake of vaccines among the general public is important for containing the spread of infections like COVID19. However, mistrust, complacency, misinformation, and wrong beliefs raise apprehension amongst the public regarding the introduction of a new vaccine. The objective of this study was to determine the level of vaccine hesitancy as well as the various factors associated with it among an urban population. **Methods:**

India began its COVID19 vaccination program in January 2021 with the vaccine rollout for the general public starting in May. A community-based cross-sectional study was carried out in the month of April 2021, in the field practice area of the urban health center of a tertiary care hospital, using a self-administered questionnaire. With the rapid increase in cases, most parts of the country, including the study location, were under lockdown during the study period.

Results: Out of 132 study participants, nearly 20% were unwilling to take the vaccine. The most common specific reason for refusing the vaccine was inadequate data about the vaccine's safety followed by concerns about adverse effects. The most commonly used source of information on vaccines was newspapers (62.1%) followed by the websites of the Government ministry and information passed by healthcare workers. Over 26% of those with graduate-level education were unwilling to take the vaccination. Nearly 23% of the respondents who perceived high risk of contracting infection for themselves were unwilling to take the vaccine while nearly 15% of those who perceived they were at no risk of contracting the disease were unwilling to take the vaccine. ($p = 0.086$)

Conclusion: Vaccine hesitancy is high even among well-educated sections of society and public health systems should devise strategies to build trust by disseminating health information through tailored interventions.

Outcomes of cervical cancer screening among vaccinated and unvaccinated women against papillomavirus: a study protocol and preliminary data in the metropolitan area of palermo

Giuseppa Minutolo¹, Mario Valenza², Rosario Piparo³, Milena Emmitti⁴, Alessia Dolce², Maria Randazzo⁵, Marylea Spedale⁵, Vincenzo Restivo¹

¹University of Palermo Health Promotion, Mother and Child Care, Internal Medicine and Medical Specialties Via del Vespro, 133 - Palermo 90127 Italy, ²Local Health Unit of Palermo, ³Local Health Unit of Palermo Local Health Unit of Palermo Via Carmelo Onorato, 6 - Palermo 90100 Italy, ⁴Local Health Unit of Palermo Operative Unit of Screening Management Center Via Carmelo Onorato, 6 - Palermo 90100 Italy, ⁵Local Health Unit of Palermo Italy

Background and objective: Several studies had shown the effectiveness of vaccination against papillomavirus (HPV) in reducing hospitalization and severe prognosis due to cervical cancer. However, in Italy data on cervical cancer screening outcomes among HPV vaccinated women are still lacking. The purpose of this study is to evaluate outcomes cervical cancer screening among vaccinated women against HPV.

Methods: Female residents in the Palermo area aged 25 years old were the eligible study population. Data on both quadrivalent and nonavalent HPV vaccination and cervical cancer screening (PAP test and HPV DNA test) were retrieved from informative dataset of Palermo local health unit (LHU) between 1st January and 30th November 2022.

Descriptive and inferential statistical analyses were performed. Appropriated measures of central tendency (mean or median) and related dispersion measures (standard deviation [SD] or interquartile range [IQR], respectively) were chosen. Chi square test compared PAP test results with HPV vaccination, with $p \leq 0.05$ as statistically significant value.

Results: Women invited to cervical cancer screening by Palermo LHU were 4718. No more than 8.4% (389) of them had a report of cervical cancer screening. The median age at first dose of HPV vaccine was 15 years old (IQR=13-21). Although the frequency of positive PAP test was higher among unvaccinated women compared with the vaccinated (68.4% vs 31.6%), it was not statistically significant ($p=0.528$). Also, the percentage of positive HPV DNA test was higher in the unvaccinated than the vaccinated (75.0% vs 25.0%), but this result was not statistically significant ($p=0.553$).

Conclusion: Notwithstanding no evidence of the HPV vaccination effectiveness

has been shown in this study population, vaccination data of Palermo LHU should be implemented, as well as increasing cervical cancer screening uptake. Since the high frequency of positive PAP/HPV DNA test among unvaccinated women, HPV vaccination should be promoted in early adolescence.

Vaccine service quality and confidence assessment results of a survey in outpatient clinics of the Catania ASP

Rosario Vinci¹, Milena Nardi², Melissa Gullotta¹, Mario Cuccia³

¹University of Catania Italy, ²University of Catania, ³2. Epidemiology and Preventive Medicine Unit - Department of Prevention, ASP Catania" Italy Gabriele Giorgianni "2. Epidemiology and Preventive Medicine Unit - Department of Prevention, ASP Catania" Giuseppe Mangano University of Catania Italy

Background and Objective: The second edition of the "Surveillance system for the main determinants of health in children aged 0-2 years", promoted by the Ministry of Health and coordinated by the ISS, was held from July to September 2022.

We took this opportunity to administer a "satisfaction survey" to assess the perceived quality of the service offered by the local health care system and the level of information and confidence about vaccines.

Methods: A total of 367 anonymous questionnaires were administered, self-filled out by mothers of children no older than 2 years of age who underwent one of the mandatory vaccination (one of the first three doses of hexavalent or the first dose of MMR-V). Among the questions, two were about confidence and fear related to vaccines.

Results: 281 (76.6%) of mothers attended the pediatrician's clinic before the vaccination appointment; 310 (84.6%) declared they were correctly informed by the pediatrician; 355 (96.7%) faced no difficulties in booking the vaccination; 338 (92.2%) reported no overly time elapsed between booking and vaccination. When asked "On a scale of 1 to 10 how much confidence do you place in vaccinations?", 338 (92.1%) rated their confidence from 6 to 10. Relative to the question "On a scale of 1 to 10, how much fear do you have of vaccinations?" the answers were more heterogeneous: 246 (67%) from 6 to 10, 28 (7.7%) 5 and 93 (25.3%) from 1 to 4.

Conclusions: Getting feedback about the service offered can help improve it. WHO considers vaccine hesitancy one of the main threats to global health. Monitoring the population level of trust and fear toward vaccines is relevant for prompt intervention to build and sustain vaccine confidence. This survey tells us that although there is good confidence among mothers, fear continues to be an important issue.

From vaccines to vaccinations ...listen to the professionals involved on the vaccination of newly arrived migrants in Italy

Giulia Marchetti¹, Maria Russo², Salvatore Scarso², Chiara De Marchi³, Silvia Declich¹, Maurizio Marceca², Igor Aloise³, Angela Gatta², Marise Sabato², Arianna Bellini², Caterina Ferrari², Maria Tosti¹, Franca D'Angelo¹

¹Italian National Institute of Public Health National Centre for Global Health, Italian National Institute of Public Health Italy, ²Sapienza University of Rome Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, ³Sapienza University of Rome

Background: Provide equitable access to vaccination for all migrants, regardless of their nationality and migration status is essential to making progress towards universal health coverage. Access to Vaccination for Newly Arrived Migrants (AcToVx4NAM) is a project (Grant n 101018349, 3rd EU Health Programme) that aims at improving the vaccine literacy of the health system and making access to vaccinations for migrants more equitable and guaranteed.

Methods: Qualitative research has been carried out to identify barriers of Italian vaccination system and possible solutions to overcome them. Focus groups and interviews were conducted with 17 professionals: vaccination planning experts, health, social professionals engaged in the topic of migrant vaccination. The results were analyzed using a thematic analysis linked to the framework produced by the project, which divided the vaccination process into five conceptual hubs: entitlement, reachability, adherence, achievement and evaluation.

Results: In Italy, migrants are entitled to vaccinations, regardless of their legal status. Nevertheless, some differences in age, gender and migratory route directly influence the interception of migrants by Italian vaccination system. The compulsory vaccines for schooling and the pathways of the reception system are key opportunities offering the recommended vaccinations. Beyond these, the capability of the vaccination offer to reach migrants is very limited. The

main strategies, that can be adopted to improve the vaccination offer, are the transversal promotion of vaccinations by all those who encounter migrants; building relationships of trust between service providers and the target population, especially through partnerships with NGO active on the issue

Conclusion: Vaccinations should be a multi-step process of protecting and promoting individual and community health, not just a single vaccine shot. Multi-sectoral alliances with a multiplicity of stakeholders are needed. Moreover, it seems that are not migrants who are hard to reach, but the vaccination system that is unable to reach them.

COVID-19 in high-risk exposure population: vaccine effectiveness in the portuguese navy

Verónica Gómez¹, Irina Kislaya², Rui de Deus³

¹Instituto Nacional de Saúde Doutor Ricardo Jorge Portugal, ²Instituto Nacional de Saúde Doutor Ricardo Jorge, ³Marinha Portuguesa Portugal
Ausenda Machado Instituto Nacional de Saúde Doutor Ricardo Jorge Portugal

Background and Objectives: Given the mass vaccination campaigns to control COVID-19 pandemic, it is important to measure the effect of vaccination against COVID-19, in real conditions. The Portuguese Navy, a population at high risk of exposure due to its functions of defence and support to the population in the scope of the pandemic were eligible to early vaccination in December 2020.

Using data from the Portuguese Navy electronic health registries, this study intended to estimate COVID-19 vaccine effectiveness in the Portuguese Navy, against laboratory-confirmed SARS-CoV-2 infection, overall and by time since complete primary vaccination.

Methods: We established a retrospective and prospective cohort that took place for 20 months (December 2020-June 2022). The study population was composed of active-duty and reserve militaries of the Portuguese Navy, all eligible for COVID-19 vaccination that consented to participate in this study. Invitation was via e-mail and consent was obtained to link data from health registries and vaccination. Complete scheme vaccine effectiveness (VE) was estimated as $100\% \times (1 - HR)$ where HR is the confounding-adjusted hazard ratio from time-dependent Cox regression, adjusted for age, sex, and presence of chronic conditions.

Results: A total of 860 Portuguese Navy militaries accepted to participate in the study. Complete primary scheme overall VE against laboratory-confirmed SARS-CoV-2 infection was 54.0% (-5.7 to 79.9) after 14 days of last dose. This estimate was 73% (16.5 to 90.1), 14 to 97 days after the conclusion of the primary vaccination scheme and a waning effect was observed for 98 to 181 days and 182+ days after primary vaccination, 47.6% (-43.5 to 80.9) and 37.8% (-60.4 to 75.9), respectively.

Conclusion: Regarding overall VE estimates against laboratory confirmed SARS-CoV-2, according to time since complete vaccination, we observed a waning effect, similar to the general population. These results should be interpreted with caution given the high uncertainty of the estimates.

European immunization week as an opportunity for raising awareness on prevention function of the primary health care services in rural settings: 2022 shamakhi-azerbaijan case

Sevinc Hasanova¹, Kevser Vatansever¹, Mehmet Akman², Araz Ibrahimov¹, Emin Huseyn³, Gunel Mammadova⁴, Shabnam Shahgeldiyeva⁴, Neymat Rahmanov⁴, Ramin Burcaliyev⁴, Fatos Harmanci⁵, Halil Durak⁵

¹WHO Dr. "WHO Country Office 62 Uzeyir Hajibeyov str. Marine Plaza, 5th floor Baku AZ-100 Azerbaijan" Azerbaijan, ²WHO dr. WHO CO Azerbaijan. Uzeyir Hajibeyov Baku Azerbaijan, ³TABIB dr. Shamakhi Region Central Hospital. Shamakhi Azerbaijan, ⁴The Administration of the Regional Medical Divisions (TABIB) Azerbaijan, ⁵WHO Azerbaijan Country Office Azerbaijan
Background and objective: Azerbaijan WHO country office used 2022 European Immunization Week (EIW) for raising awareness on preventive functions of primary health care (PHC) among stakeholders, healthcare workers (HCW), medical and nursing students, and the community. EIW 2022 activity in six villages of Shamakhi aimed to resume COVID-19 vaccination in adults and immunization courses of 0-15 ages children, besides screening.

Methods: Multifaceted and ten-day-long EIW 2022 activity was realized in Shamakhi, a mountainous region of Azerbaijan with 107.800 population, where the WHO country office has implemented PHC demonstration project. First-approach was home visits by students and community leaders for applying the second approach of raising awareness. The third was screening and vaccination

of children and adults. Rewarding of vaccinated was used as the fourth approach and incentives were provided to HCWs as an example of P4P approach. Total 80 HCWs (17 medical students, 17 nursing students, and 12 community leaders) participated.

Results: Active engagement of community leaders improved acceptability. Total 387 children and 78 adults with incomplete immunization schedule were vaccinated. Administration of next doses were followed up and 101 children were administered booster or primary doses, until September 2022. 1091 adults and 473 children of 0-18 ages were screened using WHO cardiovascular risk charts, FINDRISK scale, and WHO percentile charts. 580 (53.2%) adults had a risk of fatal cardiovascular disease >5%, and 693 (63.5%) had diabetes risk score >7. Among 0-5 ages children, 46(20.6%) were stunted and 23(10.3%) were underweight. Among 5-18 ages, 38(15.0%) were overweight or obese and 32(13.4%) were wasted.

Conclusion: EIW helped to expand PHC horizons in Shamakhi and meet all stakeholders on common grounds, and served as an interprofessional education program. With a thorough organization, home visiting is shown to be a good tool for primary prevention without waiting for peoples demand for healthcare.

Immunisation of people with HIV: an analysis of current pathways

Juan Juaneda¹, Alva Saa-Casal², Escrig-Collado Miriam¹, Jose Antonio Lluch-Rodrigo¹, Pastor-Villalba Eliseo¹, Julio Muñoz-Miguel²

¹General Direction of Public Health and Addictions - Valencian Community, Spain, ²Sagunto Hospital, Valencia, Spain

Background and objective: Immunisation of patients with altered immunity is indicated to prevent diseases for which they are considered to have an increased vulnerability. Adapted vaccination protocols have been implemented through Preventive Medicine departments since 2013 according to national and regional guidelines in the Valencian Community. This study aims to evaluate the success of high risk patient vaccination through existing clinical pathways by assessing the vaccination protocol in people infected with HIV.

Methods: We conducted a descriptive retrospective study in the Valencian Health System (VHS). People 18 years or older with an HIV diagnosis (ICD-9 042, V08; ICD-10 Z21, B20) and microbiological confirmation were included. People with less than 14 months between diagnosis and death, withdrawal from the VHS or data extraction date were excluded. Adequate vaccination was assessed through: vaccination protocol initiation success, successful initiation within 6 months of diagnosis and success in protocol completion. Global, antipneumococcal, antimeningococcal, papillomavirus (3 doses) and shingles (2 doses) vaccination coverages were calculated. For global coverage, we assumed that people with sequential antipneumococcal vaccination and 2 antimeningococcal doses (menC+menACWY or 2 MenACWY doses) were fully vaccinated.

Result: 10610 people with an HIV diagnosis were included (22.9% women). Mean age and mean age (SD) at diagnosis were 56.6 (13.1) and 41.7 (10.9) years. 30.5% were foreign, of which 78.4% were non-EU citizens. 39.9% of people had initiated a vaccination protocol, of which 28.8% did so within 6 months of diagnosis and 27.4% were fully vaccinated. 511 people had not received any vaccine in their lifetime. Vaccination coverages were: global 11.3%, antipneumococcal 35.2%, antimeningococcal 14.1%, papillomavirus 16.3% and shingles 3.1% (vaccination strategy since December 2021).

Conclusion: Current vaccination coverages and patient engagement in the vaccination protocol are suboptimal. While more research is needed on underlying factors, data-based active inclusion strategies may improve the studied indicators.

Herpes zoster vaccination pathway in the immunocompromised patients

Smeralda D'Amato¹, Caterina Rizzo¹, Vincenza Fauci¹, Francesco Fedele¹, Concetta Ceccio¹, Cristina Genovese¹, Raffaele Squeri¹

¹University of Messina Department of Biomedical and Dental Sciences and Morphofunctional Imaging Italy

Material and methods: Shingles vaccine was administered at the vaccination center afferent to the Hospital Hygiene, thanks to an agreement of it with the operative units that manage particularly frail patients to improve vaccination coverage, to reduce vaccine hesitancy and offering therapeutic continuity. Tailored vaccination pathways have been created for "fragile" patients such as patients with HIV, patients with inflammatory bowel disease (IBD) and patients splenectomized or to undergo splenectomy.

Results: We administered a total of 143 doses whereof 64.58% in patients with IBD,

18.06% with HIV, 4.08% patients with splenectomy and the remaining part patients with over 65 years old.

Discussion and conclusion: It is necessary to alert policy makers about the need to operationalize the vaccination indications for frail/immunocompromised individuals contained in the PNPV 2017-2019 as well as in the recommendations expressed by several guidelines. Vaccination coverage of these individuals is in fact very low to date. It is deemed necessary to act with a sense of urgency with actions aimed at fostering new vaccination pathways, closer to the places where patients attend for disease treatment.

Active offering influenza vaccination for frail people during hospitalization: a pilot study in Sicily (Italy)

Alessandra Fallucca¹, Patrizia Ferro², Luca Mazzeo³, Luigi Zagra³, Francesco Vitale², Alessandra Casuccio³, Vincenzo Restivo⁴

¹University of Study of Palermo Department of Health Promotion, Maternal and Infant Care, Internal Medicine, and Medical Specialties, "G. D'Alessandro", University of Palermo. Via Costanza D' Altavilla 32 Italy,

²University of Study of Palermo, ³University of Study of Palermo Italy,

⁴University of Study of Palermo Italy Vaccination Team University of Study of Palermo Via Costanza D' Altavilla 32 Italy

Background and objective: Influenza is a highly contagious infection that it is estimated to kill 290.000 to 650.000 people each year. Elderly and the immunocompromised are particularly exposed to risk of severe complications. Although immunization is strongly recommended as effective in reducing the burden of the disease, vaccination coverage for influenza is still far from the desirable target. There are few studies in the literature that promote vaccination interventions for the high-risk population. This study has the aim to evaluate the impact of an innovative vaccine offer strategy and to analyze the factors associated with influenza vaccination uptake among frail people.

Methods: The vaccination intervention began at the Policlinic Hospital in Palermo at November 2022. Hospitalized patients, over 60 years old or with chronic diseases, were offered vaccination against influenza upon discharge and a questionnaire was administered. The "Health Action Process Approach" model has been used to investigate the propensity to adopt the health behavior of vaccination. The project will continue throughout the flu season, until the end of February.

Results: After one month of activity, 149 patients with a median age of 67 (IQR:58-75) years have been recruited. Frail patients who accepted to be vaccinated against influenza were 60% (n=85). Multivariate logistic regression showed the factors significantly associated with vaccination acceptance were: having received influenza vaccine advice from specialist physicians (OR:3.7,p=0.010), a low level of education (OR:14.4,p=0.004) and a high degree of expectation of a successful vaccination outcome (OR:3.1,p=0.035).

Conclusions: Data collected show that vaccination in the ward could be an effective strategy to vaccinate precisely the most susceptible population. Furthermore, counsel by medical personnel and the correct perception of the benefits of vaccination play an important role in the influenza vaccine acceptance process. Therefore, the results obtained could be useful for planning and improving future influenza vaccination campaigns.

Effectiveness of covid-19 vaccine booster dose among healthcare workers: a systematic review

Luca Bartolucci¹, Gianfranco Damiani², Patrizia Laurenti¹, Domenico Pascucci³

¹Università Cattolica del Sacro Cuore, Roma, Italia Italy, ²Università Cattolica del Sacro Cuore, Roma, Italia, ³Fondazione Policlinico Universitario A. Gemelli IRCCS Roma, Italia Italy

Background and objective: The pandemic caused by the SARS-CoV-2 virus still being a major public health issue, causing significant death tolls and straining national health systems. Characterized by innovative technologies (mRNA for Spikevax and Comirnaty, viral vector for Jcovden and Vaxevria), new vaccine products have been developed, approved, distributed and, starting from December 2020, given primarily to Healthcare Workers (HCWs) in countries such as Italy and USA. The aim of this systematic review is to define the term of protection offered by the administration of EMA (European Medicines Agency)-approved COVID-19 vaccine booster dose for healthcare professionals, considering the Vaccine Efficacy/Effectiveness (VE) against SARS-CoV-2 infections.

Methods: A systematic research of the literature was carried out using the PICO (Population, Intervention, Comparison, Outcomes) model and following the

recommendations of the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines.

Results: Starting from 1241 obtained, 4 studies met the inclusion criteria. All studies dealt with only first booster dose. Considering the different viral variants reported, VE against infection was estimated, with Comirnaty booster dose, between 50% (95% C.I. 42–56%) and 85,6% (95% C.I. 79,2–90,1%) and, with Spikevax booster dose, between 56% (95% C.I. 45–65%) and 96% (95% C.I. 82–99%).

Conclusions: The results of this systematic review show high VE levels among HCWs in the prevention of SARS-CoV-2 outcomes of infections, which however rapidly decline. Hence, the periodic administration of additional booster vaccine doses, could maintain the percentages previously recorded.

DOI: 10.18332/popmed/164355

COVID-19 vaccination hesitancy in people affected by diabetes and strategies to increase vaccine compliance: A systematic review and meta-analysis

Eustachio Cuscianna¹, Francesco Bianchi¹, Silvio Tafuri¹, Giacomo Riformato¹, Sara Colonna¹, Donato Rizzi¹, Giovanni Migliore², Pasquale Stefanizzi¹

¹Interdisciplinary Department of Medicine, Aldo Moro University of Bari Italy,

²General Hospital Policlinico Bari

Background and objective: People affected by diabetes are at higher risk for complications from certain vaccine-preventable diseases. Thus, international public health authorities, such as the Center for Disease Control and Prevention, have highlighted the priority of COVID-19 vaccination for diabetic persons. Despite this, suboptimal vaccination coverages are reported in this population sub-group. The purpose of this study is to estimate the proportion of people with diabetes who express hesitation to the COVID-19 vaccine worldwide. Determinants of vaccine compliance and options suggested by these studies to address vaccine hesitancy were also analyzed.

Methods: Seven studies were included in the meta-analysis and systematic review, selected from scientific articles available in the MEDLINE/PubMed, Google Scholar and Scopus databases between January 1, 2020 and March 21, 2022. The following terms were used for the search strategy: (adherence OR hesitancy OR compliance OR attitude) AND (covid* OR SARS*) AND (vaccin* OR immun*) AND (diabet*).

Results: The vaccine hesitation rate among persons with diabetes was 27.8% (95%CI: 15.6–41.9%). In the comparison of vaccine hesitancy between sexes (male vs. female), the RR was 0.90 (95%CI=0.71–1.15); in the comparison based on educational status (college or more vs. lower education) the RR was 0.88 (95%CI=0.76–1.02). The systematic review showed that the main reasons of unwillingness were lack of information about vaccination, opinion that the vaccine was unsafe or not efficient, and fear of adverse events.

Conclusion: In order to achieve a high vaccination coverage, multifactorial approach is needed, which requires major social, scientific and health efforts. The success of the vaccination campaign in this population depends on the capillarity and consistency of the interventions implemented.

DOI: 10.18332/popmed/164368

Factors associated with covid-19 vaccine hesitancy: Cross-sectional study

Pedro Teixeira¹, Alex França¹, Angelo Pergo¹, Lucas Siqueira¹, Paulo Cortez², Luciano Vitorino

¹Faculty of Medicine of Itajubá Brazil, ²Faculty of Medicine of Itajubá

Background and Objectives: The coronavirus 2019 (COVID-19) pandemic has the vaccine as the best preventive measure. A lot of unscientific information about COVID-19 vaccines has been circulated, which can increase vaccine hesitancy (VH). This study assessed the associated factors with the VH of COVID-19, such as sociodemographic variables and anxiety disorder.

Methods: In this cross-sectional community-based online survey with 1345 Brazilians aged 18 years and older. All Brazilian residents were able to participate in the study. The dependent variable was VH (the VH-COVID-19 tool was developed and validated based on the General Childhood Vaccination Hesitation Questionnaire from the United Nations Strategic Advisory Group of Experts on Immunization Working Group). The associated variables were sociodemographic variables (e.g., age, gender, health care professional, friend/family with COVID-19; risk group for COVID-19, has a religion, income, health status, use of Primary Care Unit and News on COVID-19 vaccine) and anxiety disorder (General Anxiety Disorder Scale).

Results: The mean age of the participants was 35.02 years (SD=14.84), most were female (n=840; 62.5%), single (n=688; 51.2%), and 40.9% (n=544) were health care professionals. We identified that being older, being a health care professional, being in the COVID-19 risk group, more dissatisfied with their health, using controlled medications, and having more frequent access to news on COVID-19 vaccines were associated with higher VH. On the other hand, being female, having a friend or family member with COVID-19, not having a religion, having a lower family income, and using Primary Health Care in the last six months were associated with lower levels of VH. Higher levels of anxiety disorder were associated with lower levels of VH.

Conclusion: We identified modifiable and non-modifiable factors associated with COVID-19 VH during the heart of the first wave in Brazil. The dissemination of misinformation is one of the main factors.

DOI: 10.18332/popmed/164392

Preventable post-measles Subacute Sclerosing Panencephalitis (sspe) in Northern Pakistan: a call to investigate vaccine failure

Talha Durrani¹

¹Resident Physician, Khyber Teaching Hospital, Pakistan

Background: Global disruption of measles vaccination coverage during the COVID-19 pandemic may amplify the future prevalence of the fatal post-measles neurodegenerative disorder Subacute Sclerosing Panencephalitis (SSPE). To provide a foundation for future comparison, we assessed SSPE cases about their vaccination status prior to the COVID-19 pandemic, between March 1, 2019, and August 31, 2019. Methods: A 26-week prospective study of SSPE was performed at a tertiary care facility serving urban and rural regions of Peshawar in northern Pakistan and the adjacent region of Afghanistan.

Results: Sixty-six cases of SSPE were diagnosed at a mean age of 6.67 years, including 38 measles-vaccinated, 19 unvaccinated, and 9 with unknown vaccination status. Only 57% of the patients had received the 1st dose of the measles vaccine, and, among them, only 38% had received the second dose.

Interpretation: While the preventable disease SSPE is now rare in countries with effective vaccination campaigns targeting measles, vaccination coverage remains insufficient in Pakistan (and neighboring Afghanistan). Investigation into the causes of vaccine failure in Pakistan needs urgent attention. Directed community education, mandatory measles vaccination, proper registration of acute measles infection, and particularly of SSPE, are key factors that need to be addressed so this deadly disease can be controlled and prevented.

Popul. Med. 2023;5(Supplement):A2050
DOI: 10.18332/popmed/164788

Sentiment towards vaccinations in Chinese healthcare workers: preliminary results from an international survey

Luca Regazzi¹, Chiara Cadeddu², Angelica Gris¹, Marta Lomazzi³

¹Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Roma, Italy, ²Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Roma, ³World Federation of Public Health Associations, Geneva, Switzerland

Background and Objective: Health care workers (HCWs) are a trusted source of vaccine information for patients and communities. Our Objective is to analyze the impact of the COVID-19 pandemic on Chinese HCWs' feelings about vaccination, focusing on COVID-19 and influenza.

Methods: We designed a multilingual Knowledge-Attitudes-Practice web-survey with 4-point-Likert-items addressed to HCWs in 11 countries. Survey dissemination is ongoing through the mediation of national Public Health Associations. We present a preliminary descriptive analysis of a representative sample from China. Results: The completion rate is 72.7% (1,938/2,665). Respondents are mostly females (67.5%), with a median age of 42 (IQR:17), mainly employed as health professionals (30.7%), nurses (27.7%) or physicians (26.8%). Most respondents agree on the effectiveness (96.1%), safety (92.7%) and necessity (96.8%) of vaccinations in general. However, many think their side effects are minimized by pharmaceutical companies (91.2%) and health authorities (91.3%). Most respondents received 3+ doses of COVID-19 vaccines (90.9%) and agree that these vaccines are effective (92.3%) and dominate the disease in terms of benefit-risk ratio (87.7%). However, many have concerns about their rapid development (41.4%) and their administration in pregnancy (68.6%), with 28.9% favoring natural immunity over vaccine-induced immunity. Most HCWs agree with mandatory COVID-19 vaccine for their category (62.0%), but only 48.1% agree with work restrictions for those noncomplying. The majority is ready to accept a further COVID-19 booster vaccination if recommended (73.5%) and agrees that

the pandemic increased their confidence in vaccines safety (80.4%) and their attention to update their vaccination schedule (86.74%). Accordingly, only 19.0% received regular influenza vaccination before the pandemic, while 36.2% got vaccinated in the last season and 42.0% plan to do so in the next one.

Conclusions: Despite some persisting doubts about COVID-19 vaccines, the sentiment towards vaccinations in Chinese HCWs is generally positive and has improved after the pandemic.

DOI: 10.18332/popmed/165050

Symbolic barriers for access to health services in Guatemala: children's immunization as marker

Ernestina Tecu¹, Cristian Figueroa²

¹Universidad Rafael Landívar, Guatemala, ²Instituto de Saúde Coletiva (ISC-UFBA), Guatemala

Background and Objective: Guatemala's immunization coverage lowered between 10-12% in the past five years. Previous studies show that users' untrust of health services has a great influence on children's immunization, mainly due to Institutionalized racism. Thus, this study aimed to determine the association between symbolic barriers for access to health services and updated immunization card of children <5 years in Guatemala. Methods: We conducted a cross-sectional study using data from Guatemala's VI Demographic and Health Survey (2014-2015). We delimited the sample to all children < 5 years. We selected health services' linguistic competence and mother's unwillingness to visit health services alone as markers for symbolic barriers. Language spoken by the mother, self-identification as Indigenous, using Indigenous clothing, religion, and place of birth were selected as indirect markers, as they may affect health services' welcoming process due to institutionalized racism. Updated immunization was defined as having all doses recommended by age group, according to Guatemala's Immunization Program. Bivariate and multivariate analysis included OR estimation, and binary logistic regression modelling.

Results: We found 73% of children not fully vaccinated. Individually, not wanting to go alone (OR: 1.26), linguistic competence (OR: 1.16), language spoken by the mother (OR: 1.51), self-identification as Indigenous (OR: 1.44), using Indigenous clothing (1.51), and place of birth (OR: 1.80) increased the risk of children not being fully vaccinated (p<0.05). After adjustment, not wanting to go alone (OR: 1.14), place of birth (OR: 1.53), and self-identification as Indigenous (OR: 1.19) remained significantly associated (p<0.05). Conclusions: Symbolic barriers for access to health services are associated with lower rates of fully vaccinated children <5 in Guatemala. Public policies oriented to mitigate Institutionalized racism on Guatemala's Health System urge. New studies approaching racism on health services are needed for a better description of the phenomenon.

Insights and expectations of health care professionals on the implementation of the new pediatric Regional Immunization Calendar in Calabria, Italy

Sandro Giuffrida¹, Fabiana Fiasca²

¹Provincial Health Agency, Reggio Calabria, Italy, ²Department of Life, Health and Environmental Sciences, Italy

Background and Objectives: The recently updated official immunization calendar of the Calabria Region includes, for the first time in Italy, the facultative opportunity of administering hexavalent, conjugate pneumococcal, 4 components meningococcal B (4CMenB) and rotavirus vaccines at the same visits of 3° and 5° months of age (1st y) and measles-mumps-rubella-varicella, meningococcal ACWY125 and 4CMenB vaccines at the same visit of 13°-15° months of age (2nd y). This innovative schedule is intended to generate advantages for vaccinees and their caregivers, healthcare providers and the regional healthcare system. To design supportive interventions for the new Calendar implementation, insights and expectations of health professionals were investigated.

Methods: A 11- questions online survey dealing with the new pediatric calendar feasibility was administered to Public Health providers (PH) and Family Pediatricians (FP). Afterwards, remote Focus Group meetings were carried out to explore in depth the major survey Findings.

Results: A total of 132 questionnaire (86 PH and 46 FP) were collected representing 22% of the PH+FP regional population. Overall, most of responses were in favor of the co-administration concept, recognizing the benefits generated for vaccinees/caregivers and Public Health organization. Among coadministrations, the most voted items concerned sharing of safety data, take into consideration the caregiver expectations and release of local recommendations on the use of paracetamol. Regional/local CME events were the preferred educational frames. Both FP and

PH specific Focus Groups generated in depth insights complementing the survey results. In the Reggio Calabria district, among 1500 1st y + 2nd y vaccinations carried out in 2022, 1200 (80%) turned out to be in the new co-administration schedule.

Conclusions: Insights and expectations of both FP and PH collected in the survey and by Focus Groups proved to be very useful to design an engagement program to support the implementation of the new Calendar.

The first 9 years of use of 4 components meningococcal B vaccine administered to nearly 3 million subjects in Italy: an outstanding achievement in public health

Paolo Bonanni¹, Federico Marchetti², Chiara Azzari³, Stefano Castagna²

¹Dipartimento di Scienze della Salute (DSS), University of Florence, Firenze, Italy, ²GlaxoSmithKline, Verona, Italy, ³University Hospital Meyer, Florence, Italy

Background and Objectives: In Italy, the peak of invasive meningococcal B disease (IMBD) occurs mainly between the 4th and 8th month of age but encompassing cases up to 5 years of age and beyond. The 4 components meningococcal B vaccine (Bexsero; 4CMenB) was first commercialized in Italy in 2013. The present work Aims to summarize 9-year experience of 4CMenB use in Italy in the Public Health perspective. **Methods:** A non-systematic review of scientific literature (2013-2022) on IMBD and 4CMenB in Italy was carried out including web searching for official documents.

Results: IMBD vaccination was firstly introduced in Italy among selected Regions in 2014, on a spontaneous basis. In 2017, IMBD vaccination was recommended to all newborns in the National Immunization Plan, and offered for free. The initial schedule was 3+1 doses but it was turned into a 2+1 after posology update in the label (albeit with differences among Regions). Overall, 10 million doses of 4CMenB were distributed in Italy, potentially protecting about 3 million subjects, mainly newborns. In the latest figures (2019 birth cohort), the average national coverage of 4CMenB was 79.7%. 4CMenB effectiveness measured in Italy was higher than 90%, with a greater impact of early immunization schedule. Different Regions released formal recommendations on the co-administration of 4CMenB with other pediatric vaccines (measles-mumps-rubella-varicella, rotavirus, 13-valent conjugate pneumococcal vaccine). In the national post-marketing surveillance of 4CMenB adverse events (AEs), fever and injection-site reactions are the most frequently observed. In 2017, highest rates of severe AEs were hyperpyrexia (6.7/100000 4CMenB doses) and fever (1.5/100000 4CMenB doses). Occurrence of 4CMenB AE was reported similar among healthy children or those with chronic conditions. **Conclusions:** The continuous efforts of different health professionals (public health vaccinators, pediatricians, etc.) made 4CMenB vaccination a well-known and accepted practice in Italy, protecting millions of babies from IMBD.

Popul. Med. 2023;5(Supplement):A2054

Results of the first national survey on vaccines co-administration knowledge and beliefs carried out among Italian health assistants

Michela Barbato¹, Roberto Rosselli², Carmela Russo³, Angelo Butera⁴, Letizia Esposito⁵, Fabiana Fiasca⁶, Maria Cavallo⁷

¹Register Commission Health Assistants, Roma, Italy, ²Prevention Health Professions, Local Health Unit, Italy, ³Health Assistance University of Padova, Padua, Italy, ⁴Prevention Health Professions, Local Health Unit Brianza, Desio, Italy, ⁵Register Commission Health Assistants, Italy, ⁶Department of Life, Health and Environmental Sciences, University of L'Aquila, L'Aquila, Italy, ⁷National Register Commission Health Assistants, Bari, Italy

Background/Objective: Vaccination coverage in Italy for pediatric mandatory vaccinations is in line with the target of 95%, while recommended vaccinations rotavirus and meningococcus B are consistently below the same target. To face this challenge, vaccine co-administrations (co-admin) is considered a major tool to optimize the crowded pediatric vaccination schedule even though it can be perceived as potentially harmful. Health Assistant (HA) engagement in co-admin is instrumental to allow calendars evolution while keeping trust in vaccination and increase coverage. The aim of the project is to document the current knowledge and beliefs on co-admin in a sample of HA.

Methods: A questionnaire including 11 questions was structured and released online. Questions were divided in conceptual sections: demographics, beliefs and knowledge on co-admin, expectations on medical education format. HA signed up to the first HA national congress were invited to take part to the survey.

Results: Within October and November 2022, 255 questionnaires were filled in, generating a 90% confidence level with a 5% error margin of the survey results.

Respondents were well distributed Countrywide. Co-admin was considered "a very useful tool to optimize calendars" in 67.9% questionnaire, while 25.5% gave co-admin the same relevance of other practices. Co-admin were considered favorable for Public Health and/or for vaccines and caregivers in more than 57% of responses while 18.5% were not in favor. Data on the co-admin immunogenicity/effectiveness (68.3%), safety profile/contraindication (75.3%) and presence in the vaccine label (80.2%) were considered the more relevant topics. No specific preferences on CME format came out.

Conclusions: The results of first survey carried out in Italy on co-admin among HA suggest an overall positive insight, although not fully endorsed by all respondents. Educational program on the value of co-admin, focusing on safety and effectiveness are warranted to increase the HA engagement.

Risk factors for reinfection after booster dose of the anti-SARS-CoV-2 vaccine BNT162b2 among healthcare workers

Alberto Lontano¹

¹Catholic University of the Sacred Heart, Italy

The spread of the Delta variant of SARS-CoV-2 led to a reduction in the efficacy of the primary schedule of anti-SARS-CoV-2 vaccination, making a booster dose necessary to prompt the neutralizing immune response. This retrospective cohort study aims at evaluating risk factors associated with SARS-CoV-2 infection after the booster dose of Pfizer-BioNTech BNT162b2 mRNA vaccine in healthcare workers (HCWs) of a large Teaching Hospital in Rome. HCWs who completed the primary course with the BNT162b2 vaccine and received the booster dose at the Hospital Vaccination Center were included, while those who received a vaccine other than BNT162b2 or carried out the booster vaccination in a vaccination center outside the Hospital were excluded. Data about vaccinations of HCWs and nasal swabs positive for SARS-CoV-2 were extracted from the digital archives of the Hospital from October 2021 to May 2022. Risk of infection was estimated using the Nelson-Aalen cumulative risk function. In total, 6,103 HCWs were observed. The cumulative risk of becoming infected by SARS-CoV-2 increased with time (9.0% at 8 weeks, 25% at 16 weeks and 45% at 32 weeks) and was significantly higher for women compared to men (at 32 weeks 48% vs 41%) and younger classes of patients compared to elderly (at 32 weeks 55% vs 30%); no significant differences were detected according to occupational category and risk profile. Multivariate analysis by Cox regression confirmed the differences detected by the univariate analysis. This study describes a higher incidence of infections after the booster dose of COVID-19 vaccine among women and young people; moreover, the probability of being infected increases over time, as a results of the reduction in the neutralizing potency and titer of the antibodies: this poses the need for continuous monitoring of vaccine-induced immunogenicity, to establish the correct timing of vaccination with more effective vaccination schedules.

Popul. Med. 2023;5(Supplement):A2056

Knowledge and practices among healthcare professionals regarding measles vaccination: is there a gap?

Bouthaina Werchfeni¹, Bouthaina Werchfeni², Imene Mlouki³, Aymen Zayed⁴, Olfa Frikha⁵, Emna Hariz¹, Ward Mallek⁶, Malek Belkhiria⁶, Nawres Aouichri⁶, Sana Mhamdi⁶

¹Preventive Department, Taher Sfar Hospital, Tunisia, ²Taher Sfar hospital, Tunisia, ³Taher Sfar Hospital, Tunisia, ⁴Souk Lahad Hospital, Tunisia, ⁵Hedi Chaker Hospital, Tunisia, ⁶preventive department, Taher Sfar hospital, Tunisia

Introduction: Measles is a highly contagious disease. As part of the measles vaccination (MV) campaign that was conducted in our country among young adults. We aimed to assess the perception and knowledge among Tunisian health professionals (HC) with regard to MV.

Methods: A cross sectional study was carried out among HC, in Tunisian hospitals, during the months of January and February 2022. The measurement tool was a self-administered questionnaire or online via Google Forms.

Results: A total of 112 healthcare workers responded to the questionnaire, including 82% of women. Medical staff accounted for 83% of responders. The average age was 30 ± 2.95 years. Fifty-two percent scored average on questions assessing knowledge of measles infection and vaccine. Among them, the correct answers were: measles infection is dangerous (60.7%), those vaccinated can transmit the virus to others (54.5%) and the vaccine against measles protects against severe forms (91.1%). Two-thirds of HC responded that the vaccine does not cause measles. The correct answers on the long duration of protection of the vaccine and on its variable effectiveness from one person to another were 75% and 77.7%, respectively. Regarding attitudes, 85.7% said they should be

vaccinated against germs they risk transmitting to their patients. Almost two thirds of responders had a moral responsibility to get MV (62.5%) and 91% were for the vaccination against contagious diseases including measles. Although most of the answers were for MV, only 35% of the responders were willing to vaccinate. The main reasons for vaccination were the protection of family members and of patients (35.6%) and the protection of oneself (33.70%).

Conclusions: Despite the good knowledge level, measles vaccine is not sufficiently accepted among healthcare providers. Awareness campaigns should be organised to encourage young people to vaccinate.

DOI: 10.18332/popmed/165742

Assessment of vaccination coverage in patients with functional or surgical asplenia: analysis of vaccination coverage for pneumococcus and influenza in the population of Azienda Sanitaria Universitaria Friuli Centrale

Alessandro Marino¹, Alessandro Marino², Nicoletta Presot¹, Paolo Collarile³, Massimo Zuliani³, Maria Parpinel¹

¹Dipartimento Area Medica, Università degli Studi di Udine, Italy, ²Dipartimento Area Medica Università degli Studi di Udine, Italy, ³Dipartimento di Prevenzione Azienda Sanitaria, Università Friuli Centrale, Italy

Background and Objective: A patient with asplenia has a greater susceptibility and an increased risk of developing invasive infectious diseases or severe complications, preventable with vaccination by some micro-organisms such as Streptococcus Pneumoniae and Influenza Virus. Preventing infectious diseases through vaccinations is a priority in public health; therefore, it's essential to investigate vaccination coverage in our target population. The study's objectives are primarily to analyze whether the target population has adhered to the pneumococcal and influenza vaccinations and, subsequently, to assess the difference in vaccination coverage across age groups with a particular focus on completed and partial vaccination courses. Finally, evaluate the proper vaccine counseling for the target category.

Methods: The population sample was analyzed through the survey of the Regional Epidemiological Repository and subsequent analysis. Patients with surgical or functional asplenia were studied from 01/01/1995 to 27/12/2020, divided by age groups starting from five years of age.

Results: The statistical analyses of subjects affected by surgical/functional asplenia (660 subjects) highlight complete pneumococcal vaccination coverage (sequential schedule) equal to 52.88%; partial coverage corresponding to 25.75% and 21.37% of patients who are not vaccinated for pneumococcus. Concerning the coverage of influenza in the target population, we see full coverage (annual vaccination performed) of 30.45%; partial (at least one vaccination from the date of diagnosis) equal to 46.66% and 22.89% of subjects are not vaccinated for influenza at all.

Conclusions: Our analysis shows that a considerable part of the target population doesn't have adequate disease protection because 47.12 % of subjects have partial or no courses against pneumococcus, and 69.55 % of patients have partial or no courses against influenza. The assessment will consider the impact of COVID-19 pandemic on the vaccinations under study. It's necessary to undertake vaccination catch-up and mop-up strategies to improve current coverage in the studied population.

Popul. Med. 2023;5(Supplement):A2058

DOI: 10.18332/popmed/165745

Assessment of vaccination coverage in Diabetic patients: analysis of vaccination coverage for pneumococcus and influenza in the population of Azienda Sanitaria Universitaria Friuli Centrale

Nicoletta Presot¹, Alessandro Marino¹, Paolo Collarile², Massimo Zuliani², Maria Parpinel¹

¹Dipartimento Area Medica, Università degli Studi di Udine, Italy, ²Dipartimento di Prevenzione Azienda Sanitaria, Università Friuli Centrale, Italy

Background and Objective: A diabetic patient has an increased risk of developing invasive infectious diseases caused by micro-organisms such as Influenza Virus and Streptococcus Pneumoniae or serious complications. This risk can be drastically reduced through vaccination. Preventing infectious diseases through vaccinations is a milestone of public health; hence it is essential to investigate vaccination coverage in our target population. The main objective of our study is to analyze the adherence to anti-influenza and anti-pneumococcal vaccinations in the diabetic patient population. Secondly, the coverage of vaccines between age groups was examined with particular attention to completed and partial vaccination courses.

Methods: The population was analyzed through the interrogation of the Regional Epidemiological Repository and subsequent analysis. Diabetics residents from

01/01/2002 to 30/04/2022 were studied.

Results: The statistical analysis of diabetic patients (32 500 subjects) highlights a full pneumococcal vaccination coverage (sequential schedule) of 16.46%; partial coverage tantamount to 36.75% and 46.79% of patients not vaccinated for Pneumococcus. On the subject of influenza coverage in the target population, we see a complete coverage (annual vaccination carried out) of 47.25%; partial (at least one vaccination from the date of diagnosis) equal to 31.2% and 21.55% of subjects are not vaccinated at all for influenza. It also emerges that 5% of diabetic patients have no known vaccination history in the regional vaccine service.

Conclusions: Our analysis underlines that a considerable part of the target population does not have adequate protection from the disease because 83.54% of patients have a partial or absent course against Pneumococcus and 52.75% of cases have a partial or absent course against influenza. Our study will continue by evaluating the impact of COVID-19 pandemic on our target vaccination coverage. In conclusion, it is considered essential to undertake mop-up and catch-up strategies to implement the current coverage in the diabetic population.

Popul. Med. 2023;5(Supplement):A2059

The vaccination coverage of the poliovaccine in Brazil: a time-series analysis from 2012 to 2022

Valter Barbosa Filho¹, George Jó Bezerra Sousa², Lucélia Malaquias Cordeiro², Maria Alves de Azevedo², Valesca de Sousa Brito², Suzyane Cortês Barcelos², Jamile Vivas Costa³, Marcelo Carlos da Silva¹, Maria Duarte Pereira¹, Kellyane Rodrigues soares Holanda⁴

¹Instituto Federal do Ceará, Universidade Estadual do Ceará, Brazil,

²Universidade Estadual do Ceará, ³Universidad de la Coruna Spain,

⁴Universidade Estadual do Ceará e Universidad de la Coruna Brazil

Results: In relation to the poliovaccine, it was observed a significant down ward trend of the coverage of this vaccine, with the coverage going from 97,8' in 2012 to 56,9' in 2022. The line equation was $y = -3,8x + 7766$, with $p = 0,01$. The adjusted coefficient of determination R^2 was 0,49, indicating that the annual variation describes in 49' the variance of the vaccination coverage.

Conclusion: It was identified a decrease in the vaccination coverage against polio over the last years in Brazil. There is a need for public health actions for expanding its coverage and selection of multisector strategies for the confront of this decrease in the vaccination coverage rates.

Popul. Med. 2023;5(Supplement):A2060

Impact of the covid-19 pandemic on the children's immunization program in the Federal District, Brazil

Jaime Ribeiro Filho¹, Davi Maia de Araújo¹, Ludmilla de Almeida Santiago¹, Nathália da Silva Sampaio¹, Bruno Pereira Stelet²

¹Oswaldo Cruz Foundation, Fiocruz Ceará, Eusébio, Ceará, Brazil, ²Health Department of the Government of the Federal District

Background and Objective: Vaccination is an integrated action, experienced mainly in the scope of Primary Health Care (PHC) in Brazil, where vaccines are provided free of charge in the Unified Health System. Vaccination significantly reduces morbidity and mortality rates due to preventable diseases. While social distancing measures related to the COVID-19 pandemic were crucial to prevent the spreading of the disease, evidence has indicated that they impaired access to health services, including vaccination. This study aimed to investigate the impact of the COVID-19 pandemic on children's vaccination coverage in the Federal District, Brazil.

Methods: This is a descriptive, retrospective epidemiological study whose data were collected through the public domain generic tabulator (TABNET), developed by the information management department of the unified health system (DATASUS) for information management and through the Information System of the National Immunization Program (SI-PNI WEB). The search included vaccination data on children aged up to 05 years from July 2018 to June 2021 in the Federal District of Brazil.

Results: Over the covered period, 3,010,938 vaccine doses were registered, prevailing the following pentavalent (320,195), pneumococcal 10 (319,651), and meningococcal C (316,696). The second half of 2018 had the highest number of administered doses (550,320). Vaccination coverage fell progressively in 2019 (494,869 doses from January to June and 460,665 from July to December), rising again in 2020 (510,458 doses from January to June and 533,156 from July to December). However, in the first half of 2021, the number of administered doses dropped again to 461,147. Of note, this period was marked by both pro- and anti-COVID-19 vaccination campaigns, which may have interfered with adherence to immunization.

Conclusion: Vaccination coverage varied irregularly during the COVID-19 pandemic. However, further research is required to investigate the causes associated with

this phenomenon.

Perception of the health providers on the factors affecting vaccine hesitancy and acceptance

Camelle Celis¹

¹Department of Health, Philippines

This study sought to determine the perception of the health providers in identified municipalities in Cebu Province, Philippines on the factors affecting vaccine hesitancy and acceptance. The immunization rate for the last three years under the Fully Immunized Child (Program) in the Fifth District of Cebu Province were analyzed and Focus Group Discussions with health care workers in the frontlines of the implementation of the program was done. As a healthcare provider, their confidence in delivering the vaccines is relevant to the success of any vaccination program, specifically with the current roll out of COVID-19 vaccines. Results revealed that there is a decline in the proportion of Fully Immunized Children starting 2018 to 2019 after the Dengvaxia fiasco. Since then, the fear in vaccines has created a domino effect in the decline in immunization accomplishments. Trends showed that health promotion activities and community engagement of relevant stakeholders can increase the immunization rates. In addition, the Focus Group Discussions resulted to 182 codes that are reported as three themes with two underlying subthemes. The factors that contribute to vaccine hesitancy and acceptance in the perception of health care providers is the track record of the efficacy and safety of the vaccines, people's perceptions of credible information and their corresponding understanding of the nature and use of the vaccines. It is recommended that community vulnerabilities be assessed in the areas of the themes as reported as basis for the interventions to be introduced and utilize the themes identified in crafting and localization Risk communication strategies for health workers and member of the community.

Influence of vaccination of pregnant women on the epidemiology of pertussis in infants under one year of age, Spain 2006-2019

Ana Garzon¹, M. Luna², Noemi Lopez³, Marta Soler⁴, Rosa Diaz¹, Esther Garcia¹, Josefa Masa

¹Centro Nacional de Epidemiología. Instituto de Salud Carlos III- Ciber de Epidemiología y Salud Pública (CIBERESP). Instituto de Salud Carlos III (ISCIII), St. Helena, ²Hospital Central de la Cruz Roja de Madrid., Spain, ³Centro Nacional de Epidemiología. Instituto de Salud Carlos III- Ciber de Epidemiología y Salud Pública (CIBERESP). Instituto de Salud Carlos III (ISCIII), Spain, ⁴Centro Nacional de Epidemiología. Instituto de Salud Carlos III, Spain

Background and Objective: Pertussis is an emerging disease in countries with long-established vaccination programmes and high vaccination coverage. Immunity waning has led to a worrying upsurge in severe cases in unvaccinated infants. In Spain, since 2006, pertussis has emerged in several epidemic waves reaching a peak in 2015, which introduced the pertussis vaccination in pregnant women in 2016.

The objective is to estimate the influence of this vaccination on the incidence and hospitalizations in children under one year of age.

Methods: We studied pertussis cases reported to the national surveillance system and hospitalisations in children under 1 year of age (<1y) between 2006-2019. We analysed the evolution of the incidence rate (IR) and hospitalisation rate (HR) in children under 1 year of age and by subgroups: <3 months (<3m) and 3-11 months (3-11m).

We calculated both rates for the pre-vaccination (P1: 2006-2015) and post-vaccination (P2: 2016-2019) periods as well as the incidence rate ratio (IRR) and hospitalisation rate ratio (HRR) using Poisson regression.

Results: Between 2006-2019, 9107 pertussis cases were reported in infants (IR: 146.6/105). IR in <1y slightly increased (P1: 145.2/105 and P2: 153.6/105) with IRR: 1.06 (95%CI: 1.59-1.65); by subgroups, in <3m IR decreased (IRR: 0.61 (95%CI: 0.58-0.67) by 39% but IR increased (IRR 1.74 (95%CI: 1.64-1.84) in the 3-11m group.

The overall HR 2006-2019 was 142.5/105. HT in <1y was reduced in the post-vaccination period (P1: 154.9/105 and P2: 107.7/105) with HRR: 0.70 (95%CI: 0.66-0.74); the reduction is maintained for the two subgroups: <3 months (HRR: 0.61 (95%CI: 0.58-0.67), 39% reduction and between 3-11m (HRR: 0.85 (95%CI: 0.78-0.92) 15% reduction.

Conclusion: In Spain, pertussis vaccination in pregnant women has reduced severe pertussis in children under one year of age, especially in the under-3 months group. High vaccination coverage should be maintained as an effective

measure to prevent complications.

Popul. Med. 2023;5(Supplement):A2063
DOI: 10.18332/popmed/164004

Herpes Zoster vaccination trends: can more be done?

Elisa Fanti¹, Chiara Cinughi De Pazzi², Eleonora Frilli¹, Emma Ceriale³, Gabriele Messina⁴, Nicola Nante⁵

¹University of Siena Post Graduate School of Public Health, University of Siena, Italy, ²Local Health Authority Toscana Sud-Est, ³Local Health Authority Toscana Sud-Est Public Hygiene and Nutrition Department, Local Health Authority Toscana Sud-Est, Siena, Italy, ⁴University of Siena, ⁵University of Siena Department of Molecular and Developmental Medicine, University of Siena Italy

Background and Objective: Herpes zoster (HZ) is the result of the reactivation of the latent varicella zoster virus. HZ reactivation is more common in the elderly and immunocompromised people. Currently, there are two HZ vaccines, one live-attenuated (ZOSTAVAX, LZV) administered with a single dose and another recombinant (SHINGRIX, RZV) with two doses. The latter was administered in October 2021 in the Local Health Authority (LHA) Toscana Sud-Est for the first time. This study aims to analyse the trend of HZ vaccinations administered in our LHA for further strategies.

Method: This retrospective descriptive study was conducted in the Public Health Department of Siena, Italy. We collected HZ vaccines data through the SISPC management system, from 1 January 2019 to 5 December 2022. A descriptive analysis was carried out using EXCEL, and the following variables were collected: age, sex, and vaccine type.

Results: During the analysed period, the total RZV first doses administered were 205, while the total LZV doses were 64. The number of LZV shots was: 3 (2019), 9 (2020), 12 (2021) and 40 (2022), while for RZV, they were: 5 (2021) and 200 (2022). The mean age for both vaccines was 70 years (SD± 6.33 for LZV; SD ±8.56 for RZV). The total percentage of vaccinated males and females with LZV is 35.9 and 64.1, while with RZV is 47.8 and 52.2.

Conclusion: From 2019 to 2022, there was a progressive increase in the administration of both vaccines, especially for RZV in 2022, probably related to the awareness campaign promoted on TV and radio starting in July. To achieve higher adherence, especially in immunocompromised patients, it might be useful to establish a collaboration between vaccine HUBs and hospital facilities that would allow them to have direct access to vaccination.

Popul. Med. 2023;5(Supplement):A2064
DOI: 10.18332/popmed/164058

Results of a pilot onsite school-based intervention aimed at increasing influenza vaccination coverage among children in an Italian local health authority

Maria Riccardi¹, Gennaro D'Agostino², Leonardo Villani³, Marcello di Pumo⁴, Andrea Barbara¹, Marta Marino⁵, Silvia Bracci¹, Paolo Parente¹, Antonietta Spadea¹

¹Azienda Sanitaria Locale Roma 1 Italy, ²Azienda Sanitaria Locale Roma 1, Italy, ³Università Cattolica del Sacro Cuore, Roma, ⁴Università Cattolica del Sacro Cuore, Roma Italy, ⁵Azienda Sanitaria Locale Roma 1

Background: Recommending annual flu vaccination to healthy children is a value-based intervention, and school-based interventions are proved to be effective in increasing vaccination uptake. For the 2021-2022 flu season, a nasal spray vaccine was available, making both the acceptance from a parents' perspective and the administration out of hospital context easier. In this study the results of a school flu vaccination campaign among children in a large urban area of Rome, Italy, are reported.

Methods: Target population was children aged 2-6 years. Schools were involved through formal communication channels. Two meetings were organized to engage school representatives in the project. Outcomes included meetings attendance, vaccination coverage and the proportion of naive children vaccinated. Secondary endpoint was the number of opportunistic vaccination among school staff, teacher, or parents.

Results: Twenty-nine schools were involved, for a total of 2.424 children. Meeting attendance rate was 100%. From November 2021 to January 2022, 405 (16.7% of the school attendees) children were vaccinated, of which 228 naive (56.3%). While the flu vaccination rate in other age groups decreased compared to the previous year, it increased in the 2-6 year age group. As for the secondary endpoint, 138 doses were administered.

Conclusion: In order to improve population health and strengthen the partnership between health professionals and community, engaging with schools for public health programs targeting children can play a pivotal role in increasing acceptance

and effectiveness. Finally, this study shows how such intervention can greatly increase the vaccination coverage of children, which in Italy was, on average 2.4% considering the period 2010-2021.

Popul. Med. 2023;5(Supplement):A2065

DOI: 10.18332/popmed/164076

Vaccine Hesitancy in Albanian university healthcare students: preliminary results

Gaia Piunno¹, Daniele Giovanni², Enkeleda Gjini³, Bora Kërpi³, Fabian Cenko⁴, Mariachiara Carestia¹, Stefania Moramarco¹, Ersilia Buonomo¹

¹University of Rome Tor Vergata Department of Biomedicine and Prevention, University of Rome Tor Vergata, Rome, Italy, ²University of Rome Tor Vergata, ³Catholic University of "Our Lady of Good Counsel", Tirana Faculty of Medicine, Catholic University of "Our Lady of Good Counsel", Tirana, Albania, ⁴Catholic University of "Our Lady of Good Counsel", Tirana

Introduction: Vaccination is one of the most successful Public Health interventions. Vaccine hesitancy can affect healthcare providers, putting their contribution to vaccination campaigns at risk, since they are also important models for their patients. The following work focuses on vaccine hesitancy among healthcare students in Albania, to identify additional educational needs.

Materials and Methods: In October 2022, an anonymous questionnaire was submitted to a sample of healthcare students (Medicine and Surgery, Nursing, Pharmacy, Dentistry) of the University of Our Lady of Good Counsel (Tirane). Attitudes, confidence, knowledge and hesitancy towards vaccinations, including COVID-19 vaccine, were investigated. The protocol was approved by the Ethical Committee of Policlinico Tor Vergata (Rome).

Results: A total of 384 questionnaires have been collected. Main results of the analysis showed a good degree of confidence in vaccines: 73.7% of respondents fully or partially agreed with the statement "I can rely on vaccines to stop serious infectious diseases", but 10.4% of them declared to "have refused a recommended vaccine". When asked about the public health role of vaccines, 24% of the sample answered "no" or "do not know" to the statement "Vaccination benefits the whole community". A positive attitude was observed in 58.6% of the respondents, who "encouraged others to be vaccinated against COVID-19". Despite living in a country where the access to COVID-19 vaccines has been disrupted, 75.3% of the sample declared to be vaccinated, although 53.2% affirmed to not feel protected against the COVID-19 infection even after the vaccination. As concerns sources of information, 44.8% of the sample considered TV and radio to be the most influential ones.

Conclusions: The preliminary results of the study show that the fight against vaccine hesitancy and low confidence is still a priority in medical university courses in Albania, and requires further investigations.

Baseline survey on the determinants of hesitancy to vaccination against covid-19 in 10 priority provinces in Chad

Mouhamadou Ba¹, Valéry Ridde², Dahab Manoufi³

¹Cheikh Anta Diop University Senegal, ²Institute of Research for Development, ³BASE Chad

Introduction: COVID-19 is a global public health problem today. Vaccination is one of the effective strategies for controlling COVID-19. The objective of this survey was to obtain reliable baseline information on the determinants of hesitancy to vaccinate against COVID-19 in 10 priority provinces of Chad.

Method: This was a cross-sectional, descriptive and analytical study that took place between July 28 and September 28, 2022. The survey was conducted among households in the 10 provinces with the head of the household or his representative as the observation unit. The sample design used for this survey was a stratified, two-stage random sample. The data collected allowed for descriptive and analytical analyses. The analyses were weighted and the complex sampling design was taken into account. Data analysis was performed with R software version 4.2.1.

Results: A total of 3346 households were surveyed. Vaccination hesitancy and refusal were estimated at 16.9% and 23.3% respectively. Vaccine hesitancy was associated with age, religion, education level, history of refusal to vaccinate, and attitude toward the COVID-19 vaccine. Vaccine refusal was associated with religion, education level, economic well-being quintile, history of vaccine refusal, lack of confidence in vaccines to prevent disease in general, and attitude toward the COVID-19 vaccine.

Conclusion: Following this baseline survey, a risk communication and community engagement plan should be developed and adapted to the realities on the ground so that communities are informed and sensitized about the benefits as well as the

adverse effects of COVID-19 vaccination.

COVID-19 vaccine hesitancy among a sample of students in Tunisia

Wafa Dhoubi¹, Manel Fredj¹, Cyrine Bennasrallah¹, Amel Gara¹, Amani Maatouk², Imen Zemni¹, Hela Abroug¹, Meriem Kacem², Ines Bouanene¹, Asma Sriha¹

¹University Hospital of Monastir Tunisia, ²University Hospital of Monastir

Background: Immunization with a safe and effective vaccine appears to be among ways to contain and control the pandemic of COVID-19. However, the overall population response to receiving the new vaccines was less than optimal. The aims of our study were to determine the rate of reluctance to receive COVID-19 vaccines, to assess the factors associated with this behavior and vaccine satisfaction among Tunisian student in Monastir (Tunisia).

Patients and methods

It was a cross-sectional study on the hesitation to vaccinate against COVID-19 among the student population in the city of Monastir, conducted during the month of October 2021.

Results: Among the 217 students interviewed, 180 agreed to participate in our survey with a response rate of 82.9%. The total vaccination rate was 77.7%; 61.1% were fully vaccinated. The main motivating factor was simple confidence in the vaccine, reported by 43% of participants. The rate of vaccine hesitancy was 19.5%, (CI95%=13.7-25.2). The main reason for hesitancy was the insufficient number and duration of studies (50%). Comparing the two groups (vaccinated and hesitant), the results of the univariate analysis showed that vaccine hesitancy in the study population was related to belief in the reliability of vaccine information and confidence in the likely efficacy and safety of the vaccine.

Conclusion: Despite an abundance of scientific evidence of vaccine safety and efficacy, vaccine hesitancy continues to emerge in different populations. There is a need to rapidly strengthen communication and planning with communities to increase vaccine coverage, especially among youth.

Using the card (comfort ask relax distract) system to deliver influenza vaccinations in university pop-up clinics

Anna Taddio¹, Victoria Gudzak², Charlotte Logeman³, Natalie Crown¹, Lisa Dolovich², C McMurtry³, Lucie Bucci⁴, Joshua LeBlanc¹

¹University of Toronto Canada, ²University of Toronto, ³The Hospital for Sick Children Canada, ⁴University of Guelph Canada

Background: CARD (Comfort Ask Relax Distract) is an evidence-based vaccination delivery framework that promotes person-centred care. No studies have evaluated its implementation in mass influenza vaccination clinics. The objective was to integrate CARD in university-based influenza vaccination pop-up clinics and evaluate client and staff experiences.

Methods: Mixed methods before-and-after quality improvement study. A baseline (control – usual care) phase preceded CARD implementation in one popup clinic. Then CARD was implemented incrementally in two subsequent clinics. Changes to the environment (delineating waiting and aftercare areas, providing privacy, obscuring needles from view), education (clients given CARD coping checklist at check-in), and interactions (defining discrete clinic roles and processes, using coping-promoting behaviours, removing alcohol skin antiseptics prior to vaccine injection) were made. Clients provided feedback using standardized surveys. Staff, including pharmacy student vaccinators, participated in clinic debriefs. Feedback informed real-time process changes during and between clinics.

Results: Clinics were held Nov 17 (control), Nov 22 and Nov 24 (both CARD). Feedback from 298 adult vaccine clients, including university students and staff (representing >98% of all vaccinated individuals) demonstrated an incremental increase in the percent of clients with an improved experience compared to the last vaccination (34% baseline, vs. 49% and 57% in CARD clinics, respectively; p=0.003). Ten percent reported CARD influenced their decision to attend by a moderate amount to a lot. Staff liked the changes. Sample quotes after the final clinic included: "very organized" and "best clinic ever."

Conclusion: This study demonstrated improvement in vaccination delivery after CARD implementation as reported by vaccine clients and staff.

Actions for counteracting vaccine hesitancy: a deep dive into three multicentre projects conducted in Europe

Anna Odone¹, Fabrizio Bert², Giuseppina Moro²

¹University of Pavia, Italy, ²University of Turin, Italy

Brief outline of the overall workshop: Human behaviours can influence the likelihood of infectious diseases transmission: the willingness to get vaccinated can impact population's susceptibility to infection and affect diseases spread. Although vaccinations represent a substantial success of public health, a growing number of people are reluctant towards these measures and the World Health Organization has identified vaccine hesitancy among the greatest threats to global health. In addition, vaccine hesitancy is particularly relevant for healthcare professionals (HCPs) who face multiple challenges in building relationships of trust with immunization programmes' target populations. Overall, this workshop will present three multicentre projects that aim to address vaccine hesitancy and that have been developed thanks to consortia of universities, public health associations and institutions across Europe. Specific Aims and Component Parts: The first presentation will introduce the VXTrain project, funded by the European Center for Disease Prevention and Control (ECDC) and led by the Association of Schools of Public Health in the European Region (ASPHER). VXTrain's main purposes are assessing training needs and existing courses in vaccinology, vaccine hesitancy, and behaviour change communication across European Member States and, consequently, designing a comprehensive curriculum for an e-learning course for primary care HCPs, which may then become trainers for their peers. The second presentation will delve into the "VAX-TRUST Addressing Vaccine Hesitancy in Europe" project, developed to improve the experience of HCPs and parents dealing with vaccination (funding from European Union's Horizon 2020 research and innovation program under Grant Agreement No. 965280). Among the main objectives, VAX-TRUST aims to support HCPs when addressing patients' vaccine hesitancy through the implementation of tailored interventions. Giuseppina Lo Moro (University of Turin) will guide through the development of the intervention, discussing the data gathered to lay the foundations of the intervention and the design of a common framework to be adapted across Europe. The last presentation will provide insights of the epidemiology, monitoring and modelling spoke (EPIMOD) within the INF-ACT project (Next Generation EU funding within the MUR PNRR Extended Partnership initiative on Emerging Infectious Diseases, Project no. PE00000007). The EPIMOD spoke will develop actions in a One Health perspective through combining surveillance and operational research. Key questions that the workshop will address: Overall, the workshop will address the following main questions: 1. What are the training needs of European HCPs in the field of vaccinology, vaccine hesitancy and behaviour change communication? 2. What are the potential interventions to help HCPs in addressing patients' hesitancy? 3. How can human behaviours during epidemics be monitored and how do they impact the implementation of public health interventions such as vaccinations?

Vaccine literacy: strategies and tools to improve vaccination uptake for newly arrived migrants and people living in prisons

Igor Aloise¹, Babak Moazen², Guglielmo Bonaccorsi³, Maurizio Marceca⁴, Lara Tavošchi⁵, Silvia Declich⁶, Pania Karnaki⁷

¹Sapienza University of Rome Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, ²Institute of Addiction Research, Frankfurt University of Applied Sciences, Germany, ³Dipartimento di Scienze della Salute, Università degli Studi di Firenze, Italy, ⁴Department of Public Health and Infectious Diseases, Sapienza University of Rome Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, ⁵Università di Pisa Department of Translational Research on New Technologies in Medicine and Surgery, University of Pisa "Lungarno Pacinotti 43 56126 Pisa" Italy, ⁶Italian National Institute of Public Health National Centre for Global Health, Italian National Institute of Public Health Via Giano Della Bella, 34 00161 Roma Italy, ⁷Prolepsis Institute Greece

Health systems are complex and health organisations are often structured and operate in ways that make access to vaccination services difficult and inequitable for some marginalized populations. In addition, professionals may not be equipped to identify and address the cultural and social needs of these groups of people. The concept of vaccine literacy (VL) emphasizes that VL is not simply knowledge of vaccines, but also development of a less complex health system for communicating and offering vaccines as a conditions of a functioning health system (Ratzan, 2011). Newly arrived migrants (NAM) and people living in prisons (PLP) are two populations with overall low vaccination rates compared to the general population. Efforts to change this situation must emphasize activities not only geared toward increasing individual vaccine literacy, but more importantly supporting the system to become more vaccine literate.

The general aim of the "Access to Vaccination for Newly Arrived Migrants -AcToVax4NAM" project is to improve the responsiveness of health systems in terms of vaccination literacy, making the conditions for access to vaccinations more equitable and guaranteed. Similarly, the "Reaching the hard-to-reach: increasing access and vaccine uptake among the prison population in Europe -RISE-Vac" aims to improve the health of people living in prisons in Europe by promoting staff and prisoners' VL, enhancing vaccine offer and increasing vaccine uptake. During the workshop, AcToVax4NAM and RISE-Vac will discuss strategies and tools developed within these two EU co-funded projects (3rd EU Health Programme) to address vaccine literacy at the organizational and individual level for the particular target groups.

The core parts of the workshop will comprise:

1. Presentation of the concept of organisational and individual VL (10 minutes – Maurizio M.Marceca/Maria Laura Russo / Babak Moazen)
2. Sharing experiences on construction of strategies and tools to increase organizational and individual VL for newly arrived migrants and people living in prison: case studies from two European project (20 minutes – Pania Karnaki/ Igor Aloise/ Lara Tavošchi.)
3. Discussion based on 3 pre-defined questions directed to the speakers and a Q/A session involving the audience (30 minutes – Guglielmo Bonaccorsi/ Silvia Declich/Maurizio Marceca/Lara Tavošchi)

Specific Aims/Objectives and Component Parts

* To increase the capacity and knowledge of delegates as to the importance of VL responsiveness

* To present the latest information about vaccination coverage of PLP and NAM at European level

* To present innovative approaches to address organisational and individual VL as developed within the EU co-funded AcToVax4NAM and the RISE-Vac projects.

* To encourage discussion and dynamic exchange of opinions about the role of organisational and individual VL among the workshop participants

Key Questions To Address

* How does organisational and individual vaccination literacy impact on the vaccination coverage of the target populations?

* Which strategies and tools can be effective for increasing individual and organisational vaccination literacy?

* What synergies can be built, and between which stakeholders, to promote organisational and individual vaccination literacy?

* What lessons are learnt from the COVID-19 pandemic on how to promote organizational vaccine literacy and what is their potential for transferability?

Popul. Med. 2023;5(Supplement):A2071

DOI: 10.18332/popmed/164677

Using the card (comfort ask relax distract) system for vaccination delivery: Review of tools, implementation approaches, and positive impact on vaccination safety and experiences

Anna Taddio¹, Lucie Bucci², Angelo Ilersich³

¹University of Toronto 144 College Street, Toronto, Ontario, M5S 3M2 Canada, ²Bucci-Hepworth Health Services Inc., Québec, Canada, ³Brock University, Canada

Around the world, fear, pain and other immunization stress-related responses (e.g., dizziness, fainting) are common adverse reactions during vaccine injections, and contribute to needless suffering, complications, and dissatisfaction with care. Across the lifespan, concerns about such stress-related responses account for vaccine refusals in about 1 out of 10 individuals. There are effective interventions; yet they are not systematically incorporated into vaccination delivery systems.

The CARD (Comfort-Ask-Relax-Distract) system is a new vaccine delivery framework that was developed to address this knowledge-to-care gap. Developed from a 2015 Canadian clinical practice guideline endorsed by the World Health Organization (WHO), CARD incorporates evidence-based interventions before, during and after vaccination that together improve the safety of vaccination delivery and lead to more positive vaccination experiences in vaccine recipients, vaccinators and onlookers (e.g., parents, clinic staff). Interventions are included in each letter category (C-A-R-D) that address the psychological, biological and social factors contributing to an individuals risk of experiencing immunization stress-related responses. These interventions include increasing knowledge and preparedness, mitigating pain and fear, and promoting trusting relationships with vaccinators, which in turn, can have a positive impact on vaccination acceptance, compliance and confidence.

During the COVID-19 pandemic, priority funding was provided by the Public Health Agency of Canada to support creation of tools and implementation approaches that allow CARD to be integrated across diverse vaccination settings delivering vaccinations to children and adults, in order to support public COVID-19

vaccination. Both English and French tools were created and are freely available online for anyone to use.

The specific objectives of this workshop are to: 1) describe the importance of including patient experiences as a quality indicator of vaccination programs; 2) introduce the CARD system as a framework for providing vaccinations to an international public health audience; 3) share key CARD tools (e.g., child web game, training e-module) for implementation; and 4) describe implementation approaches used across diverse vaccination settings (mass clinics, pharmacies, hospitals, long-term care) and the successes achieved, in order to stimulate global interest and adoption.

There are 3 workshop speakers: Anna Taddio, Lucie Marisa Bucci, and Angelo Ilersich. Speakers will engage the audience with questions throughout the presentation to stimulate discussion. Videos and other tools will be demonstrated. The audience will be asked for feedback and to describe their needs to support broad implementation across health care settings.

Key questions that the workshop will address: Why are immunization stress-related responses important to track for vaccination delivery programs? How can the CARD system improve the safety of vaccination delivery and improve patient-centredness in health care delivery? What are the key CARD tools and how can they be feasibly integrated across diverse vaccination settings? What are the expected benefits of implementing CARD as a vaccination delivery framework?

Popul. Med. 2023;5(Supplement):A2072

DOI: 10.18332/popmed/164294

Public health workforce in Indonesia: A dilemma between professional worker and way of life for health worker

Background: Public health as a joint effort to fulfill the right of citizens to live healthily and live long lives requires the involvement of all parties. However in Indonesia, this situation invites a lot of debate, about whether public health is a way of life that can be carried out by any profession (health), or a specific/specific job, or a profession that should only be done by those who are specially educated and trained in public health. Current Law No. 36/2014 said that public health worker in Indonesia is a specific work but in practice, it brings scattered workers and is no longer integrated as public health with a holistic view and interventions. **Objective:** This paper aimed to explore public health practices and invited dialogue among countries under WFPHA membership

Method: We will do a systematic literature review and develop a summary of public health workers and practices all over the world **Expected Results:** Comparison of the main feature of public health among countries to developed contributions of the public health workforce to Indonesia and the rest of the world

International guidelines for controlling aerosol infections in dental services: which countries were prepared?

Thiago Nascimento¹

¹Secretaria de Saúde Pública do Rio Grande do Norte (SESAP-RN), Brazil

Bioaerosols are frequently present in the dentistry routine activities and represent a risk for a series of infectious diseases, such as influenza, tuberculosis, varicella, and COVID-19. Aiming at health security in dental services, important measures were highlighted in international recommendations. To verify the existence of universal standards in dental practice around the world, airborne infection control guidelines, developed before the year 2020, adopted by 29 countries based on 8 requirements for protection against dental aerosols were reviewed. A score of 0 and 1 (presence and absence, respectively) was adopted for the analysis of the following protocol items: (1) heating and ventilation system (HVAC), (2) mask, (3) respirator (N95 OR PFF2), (4) rubber dam, (5) antiseptic mouthwash, (6) high suction system, (7) physical barriers for equipment/furniture protection, and (8) disinfection of waterlines. Among the protocols, only 5 obtained the maximum score. Only the use of a surgical mask was present in all recommendations. In a general way, there was no international consensus on measures to prevent airborne infection. The evidence regarding the risk of aerosol infections in dental services, the context of the pandemic faced worldwide, calls for a standardization of the norms related to airborne infection control guidelines in the clinical area where dental procedures will be performed.

Bringing greater accuracy to Europe's healthcare systems: the unexploited potential of Next generation sequencing and biomarker testing in the role of public health

Ruggero Maria¹, Sarah Garner², Ruth Lopert³, France Dube⁴, Bettina Ryll⁵

¹Alliance Against Cancer, Italy, ²World Health Organization, Denmark,

³Organisation for Economic Co-operation and Development (OECD), France,

⁴AstraZeneca, United States, ⁵Melanoma Patient Network Europe, Sweden

Rapid and continuing advances in biomarker testing are not being matched by take-up in health systems, and this is hampering both patient care and innovation. It also risks costing health systems the opportunity to make their services more efficient and, over time, more economical. The potential that public health genomics has brought to biomarker testing in diagnosis, prediction and research is being realised, pre-eminently in many cancers, but also in an ever-wider range of conditions. But development is impeded by data deficiencies, and lack of policy alignment on standards, approval and reimbursement. Europe should already have in place a guarantee of universal access to a minimum suite of biomarker tests and should be planning for an optimum testing scenario with a wider range of biomarker tests integrated into a more sophisticated health system articulated around personalised medicine. Improving healthcare and winning advantages for Europe's industrial competitiveness and innovation require an appropriate policy framework – starting with an update to outdated recommendations. **Impact:** 1. This directly supports activities in two Flagships of the European Beating Cancer plan: Flagship 6 on 'The new "Cancer Diagnostic and Treatment for All" initiative and Flagship 7 on "Genomic for Public Health", 2. Short-term effects of the session will be to raise awareness in the community on the need of building such cancer lifespan continuum and provide a new conceptual health paradigm for cancer prevention, diagnosis and treatment, 3. Medium-term efforts will be made to define how the new paradigm can fit and be integrated into the healthcare systems of the member states. Large capacity building and knowledge transfer initiatives will be needed for this. 4. The target population of this session in principle includes all stakeholders directly or indirectly concerned in creating the cancer lifespan initiative: cancer healthcare professionals and researchers, cancer patients, citizens and cancer healthcare policy makers. Their experience will provide guidelines and recommendations for further fine-tuning and/or research towards an evidence based cancer lifespan continuum.

Investment for Health and Development, Ospedale SS. Giovanni e Paolo,

Corridio S. Domenico, 1st fl., 6777 Castello, 30122 Venice, Italy, ⁵World

Health Organization, Castello 2956, Italy

The WHO European Programme of Work (2020-2025) emphasizes the importance of "supporting local living environments that enable health and well-being", and identifies the WHO Regions for Health Network as an instrument to achieve this goal.

One of the key issues the Network has been working on in recent years, has been the cross-border cooperation amongst regions and countries, particularly in light of the COVID-19 pandemic, which has shown that health threats do not stop at national borders. Different responses amongst cross-border regions, based on national policies in terms of Public Health and Social Measures (PHSM), may even weaken their effectiveness.

The importance of cooperation across border is not only relevant in the framework of pandemic preparedness and responses, but in many other fields: healthcare cooperation, emergency medical care, medico-social cooperation and increasingly, for health prevention and promotion. All have shown to be beneficial to population health when developed at the subnational level across border regions.

Consequently, the aim of this workshop is to adopt a broader perspective to cross-border cooperation, which should move beyond the 'traditional' healthcare perspective, to involve a wider spectrum of actors: public health authorities, local authorities, and academic institutions. There is a need to jointly build a new and common understanding on these issues, for a truly pan-European outlook that uses an equity lens to address the challenges of health and wellbeing promotion in border regions.

The Keynote speech will be given by the Coordinator of the WHO Europe Regions for Health Network, Dr. Bettina Menne. Subsequently, 3-4 well-established health experts and networks for cross-border cooperation will take the floor with short presentations (5 min) in order to present their 'business case' and value. The

presentations will be followed by a short round table discussion to highlight the role and strengths health networks can bring to regions in order to improve cross-border cooperation in public health. **KEY QUESTION TO BE ADDRESSED** What are the advantages, and how can we jointly promote a public health approach for cross-border health cooperation?

Moderator:

Alvise Forcellini, Consultant, WHO Regional Office for Europe

Speakers:

Bettina Maria Menne, Coordinator of the healthy settings program, WHO Regional Office for Europe

What is the mandate of public health professionals in practice? making our mark for the public's health

Maria Neira¹, Michael Marmot², Emma Te-Patu¹, John Coggon¹, Brigit Toebes³, Ominia Omrani¹, Farhang Tahzib¹

¹World Health Organisation, Geneva Switzerland, ²UCL Institute of Health Equity, United Kingdom, ³University of Groningen Netherlands

In a world in turmoil, with ongoing challenges for the public's and the planet's health, it is crucial for public health professionals to reflect on who they are, on their profession's moral mandates, and to clearly assess and understand the reality of the public health challenges in these times. This is essential if we are to be, and feel, empowered to lead and support actions to promote and protect the public's health.

The climate emergency, the COVID-19 pandemic, the growing spread of NCDs, and other public health challenges have demonstrated the importance of public health and a professional workforce and systems to protect and promote the health of people and the planet. There are wide variations in understandings of what public health is, how it finds its mandate, and what then the role of public health professionals can and should be. Is public health just science, or does it have a mandate around social reform? If and how should we be advocates for health and social justice? There have been challenges to public health leadership to "regain courage and purpose" and "wider ambitions", that "the field's future lies in reclaiming parts of the past that it willingly abandoned", and the need for "thinking anew on the paradigms of health, harm and disease", be "the science of social justice" and sow new seeds which are necessary now to deal with the problems that define the public's health.

The purpose of the session is to bring together public health leaders and thinkers to reflect and consult on these critical questions from different perspectives, with a particular focus on the Climate Emergency as a case study. This will include Dr Maria Neira, Director of the Public Health, Environment and Social Determinants of Health Department of the World Health Organization, Professor Sir Michael Marmot, Director of the UCL Institute of Health Equity, Professor Toebes, senior legal scholar on global health law, Dr Emma Rawson Te-Patu, the first Indigenous President Elect of the World Federation of Public Health Association, Professor John Coggon, distinguished public health ethico-legal scholar, and Dr Omnia El Omrani, the CoP 27 Presidential youth envoy. The dialogue will be facilitated by Farhang Tahzib.

Aims

- * To examine the diversity in understandings of the mandates of public health and their implications for practice
- * To consider the Climate Emergency, and the roles, responsibilities, and opportunities for public health practitioners
- * Consider ethico-legal perspectives and insights from indigenous knowledge systems to inform the dialogue

Key questions

- * What is public health and the role of public health professionals? Is public health just science? If and how should public health practitioners 'be political', 'be advocates' and engage with political processes and social reform?
- * How do different world views inform and impact practice?
- * Why is public health "a global thing" and what are the implications for the "organised efforts of society"?
- * In light of the above considerations, the dialogue will explore the question around the role of public health professionals in tackling the Climate Emergency as the

case study

Gender, power and privilege: Opportunities and challenges for women leading in a world of turmoil

Flávia Virginio¹, Flavia Senkubuge², María Caro³, Raquel Bennet⁴, Vina HuLamm⁵

¹Women in Global Health - Brazil Butantan Foundation/Institute Av. Vital

Brazil, 1500 - Butantã - São Paulo, SP, Brazil Brazil, ²Faculty of Health

Sciences, Women in Global Health, University of Pretoria, South Africa,

³Women in Global Health, Fundación Gedyt, Buenos Aires, Argentina,

⁴Women in Global Health Brazil, ⁵American Public Health Association 800 I Street, N.W. Washington, D.C. 20001 United States

The covid-19 pandemic hit a grossly unequal world and has deepened inequality both within and between countries, especially in terms of gender. In this context, data reveals that women have been the majority at the forefront and also the most affected by the pandemic inside the health care sector. Women represent the majority of healthcare workers across the globe. Although women represent the majority of healthcare workers across the globe and account for 67 percent of the professionals in the field (who, 2022), they remain clustered into job positions that are of lower status and lower pay. Only 25% of decision-making roles are represented by women. A July 2022 report from women in global health estimated that at least 6 million women are working either in unpaid and/or grossly underpaid positions within health systems. Given this context, we must challenge the status quo and ensure there is both fairness and justice in how benefits, power, resources and responsibilities are equally distributed between women and men (paho, 2022). During these times of great transition and continuous change globally, it becomes even more pressing to acknowledge the issues women face and address the place where women stand within these processes.

This world leadership dialogue presents an opportunity for all of us to come together and jointly learn from the experiences of women of different backgrounds who are leading change across the global health sector. Wgh and apha will be inviting three women from diverse backgrounds for a fireside chat to share experiences on their respective health career paths, as well as reflections on the challenges they are facing inside the public health field in a post-covid world. The panelists will also provide solutions to overcoming gender barriers and other challenges that women usually face as women health professionals in a world of turmoil. Audience members will be encouraged to participate in the discussion and have time to pose questions to the esteemed panelists at the end.

Popul. Med. 2023;5(Supplement):A2078

DOI: 10.18332/popmed/164462

Eliminating HPV globally: from strategy to implementation

Daniel Kelly¹, Monica Geingos², Joan Benson³, Bettina Borisch⁴

¹European Cancer Organization, United Kingdom, ²Joint United Nations

Programme on HIV/AIDS (UNAIDS) Special Advocate for Young Women

and Adolescent Girls, Namibia, ³MSD Executive Director Global Policy and

Strategy, United States, ⁴World Federation of Public Health Associations, Switzerland

Few diseases reflect global inequalities as much as cervical cancer. Of the estimated 342,000 deaths from cervical cancer in 2020, about 90% of these occur in low- and middle-income countries. Moreover, women living with HIV are six times more likely to develop cervical cancer compared to women without HIV, and globally the contribution of HIV to cervical cancer falls disproportionately on younger women.

A large majority of cervical cancer (more than 95%) is due to the human papillomavirus (HPV). Cervical cancer is the fourth most common form of cancer among women worldwide but it is preventable and curable, if detected early and managed effectively. HPV additionally causes anal, penile, oropharyngeal, vulval, vaginal and other cancers. At least 10%, and possibly up to 40%, of cancers caused by human papillomavirus are in men. Men who have sex with men are at particular risk.

The global coverage of the first dose of HPV vaccine in girls is only 15% and the COVID-19 pandemic fueled the largest continued backslide in vaccination and screening. While in high-income countries people can be vaccinated against HPV and women have access to regular screening and treatment, this is not the reality in LICs and LMICs. Moreover, males are currently excluded from most HPV vaccination programs. Gender-neutral vaccination would protect woman and men and accelerate the elimination of cervical cancer.

WHO has developed an aspirational strategy to eliminate cervical cancer as a public health problem, aiming to increase HPV vaccination to 90%, twice-lifetime

cervical screening to 70%, and treatment of pre-invasive lesions and invasive cancer to 90%. In line with the strategy as well as Europe's Beating Cancer Plan, this World Leadership Dialogue will provide a platform for health leaders from governments, UN agencies, the private sector, civil society, and patients to share progress and challenges toward eliminating all HPV-related cancers.

Objectives: Highlight progress towards the WHO's 90-70-90 cervical cancer elimination goals

Discuss the determinants of health that limit women's access to health services, screening and treatment, starting from the real experience of some countries
Consider the merits of gender-neutral HPV vaccination

Create a sense of urgency to direct policy decisions toward concrete actions to prevent and treat HPV-related diseases and to increase investments to scale access to these tools.

Key questions: Health leaders will listen to and discuss with the communities and policy makers to define the best approaches and leverages to implement concrete actions based on WHO global strategy to prevent and treat HPV locally and worldwide; and to facilitate intersectoral collaborations to achieve this common goal.

Popul. Med. 2023;5(Supplement):A2079

The BRICS' contribution to developing a public health-oriented model of vaccine production and distribution

Rosana Campos¹, Sanjay Rai², Zijian Feng³, Glenda Gary⁴

¹Brazilian Association of Collective Health (ABRASC), Brazil, ²Indian Public Health Association, India, ³Chinese Preventive Medicine Association, China, ⁴South African Medical Research Council (SAMRC), South Africa

Doubtless, access to vaccines is an important issue, as highlighted by the failure to assure universal and equitable access to Covid-19 vaccines. Indeed, this failure relates to the lack of vaccine capacity, shortage and the hoarding of vaccines in developed countries. In March 2022, the BRICS Vaccine Research and Development Centre has been launched to strengthen global preparedness and responses to future pandemics, the establishment of which is an important attempt by BRICS countries to contribute to the global public good by ensuring that countries of the world have equitable access to vaccines.

Solutions to solve the immunization problems are similar globally, with vaccines being a critical component. In this sense, it is important to discuss how the public health associations of the BRICS countries, which have the capacity of producing vaccines, and the World Federation of Public Health Associations can contribute to promoting equitable access to vaccines.

The mechanism of cooperation between BRICS public health associations started in 2015 with a workshop on disease prevention and control at the 14th Congress of WFPHA. This WLD session is a continuation of this good cooperation among BRICS member associations. In the meanwhile, a WLD session during the 17th World Congress on Public Health will be a great opportunity for the public health community to know the opportunities and challenges of integration between public health systems and policies and vaccine development and production in the Global South. Furthermore, building high-quality partnerships and deepening BRICS cooperation mechanisms in the field of public health is also one of the key objectives of this WLD session.

For these reasons, we present this proposal for a WLD session to discuss the opportunities and challenges for a public health-oriented model of vaccine development, production and distribution that contributes to promoting health equity.

Specific aims/objectives and component parts: Present the vaccine contributions to global public health from Brazil, India, China and South Africa

Discuss how to promote equitable access to vaccines

1. Key questions that the dialogue will address: What are the challenges to promoting equal world access to vaccines, considering the contribution of the BRICS countries?

2. How to strengthen the cooperation mechanism established by BRICS countries in regard to public health, in general, and equitable access to vaccines, in particular?

Spotlight on Cardiovascular CARDIO-vascular risk Stratification, Management And Refining Treatment

Natasha Muscat¹, Stefania Boccia², Gabriella Pravettoni³, Aoiffe O'Brien⁴, Alessandra Moretti⁵

¹World Health Organisation (WHO), Denmark, ²Università Cattolica del Sacro Cuore (UCSC), Italy, ³European Institute of Oncology, Italy, ⁴Novartis, Switzerland, ⁵European Parliament, Belgium

Despite remarkable therapeutic advances in medicine, CVDs remain the major cause of morbidity and mortality, affecting millions of individuals in Europe and worldwide. There is therefore an urgent need for better solutions at all levels of cardiac care and public health.

The term 'cardiovascular disease continuum' was coined to describe the chain of events from exposure to cardiovascular risk factors to atherosclerosis and end-stage heart disease. It is increasingly recognised that early detection and maintenance of risk factor levels, along with interventions in the chain of cardio-metabolic risk continuum, can be more effective than the current approach of detecting and controlling disease. The silent onset of CVDs in many asymptomatic individuals, however, made early risk detection in medical practice impossible.

The session aims to create a framework for the understanding of the complex interplay of factors influencing early diagnosis of CVD. Thus, enabling the detection of development and progression of CVDs at much earlier stages.

Genomes Over a Lifetime (GOAL): An innovative approach to personalized patient empowerment through early diagnosis and treatment for cancer patients and rare disease

Gennaro Ciliberto¹, Rosa Giuliani^{2,3}, Marzia Zambon⁴, Ciarán Nicholl⁵, Allona McCloy⁶

¹Istituto di Ricovero e Cura a Carattere Scientifico (IRCCS), Istituto Nazionale Tumori Regina Elena, Italy, ²European Society of Medical Oncology (ESMO), Italy, ³European Society of Medical Oncology, The Clatterbridge Cancer Centre, Liverpool, United Kingdom, ⁴Europa Donna, Switzerland, ⁵Unit of Health, JRC, European Commission, Belgium, ⁶Oncology Policy EUCan

In the EU, the "portrait" of healthcare has undergone many changes down the years, with many adaptations as the EU has evolved. The role of patients has become much more significant as they have gained greater knowledge; there have been giant leaps in innovation, while societal changes and issues (such as the ageing population) have led to different priorities. Today's portrait of healthcare features many perspectives, schools of thought and approaches coming from different stakeholders, different Member States and even different regions within those Member States. One thing that has become very clear is that a one-size-fits-all approach to treatment is outmoded, wasteful and often counterproductive to the health of patients. This includes, in these days of increasing co-morbidities, treating one disease separately, rather than looking at the patient's health issues as a whole. Meanwhile, citizens are being bombarded with often contradictory messages regarding what is "good" or "bad" for them, often in a patronising manner, while the realities of extremely effective preventative measures are often obscured, with a lack of emphasis on screening and early diagnosis.

The session will focus on the role of public health to tackle cancer among young women and the role of the EU Beating Cancer plan as well as the European Health Data Space to tackle this.

Driving Resilient Pediatric Immunization Programs Globally

Viorica Verdaga¹, Susana Esposito², Lucia Oliveira³, Ahmed Ouma⁴, Michael Moore⁵, Marta Lomazzi⁶

¹UNICEF, United States, ²Specialization School in Pediatrics, Department of Medicine and Surgery, Pietro Barilla Children's Hospital, University of Parma, Parma, Italy, ³PAHO, United States, ⁴CDC Afro, Ethiopia, ⁵World Federation of Public Health Associations, Australia, ⁶World Federation of Public Health Associations, Switzerland

Vaccination is one of the most powerful and cost-effective tools in the history of public health, with important health, economic and social benefits. Pediatric vaccinations help protect children and adults from serious, preventable, and sometimes life-threatening diseases and are a key contributor to support global health security. Globally, vaccination coverage has stagnated at around 85 percent from 2011 to 2019, with some regions reaching excellent results.

However, since the onset of the COVID-19 pandemic, global childhood vaccinations have experienced the largest sustained decline in 30 years. Globally, in 2021 alone,

25 million children did not receive routine vaccinations against diseases such as measles, causing preventable epidemics. This rate plummeted in 2020 and 2021 during the pandemic, particularly in low- and middle-income countries: of the 18 million children who did not receive a single dose of DTP in 2021, the highest number live in India, Nigeria, Indonesia, Ethiopia and the Philippines. Data collected by WHO and UNICEF show that the percentage of children who received three doses of the diphtheria, tetanus and pertussis (DTP3) vaccine declined by 5% between 2019 and 2021, to 81% worldwide. These figures are extremely alarming because DTP3 is considered an indicator of overall vaccine coverage and broader healthcare access; if children are missing these vaccinations, they are probably also missing preventive care visits and crucial vaccinations for many other diseases. If this downward trend continues, we can expect to see a continued increase in cases, outbreaks, and deaths from diseases that are completely preventable.

Conflicts worldwide and related population displacement are placing additional pressures on health systems and exacerbating disruptions to routine immunization programs. To date, the war in Ukraine had led to at least 5.6 million refugees being hosted in EU countries. This has resulted in an increased threat of vaccine-preventable disease outbreaks in the region.

We live in a world where health systems are constantly facing threats and preventing the spread of vaccine preventable diseases is a key component of global health security. Recent pressures on the health system and geopolitical conflicts underscore the need for resilient immunization programs which are able to withstand major shocks and disruptions, quickly adapt to changing circumstances, and maintain high vaccine uptake and acceptance over time. Prioritizing immunization as an essential health service and ensuring pediatric immunization programs are resilient in the face of current and new threats is of the utmost important to ensure populations are healthy.

Goal: Engage health leaders from governments, public health authorities, communities, and advocacy groups to discuss how to build resilient pediatric immunization systems through effective monitoring, communication, legislation, funding, and crisis-preparedness planning.

Objectives: Highlight progress in pediatric vaccination and discuss the impact of COVID-19 and other external factors on vaccine coverage rates

Utilize real-life experiences from select countries to discuss barriers and opportunities to developing resilient immunization systems and ensuring health system strengthening. Create a sense of urgency to drive policy decisions that support resilient immunization systems and concrete crisis preparedness plans globally to ensure efficient pediatric immunization programs.

Equitable access to vaccines: Contributions from the Global South

Huichuan Yang¹, Rajinder Suri², Shu Xiang³, Andrew Wong⁴, Morena Makhoana⁵, Sunil Gairola⁶, Weining Meng⁷, Adriansjah Azhari⁸, Tiago Moraes⁹, Venkatraman Hariharan¹⁰, Youngran Park¹¹

¹China National Biotec Group (Sinopharm CNBG), China, ²Developing Countries Vaccine Manufacturers Network, India, ³China National Biotec Group Company Limited, China, ⁴Walvax Biotechnology Co., Ltd., China, ⁵Biovac, South Africa, ⁶Serum Institute of India Pvt. Ltd., India, ⁷Sinovac Life Science Co., Ltd., China, ⁸Biofarma Indonesia, Indonesia, ⁹Instituto Butantan, Brazil, ¹⁰Bharat Biotech, India, ¹¹Eu Biologics, Republic of Korea

A brief outline of the overall WLD

Doubtless, access to vaccines is an important issue, as highlighted by the failure to assure universal and equitable access to Covid-19 vaccines. Indeed, this failure relates to the concentration of vaccine producers in countries in the Global North and the patent-led business model they adopt.

In this sense, the existence of vaccine producers in countries in the Global South, some of them state-owned and not profit seekers, may represent a way to increase production and contribute to a fairer distribution.

Of course, these producers face many challenges in accomplishing a significant role in the global arena, including research and innovation capabilities, industrial infrastructure, financial sufficiency and stability, and trade opportunities and constraints related to competence and international agreements.

Vaccine producers are adopting different strategies to face the challenges, including strengthening collaboration. They articulated the Developing Countries Vaccine Manufacturers Network (DCVMN), a voluntary public health-driven alliance of vaccine manufacturers from developing countries, firmly engaged in research, development, manufacturing and supply of high-quality vaccines that are accessible to protect people against known and emerging infectious diseases globally.

A WLD session during the 17th World Congress on Public Health would be an

excellent opportunity for the public health community to know the current and potential DCVMN initiatives. Furthermore, it would provide a space to reinforce, among the manufacturers, the values of public health as universality, equality, and sustainability of health and health care.

For these reasons, we present this proposal for a WLD session to discuss the opportunities and challenges for a vaccine development, production and distribution model that contributes to promoting health equity.

Specific aims/objectives and component parts: Present the experience of vaccine manufacturers from the DCVMN. Discuss the contributions of DCVMN to promote equitable access to vaccines

Key questions that the dialogue will address: What are the challenges to developing, producing and distributing vaccines by public health-driven manufacturers based in the Global South? How can these manufacturers contribute to promoting equal world access to vaccines?

The public health impact of innovations in vaccine technology

Glenda Gray¹, Hamilton Bennett², Walter Ricciardi³

¹South African Medical Research Council, Cape Town, South Africa, ²Vaccine Access and Partnerships at Moderna, United States, ³Università Cattolica del Sacro Cuore, Rome, Italy

COVID-19 has broadly worsened existing disparities in health in our society. Whilst the pandemic has generally had a negative impact on public health, it has also been an important opportunity to gain key insights on how to address health inequalities at a global level. In this World Leadership Dialogue, world-renowned experts will provide an overview of how through evolving our public health strategies alongside advances in science and technology, we have gained important insights on how to prepare for and manage future pandemics. Providing equal access to advances in health technology and effective public health programs will be critical components to reducing future inequalities in care across the globe.

Professor Walter Ricciardi will chair the session. Professor Glenda Gray will provide an overview of the key drivers of health disparities and the importance of addressing these gaps. She will also provide examples of what current disparities look like, through HIV and COVID-19 as examples. The actions required to eliminate these disparities will also be discussed, along with reflecting on the key lessons learned from the COVID-19 pandemic. This will include an overview of the global need to provide equitable access to vaccines and the sharing of technology to facilitate vaccine manufacturing in low- and middle-income countries, along with the inclusion of participants from these nations in global clinical studies of emerging interventions.

Following on from this, Hamilton Bennett will review the potential role that new technologies, including mRNA technology, could play in addressing specific health disparities and ensuring pandemic preparedness for the future. She will also provide an overview of the recent advancements in characterizing pathogens of concern and identifying public health threats before they emerge. The urgency of shortened timelines between pathogen emergence and the approval of medical countermeasures will also be discussed along with the importance of access to new technology in facilitating future pandemic preparedness.

Approaches to increasing health equity

Hyewon Lee¹, John Gannon², Deborah Walker³, Adrian Patu⁴, Leanne Coombe⁵, Vina Hulamm⁶, Alessandro Berionni⁷, Soyce Shirinde⁸

¹Chair of WFPHA Oral Health Working Group, ²Chair of WFPHA Tobacco Control Working Group, ³Chair of WFPHA Women, Adolescent and Children's Health Working Group, ⁴co-Chair of WFPHA Indigenous Working Group, ⁵co-Chair of WFPHA Professionals Education and Training Working Group, ⁶co-Chair of WFPHA Global Health Equity and Digital Technology Working Group, ⁷Chair of WFPHA Students and Young Professionals Working Group, ⁸member of WFPHA Environmental Health Working Group

Health is a fundamental human right, so every human being should be able to attain her full potential for health and well-being. Notwithstanding, most human beings do not have the conditions to enjoy this right. Health conditions vary significantly across population groups. Indeed, health inequities are a major ethical problem worldwide.

Health inequities have increased due, in part, to the Covid-19 pandemic. People in more vulnerable social situations, or Black and Indigenous people, have experienced higher rates of Covid-19 cases and deaths. In Africa, in 2018, the Infant Mortality Rate was 52 per 1,000 live births, more than seven times higher than in Europe, where it was 7 per 1,000 live births.

In 2022, while nearly half of the world population (3.3 billion people) lived below the poverty line on \$5.50 a day, billionaire wealth experienced the most significant increase in history, with the top 10 wealthiest men in the world having doubled their fortunes.

In this context, promoting health equity must be the principal commitment of any organisation active in the health field. Health equity is officially a priority of the United Nations and all States who signed the Agenda 2030 - Sustainable Development Goals. It is also part of the World Federation of Public Health Organisations (WFPHA) mission.

Considering these recent setbacks in health equity, the approaches to promote it must be rethought. Maybe it is time to move away from the aid and charity-based model, focused on controlling diseases and patients in poor populations, to a technical-political approach that seeks to overcome inequities through interventions in the social process of health determination, including the public and communities as permanent partners in organising services with people, rather than for people. How to make this move?

This World Leadership Dialogue session aims to discuss this general question, focusing on the role and strategies that the WFPHA can accomplish. Members and chairs of its eight working groups - Tobacco Control; Women, Adolescents & Children; Public Health Professionals Education & Training; Indigenous People, Students & Young Professionals; Environmental Health; Digital Technology; and Oral Health - will share their experiences and reflect about specific questions such as:

- How can a more representative and diversified international community be created to improve global health equity?
 - o How to involve historically minority groups and perspectives from the global south in the Public Health field?
 - o What is health equity from the Indigenous Peoples' perspective?
 - o How can youth voices be equally involved and represented worldwide?
- What should Public Health do to be prepared to deal with climate change impacts?
- How to ensure Public Health trainees gain the required competencies to promote equity and health equity in their practice?
- How are WFPHA workgroups collaborating to promote health and health equity?
 - o What are the future opportunities for collaborations within the WFPHA?
 - o What are the opportunities for collaborations external to the WFPHA?

Peripheral arterial disease - in Slovakia a matter of general practitioners

Katarina Dostalova¹, Peter Makara², Sona Wimmerova, Katarina Gazdikova¹, Maria Bartusova, Stefania Moricova¹

¹Slovak Medical University, Bratislava, Slovakia, ²Slovak Society of General Practice, Bratislava, Slovakia

Background: The diagnosis of peripheral arterial disease is determined by measurement of ankle-brachial index (ABI) - simple, highly sensitive, specific, fulfilling the WHO criteria for screening method. Slovak Angiological Society and Slovak Society of General Practice studied if ABI measurement would be beneficial in screening and could be performed by general practitioners.

Methods: Slovak Angiological Society and Slovak Society of General Practice acted responsibly when considering the introduction of screening. First of all we started by analysing epidemiological studies. This led to a decision to conduct a pilot study: 24 general practitioners from all regions of Slovakia under supervision of angiologists assessed 2207 consecutive patients over 60 years old..

Results: 67.4% of patients had a normal ABI (0.9-1.2), 9.4% of patients had

decreased ABI (<0.9) and 23.2% of patients had increased ABI (> 1.2). Patients with decreased ABI have significantly increased risk of myocardial infarction and stroke. Decreased ABI is more often in men, smokers, diabetics, suffering from high blood pressure, dyslipidaemia. This is our target group, patients in whom adherence to preventive measures and lifestyle changes introduced by general practitioner can lead to improvement of health and prognosis.

Conclusions: In 2016, the possibility of ABI measurement was included in the preventive check-up. In the same year, 3,886 amputations were performed in Slovakia. It is a challenge to evaluate the benefit of this measure over time. General practitioners determine the dominant way and rate of health care. Differential diagnosis of lower limb pain is their daily agenda in which ABI measurement can be effective. ABI test is a similar and cheap tool for the non-invasive assessment of PAD, expands the basic diagnostics and helps to clarify the cardio-vascular risk and risk of amputation.
